30). A certain tribe has a language of the kind 2). The numerals used are those of our decimal system. No one numeral used can be observed to play the predominant role of the last numeral in some of the above games (27), 28)). (One is tempted to continue this sentence by saying, "although there is of course a highest numeral actually used".) The children of the tribe learn the numerals in this way: They are taught the signs from 1 to 20 as in 2) and to count rows of beads of no more than 20 on being ordered, "Count these". When in counting the pupil arrives at the numeral 20, one makes a gesture suggestive of "Go on", upon which the child says (in most cases at any rate) "21". Analogously, the children are made to count to 22 and to higher numbers, no particular number playing in these

exercises the predominant role of a last one. The last stage of the training is that the child is ordered to count a group of objects, well above 20, without the suggestive gesture being used to help the child over the numeral 20. If a child does not respond to the suggestive gesture, it is separated from the others and treated as a lunatic.

Page 93

31). Another tribe. Its language is like that in 30). The highest numeral observed in use is 159. In the life of this tribe the numeral 159 plays a peculiar role. Supposing I said, "They treat this number as their highest",--but what does this mean? Could we answer: "They just say that it is the highest"?--They say certain words, but

Page Break 94

how do we know what they mean by them? A criterion for what they mean would be the occasions on which the word we are inclined to translate into our word "highest" is used, the role, we might say, which we observe this word to play in the life of the tribe. In fact we could easily imagine the numeral 159 to be used on such occasions, in connection with such gestures and forms of behaviour as would make us say that this numeral plays the role of an unsurmountable limit, even if the tribe had no word corresponding to our "highest", and the criteria for numeral 159 being the highest numeral did not consist of anything that was *said* about the numeral.

Page 94

32). A tribe has two systems of counting. People learned to count with the alphabet from A to Z and also with the decimal system as in 30.) If a man is to count objects with the first system, he is ordered to count "*in the closed way*", in the second case, "*in the open way*"; and the tribe uses the words "closed" and "open" also for a closed and open door.

Page 94

(Remarks: 23) is limited in an obvious way by the set of cards. 24): Note analogy and lack of analogy between the *limited supply* of cards in 23) and of words in our memory in 24). Observe that the limitation in 26) on the one hand lies in the *tool* (the abacus of 20 beads) and its usage in our game, on the other hand (in a totally different way) in the fact that in the actual practice of playing the game no more than 20 objects are ever to be counted. In 27) that latter kind of limitation was absent, but the large bead rather stressed the limitation of our means. Is 28) a limited or an unlimited game? The practice we have described gives the limit 40. We are inclined to say this game 'has it in it' to be continued indefinitely, but remember that we could also have construed the preceding games as beginnings of a system. In 29) the systematic aspect of the numerals used is even more conspicuous than in 28). One might say that there was no limitation imposed by the tools of this game, if it were not for the remark that the numerals up to 20 are learnt by heart. This suggests the idea that the child is not taught to '*understand*' the system which we see in the decimal notation. Of the tribe in 30) we should certainly say that they are trained to construct numerals indefinitely, that the arithmetic of their language is not a finite one, that their series of numbers has no end. (It is just in such a case when numerals are constructed 'indefinitely' that we say that people have the infinite series of numbers.) 31) might show you what a vast variety of cases can be imagined in which we

Page Break 95

should be inclined to say that the arithmetic of the tribe deals with a finite series of numbers, even in spite of the fact that the way in which the children are trained in the use of numerals suggests no upper limit. In 32) the terms "closed" and "open" (which could by a slight variation of the example be replaced by "limited" and "unlimited") are introduced into the language of the tribe itself. Introduced in that simple and clearly circumscribed game, there is of course nothing mysterious about the use of the word "open". But this word corresponds to our "infinite", and the games we play with the latter differ from 31) only by being vastly more complicated. In other words, our use of the word "infinite" is just as *straightforward* as that of "open" in 31), and our idea that its meaning is 'transcendent' rests on a misunderstanding.)

Page 95

We might say roughly that the unlimited cases are characterized by this: that they are not played with a *definite supply* of numerals, but instead with a *system* for constructing numerals (indefinitely). When we say that someone has been supplied with a system for constructing numerals, we generally think of one of three things: a) of giving him a *training* similar to that described in 30), which, experience teaches us, will make him pass tests of the kind mentioned there; b) of creating a *disposition* in the same man's mind, or brain, to react in that way; c) of supplying him with a *general* rule for the construction of numerals.

Page 95

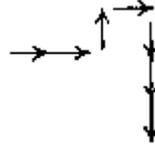

What do we call a rule? Consider this example:

Page 95

33). B moves about according to rules which A gives him. B is supplied with the following table:

a	→
b	←
c	↑
d	↓

A gives an order made up of the letters in the table, say: "aacadd". B looks up the arrow corresponding to each

letter of the order and moves accordingly; in our example thus:

The table 33) we should call a rule (or else "the expression of a rule". Why I give these synonymous expressions will appear later.) We shan't be inclined to call the sentence "aacadd" itself a rule. It is of course the description of the way B has to take. On the other hand,

Page Break 96

such a description would under certain circumstances be called a rule, e.g., in the following case:

Page 96

34). B is to draw various ornamental linear designs. Each design is a repetition of one element which A gives

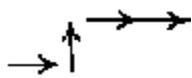

him. Thus if A gives the order "cada", B draws a line thus: 

Page 96

In this case I think we should say that "cada" is the rule for drawing the design. Roughly speaking, it characterizes what we call a rule to be applied repeatedly, in an indefinite number of instances. Cf., e.g., the following case with 34):

Page 96

35). A game played with pieces of various shapes on a chess board. The way each piece is allowed to move is laid down by a rule. Thus the rule for a particular piece is "ac", for another piece "acaa", and so on. The first piece

then can make a move like this: , the second, like this: . Both a formula like "ac" or a diagram like that corresponding to such a formula might here be called a rule.

Page 96

36). Suppose that after playing the game 33) several times as described above, it was played with this variation: that B no longer looked at the table, but reading A's order the letters call up the images of the arrows (by association), and B acts according to these imagined arrows.

Page 96

37). After playing it like this for several times, B moves about according to the written order as he would have done had he looked up or imagined the arrows, but actually without any such picture intervening. Imagine even this variation:

Page 96

38). B in being trained to follow a written order, is shown the table of 33) once, upon which he obeys A's orders without further intervention of the table in the same way in which B in 33) does with the help of the table on each occasion.

Page 96

In each of these cases, we might say that the table 33) is a rule of the game. But in each one this rule plays a different role. In 33) the table is an instrument used in what we should call *the practice* of the game. It is replaced in 36) by the working of association. In 37) even this shadow of the table has dropped out of the practice of the game, and in 38) the table is admittedly an instrument for the *training* of B only.

Page 96

But imagine this further case:

Page Break 97

39). A certain system of communication is used by a tribe. I will describe it by saying that it is similar to our game 38) except that no table is used in the training. The training *might* have consisted in several times leading the pupil by the hand along the path one wanted him to go. But we could also imagine a case:

40). where even this training is not necessary, where, as we should say, the look of the letters abcd naturally produced an urge to move in the way described. This case at first sight looks puzzling. We seem to be assuming a most unusual working of the mind. Or we may ask, "How on earth is he to know which way to move if the letter a is shown him?". But isn't B's reaction in this case the very reaction described in 37) and 38), and in fact our usual reaction when for instance we hear and obey an order? For, the fact that the training in 38) and 39) *preceded* the carrying out of the order does not change the process of carrying out. In other words the 'curious mental mechanism' assumed in 40) is no other than that which we assumed to be created by the training in 37) and 38). 'But *could* such a mechanism be born with you?' But did you find any difficulty in assuming that *that* mechanism was born with B, which enabled him to respond to the training in the way he did? And remember that the rule or explanation given in table 33) of the signs abcd was not essentially the last one, and that we might have given a table for the use of such tables, and so on. (Cf. 21).)

How does one explain to a man how he should carry out the order, "Go *this* way!" (pointing with an arrow the way he should go)? Couldn't this mean going the direction which we should call the opposite of that of the arrow? Isn't every explanation of how he should follow the arrow in the position of another arrow? What would you say to this explanation: A man says, "If I point this way (pointing with his right hand) I mean you to go like this" (pointing with his left hand the same way)? This just shows you the extremes between which the uses of signs vary.

Let us return to 39). Someone visits the tribe and observes the use of the signs in their language. He describes the language by saying that its sentences consist of the letters abcd used according to the table (of 33)). We see that the expression, "A game is played according to the rule so and so" is used not only in the variety of cases exemplified by 36), 37), and 38), but even in cases where the rule is neither an instrument of the training nor of the practice of the game, but stands

in the relation to it in which our table stands to the practice of our game 39). One might in this case call the table a natural law describing the behaviour of the people of this tribe. Or we might say that the table is a record belonging to the natural history of the tribe.

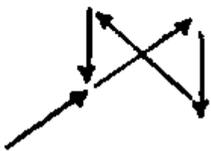

Note that in the game 33) I distinguished sharply between the order to be carried out and the rule employed. In 34), on the other hand, we called the sentence "cada" a rule, and it was the order. Imagine also this variation:

41). The game is similar to 33), but the pupil is not just trained to use a single table; but the training aims at making the pupil use any table correlating letters with arrows. Now by this I mean no more than that the training is of a peculiar kind, roughly speaking one analogous to that described in 30). I will refer to a training more or less similar to that in 30) as a "*general training*". General trainings form a family whose members differ greatly from one another. The kind of thing I'm thinking of now mainly consists: *a*) of a training in a limited range of actions, *b*) of giving the pupil a lead to extend this range, and *c*) of random exercises and tests. After the general training the order is now to consist in giving him a sign of this kind:

rrtst

r	↗
s	↖
t	↓

He carries out the order by moving thus:

Here I suppose we should say the table, the rule, is *part* of the order.

Page 98

Note, we are not saying '*what a rule is*' but just giving different applications of the word "rule": and we certainly do this by giving applications of the words "expression of a rule".

Page 98

Note also that in 41) there is no clear case against calling the whole symbol given the sentence, though we *might* distinguish in it between the sentence and the table. What in this case more particularly tempts us to this distinction is the linear writing of the part outside the table. Though from certain points of view we should call the linear character of the sentence merely external and inessential, this character and similar ones play a great role in what as logicians we are inclined to say about sentences and propositions. And therefore if we conceive

Page Break 99

of the symbol in 41) as a unit, this may make us realize what a sentence *can* look like.

Page 99

Let us now consider these two games:

Page 99

42). A gives orders to B: They are written signs consisting of dots and dashes, and B executes them by doing a figure in dancing with a particular step. Thus the order "-- •" is to be carried out by taking a step and a hop alternately; the order "• • -- --" by alternately taking two hops and three steps, etc. The training in this game is 'general' in the sense explained in 41); and I should like to say, "The orders given don't move in a limited range. They comprise combinations of any number of dots and dashes".--But what does it mean to say that the orders don't move in a limited range? Isn't this nonsense? Whatever orders are given in the practice of the game constitute the limited range.--Well, what I meant to say by "The orders don't move in a limited range" was that neither in the teaching of the game nor in the practice of it a limitation of the range plays a 'predominant' role (see 30)), or, as we might say, the range of the game (it is superfluous to say limited) is just the extent of its actual ('accidental') practice. (Our game is in this way like 30).) Cf. with this game the following:

Page 99

43). The orders and their execution as in 42); but only these three signs are used: "--", "-- ••", "• -- --". We say that in 42) B, in executing the order, is *guided* by the sign given to him. But if we ask ourselves whether the three signs in 43) guide B in executing the orders, it seems that we can say both yes and no according to the way we look at the execution of the orders.

Page 99

If we try to decide whether B in 43) is guided by the signs or not, we are inclined to give such answers as the following: a) B is guided if he doesn't just look at an order, say "• -- --" as a whole and then act, but if he reads it 'word by word' (the words used in our language being "•" and "--") and acts according to the words he has read.

Page 99

We could make these cases clearer if we imagine that the 'reading word by word' consisted in pointing to each word of the sentence in turn with one's finger as opposed to pointing at the whole sentence at once, say by pointing to the beginning of the sentence. And the 'acting according to the words' we shall for the sake of simplicity imagine to consist in acting (stepping or hopping) after each word of the sentence in turn.--b) B is guided if he goes through a conscious process which makes a connection between the pointing to a word and the act of hopping and stepping. Such a connection could be

Page Break 100

imagined in many different ways. E.g., B has a table in which a dash is correlated to the picture of a man making a step and a dot to a picture of a man hopping. Then the conscious acts connecting reading the order and carrying it out might consist in consulting the table, or in consulting a memory image of it 'with one's mind's eye'. c) B is guided if he does not just react to looking at each word of the order, but experiences the peculiar strain of 'trying to remember what the sign means', and further, the relaxing of this strain when the meaning, the right action, comes before his mind.

Page 100

All these explanations seem in a peculiar way unsatisfactory, and it is the limitation of our game which

makes them unsatisfactory. This is expressed by the explanation that B is guided by the particular combination of words in one of our three sentences if he *could* also have carried out orders consisting in other combinations of dots and dashes. And if we say this, it seems to us that the 'ability' to carry out other orders is a particular state of the person carrying out the orders of 42). And at the same time we can't in this case find anything which we should call such a state.

Page 100

Let us see what role the words "can" or "to be able to" play in our language. Consider these examples:

Page 100

44). Imagine that for some purpose or other people use a kind of instrument or tool; this consists of a board with a slot in it guiding the movement of a peg. The man using the tool slides the peg along the slot. There are such boards with straight slots, circular slots, elliptic slots, etc. The language of the people using this instrument has expressions for describing the activity of moving the peg in the slot. They talk of moving it in a circle, in a straight line, etc. They also have a means of describing the board used. They do it in this form: "This is a board in which the peg *can* be moved in a circle". One could in this case call the word "can" an operator by means of which the form of expression describing an action is transformed into a description of the instrument.

Page 100

45). Imagine a people in whose language there is no such form of sentence as "the book is in the drawer" or "water is in the glass", but wherever we should use these forms they say, "The book can be taken out of the drawer", "The water can be taken out of the glass".

Page 100

46). An activity of the men of a certain tribe is to test sticks as to their hardness. They do it by trying to bend the sticks with their

Page Break 101

hands. In their language they have expressions of the form, "This stick can be bent easily", or "This stick can be bent with difficulty". They use these expressions as we use "This stick is soft", or "This stick is hard". I mean to say that they don't use the expression, "This stick can be bent easily" as we should use the sentence, "I am bending the stick with ease". Rather they use their expression in a way which would make us say that they are describing a state of the stick. I.e., they use such sentences as, "This hut is built of sticks that can be bent easily". (Think of the way in which we form adjectives out of verbs by means of the ending "able", e.g., "deformable".)

Page 101

Now we might say that in the last three cases the sentences of the form "so and so can happen" described the state of objects, but there are great differences between these examples. In 44) we saw the state described before our eyes. We saw that the board had a circular or a straight slot, etc. In 45), in some instances at least this was the case, we could see the objects in the box, the water in the glass, etc. In such cases we use the expression "state of an object" in such a way that there corresponds to it what one might call a stationary sense experience.

Page 101

When, on the other hand, we talk of the state of a stick in 46), observe that to this 'state' there does not correspond a particular sense experience which lasts while the state lasts. Instead of that, the defining criterion for something being in this state consists in certain *tests*.

Page 101

We may say that a car travels 20 miles an hour even if it only travels for half an hour. We can explain our form of expression by saying that the car travels with a speed which enables it to make 20 miles an hour. And here also we are inclined to talk of the velocity of the car as of a state of its motion. I think we should not use this expression if we had no other 'experiences of motion' than those of a body being in a particular place at a certain time and in another place at another time; if, e.g., our experiences of motion were of the kind which we have when we see that the hour hand of the clock has moved from one point of the dial to the other.

Page 101

47). A tribe has in its language commands for the execution of certain actions of men in warfare, something like "Shoot!", "Run!", "Crawl!", etc. They also have a way of describing a man's build. Such a description has the form "He can run fast", "He can throw the spear far". What justifies me in saying that these sentences are descriptions of the man's build is the use which they make of sentences of this

Page Break 102

form. Thus if they see a man with bulging leg muscles but who as we should say has not the use of his legs for some reason or other, they say he is a man who can run fast. The drawn image of a man which shows large biceps they describe as representing a man "who can throw a spear far".

48). The men of a tribe are subjected to a kind of medical examination before going into war. The examiner puts the men through a set of standardized tests. He lets them lift certain weights, swing their arms, skip, etc. The examiner then gives his verdict in the form "So and so can throw a spear" or "can throw a boomerang" or "is fit to pursue the enemy", etc. There are no special expressions in the language of this tribe for the activities performed in the tests; but these are referred to only as the tests for certain activities in warfare.

It is an important remark concerning this example and others which we give that one may object to the description which we give of the language of a tribe, that in the specimens we give of their language we let†1 them speak English, thereby already presupposing the whole background of the English language, that is, our usual meanings of the words. Thus if I say that in a certain language there is no special verb for "skipping", but that this language uses instead the form "making the test for throwing the boomerang", one may ask how I have characterized the use of the expressions, "make a test for" and "throwing the boomerang", to be justified in substituting these English expressions for whatever their actual words may be. To this we must answer that we have only given a very sketchy description of the practices of our fictitious languages, in some cases only hints, but that one can easily make these descriptions more complete. Thus in 48) I could have said that the examiner uses orders for making the men go through the tests. These orders all begin with one particular expression which I could translate into the English words, "Go through the test". And this expression is followed by one which in actual warfare is used for certain actions. Thus there is a command upon which men throw their boomerangs and which therefore I should translate into, "Throw the boomerangs". Further, if a man gives an account of the battle to his chief, he again uses the expression I have translated into "throw a boomerang", this time in a description. Now what characterizes an order as such, or a description as such,

or a question as such, etc., is--as we have said--the role which the utterance of these signs plays in the whole practice of the language. That is to say, whether a word of the language of our tribe is rightly translated into a word of the English language depends upon the role this word plays in the whole life of the tribe; the occasions on which it is used, the expressions of emotion by which it is generally accompanied, the ideas which it generally awakens or which prompt its saying, etc., etc. As an exercise ask yourself: in which cases would you say that a certain word uttered by the people of the tribe was a greeting? In which cases should we say it corresponded to our "Goodbye", in which to our "Hello"? In which cases would you say that a word of a foreign language corresponded to our "perhaps"?--to our expressions of doubt, trust, certainty? You will find that the justifications for calling something an expression of doubt, conviction, etc., largely, though of course not wholly, consist in descriptions of gestures, the play of facial expressions, and even the tone of voice. Remember at this point that the personal experiences of an emotion must in part be strictly localized experiences; for if I frown in anger I feel the muscular tension of the frown in my forehead, and if I weep, the sensations around my eyes are obviously part, and an important part, of what I feel. This is, I think, what William James meant when he said that a man doesn't cry because he is sad but that he is sad because he cries. The reason why this point is often not understood, is that we think of the utterance of an emotion as though it were some artificial device to let others know that we have it. Now there is no sharp line between such 'artificial devices' and what one might call the natural expressions of emotion. Cf. in this respect: a) weeping, b) raising one's voice when one is angry, c) writing an angry letter, d) ringing the bell for a servant you wish to scold.

49) Imagine a tribe in whose language there is an expression corresponding to our "He has done so and so", and another expression corresponding to our "He can do so and so", this latter expression, however, being only used where its use is justified by the same fact which would also justify the former expression. Now what can make me say this? They have a form of communication which we should call narration of past events because of the circumstances under which it is employed. There are also circumstances under which we should ask and answer such questions as "Can so and so do this?" Such circumstances can be described, e.g., by saying that a chief picks men

suitable for a certain action, say crossing a river, climbing a mountain, etc. As the defining criteria of "the chief picking men suitable for this action", I will not take what he says but only the other features of the situation. The chief under these circumstances asks a question which, as far as its practical consequences go, would have to be translated by our "Can so and so swim across this river?" This question however, is only answered affirmatively by

those who actually have swum across this river. This answer is not given in the same words in which under the circumstances characterizing narration he would say that he has swum across this river, but it is given in the terms of the question asked by the chief. On the other hand, this answer is not given in cases in which we should certainly give the answer, "I can swim across this river", if, e.g., I had performed more difficult feats of swimming though not just that of swimming across this particular river.

Page 104

By the way, have the two phrases "He has done so and so" and "He can do so and so" the same meaning in this language or have they different meanings? If you think about it, something will tempt you to say the one, something to say the other. This only shows that the question has here no clearly defined meaning. All I can say is: If the fact that they only say "He can..." if he has done... is your criterion for the same meaning, then the two expressions have the same meaning. If the circumstances under which an expression is used make its meaning, the meanings are different. The use which is made of the word "can"--the expression of possibility in 49)--can throw a light upon the idea that what can happen must have happened before (Nietzsche). It will also be interesting to look, in the light of our examples, on the statement that what happens can happen.

Page 104

Before we go on with our consideration of the use of 'the expression of possibility', let us get clearer about that department of our language in which things are said about past and future, that is, about the use of sentences containing such expressions as "yesterday", "a year ago", "in five minutes", "before I did this", etc. Consider this example:

Page 104

50). Imagine how a child might be trained in the practice of 'narration of past events'. He was first trained in asking for certain things (as it were, in giving orders. See 1)). Part of this training was the exercise of 'naming the things'. He has thus learnt to name (and ask for) a dozen of his toys. Say now that he has played with three of them (e.g., a ball, a stick, and a rattle), then they are taken away from

Page Break 105

him, and now the grown up says such a phrase as, "He's had a ball, a stick, and a rattle". On a similar occasion he stops short in the enumeration and induces the child to complete it. On another occasion, perhaps, he only says, "He's had..." and leaves the child to give the whole enumeration. Now the way of 'inducing the child to go on' can be this: He stops short in his enumeration with a facial expression and a raised tone of voice which we should call one of expectancy. All then depends on whether the child will react to this 'inducement' or not. Now there is a queer misunderstanding we are most liable to fall into, which consists in regarding the 'outward means' the teacher uses to induce the child to go on as what we might call an indirect means of making himself understood to the child. We regard the case as though the child already possessed a language in which it thought and that the teacher's job is to induce it to guess his meaning in the realm of meanings before the child's mind, as though the child could in his own private language ask himself such a question as, "Does he want me to continue, or repeat what he said, or something else?" (Cf. with 30.)

Page 105

51). Another example of a primitive kind of narration of past events: we live in a landscape with characteristic natural landmarks against the horizon. It is therefore easy to remember the place at which the sun rises at a particular season, or the place above which it stands when at its highest point, or the place at which it sets. We have some characteristic pictures of the sun in different positions in our landscape. Let us call this series of pictures the sun series. We have also some characteristic pictures of the activities of a child, lying in bed, getting up, dressing, lunching, etc. This set I'll call the life pictures. I imagine that the child can frequently see the position of the sun while about the day's activities. We draw the child's attention to the sun's standing in a certain place while the child is occupied in a particular way. We then let it look both at a picture representing its occupation and at a picture showing the sun in its position at that time. We can thus roughly tell the story of the child's day by laying out a row of the life pictures, and above it what I called the sun series, the two rows in the proper correlation. We shall then proceed to let the child supplement such a picture story, which we leave incomplete. And I wish to say at this point that this form of training (see 50) and 30)) is one of the big characteristic features in the use of language, or in thinking.

Page Break 106

Page 106

52). A variation of 51). There is a big clock in the nursery, for simplicity's sake imagine it with an hour hand only. The story of the child's day is narrated as above, but there is no sun series; instead we write one of the numbers of the dial against each life picture.

53). Note that there would have been a similar game in which also, as we might say, time was involved, that of just laying out a series of life pictures. We might play this game with the help of words which would correspond to our "before" and "after". In this sense we may say that 53) involves the ideas of before and after, but not the idea of a measurement of time. I needn't say that an easy step would lead us from the narrations in 51), 52), and 53) to narrations in words. Possibly someone considering such forms of narration might think that in them the real idea of time isn't yet involved at all, but only some crude substitute for it, the positions of a clock hand and suchlike. Now if a man claimed that there is an idea of five o'clock which does not bring in a clock, that the clock is only the coarse instrument indicating when it is five o'clock or that there is an idea of an hour which does not bring in an instrument for measuring the time, I will not contradict him, but I will ask him to explain to me what his use of the term "an hour" or "five o'clock" is. And if it is not that involving a clock, it is a different one; and then I will ask him why he uses the terms "five o'clock", "an hour", "a long time", "a short time", etc., in one case in connection with a clock, in the other independent of one; it will be because of certain analogies holding between the two uses, but we have now two uses of these terms, and no reason to say that one of them is less real and pure than the other. This might get dearer by considering the following example:

54). If we give a person the order "Say a number, any one which comes into your mind", he can generally comply with it at once. Suppose it were found that the numbers thus said on request increased--with every normal person--as the day went on; a man starts out with some small number every morning and reaches the highest number before falling asleep at night. Consider what could tempt one to call the reactions described "a means of measuring time" or even to say that they are the *real* milestones in the passage of time, the sun clocks, etc., being only indirect markers. (Examine the statement that the human heart is the real clock behind all the other clocks.)

Let us now consider further language games into which temporal expressions enter.

55). This arises out of 1). If an order like "slab!", "column!", etc. is called out, B is trained to carry it out immediately. We now introduce a clock into this game, an order is given, and we train the child not to carry it out until the hand of our clock reaches a point indicated before with the finger. (This might, e.g., be done in this way: You first trained the child to carry out the order immediately. You then give the order, but hold the child back, releasing it only when the hand of the clock has reached the point of the dial to which we point with our fingers.)

We could at this stage introduce such a word as "now". We have two kinds of orders in this game, the orders used in 1), and orders consisting of these, together with a gesture indicating a point of the clock dial. In order to make the distinction between these two kinds more explicit, we may affix a particular sign to the orders of the first kind and, e.g., say: "slab, now!".

It would be easy now to describe language games with such expressions as "in five minutes", "half an hour ago".

56). Let us now have the case of a *description* of the future, a forecast. One might, e.g., awaken the tension of expectation in a child by keeping his attention for a considerable time on some traffic lights changing their colour periodically. We also have a red, a green, and a yellow disc before us and alternately point to one of these discs by way of forecasting the colour which will appear next. It is easy to imagine further developments of this game.

Looking at these language games, we don't come across the ideas of the past, the future and the present in their problematic and almost mysterious aspect. What this aspect is and how it comes about that it appears can be almost characteristically exemplified if we look at the question "Where does the present go when it becomes past, and where is the past?"--Under what circumstances has this question an allurements for us? For under certain circumstances it hasn't, and we should wave it away as nonsense.

It is clear that this question most easily arises if we are preoccupied with cases in which there are things flowing by us,--as logs of wood float down a river. In such a case we can say the logs which *have passed* us are all down towards the left and the logs which *will pass* us are all up towards the right. We then use this situation as a simile for all happening in time and even embody the simile in our language, as when we say that 'the present event passes by' (a log passes by),

'the future event is to come' (a log is to come). We talk about the flow of events; but also about the flow of time--the river on which the logs travel.

Here is one of the most fertile sources of philosophic puzzlement: we talk of the future event of something coming into my room, and also of the future coming of this event.

We say, "*Something* will happen", and also, "Something comes towards me"; we refer to the log as "something", but also the log's coming towards me.

Thus it can come about that we aren't able to rid ourselves of the implications of our symbolism, which seems to admit of a question like "Where does the flame of a candle go to when it's blown out?" "Where does the light go to?", "Where does the past go to"? We have become obsessed with our symbolism.--We may say that we are led into puzzlement by an analogy which irresistibly drags us on.--And this also happens when the meaning of the word "now" appears to us in a mysterious light. In our example 55) it appears that the function of "now" is in no way comparable to the function of an expression like "five o'clock", "midday", "the time when the sun sets", etc. This latter group of expressions I might call "specifications of times". But our ordinary language uses the word "now" and specifications of time in similar contexts. Thus we say

"The sun sets at six o'clock".

"The sun is setting now".

We are inclined to say that both "now" and "six o'clock" 'refer to points of time'. This use of words produces a puzzlement which one might express in the question "What is the 'now'?--for it is a moment of time and yet it can't be said to be either the 'moment at which I speak' or 'the moment at which the clock strikes', etc., etc."--Our answer is: The function of the word "now" is entirely different from that of a specification of time.--This can easily be seen if we look at the role this word really plays in our usage of language, but it is obscured when instead of looking at the *whole language game*, we only look at the contexts, the phrases of language in which the word is used. (The word "today" is not a date, but it isn't anything like it either. It doesn't differ from a date as a hammer differs from a mallet, but as a hammer differs from a nail; and surely we may say there is both a connection between a hammer and a mallet and between a hammer and a nail.)

One has been tempted to say that "now" is the name of an instant of

time, and this, of course, would be like saying that "here" is the name of a place, "this" the name of a thing, and "I" the name of a man. (One could, of course, also have said "a year ago" was the name of a time, "over there" the name of a place, and "you" the name of a person.) But nothing is more unlike than the use of the word "this" and the use of a proper name--I mean *the games* played with these words, not the phrases in which they are used. For we do say "This is short" and "Jack is short"; but remember that "This is short" without the pointing gesture and without the thing we are pointing to would be meaningless.--What can be compared with a name is not the word "this" but, if you like, the symbol consisting of this word, the gesture, and the sample. We might say: Nothing is more characteristic of a proper name A than that we can use it in such a phrase as "This is A"; and it makes no sense to say "This is this" or "Now is now" or "Here is here".

The idea of a proposition saying something about what will happen in the future is even more liable to puzzle us than the idea of a proposition about the past. For comparing future events with past events, one may almost be inclined to say that though the past events do not really exist in the full light of day, they exist in an underworld into which they have passed out of the real life; whereas the future events do not even have this shadowy existence. We could, of course, imagine a realm of the unborn, future events, whence they come into reality and pass into the realm of the past; and, if we think in terms of this metaphor, we may be surprised that the future should appear less existent than the past. Remember, however, that the grammar of our temporal expressions is not symmetrical with respect to an origin corresponding with the present moment. Thus the grammar of the expressions relating to memory does not reappear 'with opposite sign' in the grammar of the future tense. This is the reason why it has been said that propositions concerning future events are not really propositions. And to say this is all right as long as it isn't meant to be more than a decision about the use of the term "proposition"; a decision which, though not agreeing with the common usage of the word "proposition", may come natural to human beings under certain

circumstances. If a philosopher says that propositions about the future are not real propositions, it is because he has been struck by the asymmetry in the grammar of temporal expressions. The danger is, however, that he imagines he has made a kind of scientific statement about 'the nature of the future'.

Page Break 110

Page 110

57). A game is played in this way: A man throws a die, and before throwing he draws on a piece of paper some one of the six faces of the die. If, after having thrown, the face of the die turning up is the one he has drawn, he feels (expresses) satisfaction. If a different face turns up, he is dissatisfied. Or, let there be two partners and every time one guesses correctly what he will throw his partner pays him a penny, and if incorrectly, he pays his partner. Drawing the face of the die will under the circumstances of this game be called "making a guess" or "a conjecture".

Page 110

58). In a certain tribe contests are held in running, putting the weight, etc., and the spectators stake possessions on the competitors. The pictures of all the competitors are placed in a row, and what I called the spectator's staking property on one of the competitors consists in laying this property (pieces of gold) under one of the pictures. If a man has placed his gold under the picture of the winner in the competition he gets back his stake doubled. Otherwise he loses his stake. Such a custom we should undoubtedly call betting, even if we observed it in a society whose language held no scheme for stating 'degrees of probability', 'chances' and the like. I assume that the behaviour of the spectators expresses great keenness and excitement before and after the outcome of the bet is known. I further imagine that on examining the placing of the bets I can understand 'why' they were thus placed. I mean: In a competition between two wrestlers, mostly the bigger man is the favourite; or if the smaller, I find that he has shown greater strength on previous occasions, or that the bigger had recently been ill, or had neglected his training, etc. Now this may be so although the language of the tribe does not express reasons for the placing of the bets. That is to say, nothing in their language corresponds to our saying, e.g., "I bet on this man because he has kept fit, whereas the other has neglected his training", and such like. I might describe this state of affairs by saying that my observation has taught me certain *causes* for their placing their bets as they do, but that the bettors used no *reasons* for acting as they did.

Page 110

The tribe may, on the other hand, have a language which comprises 'giving reasons'. Now this game of giving the reason why one acts in a particular way does not involve finding the causes of one's actions (by frequent observations of the conditions under which they arise). Let us imagine this:

Page Break 111

Page 111

59). If a man of our tribe has lost his bet and upon this is chaffed or scolded, he points out, possibly exaggerating, certain features of the man on whom he has laid his bet. One can imagine a discussion of pros and cons going on in this way: two people pointing out alternately certain features of the two competitors whose chances, as we should say, they are discussing; A pointing with a gesture to the great height of the one, B in answer to this shrugging his shoulders and pointing to the size of the other's biceps, and so on. I could easily add more details which would make us say that A and B are giving reasons for laying a bet on one person rather than on the other.

Page 111

Now one might say that giving reasons in this way for laying their bets certainly presupposes that they have observed causal connections between the result of a fight, say, and certain features of the bodies of the fighters, or of their training. But this is an assumption which, whether reasonable or not, I certainly have not made in the description of our case. (Nor have I made the assumption that the bettors give reasons for their reasons.) We should in a case like that just described not be surprised if the language of the tribe contained what we should call expressions of degrees of belief, conviction, certainty. These expressions we could imagine to consist in the use of a particular word spoken with different intonations, or a series of words. (I am not thinking, however, of the use of a scale of probabilities.)--It is also easy to imagine that the people of our tribe accompany their betting by verbal expressions which we translate into "I believe that so and so *can* beat so and so in wrestling," etc.

Page 111

60). Imagine in a similar way conjectures being made as to whether a certain load of gunpowder will be sufficient to blast a certain rock, and the conjecture to be expressed in a phrase of the form "This quantity of gunpowder can blast this rock".

Page 111

61). Compare with 60) the case in which the expression "I shall be able to lift this weight", is used as an

abbreviation for the conjecture "My hand holding this weight will rise if I go through the process (experience) of 'making an effort to lift it'". In the last two cases the word "can" characterized what we should call the expression of a conjecture. (Of course I don't mean that we call the sentence a conjecture because it contains the word "can"; but in calling a sentence a conjecture we referred to the role which the sentence played in the language game; and we translate a word our tribe uses by "can" if

Page Break 112

"can" is the word we should use under the circumstances described.) Now it is clear that the use of "can" in 59), 60), 61) is closely related to the use of "can" in 46) to 49); differing, however in this, that in 46) to 49) the sentences saying that something *could* happen were not expressions of conjecture. Now one might object to this by saying: Surely we are only willing to use the word "can" in such cases as 46) to 49) because it is reasonable to conjecture in these cases what a man will do in the future from the tests he has passed or from the state he is in.

Page 112

Now it is true that I have deliberately made up the cases 46) to 49) so as to make a conjecture of this kind seem reasonable. But I have also deliberately made them up so as *not* to contain a conjecture. We can, if we like, make the hypothesis that the tribe would never use such a form of expression as that used in 49), etc. if experience had not shown them that... etc. But this is an assumption which, though possibly correct, is in no way presupposed in the games 46) to 49) as I have actually described them.

Page 112

62). Let the game be this: A writes down a row of numbers. B watches him and tries to find a system in the sequence of these numbers. When he has done so he says: "Now I can go on". This example is particularly instructive because 'being able to go on' here seems to be something setting in suddenly in the form of a clearly outlined event.--Suppose then that A had written down the row 1, 5, 11, 19, 29. At that point B shouts "Now I can go on". What was it that happened when suddenly he saw how to go on? A great many different things might have happened. Let us assume then that in the present case, while A wrote one number after the other, B busied himself with trying out several algebraic formulae to see whether they fitted. When A had written "19" B had been led to try the formula $a_n = n^2 + n - 1$. A's writing 29 confirms his guess.

Page 112

63). Or, no formula came into B's mind. After looking at the growing row of numbers A was writing, possibly with a feeling of tension and with hazy ideas floating in his mind, he said to himself the words "He's squaring and always adding one more"; then he made up the next number of the sequence and found it to agree with the numbers A then wrote down.--

Page 112

64). Or, the row A wrote down was 2, 4, 6, 8. B looks at it, and says "Of course I can go on", and continues the series of even

Page Break 113

numbers. Or he says nothing, and just goes on. Perhaps when looking at the row 2, 4, 6, 8 which A had written down, he had some sensation, or sensations, often accompanying such words as "That's easy!" A sensation of this kind is, for instance, the experience of a slight, quick intake of breath, what one might call a slight start.

Page 113

Now, should we say that the proposition "B can continue the series", means that one of the occurrences just described takes place? Isn't it dear that the statement "B can continue..." is not the same as the statement that the formula $a_n = n^2 + n - 1$ comes into B's mind? This occurrence might have been all that actually took place. (It is dear, by the way, that it can make no difference to us here whether B has the experience of this formula appearing before his mind's eye, or the experience of writing or speaking the formula, or of picking it out with his eyes from amongst several formulae written down beforehand.) If a parrot had uttered the formula, we should not have said that he could continue the series.--Therefore, we are inclined to say "to be able to..." must mean more than just uttering the formula--and in fact more than any one of the occurrences we have described. And this, we go on, shows that saying the formula was only a symptom of B's being able to go on, and that it was not the ability of going on itself. Now what is misleading in this is that we seem to intimate that there is one peculiar activity, process, or state called "being able to go on" which somehow is hidden from our eyes but manifests itself in those occurrences which we call symptoms (as an inflammation of the mucous membranes of the nose produces the symptom of sneezing). This is the way talking of symptoms, in this case, misleads us. When we say "Surely there must be something else behind the mere uttering of the formula, as this alone we should not call 'being able to...'", the word "behind" here is certainly used metaphorically, and 'behind' the utterance of the formula may be the circumstances under which it is uttered. It is true, "B can continue..." is not the same as to say "B says the formula...", but it doesn't

follow from this that the expression "B can continue..." refers to an activity other than that of saying the formula, in the way in which "B says the formula" refers to the well-known activity. The error we are in is analogous to this: Someone is told the word "chair" does not mean this particular chair I am pointing to, upon which he looks round the room for the object which the word "chair" does denote. (The case would be even more a striking illustration if he tried to look inside the chair in order to find the real meaning of the word "chair".) It is clear that when with

Page Break 114

reference to the act of writing or speaking the formula etc., we use the sentence "He can continue the series", this must be because of some connection between writing down a formula and actually continuing the series. And the connection in experience of these two processes or activities is clear enough. But this connection tempts us to suggest that the sentence "B can continue..." means something like "B does something which, experience has shown us, generally leads to his continuing the series". But does B, when he says "Now I can go on" really mean "Now I am doing something which, as experience has shown us, etc., etc."? Do you mean that he had this phrase in his mind or that he would have been prepared to give it as an explanation of what he had said? To say the phrase "B can continue..." is correctly used when prompted by such occurrences as described in (62), (63), (64) but that these occurrences justify its use only under certain circumstances (e.g. when experience has shown certain connections) is not to say that the sentence "B can continue..." is short for the sentence which describes all these circumstances, i.e. the whole situation which is the background of our game.

Page 114

On the other hand we should *under certain circumstances* be ready to substitute "B knows the formula", "B has said the formula" for "B can continue the series". As when we ask a doctor "Can the patient walk?", we shall sometimes be ready to substitute for this "Is his leg healed?"--"Can he speak?" under circumstances means "Is his throat all right?", under others (e.g., if he is a small child) it means "Has he learned to speak?"--To the question "Can the patient walk?", the doctor's answer may be "His leg is all right"---We use the phrase "He can walk, as far as the state of his leg is concerned", especially when we wish to oppose this condition for his walking to some other condition, say the state of his spine. Here we must beware of thinking that there is in the nature of the case something which we might call the complete set of conditions, e.g., for his walking; so that the patient, as it were, can't help walking, *must* walk, if all these conditions are fulfilled.

Page 114

We can say: The expression "B can continue the series" is used under different circumstances to make different distinctions. Thus it may distinguish *a*) between the case when a man knows the formula and the case when he doesn't; or *b*) between the case when a man knows the formula and hasn't forgotten how to write the numerals of the decimal system, and the case when he knows the formula and has forgotten how to write the numerals; or *c*) (as perhaps in (64)) between the case when a man is feeling his normal self and the case when he is

Page Break 115

still in a condition of shell-shock; or *d*) between the case of a man who has done this kind of exercise before and the case of a man who is new at it. These are only a few of a large family of cases.

Page 115

The question whether "He can continue..." means the same as "He knows the formula" can be answered in several different ways: We can say "They don't mean the same, i.e., they are not in general used as synonyms as, e.g., the phrases 'I am well' and 'I am in good health'"; or we may say "*Under certain circumstances* 'He can continue...' means he knows the formula". Imagine the case of a language (somewhat analogous to (49)) in which two forms of expression, two different sentences, are used to say that a person's legs are in working order. The one form of expression is exclusively used under circumstances when preparations are going on for an expedition, a walking tour, or the like; the other is used in cases when there is no question of such preparations. We shall here be doubtful whether to say the two sentences have the same meaning or different meanings. In any case the true state of affairs can only be seen when we look into the detail of the usage of our expressions.--And it is clear that if in our present case we should decide to say that the two expressions have different meanings, we shall certainly not be able to say that the difference is that the fact which makes the second sentence true is a different one from the fact which makes the first sentence true.

Page 115

We are justified in saying that the sentence "He can continue..." has a different meaning from this: "He knows the formula". But we mustn't imagine that we can find a particular state of affairs 'which the first sentence refers to', as it were on a plane above that on which the special occurrences (like knowing the formula, imagining certain further terms, etc.) take place.

Page 115

Let us ask the following question: Suppose that, on one ground or another, B has said "I can continue the series", but on being asked to continue it he had shown himself unable to do so should we say that this proved that his statement, that he could continue, was wrong, or should we say that he was able to continue when he said he was? Would B himself say "I see I was wrong", or "What I said was true, I could do it then but I can't now"?--There are cases in which he would correctly say the one and cases in which he would correctly say the other. Suppose *a*) when he said he could continue he saw the formula before his mind, but when he was asked to continue he found he had forgotten it;--or, *b*) when he said he could continue he had said to himself the next five terms of the series, but now finds

Page Break 116

that they don't come into his mind; or, *c*) before, he had continued the series calculating five more places, now he still remembers these five numbers but has forgotten how he had calculated them;--or, *d*) he says "Then I felt I could continue, now I can't";--or, *e*) "When I said I could lift the weight my arm didn't hurt, now it does"; etc.

Page 116

On the other hand we say "I thought I could lift this weight, but I see I can't", "I thought I could say this piece by heart, but I see I was mistaken".

Page 116

These illustrations of the use of the word "can" should be supplemented by illustrations showing the variety of uses we make of the terms "forgetting" and "trying", for these uses are closely connected with those of the word "can". Consider these cases: *a*) Before, B had said to himself the formula, now, "he finds a complete blank there". *b*) Before, he had said to himself the formula, now, for a moment he isn't sure 'whether it was 2^n or 3^n '. *c*) He has forgotten a name and it is 'on the tip of his tongue'. Or, *d*) he is not certain whether he has ever known the name or has forgotten it.

Page 116

Now look at the way in which we use the word "trying": *a*) A man is trying to open a door by pulling as hard as he can. *b*) He is trying to open the door of a safe by trying to find the combination. *c*) He is trying to find the combination by trying to remember it, or *d*) by turning the knobs and listening with a stethoscope. Consider the various processes we call "trying to remember". Compare *e*) trying to move your finger against a resistance (e.g., when someone is holding it), and *f*) when you have intertwined the fingers of both hands in a particular way and feel 'you don't know what to do in order to make a particular finger move'.

Page 116

(Consider also the class of cases in which we say "I can do so and so but I won't": "I could if I tried"--e.g., lift 100 pounds; "I could if I wished"--e.g., say the alphabet.)

Page 116

One might perhaps suggest that the only case in which it is correct to say, without restriction, that I can do a certain thing, is that in which while saying that I can do it, I actually do it, and that otherwise I ought to say "I can do it as far as... is concerned". One may be inclined to think that only in the above case has a person given a real proof of being able to do a thing.

Page 116

65). But if we look at a language game in which the phrase "I can..." is used in this way (i.e., a game in which doing a thing is taken as the only justification for saying that one is able to do it),

Page Break 117

we see that there is not the *metaphysical* difference between this game and one in which other justifications are accepted for saying "I can do so and so". A game of the kind 65), by the way, shows us the real use of the phrase "If something happens it certainly can happen"; an almost useless phrase in our language. It sounds as though it had some very clear and deep meaning, but like most of the general philosophical propositions it is meaningless except in very special cases.

Page 117

66). Make this clear to yourself by imagining a language (similar to 49)) which has two expressions for such sentences as "I am lifting a fifty pound weight"; one expression is used whenever the action is performed as a test (say, before an athletic competition), the other expression is used when the action is not performed as a test.

Page 117

We see that a vast net of family likenesses connects the cases in which the expressions of possibility, "can", "to be able to", etc. are used. Certain characteristic features, we may say, appear in these cases in different combinations: there is, e.g., the element of conjecture (that something will behave in a certain way in the future); the description of the state of something (as a condition for its behaving in a certain way in the future); the account of

certain tests someone or something has passed.--

Page 117

There are, on the other hand, various reasons which incline us to look at the fact of something being possible, someone being able to do something, etc., as the fact that he or it is in a particular state. Roughly speaking, this comes to saying that "A is in the state of being able to do something" is the form of representation we are most strongly tempted to adopt; or, as one could also put it, we are strongly inclined to use the metaphor of something being in a peculiar state for saying that something can behave in a particular way. And this way of representation, or this metaphor, is embodied in the expressions "He is capable of...", "He is able to multiply large numbers in his head", "He can play chess": in these sentences the verb is used in the *present tense*, suggesting that the phrases are descriptions of states which exist at the moment when we speak.

Page 117

The same tendency shows itself in our calling the ability to solve a mathematical problem, the ability to enjoy a piece of music, etc., certain states of the mind; we don't mean by this expression 'conscious mental phenomena'. Rather, a state of the mind in this sense is the state of a hypothetical mechanism, a mind model meant to explain

Page Break 118

the conscious mental phenomena. (Such things as unconscious or subconscious mental states are features of the mind *model*.) In this way also we can hardly help conceiving of memory as of a kind of storehouse. Note also how sure people are that to the ability to add or to multiply or to say a poem by heart, etc., there *must* correspond a peculiar state of the person's brain, although on the other hand they know next to nothing about such psycho-physiological correspondences. We regard these phenomena as manifestations of this mechanism, and their possibility is the particular construction of the mechanism itself.

Page 118

Now looking back to our discussion of 43), we see that it was no real explanation of B's being guided by the signs when we said that B was guided if he *could* also have carried out orders consisting in other combinations of dots and dashes than those of 43). In fact, when we considered the question whether B in 43) was guided by the signs, we were all the time inclined to say some such thing as that we could only decide this question with certainty if we could look into the actual mechanism connecting seeing the signs with acting according to them. For we have a definite picture of what in a mechanism we should call certain parts being guided by others. In fact, the mechanism which immediately suggests itself when we wish to show what in such a case as 43) we should call "being guided by the signs" is a mechanism of the type of a pianola. Here, in the working of the pianola we have a clear case of certain actions, those of the hammers of the piano, being guided by the pattern of the holes in the pianola roll. We could use the expression "The pianola is *reading off* the record made by the perforations in the roll", and we might call patterns of such perforations *complex signs* or *sentences*, opposing their function in a pianola to the function which similar devices have in mechanisms of a different type, e.g., the combination of notches and teeth which form a key bit. The bolt of a lock is caused to slide by this particular combination, but we should not say that the movement of the bolt was guided by the way in which we combined teeth and notches, i.e., we should not say that the bolt moved *according* to the pattern of the key bit. You see here the connection between the idea of being guided and the idea of being able to read new combinations of signs; for we should say that the pianola *can* read *any* pattern of perforations, of a particular kind, it is not built for one particular tune or set of tunes (like a musical box),-whereas the bolt of the lock reacts to that pattern of the key bit only which is predetermined in the construction of the lock.

Page Break 119

We could say that the notches and teeth forming a key bit are not comparable to the words making up a sentence but to the letters making up a word, and that the pattern of the key bit in this sense did not correspond to a complex sign, to a sentence, but to a word.

Page 119

It is clear that although we might use the ideas of such mechanisms as similes for describing the way in which B acts in the games 42) and 43), no such mechanisms are actually involved in these games. We shall have to say that the use which we made of the expression "to be guided" in our examples of the pianola and of the lock is only one use within a family of usages, though these examples may serve as metaphors, ways of representation, for other usages.

Page 119

Let us study the use of the expression "to be guided" by studying the use of the word "reading". By "reading" I here mean the activity of translating script into sounds, also of writing according to dictation or of copying in writing a page of print, and suchlike; reading in this sense does not involve any such thing as understanding what you read. The use of the word "reading" is, of course, extremely familiar to us in the

circumstances of our ordinary life (it would be extremely difficult to describe these circumstances even roughly). A person, say an Englishman, has as a child gone through one of the normal ways of training in school or at home, he has learned to read his language, later on he reads books, newspapers, letters, etc. What happens when he reads the newspaper?--His eyes glide along the printed words, he pronounces them aloud or to himself, but he pronounces certain words just taking their pattern in as a whole, other words he pronounces after having seen their first few letters only, others again he reads out letter by letter. We should also say that he had read a sentence if while letting his eyes glide along it he had said nothing aloud or to himself, but on being asked afterwards what he had read he was able to reproduce the sentence verbatim or in slightly different words. He may also act as what we might call a mere reading machine, I mean, paying no attention to what he spoke, perhaps concentrating his attention on something totally different. We should in this case say that he read if he acted faultlessly like a reliable machine.--Compare with this case the case of a beginner. He reads the words by spelling them out painfully. Some of the words, however, he just guesses from their contexts, or possibly he knows the piece by heart. The teacher then says that he is pretending to read the words, or just that he is not really reading them. If, looking at this example, we asked ourselves what reading was, we should be

Page Break 120

inclined to say that it was a particular conscious mental act. This is the case in which we say "Only he knows whether he is reading; nobody else can really know it". Yet we must admit that as far as the reading of a particular word goes, exactly the same thing might have happened in the beginner's mind when he 'pretended' to read as what happened in the mind of the fluent reader when he read the word. We are using the word "reading" in a different way when we talk about the accomplished reader on the one hand and the beginner on the other hand. What in the one case we call an instance of reading we don't call an instance of reading in the other.--Of course we are inclined to say that what happened in the accomplished reader and in the beginner when they pronounced the word could not have been the same. The difference lying, if not in their conscious states, then in the unconscious regions of their minds, or in their brains. We here imagine two mechanisms, the internal working of which we can see, and this internal working is the real criterion for a person's reading or not reading. But in fact no such mechanisms are known to us in these cases. Look at it in this way:

Page 120

67). Imagine that human beings or animals were used as reading machines; assume that in order to become reading machines they need a particular training. The man who trains them says of some of them that they already can read, of others that they can't. Take a case of one who has so far not responded to the training. If you put before him a printed word he will sometimes make sounds, and every now and then it happens 'accidentally' that these sounds more or less correspond to the printed word. A third person hears the creature under training uttering the right sound on looking at the word "table". The third person says "He's reading", but the teacher answers "No, he isn't, it is mere accident". But supposing now that the pupil on being shown other words and sentences goes on reading them correctly. After a time the teacher says "Now he can read".--But what about the first word "table"? Should the teacher say "I was wrong. He read that, too"?, or should he say "No, he only started reading later"? When did he really begin to read, or: Which was the first word, or the first letter, which he read? It is clear that this question here makes no sense unless I give an 'artificial' explanation such as: "The first word which he reads = the first word of the first hundred consecutive words he reads correctly."--Suppose on the other hand that we used the word "reading" to distinguish between the case when a particular conscious

Page Break 121

process of spelling out the words takes place in a person's mind from the case in which this does not happen.--Then, at least the person who is reading could say that such and such a word was the first which he actually read.--Also, in the different case of a reading machine which is a mechanism connecting signs with the reactions to these signs, e.g., a pianola, we could say "Only after such and such a thing had been done to the machine, e.g., certain parts had been connected by wires, the machine actually read; the first letter which it read was a *d*".--

Page 121

In the case 67), by calling certain creatures "reading machines" we meant only that they react in a particular way to seeing printed signs. No connection between seeing and reacting, no internal mechanism enters into this case. It would be absurd if the trainer had answered to the question whether he read the word "table" or not, "Perhaps he read it", for there is no doubt in this case about what he actually did. The change which took place was one which we might call a change in the general behaviour of the pupil, and we have in this case not given a meaning to the expression "the first word in the new era". (Compare with this the following case:

.....
In our figure a row of dots with large intervals succeeds a row of dots with small intervals. Which is the last dot in

the first sequence and which the first dot in the second? Imagine our dots were holes in the revolving disc of a siren. Then we should hear a tone of low pitch following a tone of high pitch (or vice versa). Ask yourself: At which moment does the tone of low pitch begin and the other end?)

Page 121

There is a great temptation on the other hand to regard the conscious mental act as the only real criterion distinguishing reading from not reading. For we are inclined to say "Surely a man always knows whether he is reading or pretending to read", or "Surely a man always knows when he is really reading". If A tries to make B believe that he is able to read Cyrillic script, cheating him by learning a Russian sentence by heart and then saying it while looking at the printed sentence, we may certainly say that A knows that he is pretending and that his not reading in this case is characterized by a particular personal experience, namely, that of saying the sentence by heart. Also, if A makes a slip in saying it by heart, this experience will be different from that which a person has who makes a slip in *reading*.

Page Break 122

Page 122

68). But supposing now that a man who could read fluently and who was made to read sentences which he had never read before read these sentences, but all the time with the peculiar feeling of knowing the sequence of words by heart. Should we in this case say that he was not reading, i.e., should we regard his personal experience as the criterion distinguishing between reading and not reading?

Page 122

69). Or imagine this case: A man under the influence of a certain drug is shown a group of five signs, not letters of an existing alphabet; and looking at them with all the outward signs and personal experiences of spelling out a word, pronounces the word "ABOVE". (This sort of thing happens in dreams. After waking up we then say, "It seemed to me that I was reading these signs though they weren't really signs at all".) In such a case some people might be inclined to say that he is reading, others that he isn't. We could imagine that after he had spelt out the word "above" we showed him other combinations of the five signs and that he read them consistently with his reading of the first permutation of signs shown to him. By a series of similar tests we might find that he used what we might call an imaginary alphabet. If this was so, we should be more ready to say "He is reading" than "He imagines that he reads, but he doesn't really".

Page 122

Note also that there is a continuous series of intermediary cases between the case when a person knows by heart what is in print before him, and the case in which he spells out the letters of every word without any such help as guessing from the context, knowing by heart, and such like.

Page 122

Do this: Say by heart the series of cardinals from one to twelve.--Now look at the dial of your watch and *read* this sequence of numbers. Ask yourself what in this case you called reading, that is, what did you do to make it reading?

Page 122

Let us try this explanation: A person reads if he *derives* the copy which he is producing from the model which he is copying. (I will use the word "model" to mean that which he is reading off, e.g., the printed sentences which he is reading or copying in writing, or such signs as "-- -- • • --" in 42) and 43) which he is "reading" by his movements, or the scores which a pianist plays off, etc. The word "copy" I use for the sentence spoken or written from the printed one, for the movements made according to such signs as "-- -- • • --", for the movements of the pianist's fingers or the tune which he plays from the scores, etc.) Thus if we had taught a person the Cyrillic alphabet and had

Page Break 123

taught him how each letter was pronounced, if then we gave him a piece printed in the Cyrillic script and he spelt it out according to the pronunciation of each letter as we had taught it, we should undoubtedly say that he was deriving the sound of every word from the written and spoken alphabet taught him. And this also would be a clear case of reading. (We might use the expression, "We have taught him the *rule* of the alphabet".)

Page 123

But let us see; what made us say that he *derived* the spoken words from the printed by means of the rule of the alphabet? Isn't all we know that we told him that this letter was pronounced this way, that letter that way, etc., and that he afterwards read out words in the Cyrillic script? What suggests itself to us as an answer is that he must have shown somehow that he did actually make the transition from the printed to the spoken words by means of the rule of the alphabet which we had given him. And what we mean by his showing this will certainly get clearer if we

alter our example and:

Page 123

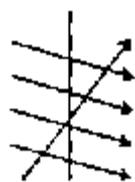

70) assume that he reads off a text by transcribing it, say, from block letters into cursive script. For in this case we can assume the rule of the alphabet to have been given in the form of a table which shows the block alphabet and the cursive alphabet in parallel columns. Then the *deriving* the copy from the text we should imagine this way: The person who copies looks up the table for each letter at frequent intervals, or he says to himself such things as, "Now what's a small *a* like?", or he tries to visualize the table, refraining from actually looking at it.--

Page 123

71). But what if, doing all this, he then transcribed an "A" into a "b", a "B" into a "c", and so on? Should we not call this "reading", "deriving", too? We might in this case describe his procedure by saying that he used the table as we should have used it had we not looked straight from left to right like this:

but like this:

Page Break 124

though he actually when looking up the table passed with his eyes or finger horizontally from left to right.--But let us suppose now

Page 124

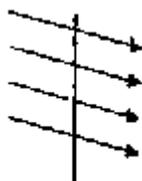

72) that going through the normal process of looking up, he transcribed an "A" into an "n", a "B" into an "x", in short, acted, as we might say, according to a scheme of arrows which showed no simple regularity. Couldn't we call this "deriving" too?--But suppose that

Page 124

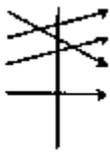

73) he didn't stick to this way of transcribing. In fact he changed it, but according to a simple rule: After having transcribed "A" into "n", he transcribes the next "A" into "o", and the next "A" into "p", and so on. But where is the sharp line between this procedure and that of producing a transcription without any system at all? Now you might object to this by saying "In the case 71), you obviously assumed that he *understood the table differently*; he didn't understand it in the normal way". But what do we call "understanding the table in a particular way?" But whatever process you imagine this 'understanding' to be, it is only another link interposed between the outward and inward processes of deriving I have described and the actual transcription. In fact this process of understanding could obviously be described by means of a schema of the kind used in 71), and we could then say that in a particular case he looked up the table like this:

understood the table like this:

and transcribed it like this:

But does this mean that the word "deriving" (or "understanding") has really no meaning, as by following up its meaning this seems to trail off into nothing? In case 70) the meaning of "deriving" stood out quite clearly, but we told ourselves that this was only one special case of deriving. It seemed to us that the essence of the

Page Break 125

process of deriving was here presented in a particular dress and that by stripping it of this we should get at the essence. Now in 71), 72), 73) we tried to strip our case of what had seemed but its peculiar costume only to find that what had seemed mere costumes were the essential features of the case. (We acted as though we had tried to find the real artichoke by stripping it of its leaves.) The use of the word "deriving" is indeed exhibited in 70), i.e., this example showed us one of the family of cases in which this word is used. And the explanation of the use of this word, as that of the use of the word "reading" or "being guided by symbols", essentially consists in describing a selection of examples exhibiting characteristic features, some examples showing these features in exaggeration, others showing transitions, certain series of examples showing the trailing off of such features. Imagine that someone wished to give you an idea of the facial characteristics of a certain family, the So and so's, he would do it by showing you a set of family portraits and by drawing your attention to certain characteristic features, and his main task would consist in the proper *arrangement* of these pictures, which, e.g., would enable you to see how certain influences gradually changed the features, in what characteristic ways the members of the family aged, what features appeared more strongly as they did so.

Page 125

It was not the function of our examples to show us the essence of 'deriving', 'reading', and so forth through a veil of inessential features; the examples were not descriptions of an outside letting us guess at an inside which for some reason or other could not be shown in its nakedness. We are tempted to think that our examples are *indirect* means for producing a certain image or idea in a person's mind,--that they *hint* at something which they cannot show. This would be so in some such case as this: Suppose I wish to produce in someone a mental image of the inside of a particular eighteenth-century room which he is prevented from entering. I therefore adopt this method: I show him the house from the outside, pointing out the windows of the room in question, I further lead him into other rooms of the same period.--

Page 125

Our method is *purely descriptive*; the descriptions we give are not hints of explanations.

Page Break 126

Page Break 127

II

Page 127

1. Do we have a feeling of familiarity whenever we look at familiar objects? Or do we have it usually?

Page 127

When do we actually have it?

Page 127

It helps us to ask: What do we contrast the feeling of familiarity with?

Page 127

One thing we contrast it with is surprise.

Page 127

One could say: "Unfamiliarity is much more of an experience than familiarity".

Page 127

We say: A shows B a series of objects. B is to tell A whether the object is familiar to him or not. *a*) The question may be "Does B know what the objects are?" or *b*) "Does he recognize the particular object?"

Page 127

1). Take the case that B is shown a series of apparatus--a balance, a thermometer, a spectroscope, etc.

Page 127

2). B is shown a pencil, a pen, an inkpot, and a pebble. Or:

Page 127

3). Besides familiar objects he is shown an object of which he says "That looks as though it served some

purpose, but I don't know what purpose".

Page 127

What happens when B recognizes something as a pencil?

Page 127

Suppose A had shown him an object looking like a stick. B handles this object, suddenly it comes apart, one of the parts being a cap, the other a pencil. B says "Oh, this is a pencil". He has recognized the object as a pencil.

Page 127

4). We could say "B always knew what a pencil looked like; he could, e.g., have drawn one on being asked to. He didn't know that the object he was given contained a pencil which he could have drawn any time". Compare with this case 5):

Page 127

5). B is shown a word written on a piece of paper held upside down. He does not recognize the word. The paper is gradually turned round until B says "Now I see what it is. It is 'pencil'".

Page 127

We might say "He always knew what the word 'pencil' looked like. He did not know that the word he was shown would, when turned round, look like 'pencil'".

Page 127

In both cases 4) and 5) you might say something was hidden. But note the different application of "hidden".

Page Break 128

Page 128

6). Compare with this: You read a letter and can't read one of its words. You guess what it must be from the context, and now can read it. You recognize this scratch as an *e*, the second as an *a*, the third as a *t*. This is different from the case where the word "eat" was covered by a blotch of ink, and you only guessed that the word "eat" must have been in this place.

Page 128

7). Compare: You see a word and can't read it. Someone alters it slightly by adding a dash, lengthening a stroke, or such like. Now you can read it. Compare this alteration with the turning in 5), and note that there is a sense in which while the word was turned round you saw that it was *not* altered. I.e., there is a case in which you say "I looked at the word while it was turned, and I know that it is the same now as it was when I didn't recognize it".

Page 128

8). Suppose the game between A and B just consisted in this, that B should say whether he knows the object or not but does not say what it is. Suppose he was shown an ordinary pencil, after having been shown a hygrometer which he had never seen before. On being shown the hygrometer he said that he was not familiar with it, on being shown the pencil, that he knew it. What happened when he recognized it? Must he have told himself, though he didn't tell A, that what he saw was a pencil? Why should we assume this?

Page 128

Then, when he recognized the pencil, what did he recognize it as? 9). Suppose even that he had said to himself "Oh, this is a pencil", could you compare this case with 4) or 5)? In these cases one might have said "He recognized this as that" (pointing, e.g., for "this" to the covered up pencil and for "that" to an ordinary pencil, and similarly in 5)).

Page 128

In 8) the pencil underwent no change and the words "Oh, this is a pencil" did not refer to a paradigm, the similarity of which with the pencil shown B had recognized.

Page 128

Asked "What is a pencil?", B would not have pointed to another object as the paradigm or sample, but could straight away have pointed to the pencil shown to him.

Page 128

"But when he said 'Oh, this is a pencil', how did he know that it was if he didn't recognize it as something?"--This really comes to saying "How did he recognize 'pencil' as the name of this sort of thing?" Well, how did he recognize it? He just reacted in this particular way by saying this word.

Page 128

10). Suppose someone shows you colours and asks you to name them.

Page Break 129

Pointing to a certain object you say "This is red". What would you answer if you were asked "How do you know that this is red?"?

Of course there is the case in which a general explanation was given to B, say, "We shall call 'pencil' anything that one can easily write with on a wax tablet." Then A shows B amongst other objects a small pointed object, and B says "Oh, this is a pencil", after having thought "One could write with this quite easily". In this case, we may say, a *derivation* takes place. In 8), 9), 10) there is no derivation. In 4) we might say that B derived that the object shown to him was a pencil by means of a paradigm, or else no such derivation might have taken place.

Now should we say that B on seeing the pencil after seeing instruments which he didn't know had a feeling of familiarity? Let us imagine what really might have happened. He saw a pencil, smiled, felt relieved, and the name of the object he saw came into his mind or mouth.

Now isn't the feeling of relief just that which characterizes the experience of passing from unfamiliar to familiar things?

2. We say we experience tension and relaxation, relief, strain and rest in cases as different as these: A man holds a weight with outstretched arm; his arm, his whole body is in a state of tension. We let him put down the weight, the tension relaxes. A man runs, then rests. He thinks hard about the solution of a problem in Euclid, then finds it, and relaxes. He tries to remember a name, and relaxes on finding it.

What if we asked "What do all these cases have in common that makes us say that they are cases of strain and relaxation?"?

What makes us use the expression "seeking in our memory", when we try to remember a word?

Let us ask the question "What is the similarity between looking for a word in your memory and looking for my friend in the park?" What would be the answer to such a question?

One kind of answer certainly would consist in describing a series of intermediate cases. One might say that the case which looking in your memory for something is most similar to is not that of looking for my friend in the park, but, say, that of looking up the spelling of a word in a dictionary. And one might go on interpolating cases. Another way of *pointing out* the similarity would be to say, e.g., "In

both these cases at first we can't write down the word and then we can". This is what we call pointing out a common feature.

Now it is important to note that we needn't be aware of such similarities thus pointed out when we are prompted to use the words "seeking", "looking for", etc., in the case of trying to remember.

One might be inclined to say "Surely a similarity must strike us, or we shouldn't be moved to use the same word".--Compare that statement with this: "A similarity between these cases must strike us in order that we should be inclined to use the same picture to represent both". This says that some act must precede the act of using this picture. But why shouldn't what we call "the similarity striking us" consist partially or wholly in our using the same picture? And why shouldn't it consist partially or wholly in our being prompted to use the same phrase?

We say: "This picture (or this phrase) suggests itself to us irresistibly". Well, isn't this an experience?

We are treating here of cases in which, as one might roughly put it, the grammar of a word seems to suggest the 'necessity' of a certain intermediary step, although in fact the word is used in cases in which there is no such intermediary step. Thus we are inclined to say: "A man *must* understand an order before he obeys it", "He must know where his pain is before he can point to it", "He must know the tune before he can sing it", and suchlike.

Let us ask the question: Suppose I had explained to someone the word "red" (or the meaning of the word "red") by having pointed to various red objects and given the ostensive explanation.--What does it mean to say "Now if he has understood the meaning, he will bring me a red object if I ask him to"? This seems to say: If he has really got hold of what is in common between all the objects I have shown him, he will be in the position to follow my order. But what is it that is in common to these objects?

Could you tell me what is in common between a light red and a dark red? Compare with this the following case: I show you two pictures of two different landscapes. In both pictures, amongst many other objects, there is the picture of a bush, and it is exactly alike in both. I ask you "Point to what these two pictures have in common", and as an answer you point to this bush.

Now consider this explanation: I give someone two boxes containing various things, and say "The object which both boxes have in common is called a toasting fork". The person I give this explanation has to

sort out the objects in the two boxes until he finds the one they have in common, and thereby, we may say, he arrives at the ostensive explanation. Or, this explanation: "In these two pictures you see patches of many colours; the one colour which you find in both is called 'mauve'".--In this case it makes a dear sense to say "If he has seen (or found) what is in common between these two pictures, he can now bring me a mauve object".

There is also this case: I say to someone "I shall explain to you the word 'w' by showing you various objects. What's in common to them all is what 'w' means." I first show him two books, and he asks himself "Does 'w' mean 'book'?" I then point to a brick, and he says to himself "Perhaps 'w' means 'parallelepiped'". Finally I point to glowing coal, and he says to himself "Oh, it's 'red' he means, for all these objects had something red about them". It would be interesting to consider another form of this game where the person has at each stage to *draw* or *paint* what he thinks I mean. The interest of this version lies in this, that in some cases it would be quite obvious what he has got to draw, say, when he sees that all the objects I have shown him so far bear a certain trademark (he'd draw the trade mark).--What, on the other hand, should he paint if he recognizes that there is something red about each object? A red patch? And of what shape and shade? Here a convention would have to be laid down, say, that painting a red patch with ragged edges does not mean that the objects have that red patch with ragged edges in common, but *something* red.

If, pointing to patches of various shades of red, you asked a man "What have these in common that makes you call them red?", he'd be inclined to answer "Don't you see?" And this of course would not be pointing out a common element.

There are cases where experience teaches us that a person is not able to carry out an order, say, of the form "Bring me x" if he did not see what was in common between the various objects to which I pointed as an explanation of "x". And 'seeing what they have in common' in some cases consisted in pointing to it, in letting one's glance rest on a coloured patch after a process of scrutiny and comparing, in saying to oneself "Oh, it's red he means", and perhaps at the same time glancing at all the red patches on the various objects, and so on.--There are cases, on the other hand, in which no process takes place comparable with this intermediary 'seeing what's in common', and where we still use this phrase, though this time we ought to say

"If after showing him these things he brings me another red object, then *I shall say* that he has seen the common feature of the objects I showed him". Carrying out the order is now the criterion for his having understood.

3. 'Why do you call "strain" all these different experiences?'--'Because they have some element in common.'-'What is it that bodily and mental strain have in common?'--'I don't know, but obviously there is some similarity.'

Then why did you say the experiences had something in common? Didn't this expression just compare the present case with those cases in which we primarily say that two experiences have something in common? (Thus we might say that some experiences of joy and of fear have the feeling of heart-beat in common.) But when you said that the two experiences of strain had something in common, these were only different words for saying that they were similar. It was then no explanation to say that the similarity consisted in the occurrence of a common element.

Also, shall we say that you had a feeling of similarity when you compared the two experiences, and that this made you use the same word for both? If you say you have a feeling of similarity, let us ask a few questions about it:

Could you say the feeling was located here or there?

When did you actually have this feeling? For, what we call comparing the two experiences is quite a complicated activity: perhaps you called the two experiences before your mind, and imagining a bodily strain, and imagining a mental strain, was each in itself imagining a process and not a state uniform through time. Then ask yourself at what time during all this you had the feeling of similarity.

'But surely I wouldn't say they are similar if I had no experience of their similarity.'--But must this experience be anything you should call a feeling? Suppose for a moment it were the experience that the word "similar" suggested itself to you. Would you call this a feeling?

'But is there no feeling of similarity?'--I think there are feelings which one might call feelings of similarity. But you don't always have any such feeling if you 'notice similarity'. Consider some of the different experiences which you have if you do so.

a) There is a kind of experience which one might call being hardly able to distinguish. You see, e.g., two lengths, two colours, almost exactly alike. But if I ask myself "Does this experience consist in

having a peculiar feeling?", I should have to say that it certainly isn't characterized by any such feeling alone, that a most important part of the experience is that of letting my glance oscillate between the two objects, fixing it intently now on the one, now on the other, perhaps saying words expressive of doubt, shaking my head, etc., etc. There is, one might say, hardly any room left for a feeling of similarity between these manifold experiences.

b) Compare with this the case in which it is impossible to have any difficulty in distinguishing the two objects. Supposing I say "I like to have the two kinds of flowers in this bed of similar colours to avoid a strong contrast". The experience here might be one which one may describe as an easy sliding of the glance from one to the other.

c) I listen to a variation on a theme and say "I don't see yet how this is a variation of the theme, but I see a certain similarity". What happened was that at certain points of the variation, at certain turning points of the key, I had an experience of 'knowing where I was in the theme'. And this experience might again have consisted in imagining certain figures of the theme, or in seeing them written before my mind or in actually pointing to them in the score, etc.

'But when two colours are similar, the experience of similarity should surely consist in noticing the similarity which there *is* between them'--But is a bluish green similar to a yellowish green or not? In certain cases we should say they are similar and in others that they are most dissimilar. Would it be correct to say that in the two cases we noticed different relations between them? Suppose I observed a process in which a bluish green gradually changed into a pure green, into a yellowish green, into yellow, and into orange. I say "It only takes a short time from bluish green to yellowish green, because these colours are similar".--But mustn't you have had some experience of similarity to be able to say this?--The experience may be this, of seeing the two colours and saying that they are both green. Or it may be this, of seeing a band whose colour changes from one end to the other in the way described, and having some one of the experiences which one may call noticing how close to each other bluish green and yellowish green are, compared to bluish green and orange.

We use the word "similar" in a huge family of cases.

There is something remarkable about saying that we use the word "strain" for both mental and physical strain because there is a similarity between them. Should you say we use the word "blue" both for light blue and dark blue because there is a similarity between them? If

you were asked "Why do you call this 'blue' also?", you would say "Because this is blue, too".

One might suggest that the explanation is that in this case you call 'blue' what is *in common* between the two colours, and that, if you called 'strain' what was in common between the two experiences of strain, it would have been wrong to say "I called them both 'strain' because they had a certain similarity", but that you would have had to

say "I used the word 'strain' in both cases because there is a strain present in both".

Page 134

Now what should we answer to the question "What do light blue and dark blue have in common?"? At first sight the answer seems obvious: "They are both shades of blue". But this is really a tautology. So let us ask "What do these colours I am pointing to have in common?" (Suppose one is light blue, the other dark blue.) The answer to this really ought to be "I don't know what game you are playing". And it depends upon this game whether I should say they had anything in common, and what I should say they had in common.

Page 134

Imagine this game: A shows B different patches of colours and asks him what they have in common. B is to answer by pointing to a particular primary colour. Thus if A points to pink and orange, B is to point to pure red. If A points to two shades of greenish blue, B is to point to pure green and pure blue, etc. If in this game A showed B a light blue and a dark blue and asked what they had in common, there would be no doubt about the answer. If then he pointed to pure red and pure green, the answer would be that these have nothing in common. But I could easily imagine circumstances under which we should say that they had something in common and would not hesitate to say what it was: Imagine a use of language (a culture) in which there was a common name for green and red on the one hand and yellow and blue on the other. Suppose, e.g., that there were two castes, one the patrician caste, wearing red and green garments the other, the plebeian, wearing blue and yellow garments. Both yellow and blue would always be referred to as plebeian colours, green and red as patrician colours. Asked what a red patch and a green patch have in common, a man of our tribe would not hesitate to say they were both patrician.

Page 134

We could also easily imagine a language (and that means again a culture) in which there existed no common expression for light blue and dark blue, in which the former, say, was called "Cambridge",

Page Break 135

the latter "Oxford". If you ask a man of this tribe what Cambridge and Oxford have in common, he'd be inclined to say "Nothing".

Page 135

Compare this game with the one above: B is shown certain pictures, combinations of coloured patches. On being asked what these pictures have in common, he is to point to a sample of red, say, if there is a red patch in both, to green if there is a green patch in both, etc. This shows you in what different ways this same answer may be used.

Page 135

Consider such an explanation as "I mean by 'blue' what these two colours have in common".--Now isn't it possible that someone should understand this explanation? He would, e.g., on being ordered to bring another blue object, carry out this order satisfactorily. But perhaps he will bring a red object and we shall be inclined to say: "He seems to notice some sort of similarity between samples we showed him and that red thing".

Page 135

Note: Some people when asked to sing a note which we strike for them on the piano, regularly sing the fifth of that note. That makes it easy to imagine that a language might have one name only for a certain note and its fifth. On the other hand we should be embarrassed to answer the question: What do a note and its fifth have in common? For of course it is no answer to say: "They have a certain affinity".

Page 135

It is one of our tasks here to give a picture of the grammar (the use) of the word "a certain".

Page 135

To say that we use the word "blue" to mean 'what all these shades of colour have in common' by itself says nothing more than that we use the word "blue" in all these cases.

Page 135

And the phrase "He sees what all these shades have in common", may refer to all sorts of different phenomena, i.e., all sorts of phenomena are used as criteria for 'his seeing that...'. Or all that happens may be that on being asked to bring another shade of blue he carries out our order satisfactorily. Or a patch of pure blue may appear before his mind's eye when we show him the different samples of blue: or he may instinctively turn his head towards some other shade of blue which we haven't shown him for sample, etc., etc.

Page 135

Now should we say that a mental strain and a bodily strain were 'strains' in the same sense of the word or in different (or 'slightly different') senses of the word?--There are cases of this sort in which we should not be doubtful about the answer.

Page 135

4. Consider this case: We have taught someone the use of the words "darker" and "lighter". He could, e.g.,

carry out such an order

Page Break 136

as "Paint me a patch of colour darker than the one I am showing you". Suppose now I said to him: "Listen to the five vowels a, e, i, o, u and arrange them in order of their darkness". He may just look puzzled and do nothing, but he may (and some people will) now arrange the vowels in a certain order (mostly i, e, a, o, u). Now one might imagine that arranging the vowels in order of darkness presupposed that when a vowel was sounded a certain colour came before a man's mind, that he then arranged these colours in their order of darkness and told you the corresponding arrangement of the vowels. But this actually need not happen. A person will comply with the order: "Arrange the vowels in their order of darkness", without seeing any colours before his mind's eye.

Page 136

Now if such a person was asked whether u was *really* darker than e, he would almost certainly answer some such thing as "It isn't really darker, but it somehow gives me a darker impression".

Page 136

But what if we asked him "What made you use the word 'darker' in this case at all?"?

Page 136

Again we might be inclined to say "He must have seen something that was in common both to the relation between two colours and to the relation between two vowels". But if he isn't capable of specifying what this common element was, this leaves us just with the fact that he was prompted to use the words "darker", "lighter" in both these cases.

Page 136

For, note the word "must" in "He must have seen something...". When you said that, you didn't mean that from past experience you conclude that he probably did see something, and that's just why this sentence adds nothing to what we know, and in fact only suggests a different form of words to describe it.

Page 136

If someone said: "I do see a certain similarity, only I can't describe it", I should say: "This itself characterizes your experience".

Page 136

Suppose you look at two faces and say "They are similar, but I don't know what it is that's similar about them". And suppose that after a while you said: "Now I know; their eyes have the same shape", I should say "Now your experience of their similarity is different from what it was when you saw similarity and didn't know what it consisted in". Now to the question "What made you use the word 'darker'...?" the answer may be "Nothing made me use the word 'darker',--that is, if you ask me for a *reason* why I use it. I just used it, and what is more, I used it with the same intonation of voice, and perhaps with the same facial expression and gesture, which I should in certain

Page Break 137

cases be inclined to use when applying the word to colours".--It is easier to see this when we speak of a *deep* sorrow, a *deep* sound, a *deep* well. Some people are able to distinguish between fat and lean days of the week. And their experience when they conceive a day as a fat one consists in applying this word together perhaps with a gesture expressive of fatness and a certain comfort.

Page 137

But you may be tempted to say: This use of the word and gesture is not their primary experience. First of all they have to conceive the day as fat and then they express this conception by word or gesture.

Page 137

But why do you use the expression "They have to"? Do you know of an experience in this case which you call "the conception, etc."? For if you don't, isn't it just what one might call a linguistic prejudice that made you say "He had to have a conception before... etc."?

Page 137

Rather, you can learn from this example and from others that there are cases in which we may call a particular experience "noticing, seeing, conceiving that so and so is the case", before expressing it by word or gestures, and that there are other cases in which if we talk of an experience of conceiving at all, we have to apply this word to the experience of using certain words, gestures, etc.

Page 137

When the man said "u isn't really darker than e... ", it was essential that he meant to say that the word "darker" was used *in different senses* when one talked of one colour being darker than another and, on the other hand, of one vowel being darker than another.

Page 137

Consider this example: Suppose we had taught a man to use the words "green", "red", "blue" by pointing to patches of these colours. We had taught him to fetch us objects of a certain colour on being ordered "Bring me something red!", to sort out objects of various colours from a heap, and such like. Suppose we now show him a heap of leaves, some of which are a slightly reddish brown, others a slightly greenish yellow, and give him the order "Put the red leaves and the green leaves on separate heaps". It is quite likely that he will upon this separate the greenish yellow leaves from the reddish brown ones. Now should we say that we had here used the words "red" and "green" in the same sense as in the previous cases, or did we use them in different but similar senses? What reasons would one give for adopting the latter view? One could point out that on being asked to paint a red patch, one should certainly not have painted a slightly reddish brown one, and therefore one might say "red" means something different in the two cases. But why shouldn't I say that it had one meaning only but was, of course, used according to the circumstances?

Page Break 138

Page 138

The question is: Do we supplement our statement that the word has two meanings by a statement saying that in one case it had this, in the other that meaning? As the criterion for a word's having two meanings, we may use the fact of there being two explanations given for a word. Thus we say the word "bank" has two meanings; for in one case it means this sort of thing (pointing, say, to a river bank), in the other case that sort of thing (pointing to the Bank of England). Now what I point to here are paradigms for the use of the words. One could not say: "The word 'red' has two meanings because in one case it means this (pointing to a light red), in the other that (pointing to a dark red)", if, that is to say, there had been only one ostensive definition for the word "red" used in our game. One could, on the other hand, imagine a language game in which two words, say "red" and "reddish", were explained by two ostensive definitions, the first showing a dark red object, the second a light red one. Whether two such explanations were given or only one might depend on the natural reactions of the people using the language. We might find that a person to whom we give the ostensive definition, "This is called 'red'" (pointing to one red object) thereupon fetches any red object of whatever shade of red on being ordered: "Bring me something red!" Another person might not do so, but bring objects of a certain range of shades only in the neighbourhood of the shade pointed out to him in the explanation. We might say that this person 'does not see what is in common between all the different shades of red'. But remember please that our only criterion for that is the behaviour we have described.

Page 138

Consider the following case: B has been taught a use of the words "lighter" and "darker". He has been shown objects of various colours and has been taught that one calls this a darker colour than that, trained to bring an object on being ordered "Bring something darker than this", and to describe the colour of an object by saying that it is darker or lighter than a certain sample, etc., etc. Now he is given the order to put down a series of objects, arranging them in the order of their darkness. He does this by laying out a row of books, writing down a series of names of animals, and by writing down the five vowels in the order u, o, a, e, i. We ask him why he put down that latter series, and he says, "Well, o is lighter than u, and e lighter than o".--We shall be astonished at his attitude, and at the same time admit that there is something in what he says. Perhaps we shall say: "But look, surely e isn't lighter than o in the way this book is lighter than

Page Break 139

that".--But he may shrug his shoulders and say, "I don't know, but e *is* lighter than o, isn't it?"

Page 139

We may be inclined to treat this case as some kind of abnormality, and to say, "B must have a different sense, with the help of which he arranges both coloured objects and vowels". And if we tried to make this idea of ours (quite) explicit, it would come to this: The normal person registers lightness and darkness of visual objects on one instrument, and, what one might call the lightness and darkness of sounds (vowels) on another, in the sense in which one might say that we record rays of a certain wave length with the eyes, and rays of another range of wave length with our sense of temperature. B on the other hand, we wish to say, arranges both sounds and colours by the readings of one instrument (sense organ) only (in the sense in which a photographic plate might record rays of a range which we could only cover with two of our senses).

Page 139

This roughly is the picture standing behind our idea that B must have 'understood' the word "darker" differently from the normal person. On the other hand let us put side by side with this picture the fact that there is in our case no evidence for 'another sense'.--And in fact the use of the word "must" when we say "B must have understood the word differently" already shows us that this sentence (really) expresses our determination to look at the phenomena we have observed after†1 the picture outlined in this sentence.

'But surely he used "lighter" in a different sense when he said e was lighter than u'.--What does this mean? Are you distinguishing between the sense in which he used the word and his usage of the word? That is, do you wish to say that if someone uses the word as B does, some other difference, say in his mind, must go along with the difference in usage? Or is all you want to say that surely the usage of "lighter" was a different one when he applied it to vowels?

Now is the fact that the usages differ anything over and above what you describe when you point out the particular differences?

What if somebody said, pointing to two patches which I had called red, "Surely you are using the word 'red' in two different ways"?--I should say "This is light red and the other dark red,--but why should I have to talk of two different usages?"--

It certainly is easy to point out differences between that part of the game in which we applied "lighter" and "darker" to coloured objects and that part in which we applied these words to vowels. In the first

part there was comparison of two objects by laying them side by side and looking from one to the other, there was painting a darker or lighter shade than a certain sample given; in the second there was no comparison by the eye, no painting, etc. But when these differences are pointed out, we are still free to speak of two parts of the same game (as we have done just now) or of two different games.

'But don't I perceive that the relation between a lighter and a darker bit of material is a different one than that between the vowels e and u,--as on the other hand I perceive that the relation between u and e is the same as that between e and i?'--Under certain circumstances we shall in these cases be inclined to talk of different relations, under certain others to talk of the same relation. One might say, "It depends how one compares them".

Let us ask the question "Should we say that the arrows \rightarrow and \leftarrow point in the same direction or in different directions?"--At first sight you might be inclined to say "Of course, in different directions". But look at it this way: If I look into a looking glass and see the reflection of my face, I can take this as a criterion for seeing my own head. If on the other hand I saw in it the back of a head I might say "It can't be my own head I am seeing, but a head looking in the opposite direction". Now this could lead me on to say that an arrow and the reflection of an arrow in a glass have the same direction when they point towards each other, and opposite directions when the head of the one points to the tail end of the other. Imagine the case that a man had been taught the ordinary use of the word "the same" in the cases of "the same colour", "the same shape", "the same length". He had also been taught the use of the word "to point to" in such contexts as "The arrow points to the tree". Now we show him two arrows facing each other, and two arrows one following the other, and ask him in which of these two cases he'd apply the phrase "The arrows point the same way". Isn't it easy to imagine that if certain applications were uppermost in his mind, he would be inclined to say that the arrows $\rightarrow \leftarrow$ point 'the same way'?

When we hear the diatonic scale we are inclined to say that after every seven notes the same note recurs, and, asked why we call it the same note again one might answer "Well, it's a c again". But this isn't the explanation I want, for I should ask "What made one call it a c again?" And the answer to this would seem to be "Well, don't you hear that it's the same note only an octave higher?"--Here, too, we could imagine that a man had been taught our use of the word

"the same" when applied to colours, lengths, directions, etc., and that we now played the diatonic scale for him and asked him whether he'd say that he heard the same notes again and again at certain intervals, and we could easily imagine several answers, in particular for instance, this, that he heard the same note alternately after every four or three notes (he calls the tonic, the dominant, and the octave the same note).

If we had made this experiment with two people A and B, and A had applied the expression "the same note" to the octave only, B to the dominant and octave, should we have a right to say that the two hear different things when we play to them the diatonic scale?-If we say they do, let us be dear whether we wish to assert that there must

be some other difference between the two cases besides the one we have observed, or whether we wish to make no such statement.

Page 141

5. All the questions considered here link up with this problem: Suppose you had taught someone to write down series of numbers according to rules of the form: Always write down a number n greater than the preceding. (This rule is abbreviated to "Add n ".) The numerals in this game are to be groups of dashes |, ||, |||, etc. What I call teaching this game, of course, consisted in giving general explanations and doing examples.--These examples are taken from the range, say, between 1 and 85. We now give the pupil the order "Add 1". After some time we observe that after passing 100 he did what we should call adding 2; after passing 300 he does what we should call adding 3. We have him up for this: "Didn't I tell you always to add 1? Look what you have done before you got to 100!"--Suppose the pupil said, pointing to the numbers 102, 104, etc., "Well, didn't I do the same here? I thought this was what you wanted me to do."--You see that it would get us no further here again to say "But don't you see...?", pointing out to him again the rules and examples we had given to him. We might, in such a case, say that this person naturally understands (interprets) the rule (and examples) we have given as we should understand the rule (and examples) telling us: "Add 1 up to 100, then 2 up to 200, etc."

Page 141

(This would be similar to the case of a man who did not naturally follow an order given by a pointing gesture by moving in the direction shoulder to hand, but in the opposite direction. And understanding here means the same as reacting.)

Page 141

I suppose what you say comes to this, that in order to follow the rule "Add 1" correctly a new insight, intuition, is needed at every step.--

Page Break 142

But what does it mean to follow the rule *correctly*? How and when is it to be decided which at a particular point is the correct step to take? The correct step at every point is that which is in accordance with the rule as it was *meant*, intended.--I suppose the idea is this: When you gave the rule "Add 1" and meant it, you meant him to write 101 after 100, 199 after 198, 1041 after 1040, and so on. But how did you do all these acts of meaning (I suppose an infinite number of them) when you gave him the rule? Or is this misrepresenting it? And would you say that there was only one act of meaning, from which, however, all these others, or any one of them, followed in turn? But isn't the point just: 'What does follow from the general rule?' You might say "Surely I knew when I gave him the rule that I meant him to follow up 100 by 101". But here you are misled by the grammar of the word "to know". Was knowing this some mental act by which you at the time made the transition from 100 to 101, i.e., some act like saying to yourself "I want him to write 101 after 100"? In this case ask yourself how many such acts you performed when you gave him the rule. Or do you mean by knowing some kind of disposition?--then only experience can teach us what it was a disposition for. But surely if one had asked me which number he should write after 1568, I should have answered "1569".--I dare say you would, but how can you be sure of it? Your idea really is that somehow in the mysterious act of *meaning* the rule you made the transitions without really making them. You crossed all the bridges before you were there.--This queer idea is connected with a peculiar use of the word "to mean". Suppose our man got to the number 100 and followed it up by 102. We should then say "I *meant* you to write 101". Now the past tense in the word "to mean" suggests that a particular act of meaning had been performed when the rule was given, though as a matter of fact this expression alludes to no such act. The past tense could be explained by putting the sentence into the form "Had you asked me before what I wanted you to do at this stage, I should have said...". But it is a hypothesis that you would have said that.

Page 142

To get this clearer, think of this example: Someone says "Napoleon was crowned in 1804". I ask him "Did you mean the man who won the battle of Austerlitz?" He says "Yes, I meant him".--Does this mean that when he 'meant him', he in some way thought of Napoleon's winning the battle of Austerlitz?

Page 142

The expression "The rule meant him to follow up 100 by 101" makes it appear that this rule, as it was meant, *foreshadowed* all the

Page Break 143

transitions which were to be made according to it. But the assumption of a shadow of a transition does not get us any further, because it does not bridge the gulf between it and the real transition. If the mere words of the rule could not anticipate a future transition, no more could any mental act accompanying these words.

Page 143

We meet again and again with this curious superstition, as one might be inclined to call it, that the mental act is capable of crossing a bridge before we've got to it. This trouble crops up whenever we try to think about the ideas of thinking, wishing, expecting, believing, knowing, trying to solve a mathematical problem, mathematical induction, and so forth.

Page 143

It is no act of insight, intuition, which makes us use the rule as we do at the particular point of the series. It would be less confusing to call it an act of decision, though this too is misleading, for nothing like an act of decision must take place, but possibly just an act of writing or speaking. And the mistake which we here and in a thousand similar cases are inclined to make is labelled by the word "to make" as we have used it in the sentence "It is no act of insight which makes us use the rule as we do", because there is an idea that 'something must make us' do what we do. And this again joins on to the confusion between cause and reason. *We need have no reason to follow the rule as we do.* The chain of reasons has an end.

Page 143

Now compare these sentences: "Surely it is using the rule 'Add 1' in a different way if after 100 you go on to 102, 104, etc." and "Surely it is using the word 'darker' in a different way if after applying it to coloured patches we apply it to the vowels".--I should say: "That depends on what you call a 'different way'".--

Page 143

But I should certainly say that *I should* call the application of "lighter" and "darker" to vowels 'another usage of the words'; and I also should carry on the series 'Add 1' in the way 101, 102, etc., but not--or not necessarily--because of some other justifying mental act.

Page 143

6. There is a kind of general disease of thinking which always looks for (and finds) what would be called a mental state from which all our acts spring as from a reservoir. Thus one says, "The fashion changes because the taste of people changes". The taste is the mental reservoir. But if a tailor to-day designs a cut of dress different from that which he designed a year ago, can't what is called his change of taste have consisted, partly or wholly, in doing just this?

Page 143

And here we say "But surely designing a new shape isn't in itself

Page Break 144

changing one's taste,--and saying a word isn't meaning it,--and saying that I believe isn't believing; there must be feelings, mental acts, going along with these lines and these words".--And the reason we give for saying this is that a man certainly could design a new shape without having changed his taste, say that he believes something without believing it, etc. And this obviously is true. But it doesn't follow that what distinguishes a case of having changed one's taste from a case of not having done so isn't under certain circumstances just designing what one hasn't designed before. Nor does it follow that in cases in which designing a new shape is not the criterion for a change of taste, the criterion must be a change in some particular region of our mind.

Page 144

That is to say, we don't use the word "taste" as the name of a feeling. To think that we do is to represent the practice of our language in undue simplification. This, of course, is the way in which philosophical puzzles generally arise; and our case is quite analogous to that of thinking that wherever we make a predicative statement we state that the subject has a certain ingredient (as we really do in the case, "Beer is alcoholic").

Page 144

It is advantageous in treating our problem to consider parallel with the feeling or feelings characteristic for having a certain taste, changing one's taste, meaning what one says, etc., etc., the facial expression (gestures or tone of voice) characteristic for the same states or events. If someone should object, saying that feelings and facial expressions can't be compared, as the former are experiences and the latter aren't, let him consider the muscular, kinaesthetic and tactile experiences bound up with gestures and facial expressions.

Page 144

7. Let us then consider the proposition "Believing something cannot merely consist in saying that you believe it, you must say it with a particular facial expression, gesture, and tone of voice". Now it cannot be doubted that we regard certain facial expressions, gestures, etc. as characteristic for the expression of belief. We speak of a 'tone of conviction'. And yet it is clear that this tone of conviction isn't always present whenever we rightly speak of conviction. "Just so", you might say, "this shows that there is something else, something behind these gestures, etc. which is the real belief as opposed to mere expressions of belief".--"Not at all", I should say, "many different criteria distinguish, under different circumstances, cases of believing what you say from those of not believing what you say". There may be

cases where the presence of a sensation other than those bound up with gestures, tone of voice, etc. distinguishes meaning what you say from not meaning it. But sometimes what distinguishes these two is nothing that happens while we speak, but a variety of actions and experiences of different kinds before and after.

To understand this family of cases it will again be helpful to consider an analogous case drawn from facial expressions. There is a family of friendly facial expressions. Suppose we had asked "What feature is it that characterizes a friendly face?" At first one might think that there are certain traits which one might call friendly traits, each of which makes the face look friendly to a certain degree, and which when present in a large number constitute the friendly expression. This idea would seem to be borne out by our common speech, talking of 'friendly eyes', 'friendly mouth', etc. But it is easy to see that the same eyes of which we say they make a face look friendly do not look friendly, or even look unfriendly, with certain other wrinkles of the forehead, lines round the mouth, etc. Why then do we ever say that it is these eyes which look friendly? Isn't it wrong to say that they characterize the face as friendly, for if we say they do so 'under certain circumstances' (these circumstances being the other features of the face) why did we single out the one feature from amongst the others? The answer is that in the wide family of friendly faces there is what one might call a main branch characterized by a certain kind of eyes, another by a certain kind of mouth, etc.; although in the large family of unfriendly faces we meet these same eyes when they don't mitigate the unfriendliness of the expression.--There is further the fact that when we notice the friendly expression of a face, our attention, our gaze, is drawn to a particular feature in the face, the 'friendly eyes', or the 'friendly mouth', etc., and that it does not rest on other features although these too are responsible for the friendly expression.

'But is there no difference between saying something and meaning it, and saying it without meaning it?'--There needn't be a difference while he says it, and if there is, this difference may be of all sorts of different kinds according to the surrounding circumstances. It does not follow from the fact that there is what we call a friendly and an unfriendly expression of the eye that there must be a difference between the eye of a friendly and the eye of an unfriendly face.

One might be tempted to say "This trait can't be said to make the face look friendly, as it may be belied by another trait". And this is like saying "Saying something with the tone of conviction can't be the

characteristic of conviction, as it may be belied by experiences going along with it". But neither of these sentences is correct. It is true that other traits in this face could take away the friendly character of this eye, and yet in this face it is the eye which is the outstanding friendly feature.

It is such phrases as "He said it and meant it" which are most liable to mislead us.--Compare meaning "I shall be delighted to see you" with meaning "The train leaves at 3.30". Suppose you had said the first sentence to someone and were asked afterwards "Did you mean it?", you would then probably think of the feelings, the experiences, which you had while you said it. And accordingly you would in this case be inclined to say "Didn't you see that I meant it?" Suppose that on the other hand, after having given someone the information "The train leaves at 3.30", he asked you "Did you mean it?", you might be inclined to answer "Certainly. Why shouldn't I have meant it?"

In the first case we shall be inclined to speak about a feeling characteristic of meaning what we said, but not in the second. Compare also lying in both these cases. In the first case we should be inclined to say that lying consisted in saying what we did but without the appropriate feelings or even with the opposite feelings. If we lied in giving the information about the train, we would be likely to have different experiences while we gave it than those which we have in giving truthful information, but the difference here would not consist in the absence of a characteristic feeling, but perhaps just in the presence of a feeling of discomfort.

It is even possible while lying to have quite strong experience of what might be called the characteristic for meaning what one says--and yet under certain circumstances, and perhaps under the ordinary circumstances, one refers to just this experience in saying, "I meant what I said", because the cases in which something might give the lie to these experiences do not come into the question. In many cases therefore we are inclined to say: "Meaning what I say" means having such and such experiences while I say it.

If by "believing" we mean an activity, a process, taking place while we say that we believe, we may say that believing is something similar to or the same as expressing a belief.

Page 146

8. It is interesting to consider an objection to this: What if I said "I believe it will rain" (meaning what I say) and someone wanted to

Page Break 147

explain to a Frenchman who doesn't understand English what it was I believed. Then, you might say, if all that happened when I believed what I did was that I said the sentence, the Frenchman ought to know what I believe if you tell him the exact words I used, or say "Il croit 'It will rain' ". Now it is clear that this will not tell him what I believe and consequently, you might say, we failed to convey just that to him which was essential, my real mental act of believing.--But the answer is that even if my words had been accompanied by all sorts of experiences, and if we could have transmitted these experiences to the Frenchman, he would still not have known what I believed. For "knowing what I believe" just doesn't mean: feeling what I do while I say it; just as knowing what I intend with this move in our game of chess doesn't mean knowing my exact state of mind while I'm making the move. Though, at the same time, in certain cases, knowing this state of mind might furnish you with very exact information about my intention.

Page 147

We should say that we had told the Frenchman what I believed if we translated my words for him into French. And it *might* be that thereby we told him nothing--even indirectly--about what happened 'in me' when I uttered my belief. Rather, we pointed out to him a sentence which in his language holds a similar position to my sentence in the English language.--Again one might say that, at least in certain cases, we could have told him much more exactly what I believed if he had been at home in the English language, because then, he would have known exactly what happened within me when I spoke.

Page 147

We use the words "meaning", "believing", "intending" in such a way that they refer to certain acts, states of mind given certain circumstances; as by the expression "checkmating somebody" we refer to the act of taking his king. If on the other hand, someone, say a child, playing about with chessmen, placed a few of them on a chess board and went through the motions of taking a king, we should not say the child had checkmated anyone.--And here, too, one might think that what distinguished this case from real checkmating was what happened in the child's mind.

Page 147

Suppose I had made a move in chess and someone asked me "Did you intend to mate him?", I answer "I did", and he now asks me "How could you know you did, as all you *knew* was what happened within you when you made the move?", I might answer "Under *these* circumstances this was intending to mate him".

Page Break 148

Page 148

9. What holds for 'meaning' holds for 'thinking'.--We very often find it impossible to think without speaking to ourselves half aloud,--and nobody asked to describe what happened in this case would ever say that something--the thinking--accompanied the speaking, were he not led into doing so by the pair of verbs "speaking"/"thinking", and by many of our common phrases in which their uses run parallel. Consider these examples: "Think before you speak!" "He speaks without thinking", "What I said didn't quite express my thought", "He says one thing and thinks just the opposite", "I didn't mean a word of what I said", "The French language uses its words in that order in which we think them".

Page 148

If anything in such a case can be said to go with the speaking, it would be something like the modulation of voice, the changes in timbre, accentuation, and the like, all of which one might call means of expressiveness. Some of these, like the tone of voice and the accent, nobody for obvious reasons would call the accompaniments of the speech; and such means of expressiveness as the play of facial expression or gestures which can be said to accompany speech, nobody would dream of calling thinking.

Page 148

10. Let us revert to our example of the use of "lighter" and "darker" for coloured objects and the vowels. A reason which we should like to give for saying that here we have two different uses and not one is this: 'We don't think that the words "darker", "lighter" actually fit the relation between the vowels, we only feel a resemblance between the relation of the sounds and the darker and lighter colours'. Now if you wish to see what sort of feeling this is, try to imagine that without previous introduction you asked someone "Say the vowels a, e, i, o, u, in the order

of their darkness". If I did this, I should certainly say it in a different tone from that in which I should say "Arrange these books in the order of their darkness"; that is, I should say it haltingly, in a tone similar to that of "I wonder if you understand me", perhaps smiling slyly as I say it. And this, if anything, describes my *feeling*. And this brings me to the following point: When someone asks me "What colour is the book over there?", and I say "Red", and then he asks "What made you call this colour 'red'?", I shall in most cases have to say: "Nothing *makes* me call it red; that is, *no reason*. I just looked at it and said 'It's red'". One is then inclined to say: "Surely this isn't all that happened; for I could look at a colour and say a

Page Break 149

word and still not name the colour". And then one is inclined to go on to say: "The word 'red' when we pronounce it, naming the colour we look at, *comes in a particular way*". But, at the same time, asked "Can you describe the way you mean?"--one wouldn't feel prepared to give any description. Suppose now we asked: "Do you, at any rate, remember that the name of the colour came to you *in that particular way* whenever you named colours on former occasions?"--he would have to admit that he didn't remember a particular way in which this always happened. In fact one could easily make him see that naming a colour could go along with all sorts of different experiences. Compare such cases as these: *a*) I put an iron in the fire to heat it to light red heat. I am asking you to watch the iron and want you to tell me from time to time what stage of *heat* it has reached. You look and say: "It is beginning to get light red". *b*) We stand at a street crossing and I say: "Watch out for the green light. When it comes on, tell me and I'll run across." Ask yourself this question: If in one such case you shout "Green!" and in another "Run!", do these words come in the same way or in different ways? Can one say anything about this in a general way? *c*) I ask you: "What's the colour of the bit of material you have in your hand?" (and I can't see). You think: "Now what does one call this? Is this 'Prussian blue' or 'indigo'?"

Page 149

Now it is very remarkable that when in a philosophical conversation we say: "The name of a colour comes in a particular way", we don't trouble to think of the many different cases and ways in which such a name comes.--And our chief argument is really that naming the colour is different from just pronouncing a word on some different occasion while looking at a colour. Thus one might say: "Suppose we counted some objects lying on our table, a blue one, a red one, a white one, and a black one,--looking at each in turn we say: 'One, two, three, four'. Isn't it easy to see that something different happens in this case when we pronounce the words than what would happen if we had to tell someone the colours of the objects? And couldn't we, with the same right as before, have said 'Nothing else happens when we say the numerals than just saying them while looking at the objects'? "Now two answers can be given to this: First, undoubtedly, at least in the great majority of cases, counting the objects will be accompanied by different experiences from naming their colours. And it is easy to describe roughly what the difference will be. In counting we know a certain gesture, as it were, beating the number out with one's finger or by nodding one's head. There is, on the other hand, an

Page Break 150

experience which one might call "concentrating one's attention on the colour", getting the full impression of it. And these are the sort of things one recalls when one says "It is easy to see that something different happens when we count the objects and when we name their colours". But it is in no way necessary that certain peculiar experiences more or less characteristic for counting take place while we are counting, nor that the peculiar phenomenon of gazing at the colour takes place when we look at the object and name its colour. It is true that the processes of counting four objects and of naming their colours will, in most cases at any rate, be different taken as a whole, and *this* is what strikes us; but that doesn't mean at all that we know that something different happens every time in these two cases when we pronounce a numeral on the one hand and a name of a colour on the other.

Page 150

When we philosophize about this sort of thing we almost invariably do something of this sort: We repeat to ourselves a certain experience, say, by looking fixedly at a certain object and trying to 'read off' as it were the name of its colour. And it is quite natural that doing so again and again we should be inclined to say, "Something particular happens while we say the word 'blue'". For we are aware of going again and again through the same process. But ask yourself: Is this also the process which we usually go through when on various occasions--not philosophizing--we name the colour of an object?

Page 150

11. The problem which we are concerned with we also encounter in thinking about volition, deliberate and involuntary action. Think, say, of these examples: I deliberate whether to lift a certain heavyish weight, decide to do it, I then apply my force to it and lift it. Here, you might say, you have a full-fledged case of willing and intentional action. Compare with this such a case as reaching a man a lighted match after having lit with it one's own cigarette

and seeing that he wishes to light his; or again the case of moving your hand while writing a letter, or moving your mouth, larynx, etc. while speaking.--Now when I called the first example a full-fledged case of willing, I deliberately used this misleading expression. For this expression indicates that one is inclined in thinking about volition to regard this sort of example as one exhibiting most clearly the typical characteristic of willing. One takes one's ideas, and one's language, about volition from this kind of example and thinks that they must apply--if not in such an obvious way-to all cases which one can properly call cases of willing.-It is the same case that we have met over and over again:

Page Break 151

The forms of expression of our ordinary language fit most obviously certain very special applications of the words "willing", "thinking", "meaning", "reading", etc., etc. And thus we might have called the case in which a man 'first thinks and then speaks' the full-fledged case of thinking and the case in which a man spells out the words he is reading the full-fledged case of reading. We speak of an 'act of volition' as different from the action which is willed, and in our first example there are lots of different acts clearly distinguishing this case from one in which all that happens is that the hand and the weight lift: there are the preparations of deliberation and decision, there is the effort of lifting. But where do we find the analogues to these processes in our other examples and in innumerable ones we might have given?

Page 151

Now on the other hand it has been said that when a man, say, gets out of bed in the morning, all that happens may be this: he deliberates, "Is it time to get up?", he tries to make up his mind, and then suddenly *he finds himself getting up*. Describing it this way emphasizes the absence of an act of volition. Now first: where do we find the prototype of such a thing, i.e., how did we come by the idea of such an act? I think the prototype of the act of volition is the experience of muscular effort.--Now there is something in the above description which tempts us to contradict it; we say: "We don't just 'find', observe, ourselves getting up, as though we were observing someone else! It isn't like, say, watching certain reflex actions. If, e.g., I place myself sideways close to a wall, my wall-side arm hanging down outstretched, the back of the hand touching the wall, and if now keeping the arm rigid I press the back of the hand hard against the wall, doing it all by means of the deltoid muscle, if then I quickly step away from the wall, letting my arm hang down loosely, my arm without any action of mine, of its own accord begins to rise; this is the sort of case in which it would be proper to say, 'I *find* my arm rising'."

Page 151

Now here again it is clear that there are many striking differences between the case of observing my arm rising in this experiment or watching someone else getting out of bed and the case of finding myself getting up. There is, e.g., in this case a perfect absence of what one might call surprise, also I don't *look* at my own movements as I might look at someone turning about in bed, e.g., saying to myself "Is he going to get up?" There is a difference between the voluntary act of getting out of bed and the involuntary rising of my arm. But there is not one common difference between so-called

Page Break 152

voluntary acts and involuntary ones, viz, the presence or absence of one element, the 'act of volition'.

Page 152

The description of getting up in which a man says "I just find myself getting up" suggests that he wishes to say that he *observes* himself getting up. And we may certainly say that an attitude of observing is absent in this case. But the observing attitude again is not one continuous state of mind or otherwise which we are in the whole time while, as we should say, we are observing. Rather, there is a family of groups of activities and experiences which we call observing attitudes. Roughly speaking one might say there are observation-elements of curiosity, observant expectation, surprise, and there are, we should say, facial expressions and gestures of curiosity, of observant expectation, and of surprise; and if you agree that there is more than one facial expression characteristic for each of these cases, and that there can be these cases without any characteristic facial expression, you will admit that to each of these three words a *family* of phenomena corresponds.

Page 152

12. If I had said "When I told him that the train was leaving at 3.30, believing that it did, nothing happened than that I just uttered the sentence", and if someone contradicted me, saying "Surely this couldn't have been all, as you might 'just say a sentence' without believing it",--my answer should be "I didn't wish to say that there was no difference between speaking, believing what you say, and speaking, not believing what you say; but the pair 'believing'/not believing' refers to various differences in different cases (differences forming a family), not to one difference, that between the presence and the absence of a certain mental state."

Page 152

13. Let us consider various characteristics of voluntary and involuntary acts. In the case of lifting the heavy weight, the various experiences of effort are obviously most characteristic for lifting the weight voluntarily. On the other hand, compare with this the case of writing, voluntarily, where in most of the ordinary cases there will be no effort; and even if we feel that the writing tires our hands and strains their muscles, this is not the experience of 'pulling' and 'pushing' which we would call typical voluntary actions. Further compare the lifting of your hand when you lift a weight with it with lifting your hand when, e.g., you point to some object above you. This will certainly be regarded as a voluntary act, though the element of effort will most likely be entirely absent; in fact this raising of the arm

Page Break 153

to point at an object is very much like raising the eye to look at it, and here we can hardly conceive of an effort.--Now let us describe an act of involuntarily raising your arm. There is the case of our experiment, and this was characterized by the utter absence of muscular strain and also by our observant attitude towards the lifting of the arm. But we have just seen a case in which muscular strain was absent, and there are cases in which we should call an action voluntary although we take an observant attitude towards it. But in a large class of cases it is the peculiar impossibility of taking an observant attitude towards a certain action which characterizes it as a- voluntary one. Try, e.g., to observe your hand rising when you voluntarily raise it. Of course you *see* it rising as you do, say, in the experiment; but you can't somehow follow it in the same way with your eye. This might get clearer if you compare two different cases of following lines on a piece of paper with your eye; a) some irregular line like this:

b) a written sentence. You will find that in a) the eye, as it were, alternately slips and gets stuck, whereas in reading a sentence it glides along smoothly.

Page 153

Now consider a case in which we do take up an observant attitude towards a voluntary action, I mean the very instructive case of trying to draw a square with its diagonals by placing a mirror on your drawing paper and directing your hand by what you see by looking at it in the mirror. And here one is inclined to say that our real *actions*, the ones to which volition *immediately* applies, are not the movements of our hand but something further back, say, the actions of our muscles. We are inclined to compare the case with this: Imagine we had a series of levers before us, through which, by a hidden mechanism, we could direct a pencil drawing on a sheet of paper. We might then be in doubt which levers to pull in order to get the desired movement of the pencil; and we could say that *we deliberately* pulled this particular lever, although we didn't deliberately produce the wrong result that we thereby produced. But this comparison, though it easily suggests itself, is very misleading. For in the case of the levers which we saw before us, there was such a thing as deciding which one we were going to pull before pulling it. But does our volition, as it were, play on a keyboard of muscles, choosing which one it was going to use next?--For some actions which we call deliberate it is characteristic

Page Break 154

that we, in some sense, 'know what we are going to do' before we do it. In this sense we say that we know what object we are going to point to, and what we might call 'the act of knowing' might consist in looking at the object before we point to it or in describing its position by words or pictures. Now we could describe our drawing the square through the mirror by saying that our acts were deliberate as far as their motor aspect is concerned, but not as far as their visual aspect is concerned. This would, e.g., be demonstrated by our ability to repeat a movement of the hand which had produced a wrong result, on being told to do so. But it would obviously be absurd to say that this motor character of voluntary motion consisted in our knowing beforehand what we were going to do, as though we had had a picture of the kinaesthetic sensation before our mind and decided to bring about this sensation. Remember the experiment where the subject has his fingers intertwined; if here, instead of pointing from a distance to the finger which you order him to move, you touch that finger, he will always move it without the slightest difficulty. And here it is tempting to say "Of course I can move it now, because now I know which finger it is I'm asked to move." This makes it appear as though I had now shown you which muscle to contract in order to bring about the desired result. The word "of course" makes it appear as though by touching your finger I had given you an item of information telling you what to do. (As though normally when you tell a man to move such and such a finger he could follow your order because he knew how to bring the movement about.)

Page 154

(It is interesting here to think of the case of sucking a liquid through a tube; if asked what part of your body you sucked with, you would be inclined to say your mouth, although the work was done by the muscles by which you draw your breath.)

Page 154

Let us now ask ourselves what we should call "speaking involuntarily". First note that when normally you speak, voluntarily, you could hardly describe what happened by saying that by an act of volition you move your mouth, tongue, larynx, etc. as a means to producing certain sounds. Whatever happens in your mouth, larynx, etc. and whatever sensations you have in these parts while speaking would almost seem secondary phenomena accompanying the production of sounds, and volition, one wishes to say, operates on the sounds themselves without intermediary mechanism. This shows how loose our idea of this agent 'volition' is.

Page 154

Now to involuntary speaking. Imagine you had to describe a

Page Break 155

case,--what would you do? There is of course the case of speaking in one's sleep; this is characterized by our doing it without being aware of it and not remembering having done it. But this obviously you wouldn't call the characteristic of an involuntary action.

Page 155

A better example of involuntary speaking would, I suppose, be that of involuntary exclamations: "Oh!", "Help!", and such like, and these utterances are akin to shrieking with pain. (This, by the way, could set us thinking about 'words as expressions of feelings'.) One might say: "Surely these are good examples of involuntary speech, because there is in these cases not only no act of volition by which we speak, but in many cases we utter these words *against* our will". I should say: I certainly should call this involuntary speaking; and I agree that an act of volition preparatory to or accompanying these words is absent,--if by "act of volition" you refer to certain acts of intention, premeditation, or effort. But then in many cases of voluntary speech I don't feel an effort, much that I say voluntarily is not premeditated, and I don't know of any acts of intention preceding it.

Page 155

Crying out with pain against our will could be compared with raising our arm against our will when someone forces it up while we are struggling against him. But it is important to notice that the will--or should we say 'wish'--not to cry out is overcome in a different way from that in which our resistance is overcome by the strength of the opponent. When we cry out against our will, we are as it were taken by surprise; as though someone forced up our hands by unexpectedly sticking a gun into our ribs, commanding "Hands up!"

Page 155

14. Consider now the following example, which is of great help in all these considerations: In order to see what happens when one understands a word, we play this game: You have a list of words, partly these words are words of my native language, partly words of foreign languages more or less familiar to me, partly words of languages entirely unknown to me (or, which comes to the same, nonsensical words invented for the occasion). Some of the words of my native tongue, again, are words of ordinary everyday usage: and some of these, like "house", "table", "man", are what we might call primitive words, being among the first words a child learns, and some of these again, words of baby talk like "Mamma", "Papa". Again, there are more or less common technical terms such as "carburettor", "dynamo", "fuse"; etc., etc. All these words are read out

Page Break 156

to me, and after each one I have to say "Yes" or "No" according to whether I understand the word or not. I then try to remember what happened in my mind when I understood the words I did understand, and when I didn't understand the others. And here again it will be useful to consider the particular tone of voice and facial expression with which I say "Yes" and "No", alongside of the so-called mental events.--Now it may surprise us to find that although this experiment will show us a multitude of different characteristic experiences, it will not show us any one experience which we should be inclined to call the experience of understanding. There will be such experiences as these: I hear the word "tree" and say "Yes" with the tone of voice and sensation of "Of course". Or I hear "corroboration" I say to myself, "Let me see", vaguely remember a case of helping, and say "Yes". I hear "gadget", I imagine the man who always used this word, and say "Yes". I hear "Mamma", this strikes me as funny and childish--"Yes". A foreign word I shall very often translate in my mind into English before answering. I hear "spintharoscope", and say to myself, "Must be some sort of scientific instrument", perhaps try to think up its meaning from its derivation and fail, and say "No". In another case I might say to myself, "Sounds like Chinese"--"No". Etc. There will, on the other hand, be a large class of cases in which I am not aware of anything happening except hearing the word and saying the answer. And there will also be cases in which I remember

experiences (sensations, thoughts) which, as I should say, had nothing to do with the word at all. Thus amongst the experiences which I can describe there will be a class which I might call typical experiences of understanding and some typical experiences of not understanding. But opposed to these there will be a large class of cases in which I should have to say "I know of no particular experience at all, I just said 'Yes', or 'No'".

Page 156

Now if someone said "But surely something did happen when you understood the word 'tree', unless you were utterly absentminded when you said 'Yes'", I might be inclined to reflect and say to myself, "Didn't I have a sort of homely feeling when I took in the word 'tree'?" But then, do I always have this feeling which now I referred to when I hear that word used or use it myself, do I remember having had it, do I even remember a set of, say, five sensations some one of which I had on every occasion when I could be said to have understood the word? Further, isn't that 'homely feeling' I referred

Page Break 157

to an experience rather characteristic for the particular situation I'm in at present, i.e., that of philosophizing about 'understanding'?

Page 157

Of course in our experiment we might call saying "Yes" or "No" characteristic experiences of understanding or not understanding, but what if we just hear a word in a sentence, where there isn't even a question of this reaction to it?--We are here in a curious difficulty: on the one hand it seems we have no reason to say that in all cases in which we understand a word one particular experience--or even one of a set--is present. On the other hand we may feel it's plainly wrong to say that in such a case all that happens may be that I hear or say the word. For that seems to be saying that part of the time we act as mere automatons. And the answer is that in a sense we do and in a sense we don't.

Page 157

If someone talked to me with a kindly play of facial expressions, is it necessary that in any short interval his face should have looked such that seeing it under any other circumstances I should have called its expression distinctly kindly? And if not, does this mean that his 'kindly play of expression' was interrupted by periods of inexpressiveness?--We certainly should not say this under the circumstances which I am assuming, and we don't feel that the look at this moment interrupts the expressiveness, although taken alone we should call it inexpressive.

Page 157

Just in this way we refer by the phrase "understanding a word" not necessarily to that which happens while we are saying or hearing it, but to the whole environment of the event of saying it. And this also applies to our saying that someone speaks like an automaton or like a parrot. Speaking with understanding certainly differs from speaking like an automaton, but this doesn't mean that the speaking in the first case is all the time accompanied by something which is lacking in the second case. Just as when we say that two people move in different circles this doesn't mean that they mayn't walk the street in identical surroundings.

Page 157

Thus also, acting voluntarily (or involuntarily) is, in many cases, characterized as such by a multitude of circumstances under which the action takes place rather than by an experience which we should call characteristic of voluntary action. And in this sense it is true to say that what happened when I got out of bed--when I should certainly not call it involuntary--was that I found myself getting up. Or rather, this is a possible case; for of course every day something different happens.

Page Break 158

Page 158

15. The troubles which we have been turning over since §7 were all closely connected with the use of the word "particular". We have been inclined to say that seeing familiar objects we have a particular feeling, that the word "red" came in a particular way when we recognized the colour as red, that we had a particular experience when we acted voluntarily.

Page 158

Now the use of the word "particular" is apt to produce a kind of delusion and roughly speaking this delusion is produced by the double usage of this word. On the one hand, we may say, it is used preliminary to a specification, description, comparison; on the other hand, as what one might describe as an emphasis. The first usage I shall call the transitive one, the second the intransitive one. Thus, on the one hand I say "This face gives me a particular impression which I can't describe". The latter sentence may mean something like: "This face gives me a strong impression". These examples would perhaps be more striking if we substituted the word "peculiar" for "particular", for the same comments apply to "peculiar". If I say "This soap has a *peculiar* smell: it is the kind we used as

children", the word "peculiar" may be used merely as an introduction to the comparison which follows it, as though I said "I'll tell you what this soap smells like:...". If, on the other hand, I say "This soap has a peculiar smell!" or "It has a most peculiar smell", "peculiar" here stands for some such expression as "out of the ordinary", "uncommon", "striking".

Page 158

We might ask "Did you say it had a peculiar smell, as opposed to no peculiar smell, or that it had this smell, as opposed to some other smell, or did you wish to say both the first and the second?"-Now what was it like when, philosophizing, I said that the word "red" came in a particular way when I described something I saw as red? Was it that I was going to describe the way in which the word "red" came, like saying "It always comes quicker than the word 'two' when I'm counting coloured objects", or "It always comes with a shock", etc.?--Or was it that I wished to say that "red" comes in a striking way?--Not exactly that either. But certainly rather the second than the first. To see this more dearly, consider another example: You are, of course, constantly changing the position of your body throughout the day; arrest yourself in any such attitude (while writing, reading, talking, etc., etc.) and say to yourself in the way in which you say "Red' comes in a particular way...", "I am now in a particular attitude". You will find that you can quite naturally say

Page Break 159

this. But aren't you always in a particular attitude? And of course you didn't mean that you were just then in a particularly striking attitude. What was it that happened? You concentrated on, as it were stared at, your sensations. And this is exactly what you did when you said that "red" came in a particular way.

Page 159

"But didn't I mean that 'red' came in a different way from 'two'?"--You may have meant this, but the phrase, "They come in different ways", is itself liable to cause confusion. Suppose I said "Smith and Jones always enter my room in different ways": I might go on and say "Smith enters quickly, Jones slowly", I am specifying the ways. I might on the other hand say "I don't know what the difference is", intimating that I'm *trying* to specify the difference, and perhaps later on I shall say "Now I know what it is; it is..."--I could on the other hand tell you that they came in different ways, and you wouldn't know what to make of this statement, and perhaps answer "Of course they come in different ways; they just *are* different".--We could describe our trouble by saying that we feel as though we could give an experience a name without at the same time committing ourselves about its use, and in fact without any intention to use it at all. Thus when I say "red" comes in a particular way..., I feel that I might now give this way a name if it hasn't already got one, say "A". But at the same time I am not at all prepared to say that I recognize this to be the way "red" has always come on such occasions, nor even to say that there are, say, four ways, A, B, C, D, in one of which it always comes. You might say that the two ways in which "red" and "two" come can be identified by, say, exchanging the meaning of the two words, using "red" as the second cardinal numeral, "two" as the name of a colour. Thus, on being asked how many eyes I had, I should answer "red", and to the question "What is the colour of blood?", "two". But the question now arises whether you can identify the 'way in which these words come' independently of the ways in which they are used,--I mean the ways just described. Did you wish to say that as a matter of experience, the word when used in *this* way always comes in the way A, but may, the next time, come in the way "two" usually comes? You will see then that you meant nothing of the sort.

Page 159

What is *particular* about the way "red" comes is that it comes while you're philosophizing about it, as what is particular about the position of your body when you concentrated on it was concentration. We appear to ourselves to be on the verge of describing the way, whereas we aren't really opposing it to any other way. We are emphasizing,

Page Break 160

not comparing, but we express ourselves as though this emphasis was really a comparison of the object with itself; there seems to be a reflexive comparison. Let me explain myself in this way: suppose I speak of the way in which A enters the room, I may say "I have noticed the way in which A enters the room", and on being asked "What is it?", I may answer "He always sticks his head into the room before coming in". Here I'm referring to a definite feature, and I could say that B had the same way, or that A no longer had it. Consider on the other hand the statement "I've now been observing the way A sits and smokes". I want to draw him like this. In this case I needn't be ready to give any description of a particular feature of his attitude, and my statement may just mean "I've been observing A as he sat and smoked".--'The way' can't in this case be separated from him. Now if I wished to draw him as he sat there, and was contemplating, studying, his attitude, I should while doing so be inclined to say and repeat to myself "He has a particular way of sitting". But the answer to the question "What way?" would be "Well, *this* way", and perhaps one would give it by drawing the characteristic outlines of his attitude. On the other hand, my phrase "He has a particular

way...", might just have to be translated into "I'm contemplating his attitude". Putting it in this form we have, as it were, straightened out the proposition; whereas in its first form its meaning seems to describe a loop, that is to say, the word "particular" here seems to be used transitively and, more particularly, reflexively, i.e., we are regarding its use as a special case of the transitive use. We are inclined to answer the question "What way do you mean?" by "This way", instead of answering: "I didn't refer to any particular feature; I was just contemplating his position". My expression made it appear as though I was pointing out something *about* his way of sitting, or, in our previous case, about the way the word "red" came, whereas what makes me use the word "particular" here is that by my attitude towards the phenomenon I am laying an emphasis on it: I am concentrating on it, or retracing it in my mind, or drawing it, etc.

Page 160

Now this is a characteristic situation to find ourselves in when thinking about philosophical problems. There are many troubles which arise in this way, that a word has a transitive and an intransitive use, and that we regard the latter as a particular case of the former, explaining the word when it is used intransitively by a reflexive construction.

Page 160

Thus we say, "By 'kilogram' I mean the weight of one litre of water", "By 'A' I mean 'B', where B is an explanation of A".

Page Break 161

But there is also the intransitive use: "I said that I was sick of it and meant it". Here again, meaning what you said could be called "retracing it", "laying an emphasis on it". But using the word "meaning" in this sentence makes it appear that it must have sense to ask "What did you mean?" and to answer "By what I said I meant what I said," treating the case of "I mean what I say" as a special case of "By saying 'A' I mean 'B' ". In fact one uses the expression "I mean what I mean" to say, "I have no explanation for it". The question, "What does this sentence *p* mean?", if it doesn't ask for a translation of *p* into other symbols, has no more sense than "What sentence is formed by this sequence of words?"

Page 161

Suppose to the question, "What's a kilogram?" I answered, "It is what a litre of water weighs", and someone asked, "Well, what does a litre of water weigh?"--

Page 161

We often use the reflexive form of speech as a means of emphasizing something. And in all such cases our reflexive expressions can be 'straightened out'. Thus we use the expression "If I can't, I can't", "I am as I am", "It is just what it is", also "That's that". This latter phrase means as much as "That's settled", but why should we express "That's settled" by "That's that"? The answer can be given by laying before ourselves a series of interpretations which make a transition between the two expressions. Thus for "That's settled", I will say "The matter is closed". And this expression, as it were, files the matter and shelves it. And filing it is like drawing a line around it, as one sometimes draws a line around the results of a calculation, thereby marking it as final. But this also makes it stand out; it is a way of emphasizing it. And what the expression "That's that" does is to emphasize the 'that'.

Page 161

Another expression akin to those we have just considered is this: "Here it is; take it or leave it!" And this again is akin to a kind of introductory statement which we sometimes make before remarking on certain alternatives, as when we say: "It either rains or it doesn't rain; if it rains we'll stay in my room, if it doesn't...". The first part of this sentence is no piece of information (just as "Take it or leave it" is no order). Instead of, "It either rains or it doesn't rain" we could have said, "Consider the two cases...". Our expression underlines these cases, presents them to your attention.

Page 161

It is closely connected with this that in describing a case like $30) \dagger 1$ we are tempted to use the phrase, "There is, *of course*, a number beyond

Page Break 162

which no one of the tribe has ever counted; let this number be...". Straightened out this reads: "Let the number beyond which no one of the tribe has ever counted be...". Why we tend to prefer the first expression to the one straightened out is that it more strongly directs our attention to the upper end of the range of numerals used by our tribe in their actual practice.

Page 162

16. Let us now consider a very instructive case of that use of the word "particular" in which it does not point to a comparison and yet seems most strongly to do so,--the case when we contemplate the expression of a face

primitively drawn in this way:

Page 162

Let this face produce an impression on you. You may then feel inclined to say: "Surely I don't see mere dashes. I see a face with a *particular* expression". But you don't mean that it has an outstanding expression nor is it said as an introduction to a description of the expression, though we might give such a description and say, e.g., "It looks like a complacent business man, stupidly supercilious, who though fat, imagines he's a lady killer". But this would only be meant as an approximate description of the expression. "Words can't exactly describe it", one sometimes says. And yet one feels that what one calls the expression of the face is something that can be detached from the drawing of the face. It is as though we could say: "This face has a particular expression: namely this" (pointing to something). But if I had to point to anything in this place it would have to be the drawing I am looking at. (We are, as it were, under an optical delusion which by some sort of reflection makes us think that there are two objects where there is only one. The delusion is assisted by our using the verb "to have", saying "The face *has* a particular expression". Things look different when, instead of this, we say: "This *is* a peculiar face". What a thing *is*, we mean, is bound up with it; what it has can be separated from it.)

Page 162

'This face has a particular expression.'--I am inclined to say this when I am trying to let it make its full impression upon me.

Page 162

What goes on here is an act, as it were, of digesting it, getting hold of it, and the phrase "getting hold of the expression of this face" suggests that we are getting hold of a thing which is *in* the face and different from it. It seems we are looking for something, but we don't

Page Break 163

do so in the sense of looking for a model of the expression outside the face we see, but in the sense of sounding the thing without attention. It is, when I let the face make an impression on me, as though there existed a double of its expression, as though the double was the prototype of the expression and as though seeing the expression of the face was finding the prototype to which it corresponded--as though in our mind there had been a mould and the picture we see had fallen into that mould, fitting it. But it is rather that we let the picture sink into our mind and make a mould there.

Page 163

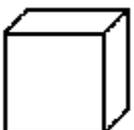

When we say, "This is a *face*, and not mere strokes", we are, of course, distinguishing such a drawing

from such a one

And it is true: If you ask anyone: "What is this?" (pointing to the first drawing) he will certainly say: "It's a face", and he will be able straight away to reply to such questions as, "Is it male or female?", "Smiling or sad?", etc. If on the other hand you ask him: "What is this?" (pointing to the second drawing), he will most likely say, "This is nothing at all", or "These are just dashes". Now think of looking for a man in a picture puzzle; there it often happens that what at first sight appears as 'mere dashes' later appears as a face. We say in such cases: "Now I see it is a face". It must be quite clear to you that this doesn't mean that we recognize it as the face of a friend or that we are under the delusion of seeing a 'real' face: rather, this 'seeing it *as a face*' must be compared with seeing this drawing

either as a cube or as a plane figure consisting of a square and two rhombuses; or with seeing this

Page Break 164

'as a square with diagonals', or 'as a swastika', that is, as a limiting case of this;

or again with seeing these four dots as two pairs of dots side by side with each other, or as two interlocking pairs, or as one pair inside the other, etc.

Page 164

The case of 'seeing

as a swastika' is of special interest because this expression might mean being, somehow, under the optical delusion that the square is not quite closed, that there are the gaps which distinguish the swastika from our drawing. On the other hand it is quite clear that this was not what we meant by "seeing our drawing as a swastika". We saw it in a way which suggested the description, "I see it as a swastika". One might suggest that we ought to have said "I see it as a closed swastika";--but then, what is the difference between a closed swastika and a square with diagonals? I think that in this case it is easy to recognize 'what happens when we see our figure as a swastika'. I believe it is that we retrace the figure with our eyes in a particular way, viz., by staring at the centre, looking along a radius, and along a side adjacent to it, starting at the centre again, taking the next radius and the next side, say in a right-handed sense of rotation, etc. But this *explanation* of the phenomenon of seeing the figure as a swastika is of no fundamental interest to us. It is of interest to us only in so far as it helps one to see that the expression "seeing the figure as a swastika" did not mean seeing *this* or *that*, seeing one thing as something else, when, essentially, *two* visual objects entered the process of doing so.-Thus also seeing the first figure as a cube did not mean 'taking it to be a cube'. (For we might never have seen a cube and still have this experience of 'seeing it as a cube'.)

Page 164

And in this way 'seeing dashes as a face' does not involve a comparison between a group of dashes and a real human face; and, on the other hand, this form of expression most strongly suggests that we are alluding to a comparison.

Page 164

Consider also this example: Look at W once as a capital double-U,

Page Break 165

and another time as a capital M upside down. Observe what doing the one and doing the other consists in.

Page 165

We distinguish seeing a drawing as a face and seeing it as something else or as 'mere dashes'. And we also distinguish between superficially glancing at a drawing (seeing it as a face), and letting the face make its full impression on us. But it would be queer to say: "I am letting the face make *a particular* impression on me" (except in such cases in which you can say that you can let the same face make different impressions on you). And in letting the face impress itself on me and contemplating its 'particular impression', no two things of the multiplicity of a face are compared with each other; there is only *one* which is laden with emphasis. Absorbing its expression, I don't find a prototype of this expression in my mind; rather, I, as it were, cut a seal from the impression.

Page 165

And this also describes what happens when in 15)†1 we say to ourselves "The word 'red' comes in a particular way...". The reply could be: "I see, you're repeating to yourself some experience and again and again gazing at it."

Page 165

17. We may shed light on all these considerations if we compare what happens when we remember the face of someone who enters our room, when we recognize him as Mr. So and So,--when we compare what really happens in such cases with the representation we are sometimes inclined to make of the events. For here we are often obsessed by a primitive conception, viz., that we are comparing the man we see with a memory image in our mind and we find the two to agree. I.e., we are representing 'recognizing someone' as a process of identification by means of a picture (as a criminal is identified by his photo). I needn't say that in most cases in which we recognize someone no comparison between him and a mental picture takes place. We are, of course, tempted to give this description by the fact that there are memory images. Very often, for instance, such an image comes before our mind immediately *after* having recognized someone. I see him as he stood when we last saw each other ten years ago.

Page 165

I will here again describe the *kind* of thing that happens in your mind and otherwise when you recognize a person coming into your room by means of what you might *say* when you recognize him. Now this may just be: "Hello!" And thus we may say that one kind of event of recognizing a thing we see consists in saying "Hello!" to it in words,

Page Break 166

gestures, facial expressions, etc.--And thus also we may think that when we look at our drawing and see it as a face, we compare it with some paradigm, and it agrees with it, or it fits into a mould ready for it in our mind. But no such mould or comparison enters into our experience, there is only this shape, not any other to compare it with, and as it were, say "Of course" to. As when in putting together a jig-saw puzzle, somewhere a small space is left unfilled and I see a piece obviously fitting it and put it in the place saying to myself "Of course". But here we say, "Of course" *because* the piece fits the mould, whereas in our case of seeing the drawing as a face, we have the same attitude for *no* reason.

Page 166

The same strange illusion which we are under when we seem to seek the something which a face expresses whereas, in reality, we are giving ourselves up to the features before us--that same illusion possesses us even more strongly if repeating a tune to ourselves and letting it make its full impression on us, we say "This tune says *something*", and it is as though I had to find *what* it says. And yet I know that it doesn't say anything such that I might express in words or pictures what it says. And if, recognizing this, I resign myself to saying "It just expresses a musical thought", this would mean no more than saying "It expresses itself".--"But surely when you play it you don't play it *anyhow*, you play it in this particular way, making a crescendo here, a diminuendo there, a caesura in this place, etc."--Precisely, and that's all I can say about it, or may be all that I can say about it. For in certain cases I can justify, explain the particular expression with which I play it by a comparison, as when I say "At this point of the theme, there is, as it were, a colon", or "This is, as it were, the answer to what came before", etc. (This, by the way, shows what a 'justification' and an 'explanation' in aesthetics is like.) It is true I may hear a tune played and say "This is not how it ought to be played, it goes like this"; and I whistle it in a different tempo. Here one is inclined to ask "What is it like to know the tempo in which a piece of music should be played?" And the idea suggests itself that there *must* be a paradigm somewhere in our mind, and that we have adjusted the tempo to conform to that paradigm. But in most cases if someone asked me "How do you think this melody should be played?", I will, as an answer, just whistle it in a particular way, and nothing will have been present to my mind but the tune *actually whistled* (not an image of *that*).

Page 166

This doesn't mean that suddenly understanding a musical theme

Page Break 167

may not consist in finding a form of verbal expression which I conceive as the verbal counterpoint of the theme. And in the same way I may say "Now I understand the expression of this face", and what happened when the understanding came was that I found the word which seemed to sum it up.

Page 167

Consider also this expression: "Tell yourself that it's a *waltz*, and you will play it correctly".

Page 167

What we call "understanding a sentence" has, in many cases, a much greater similarity to understanding a musical theme than we might be inclined to think. But I don't mean that understanding a musical theme is more like the picture which one tends to make oneself of understanding a sentence; but rather that this picture is wrong, and that understanding a sentence is much more like what really happens when we understand a tune than at first sight

appears. For understanding a sentence, we say, points to a reality outside the sentence. Whereas one might say "Understanding a sentence means getting hold of its content; and the content of the sentence is *in* the sentence."

Page 167

18. We may now return to the ideas of 'recognizing' and 'familiarity', and in fact to that example of recognition and familiarity which started our reflections on the use of these terms and of a multitude of terms connected with them. I mean the example of reading, say, a written sentence in a well-known language.--I read such a sentence to see what the experience of reading is like, what 'really happens' when one reads, and I get a particular experience which I take to be the experience of reading. And, it seems, this doesn't simply consist in seeing and pronouncing the words, but, besides, in an experience of an intimate character, as I should like to say. (I am as it were on an intimate footing with the word 'I read'.)

Page 167

In reading the spoken words come in a particular way, I am inclined to say; and the written words themselves which I read don't just look to me like any kind of scribbles. At the same time I am unable to point to, or get a grasp on, that 'particular way'.

Page 167

The phenomenon of seeing and speaking the words seems enshrouded by a particular atmosphere. But I don't recognize this atmosphere as one which always characterized the situation of reading. Rather, I notice it when I read a line, trying to see what reading is like.

Page 167

When noticing this atmosphere I am in the situation of a man who is working in his room, reading, writing, speaking, etc., and

Page Break 168

who suddenly concentrates his attention on some soft uniform noise, such as one can almost always hear, particularly in a town (the dim noise resulting from all the various noises of the street, the sounds of wind, rain, workshops, etc.). We could imagine that this man might think that a particular noise was a common element of all the experiences he had in this room. We should then draw his attention to the fact that most of the time he hadn't noticed any noises going on outside, and secondly, that the noise he could hear wasn't always the same (there was sometimes wind, sometimes not, etc.).

Page 168

Now we have used a misleading expression when we said that besides the experiences of seeing and speaking in reading there was another experience, etc. This is saying that to certain experiences another experience is added.--Now take the experience of seeing a sad face, say in a drawing,--we can say that to see the drawing as a sad face is not 'just' to see it as some complex of strokes (think of a puzzle picture). But the word 'just' here seems to intimate that in seeing the drawing as a face some experience is added to the experience of seeing it as mere strokes; as though I had to say that seeing the drawing as a face consisted of two experiences, elements.

Page 168

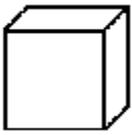

You should now notice the difference between the various cases in which we say that an experience consists of several elements or that it is a *compound* experience. We might say to the doctor, "I don't have one pain; I have two: toothache and headache". And one might express this by saying, "My experience of pain is not simple, but compound, I have toothache and headache". Compare with this case that in which I say, "I have got both pains in my stomach and a general feeling of sickness". Here I don't separate the constituent experiences by pointing to two localities of pain. Or consider this statement: "When I drink sweet tea, my taste experience is a compound of the taste of sugar and the taste of tea". Or again: "If I hear the C Major chord my experience is composed of hearing C, E, and G". And, on the other hand, "I hear a piano playing and some noise in the street". A most instructive example is this: In a song words are sung to certain notes. In what sense is the experience of hearing the vowel *a* sung to the note C a composite one? Ask yourself in each of these cases: What is it like to single out the constituent experiences in the compound experience?

Page 168

Now although the expression that seeing a drawing as a face is not merely seeing strokes seems to point to some kind of addition of experiences, we certainly should not say that when we see the

Page Break 169

drawing as a face we also have the experience of seeing it as mere strokes and some other experience *besides*. And this becomes still clearer when we imagine that someone said that seeing the drawing

as a cube consisted in seeing it as a plane figure plus having an experience of depth.

Page 169

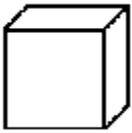

Now when I felt that though while reading a certain constant experience went on and on, I could not in a sense lay hold of that experience, my difficulty arose through wrongly comparing this case with one in which one part of my experience can be said to be an accompaniment of another. Thus we are sometimes tempted to ask: "If I feel this constant hum going on while I read, *where* is it?" I wish to make a pointing gesture, and there is nothing to point to. And the words "lay hold of" express the same misleading analogy.

Page 169

Instead of asking the question "Where is this constant experience which seems to go on all through my reading?", we should ask "What is it in saying 'A particular atmosphere enshrouds the words which I am reading', that I am contrasting this case with?"

Page 169

I will try to elucidate this by an analogous case: We are inclined to be puzzled by the three-dimensional appearance of the drawing

in a way expressed by the question "What does seeing it three-dimensionally consist in?" And this question really asks 'What is it that is added to simply seeing the drawing when we see it three-dimensionally?' And yet what answer can we expect to this question? It is the form of this question which produces the puzzlement. As Hertz says: "Aber offenbar irrt die Frage in Bezug auf die Antwort, welche sie erwartet" (p. 9, Einleitung, *Die Prinzipien der Mechanik*). The question itself keeps the mind pressing against a blank wall, thereby preventing it from ever finding the outlet. To show a man how to get out you have first of all to free him from the misleading influence of the question.

Page Break 170

Page 170

Look at a written word, say "read",--"It isn't just a scribble, it's 'read'", I should like to say, "it has one definite physiognomy". But what is it that I am really saying about it? What is this statement, straightened out? "The word falls", one is tempted to explain, "into a mould of my mind *long* prepared for it". But as I don't perceive both the word and a mould, the metaphor of the word's fitting a mould can't allude to an experience of comparing the hollow and the solid shape before they are fitted together, but rather to an experience of seeing the solid shape accentuated by a particular background.

i) would be the picture of the hollow and the solid shape before they are fitted together. We here see two circles and can compare them. ii) is the picture of the solid in the hollow. There is only one circle, and what we call the mould only accentuates, or as we sometimes said, emphasizes it.

Page 170

I am tempted to say, "This isn't just a scribble, but it's *this* particular face".--But I can't say, "I see *this* as *this* face", but ought to say "I see this as a face". But I feel I want to say, "I don't see this as *a* face, I see it as *this* face". But in the second half of this sentence the word "face" is redundant, and it should have run, "I don't see this as a face, I see it like *this*".

Page 170

Suppose I said "I see this scribble like *this*", and while saying "this scribble" I look at it as a mere scribble, and while saying "like *this*", I see the face,--this would come to something like saying "What at one time appears to me like this, at another appears to me like that", and here the "this" and the "that" would be accompanied by the two different ways of seeing.--But we must ask ourselves in what game is this sentence with the processes accompanying it to be used. E.g., whom am I telling this? Suppose the answer is "I'm saying it to myself". But that is

not enough. We are here in the grave danger of believing that we know what to do with a sentence if it looks more or less like one of the common sentences of our language. But here in order not to be deluded we have to ask ourselves: What is the use, say, of the words "this" and "that"?--or rather, What are the different uses which we make of them? What we call their meaning is not anything which they have got in them or which is fastened to them irrespective of what use we make of them. Thus it is one use of the

Page Break 171

word "this" to go along with a gesture pointing to something: We say "I am seeing the square with the diagonals like this", pointing to a swastika. And referring to the square with diagonals I might have said, "What at one time appears to me like this

at another time appears to me like that

And this is certainly not the use we made of the sentence in the above case.--One might think the whole difference between the two cases is this, that in the first the pictures are mental, in the second, real drawings. We should here ask ourselves in what sense we can call mental images pictures, for in some ways they are comparable to drawn or painted pictures, and in others not. It is, e.g., one of the essential points about the use of a 'material' picture that we say that it remains the same not only on the ground that it seems to us to be the same, that we remember that it looked before as it looks now. In fact we shall say under certain circumstances that the picture hasn't changed although it seems to have changed; and we say it hasn't changed because it has been kept in a certain way, certain influences have been kept out. Therefore the expression "The picture hasn't changed" is used in a different way when we talk of a material picture on the one hand, and of a mental one on the other. Just as the statement "These ticks follow at equal intervals" has got one grammar if the ticks are the tick of a pendulum and the criterion for their regularity is the result of measurements which we have made on our apparatus, and another grammar if the ticks are ticks which we imagine. I might for instance ask the question: When I said to myself "What at one time appears to me like this, at another...", did I recognize the two aspects, this and that, as the same which I got on previous occasions? Or were they new to me and I tried to remember them for future occasions? Or was all that I meant to say "I can change the aspect of this figure"?

Page 171

19. The danger of delusion which we are in becomes most clear if we propose to ourselves to give the aspects 'this' and 'that' names,

Page Break 172

say A and B. For we are most strongly tempted to imagine that giving a name consists in correlating in a peculiar and rather mysterious way a sound (or other sign) with something. How we make use of this peculiar correlation then seems to be almost a secondary matter. (One could almost imagine that naming was done by a peculiar sacramental act, and that this produced some magic relation between the name and the thing.)

Page 172

But let us look at an example; consider this language game: A sends B to various houses in their town to fetch goods of various sorts from various people. A gives B various lists. On top of every list he puts a scribble, and B is trained to go to that house on the door of which he finds the same scribble, this is the name of the house. In the first column of every list he then finds one or more scribbles which he has been taught to read out. When he enters the house he calls out these words, and every inhabitant of the house has been trained to run up to him when a certain one of these sounds is called out, these sounds are the names of the people. He then addresses himself to each one of them in turn and shows to each two consecutive scribbles which stand on the list against his name. The first of these two, people of that town have been trained to associate with some particular kind of object, say, apples. The second is one of a series of scribbles which each man carries about him on a slip of paper. The person thus addressed fetches say, five apples. The first scribble was the generic name of the objects required, the second, the name of their number.

Page 172

What now is the relation between a name and the object named, say, the house and its name? I suppose we could give either of two answers. The one is that the relation consists in certain strokes having been painted on the door of the house. The second answer I meant is that the relation we are concerned with is established, not just by painting these strokes on the door, but by the particular role which they play in the practice of our language as we have been sketching it.--Again, the relation of the name of a person to the person here consists in the person having been trained to run up to someone who calls out the name; or again, we might say that it consists in this and the whole of the usage of the name in the language game.

Page 172

Look into this language game and see if you can find the mysterious relation of the object and its name.--The relation of name and object we may say, consists in a scribble being written on an object (or some other such very trivial relation), and that's all there is to it. But we are not satisfied with that, for we feel that a scribble written on an

Page Break 173

object in itself is of no importance to us, and interests us in no way. And this is true; the whole importance lies in the particular use we make of the scribble written on the object, and we, in a sense, simplify matters by saying that the name has a peculiar relation to its object, a relation other than that, say, of being written on the object, or of being spoken by a person pointing to an object with his finger. A primitive philosophy condenses the whole usage of the name into the idea of a relation, which thereby becomes a mysterious relation. (Compare the ideas of mental activities, wishing, believing, thinking, etc., which for the same reason have something mysterious and inexplicable about them.)

Page 173

Now we might use the expression "The relation of name and object does not merely consist in this kind of trivial, 'purely external', connection", meaning that what we call the relation of name and object is characterized by the entire usage of the name; but then it is dear that there is no one relation of name to object, but as many as there are uses of sounds or scribbles which we call names.

Page 173

We can therefore say that if naming something is to be more than just uttering a sound while pointing to something, there must also be, in some form or other, the knowledge of how in the particular case the sound or scratch is to be used.

Page 173

Now when we proposed to give the aspects of a drawing names, we made it appear that by seeing the drawing in two different ways, and each time saying something, we had done more than performing just this uninteresting action; whereas we now see that it is the usage of the 'name' and in fact the detail of this usage which gives the naming its peculiar significance.

Page 173

It is therefore not an unimportant question, but a question about the essence of the matter; "Are 'A' and 'B' to remind me of these aspects; can I carry out such an order as 'See this drawing in the aspect A'; are there, in some way, pictures of these aspects correlated with the names 'A' and 'B' (like

and);

are 'A' and 'B' used in communicating with other people, and what exactly is the game played with them?"

Page Break 174

Page 174

When I say "I don't see mere dashes (a mere scribble) but a face (or word) with this particular physiognomy", I don't wish to assert any general characteristic of what I see, but to assert that I see that particular physiognomy which I do see. And it is obvious that here my expression is moving in a circle. But this is so because really the particular physiognomy which I saw ought to have entered my proposition.--When I find that "In reading a sentence, a peculiar experience goes on all the while", I have actually to read over a fairly long stretch to get the peculiar impression which makes one say this.

Page 174

I might then have said "I find that the same experience goes on all the time", but I wished to say: "I don't just notice that it's the same experience throughout, I notice a particular experience". Looking at a uniformly coloured wall I might say, "I don't just see that it has the same colour all over, but I see a particular colour". But in saying this I am mistaking the function of a sentence.--It seems that you wish to specify the colour you see, but not by saying anything about it, nor by comparing it with a sample,--but by pointing to it; using it at the same time as the sample and that which the sample is compared with.

Page 174

Consider this example: You tell me to write a few lines, and while I am doing so you ask "Do you feel something in your hand while you are writing?" I say, "Yes, I have a peculiar feeling".--Can't I say to myself when I write, "I have *this* feeling"? Of course I can say it, and while saying "this feeling", I concentrate on the feeling.--But what do I do with this sentence? What use is it to me? It seems that I am pointing out to myself what I am feeling,--as though my act of concentration was an 'inward' act of pointing, one which no one else but me is aware

of, this however is unimportant. But I don't point to the feeling by attending to it. Rather, attending to the feeling means producing or modifying it. (On the other hand, observing a chair does not mean producing or modifying the chair.)

Page 174

Our sentence "I have *this* feeling while I'm writing" is of the kind of the sentence "I see this". I don't mean the sentence when it is used to inform someone that I am looking at the object which I am pointing to, nor when it is used, as above, to convey to someone that I see a certain drawing in the way A and not in the way B. I mean the sentence, "I see this", as it is sometimes contemplated by us when we are brooding over certain philosophical problems. We are then, say, holding on to a particular visual impression by staring at some object, and we feel it is most natural to say to ourselves "I see this", though we know of no further use we can make of this sentence.

Page Break 175

Page 175

20. 'Surely it makes sense to say what I see, and how better could I do this than by letting what I see speak for itself!'

Page 175

But the words "I see" in our sentence are redundant. I don't wish to tell myself that it is I who see this, nor that I *see* it. Or, as I might put it, it is impossible that I should not see *this*. This comes to the same as saying that I can't point out to myself by a visual hand what I am seeing; as this hand does not point to what I see but is part of what I see.

Page 175

It is as though the sentence was singling out the particular colour I saw; as if it presented it to me.

Page 175

It seems as though the colour which I see was its own description.

Page 175

For the pointing with my finger was ineffectual. (And the looking is no pointing, it does not, for me, indicate a direction, which would mean contrasting a direction with other directions.)

Page 175

What I see, or feel, enters my sentence as a sample does; but no use is made of this sample; the words of my sentence don't seem to matter, they only serve to present the sample to me.

Page 175

I don't really speak *about* what I see, but *to* it.

Page 175

I am in fact going through the acts of attending which could accompany the use of a sample. And this is what makes it seem as though I was making use of a sample. This error is akin to that of believing that an ostensive definition says something about the object to which it directs our attention.

Page 175

When I said "I am mistaking the function of a sentence" it was because by its help I seemed to be pointing out to myself which colour it is I see, whereas I was just contemplating a sample of a colour. It seemed to me that the sample was the description of its own colour.

Page 175

21. Suppose I said to someone: "Observe the particular lighting of this room".--Under certain circumstances the sense of this order will be quite clear, e.g., if the walls of the room were red with the setting sun. But suppose at any other time when there is nothing striking about the lighting I said "Observe the particular lighting of this room":--Well, isn't there a particular lighting? So what is the difficulty about observing it? But the person who was told to observe the lighting when there was nothing striking about it would probably look about the room and say "Well, what about it?" Now I might go on and say "It is exactly the same lighting as yesterday at this hour",

Page Break 176

or "It is just this slightly dim light which you see in this picture of the room".

Page 176

In the first case, when the room was lit a striking red, you could have pointed out the peculiarity which you were meant, though not explicitly told, to observe. You could, e.g., have used a sample of the particular colour in order to do so. We shall in this case be inclined to say that a peculiarity was added to the normal appearance of the room.

Page 176

In the second case, when the room was just ordinarily lighted and there was nothing striking about its

appearance, you didn't know exactly what to do when you were told to observe the lighting of the room. All you could do was to look about you waiting for something further to be said which would give the first order its full sense.

Page 176

But wasn't the room, in both cases, lit in a particular way? Well, this question, as it stands, is senseless, and so is the answer "It was...". The order "Observe the particular lighting of this room", does not imply any statement about the appearance of this room. It seemed to say: "This room has a particular lighting, which I need not name; observe it!" The lighting referred to, it seems, is given by a sample, and you are to make use of the sample; as you would be doing in copying the precise shade of a colour sample on a palette. Whereas the order is similar to this: "Get hold of this sample!"

Page 176

Imagine yourself saying "There is a particular lighting which I'm to observe". You could imagine yourself in this case staring about you in vain, that is, without seeing the lighting.

Page 176

You could have been given a sample, e.g., a piece of colour material, and been asked: "Observe the colour of this patch".-And we can draw a distinction between observing, attending to, the shape of the sample and attending to its colour. But, attending to the colour can't be described as looking at a thing which is connected with the sample, rather, as looking at the sample in a peculiar way.

Page 176

When we obey the order, "Observe the colour...", what we do is to open our eyes to colour. "Observe the colour..." doesn't mean "See the colour you see". The order, "Look at so and so", is of the kind, "Turn your head in this direction"; what you will see when you do so does not enter this order. By attending, looking, you produce the impression; you can't look at the impression.

Page 176

Suppose someone answered to our order: "All right, I am now observing the particular lighting this room has",--this would sound as though he could point out to us which lighting it was. The order, that is to say, may seem to have told you to do something with this

Page Break 177

particular lighting, as opposed to another one (like "Paint this lighting, not that"). Whereas you obey the order by taking in *lighting*, as opposed to dimensions, shapes, etc.

Page 177

(Compare, "Get hold of the colour of this sample" with "Get hold of this pencil", i.e., there it is, take hold of it.)

Page 177

I return to our sentence: "this face has a particular expression". In this case too I did not compare or contrast my impression with anything, I did not make use of the sample before me. The sentence was an utterance†1 of a state of attention.

Page 177

What has to be explained is this: Why do we talk to our impression?--You read, put yourself into a state of attention and say: "Something peculiar happens undoubtedly". You are inclined to go on: "There is a certain smoothness about it"; but you feel that this is only an inadequate description and that the experience can only stand for itself. "Something peculiar happens undoubtedly" is like saying, "I have had an experience". But you don't wish to make a general statement independent of the particular experience you have had, but rather a statement into which this experience enters.

Page 177

You are under an impression. This makes you say "I am under a *particular* impression", and this sentence seems to say, to yourself at least, under what impression you are. As though you were referring to a picture ready in your mind, and said "This is what my impression is like". Whereas you have only pointed to your impression. In our case (p. 174), saying "I notice the particular colour of this wall" is like drawing, say, a black rectangle enclosing a small patch of the wall and thereby designating that patch as a sample for further use.

Page 177

When you read, as it were attending closely to what happened in reading, you seemed to be observing reading as under a magnifying glass and to see the reading process. (But the case is more like that of observing something through a coloured glass.) You think you have noticed the process of reading, the particular way in which signs are translated into spoken words.

Page 177

22. I have read a line with a peculiar attention; I am impressed by the reading, and this makes me say that I have observed something besides the mere seeing of the written signs and the speaking of words. I have also expressed it by saying that I have noticed a particular atmosphere round the seeing and speaking. How such a metaphor as that embodied in the last sentence can come to suggest

Page Break 178

itself to me may be seen more clearly by looking at this example: If you heard sentences spoken in a monotone, you might be tempted to say that the words were all enshrouded in a particular atmosphere. But wouldn't it be using a peculiar way of representation to say that speaking the sentence in a monotone was adding something to the mere saying of it? Couldn't we even conceive speaking in a monotone as the result of *taking away* from the sentence its inflexion? Different circumstances would make us adopt different ways of representation. If, e.g., certain words had to be read out in a monotone, this being indicated by a staff and a sustained note beneath the written words, this notation would very strongly suggest the idea that something had been added to the mere speaking of the sentence.

Page 178

I am impressed by the reading of a sentence, and I say the sentence has shown me something, that I have noticed something in it. This made me think of the following example: A friend and I once looked at beds of pansies. Each bed showed a different kind. We were impressed by each in turn. Speaking about them my friend said "What a variety of colour patterns, and each says something". And this was just what I myself wished to say.

Page 178

Compare such a statement with this: "Every one of these men says something".--

Page 178

If one had asked what the colour pattern of the pansy said, the right answer would have seemed to be that it said itself. Hence we could have used an intransitive form of expression, say "Each of these colour patterns impresses one".

Page 178

It has sometimes been said that what music conveys to us are feelings of joyfulness, melancholy, triumph, etc., etc. and what repels us in this account is that it seems to say that music is an instrument for producing in us sequences of feelings. And from this one might gather that any other means of producing such feelings would do for us instead of music.--To such an account we are tempted to reply "Music conveys to us *itself!*"

Page 178

It is similar with such expressions as "Each of these colour patterns impresses one". We feel we wish to guard against the idea that a colour pattern is a means to producing in us a certain impression--the colour pattern being like a drug and we interested merely in the effect this drug produces.--We wish to avoid any form of expression which would seem to refer to an effect produced by an object on a subject. (Here we are bordering on the problem of idealism and realism and on the problem whether statements of aesthetics are subjective or

Page Break 179

objective.) Saying, "I see this and am impressed" is apt to make it seem as though the impression was some feeling accompanying the seeing, and that the sentence said something like "I see this and feel a pressure".

Page 179

I could have used the expression "Each of these colour patterns has meaning"; but I didn't say "has meaning", for this would provoke the question, "What meaning?", which in the case we are considering is senseless. We are distinguishing between meaningless patterns and patterns which have meaning; but there is no such expression in our game as "This pattern has the meaning so and so". Nor even the expression "These two patterns have different meanings", unless this is to say: "These are two different patterns and both have meaning".

Page 179

It is easy to understand though why we should be inclined to use the transitive form of expression. For let us see what use we make of such an expression as "This face says something", that is, what the situations are in which we use this expression, what sentences would precede or follow it (what kind of conversation it is a part of). We should perhaps follow up such a remark by saying, "Look at the line of these eyebrows" or "The *dark* eyes and the *pale* face!", these expressions would draw attention to certain features. We should in the same connection use comparisons, as for instance, "The nose is like a beak",--but also such expressions as "The whole face expresses bewilderment", and here we have used "expressing" transitively.

Page 179

23. We can now consider sentences which, as one might say, give an analysis of the impression we get, say, from a face. Take such a statement as, "The particular impression of this face is due to its small eyes and low

forehead". Here the words "the particular impression" may stand for a certain specification, e.g., "the stupid expression". Or, on the other hand, they may mean 'what makes this expression a striking one' (i.e., an extraordinary one); or, 'what strikes one about this face' (i.e., 'what draws one's attention'). Or again, our sentence may mean "If you change *these* features in the slightest the expression will change entirely (whereas you might change other features without changing the expression nearly so much)". The form of this statement, however, mustn't mislead us into thinking that there is in every case a supplementing statement of the form "First the expression was *this*, after the change it's *that*". We can, of course, say "Smith frowned, and his expression changed from this to that", pointing, say, at two drawings

Page Break 180

of his face.--(Compare with this the two statements: "He said these words", and "His words said something".)

Page 180

When, trying to see what reading consisted in, I read a written sentence, let the reading of it impress itself upon me, and said that I had a particular impression, one could have asked me such a question as whether my impression was not due to the particular handwriting. This would be asking me whether my impression would not be a different one if the writing had been a different one, or say, if each word of the sentence were written in a different handwriting. In this sense we could also ask whether that impression wasn't due after all to the *sense* of the particular sentence which I read. One might suggest: Read a different sentence (or the same one in a different handwriting) and see if you would still say that you had the same impression. And the answer might be: "Yes, the impression I had was really due to the handwriting".--But this would *not* imply that when I first said the sentence gave me a particular impression I had contrasted one impression with another, or that my statement had not been of the kind "This sentence has *its own character*". This will get clearer by considering the following example: Suppose we have three faces drawn side by side:

I contemplate the first one, saying to myself "This face has a peculiar expression". Then I am shown the second one and asked whether it has the same expression. I answer "Yes". Then the third one is shown to me and I say "It has a different expression". In my two answers I might be said to have distinguished the face and its expression: for b) is different from a) and still I say they have the same expression, whereas the difference between c) and a) corresponds to a difference of expression; and this may make us think that also in my first utterance I distinguished between the face and its expression.

Page 180

24. Let us now go back to the idea of a feeling of familiarity, which arises when I see familiar objects. Pondering about the question whether there is such a feeling or not, we are likely to gaze at some object and say, "Don't I have a particular feeling when I look at my old coat and hat?" But to this we now answer: What feeling do you compare this with, or oppose it to? Should you say that your old coat gives you the same feeling as your old friend A with whose

Page Break 181

appearance too you are well acquainted, or that *whenever* you happened to look at your coat you get that feeling, say of intimacy and warmth?

Page 181

'But is there no such thing as a feeling of familiarity?'--I should say that there are a great many different experiences, some of them feelings, which we might call "experiences (feelings) of familiarity".

Page 181

Different experiences of familiarity: a) Someone enters my room, I haven't seen him for a long time, and didn't expect him. I look at him, say or feel "Oh, it's you".--Why did I in giving this example say that I hadn't seen the man for a long time? Wasn't I setting out to describe *experiences of familiarity*? And whatever the experience was I alluded to, couldn't I have had it even if I had seen the man half an hour ago? I mean, I gave the circumstances of recognizing the man as a means to the end of describing the precise situation of the recognition. One might object to this way of describing the *experience*, saying that it brought in irrelevant things, and in fact wasn't a *description* of the feeling at all. In saying this one takes as the prototype of a description, say, the description of a table, which tells you the exact shape, dimensions, the material which it is made of, and its colour. Such a description one might say pieces the table together. There is on the other hand a different kind of description of a table, such as you might find in a novel, e.g., "It was a small rickety table decorated in Moorish style, the sort that is used for smoker's

requisites". Such a description might be called an indirect one; but if the purpose of it is to bring a vivid image of the table before your mind in a flash, it might serve this purpose incomparably better than a detailed 'direct' description.--Now if I am to give the description of a feeling of familiarity or recognition,--what do you expect me to do? Can I piece the feeling together? In a sense of course I could, giving you many different stages and the way my feelings changed. Such detailed descriptions you can find in some of the great novels. Now if you think of descriptions of pieces of furniture as you might find them in a novel, you see that to this kind of description you can oppose another making use of drawings, measures such as one should give to a cabinet maker. This latter kind one is inclined to call the only direct and complete description (though this way of expressing ourselves shows that we forget that there are certain purposes which the 'real' description does not fulfil). These considerations should warn you not to think that there is one real and direct description of, say, the feeling of recognition as opposed to the 'indirect' one which I have given.

Page Break 182

Page 182

b) The same as a), but the face is not familiar to me immediately. After a little, recognition 'dawns upon me'. I say, "Oh, it's you", but with totally different inflexion than in a). (Consider tone of voice, inflexion, gestures, as *essential* parts of our experience, not as inessential accompaniments or mere means of communication. (Compare pp. 144-6.)) c) There is an experience directed towards people or things which we see every day when suddenly we feel them to be 'old acquaintances' or 'good old friends'; one might also describe the feeling as one of warmth or of being at home with them. d) My room with all the objects in it is thoroughly familiar to me. When I enter it in the morning do I greet the familiar chairs, tables, etc., with a feeling of "Oh, hello!"? or have such a feeling as described in c)? But isn't the way I walk about in it, take something out of a drawer, sit down, etc., different from my behaviour in a room I don't know? And why shouldn't I say therefore, that I had experiences of familiarity whenever I lived amongst these familiar objects? e) Isn't it an experience of familiarity when on being asked "Who is this man?" I answer straight away (or after some reflection) "It is so and so"? Compare with this experience, f), that of looking at the written word "feeling" and saying "This is A's handwriting" and on the other hand g) the experience of reading the word, which also is an experience of familiarity.

Page 182

To e) one might object, saying that the experience of saying the man's name was not the experience of familiarity, that he had to be familiar to us in order that we might know his name, and that we had to *know his name* in order that we might say it. Or, we might say "Saying his name is not enough, for surely we might say the name without knowing that it was his name". And this remark is certainly true if only we realize that it does not imply that knowing the name is a process accompanying or preceding saying the name.

Page 182

25. Consider this example: What is the difference between a memory image, an image that comes with expectation, and say, an image of a daydream. You may be inclined to answer, "There is an intrinsic difference between the images".--Did you notice that difference, or did you only say there was one because you think there must be one?

Page 182

But surely I recognize a memory image as a memory image, an image of a daydream as an image of a daydream, etc.!--Remember that you are sometimes doubtful whether you actually saw a certain

Page Break 183

event happening or whether you dreamt it, or just had heard of it and imagined it vividly. But apart from that, what do you mean by "recognizing an image as a memory image"? I agree that (at least in most cases) while an image is before your mind's eye you are not in a state of doubt as to whether it is a memory image, etc. Also, if asked whether your image was a memory image, you would (in most cases) answer the question without hesitation. Now what if I asked you "When do you know what sort of an image it is?" Do you call knowing what sort of image it is not being in a state of doubt, not wondering about it? Does introspection make you see a state or activity of mind which you would call knowing that the image was a memory image, and which takes place while the image is before your mind?--Further, if you answer the question what sort of image it was you had, do you do so by, as it were, looking at the image and discovering a certain characteristic in it (as though you had been asked by whom a picture was painted, looked at it, recognized the style, and said it was a Rembrandt)?

Page 183

It is easy, on the other hand, to point out experiences characteristic of remembering, expecting, etc., accompanying the images, and further differences in the immediate or more remote surrounding of them. Thus we certainly *say* different things in the different cases, e.g., "I remember his coming into my room", "I expect his

coming into my room", "I imagine his coming into my room".-"But surely this can't be all the difference there is!" It isn't all: There are the three different games played with these three words surrounding these statements.

Page 183

When challenged: do we *understand* the word "remember", etc.? is there really a difference between the cases besides the mere verbal one? our thoughts move in the immediate surroundings of the image we had or the expression we used. I have an image of dining in Hall with T. If asked whether this is a memory image, I say "Of course", and my thoughts begin to move on paths starting from this image. I remember who sat next to us, what the conversation was about, what I thought about it, what happened to T later on, etc., etc.

Page 183

Imagine two different games both played with chess men on a chess board. The initial positions of both are alike. One of the games is always played with red and green pieces, the other with black and white. Two people are beginning to play, they have the chess board between them with the green and red pieces in position. Someone asks them "Do you know what game you're intending to play?" A player answers "Of course; we are playing no. 2". "What is the

Page Break 184

difference now between playing no. 2 and no. 1?"--"Well, there are red and green pieces on the board and not black and white ones, also we say that we are playing no. 2".--"But this couldn't be the only difference; don't you *understand* what 'no. 2' means and what game the red and green pieces stand for?" Here we are inclined to say "Certainly I do", and to prove this to ourselves we actually begin to move the pieces according to the rules of game no. 2. This is what I should call moving in the immediate surrounding of our initial position.

Page 184

But isn't there also a peculiar feeling of pastness characteristic of images as memory images? There certainly are experiences which I should be inclined to call feelings of pastness, although not always when I remember something is one of these feelings present.--To get clear about the nature of these feelings it is again very useful to remember that there are gestures of pastness and inflexions of pastness which we can regard as representing the experiences of pastness.

Page 184

I will examine one particular case, that of a feeling which I shall roughly describe by saying it is the feeling of 'long, long ago'. These words and the tone in which they are said are a gesture of pastness. But I will specify the experience which I mean still further by saying that it is that corresponding to a certain tune (Davids Bündler Tänze--"Wie aus weiter Ferne"). I'm imagining this tune played with the right expression and thus recorded, say, for a gramophone. Then this is the most elaborate and exact expression of a feeling of pastness which I can imagine.

Page 184

Now should I say that hearing this tune played with this expression is in itself that particular experience of pastness, or should I say that hearing the tune causes the feeling of pastness to arise and that this feeling accompanies the tune? I.e., can I separate what I call this experience of pastness from the experience of hearing the tune? Or, can I separate an experience of pastness expressed by a gesture from the experience of making this gesture? Can I discover something, the essential feeling of pastness, which remains after abstracting all those experiences which we might call the experiences of expressing the feeling?

Page 184

I am inclined to suggest to you to put the expression of our experience in place of the experience. 'But these two aren't the same'. This is certainly true, at least in the sense in which it is true to say that a railway train and a railway accident aren't the same thing. And yet there is a justification for talking as though the expression "the gesture

Page Break 185

'long, long ago"', and the expression "the feeling 'long, long ago'" had the same meaning. Thus I could give the rules of chess in the following way: I have a chess board before me with a set of chess men on it. I give rules for moving these particular chess men (these particular pieces of wood) on this particular board. Can these rules be the rules of the game of chess? They can be converted into them by the usage of a single operator, such as the word "any". Or, the rules for my particular set may stand as they are and be made into rules of the game of chess by changing our standpoint towards them.

Page 185

There is the idea that the feeling, say, of pastness, is an amorphous something in a place, the mind, and that this something is the cause or effect of what we call the expression of feeling. The expression of feeling then is an indirect way of transmitting the feeling. And people have often talked of a direct transmission of feeling which

would obviate the external medium of communication..

Page 185

Imagine that I tell you to mix a certain colour and I describe the colour by saying that it is that which you get if you let sulphuric acid react on copper. This might be called an indirect way of communicating the colour I meant. It is conceivable that the reaction of sulphuric acid on copper under certain circumstances does not produce the colour I wished you to mix, and that on seeing the colour you had got I should have to say "No, it's not this", and to give you a sample.

Page 185

Now can we say that the communication of feelings by gestures is in this sense indirect? Does it make sense to talk of a direct communication as opposed to that indirect one? Does it make sense to say "I can't feel his toothache, but if I could I'd know what he feels like"?

Page 185

If I speak of communicating a feeling to someone else, mustn't I in order to understand what I say know what I shall call the criterion of having succeeded in communicating?

Page 185

We are inclined to say that when we communicate a feeling to someone, something which we can never know happens at the other end. All that we can receive from him is again an expression. This is closely analogous to saying that we can never know when in Fizeau's experiment the ray of light reaches the mirror.

Reprinted 1989, 1994, 1998

ISBN 0-631-12505-1 (Pbk)

Printed in Great Britain by Athenæum Press Ltd, Gateshead, Tyne & Wear

TABLE OF CONTENTS PART I

1-5. Following a rule (Cf. *Philosophical Investigations* §§ 189-90 ff.).--Steps determined by a formula (1-2). Continuation of a series (3). Inexorability of mathematics; mathematics and truth (4-5). Remark on measuring (5).
35

6-23. Logical inference.--The word "all"; inference from ' $(x).fx$ ' to ' fa ' (10-16). Inference and truth (17-23).
39

24-74. Proof.--Proof as pattern or model (paradigm). Example: hand and pentacle (25 ff.). Proof as picture of an experiment (36). Example: 100 marbles (36 ff.). Construction of figures out of their parts (42-72). Mathematical surprise. Proof and conviction. Mathematics and essence (32, 73, 74). The depth of the essence: the deep need for the convention (74).
46

75-105. Calculation and experiment.--The 'unfolding' of mathematical properties. Example of 100 marbles (75, 86, 88). Unfolding the properties of a polygon (76), and of a chain (79, 80, 91, 92). Measuring (93, 94). Geometrical examples (96-98). Internal properties and relations (102-105); examples from the logic of colour.
65

106-112. Mathematical belief.
76

113-142. Logical compulsion.--In what sense does logical argument compel? (113-117). The inexorability of logic

compared with that of the law (118). The 'logical machine' and the kinematics of rigid bodies' (119-125). 'The hardness of the logical *must*' (121). The machine as symbolizing its way of working (122). The employment

Page Break 6

of a word grasped in a flash (123-130). Possibility as a shadow of reality (125). The employment of a word misunderstood and interpreted as a queer process (127). (For 122-130 see also *Philosophical Investigations* §§ 191-197.) The laws of logic as 'laws of thought' (131-133). Logic interprets 'proposition' and 'language' (134). Going wrong in a calculation (136-137). Remark on measuring (140). Logical impossibility (141). "What we are supplying is really remarks on the natural history of man" (142). 79

Page 6

143-156. Foundation of a calculating procedure and of a logical inference.--Calculating without propositions (143-145). Example: sale of timber (143-152). "Are our laws of inference eternal and unalterable"? (155). Logic precedes truth (156). 92

Page 6

157-170. Mathematics, logic and experience.--Proof and experiment (157-169). What about mathematics is logic: it moves in the rules of our language (165). The mathematician is an inventor, not a discoverer (168). The grounds of the logical *must* (169-171). 96

Appendix I

Page 6

1-7. Two sorts of negation. One cancels out when repeated, the other is still a negation. How we *mean* the one or the other sort in double negation. Meaning tested by the expression of meaning (3). Negation compared with rotation through 180° in geometry (1, 6, 7). 102

Page 6

8-10. We can imagine a 'more primitive' logic, in which only sentences containing no negation can be negated (8). The question whether negation has the same meaning for these people as for us (9). Does the figure one mean the same both times in "This rod is 1 metre long" and "Here is 1 soldier" (10)? 105

Page Break 7

Page 7

12-13. Two systems for measuring length. 1 foot = 1W, but 2W = 4 foot, etc. Do "W" and "foot" mean the same? 106

Page 7

16. Meaning as the function of a word in a sentence. 107

Page 7

17-27. Use of the word "is" as copula and as sign of identity. The personal union by the same word a mere accident. Essential and inessential features of a notation. Comparison with the role of a piece in a game. A game does not just have rules, it has a point (20). 108

Appendix II

Page 7

1-13. The surprising may play completely different roles in mathematics in two different ways.--A state of affairs may appear astonishing because of the kind of way it is represented. Or the emergence of a particular result may be seen as in itself surprising. The second kind of surprise not legitimate. Criticism of the conception that mathematical demonstration brings something hidden to light (2). "No mystery here" means: Look around (4). A calculation compared with a way of turning up a card (5). When we don't command a view over what we have been doing, it strikes us as mysterious. We adopt a particular form of expression and become dominated by it in acting and thinking (8). 111

Appendix III

Page 7

1-4. Kinds of proposition.--Arithmetic done without propositions (4). 116

Page 7

5-7. Truth and provability in the system of *Principia Mathematica*. 117

Page 7

8-19. Discussion of a proposition '*P*' which asserts its own unprovability

in the system of *Principia Mathematica*.--The role of contradiction in the language-game (11-14, 17).

118

20. The propositions of logic. 'Proposition' and 'proposition-like formation'.

123

PART II

1-22. ("Additions").--The diagonal procedure. What use can be made of the diagonal number? (3) "The motto here is: Take a *wider* look round" (6). We should regard with suspicion the result of a calculation expressed in words (7). The concept 'nondenumerable' (10-13). Comparison of the concepts 'real number' and 'cardinal number' from the point of view of serial ordering (16-22).

125

23. The sickness of a time.

132

24-27. Discussion of the proposition "There is no greatest cardinal number." "We say of a *licence* that it does not terminate" (26).

133

28-34. Irrational numbers. There is no system of irrational numbers (33). But Cantor defines a higher order difference, namely a difference between a development and a system of developments (34).

133

35-39. \aleph_0 . From our having a use for a kind of numeral that gives the number of terms of an infinite series it doesn't follow that it also makes any sense to talk about the number of the concept 'infinite series'. There is no grammatical technique suggesting the use of such an expression. Such a use is not still to be discovered, but takes inventing (38).

135

40-48. Discussion of the proposition "Fractions cannot be arranged in a series in order of magnitude."

137

49-50. How do we compare games?

139

51-57. Discussion of the proposition that fractions (number-pairs) can be ordered in an infinite series.

139

58-60. "Is the word 'infinite' to be avoided in mathematics?"

141

61. Finitism and Behaviourism are similar trends. Both deny the existence of something with a view to getting out of a muddle.

142

62. "What I am doing is not showing up calculations as wrong, but subjecting the *interest* of calculations to test."

142

PART III

1-2. Proof.--Mathematical proof must be perspicuous. Role of definitions (2). 143

3-8. Russell's logic and the idea of the reduction of arithmetic to symbolic logic.--The application of the calculation must take care of itself (4). Proof in the Russellian calculus, in the decimal calculus, and in the stroke calculus. 144

9-11. Proof.--Proof as a memorable picture (9). The reproduction of the pattern of a proof (10-11).

149

12-20. Russell's logic and the problem of the mutual relation of different calculating techniques.--What is the invention of the decimal system? (12.) Proof in the Russellian calculus and in the decimal system (13). Signs for

numbers that can, and that cannot, be taken in (16). Relation of abbreviated and unabbreviated calculating techniques to one another (17-20). 151

Page 9

21-44. Proof.--Identity and reproducibility of a proof (21). The proof

Page Break 10

as model. Proof and experiment (22-24). Proof and mathematical conviction (25-26). In the proof we have won through to a decision (27). The proved proposition as a rule. It serves to shew us what it makes *sense* to say (28). The propositions of mathematics as 'instruments of language' (29). The mathematical *must* correspond to a track which I lay down in language (30). The proof introduces a new concept (31). What concept does ' $p \supset p$ ' produce? (32). ' $p \supset p$ ' as pivot of the linguistic method of representation (33). The proof as part of an institution (36). Importance of the distinction between determining and using a sense (37). Acceptance of a proof; the 'geometrical' conception of proof (38-40). The proof as adoption of a particular employment of signs (41). "The proof must be a procedure plain to view" (42). "Logic as foundation of mathematics does not work if only because the cogency of the logical proof stands and falls with its geometrical cogency" (43). In mathematics we can get away from logical proofs (44). 158

Page 10

45-64. Russell's logic.--Relation between the ordinary and the Russellian technique of proof (45). Criticism of the conception of logic as the 'foundation' of mathematics. Mathematics is a *motley* of calculating techniques. The abbreviated technique as a new aspect of the unabbreviated (46-48). Remark on trigonometry (50). The decimal notation is independent of calculation with unit strokes (51). Why Russell's logic does not teach us to *divide* (52). Why mathematics is not logic (53). Recursive proof (54). Proof and experiment (55). The correspondence of different calculi; stroke notation and decimal notation (56-57). Several proofs of one and the same proposition; proof and the sense of a mathematical proposition (58-62). The *exact* correspondence of a convincing transition in music and in mathematics (63). 175

Page 10

65-76. Calculation and experiment.--Are the propositions of mathematics anthropological propositions? (65). Mathematical propositions conceived as prophecies of concordant results of calculating (66). Agreement is part of the phenomenon of

Page Break 11

calculating (67). If a calculation is an experiment, what in that case is a mistake in calculation? (68). The calculation as an experiment and as a *path* (69). A proof subserves mutual understanding. An experiment presupposes it (71). Mathematics and the science of conditioned calculating reflexes (72). The concept of calculation excludes confusion (75-76). 192

Page 11

77-90. Contradiction.--A game in which the one who moves first must always win (77). Calculating with $(a - a)$. The chasms in a calculus are not there if I do not see them (78). Discussion of the heterological paradox (79). Contradiction regarded from the point of view of the language-game. Contradiction as a 'hidden sickness' of the calculus (80). Contradiction and the usability of a calculus (81). The consistency proof and the misuse of the idea of *mechanical* insurance against contradiction (82-89). "My aim is to change the *attitude* towards contradiction and the consistency proof." (82) The role of the proposition: "I must have miscalculated"--the key to understanding the 'foundations' of mathematics (90). 202

PART IV

Page 11

1-7. On axioms.--The self-evidence of axioms (1-3). Self-evidence and use (2-3). Axiom and empirical proposition (4-5). The negation of an axiom (5). The mathematical proposition stands on four legs, not on three (7). 223

Page 11

8-9. Following a rule.--Description by means of a rule (8). 227

Page 11

10. The arithmetical assumption is not tied to experience. 229

Page 11

11-13. The conception of arithmetic as the natural history of numbers.--Judging experience by means of the picture (12). 229

Page Break 12

Page 12	14. External relation of the logical (mathematical) proposition.	231
Page 12	15-19. The possibility of doing applied mathematics without pure mathematics.--Mathematics need not be done in <i>propositions</i> ; the centre of gravity may lie in <i>action</i> (15). The commutative law as an example (16-17).	232
Page 12	20. Calculation as a mechanical activity.	234
Page 12	21. The picture as a proof.	235
Page 12	22-27. Intuition.	235
Page 12	26. What is the difference between <i>not</i> calculating and calculating <i>wrong</i> ?	236
Page 12	29-33. Proof and mathematical concept formation.--Proof alters concept formation. Concept formation as the limit of the empirical (29). Proof does not <i>compel</i> , but <i>guides</i> (30). Proof conducts our experience into definite channels (31, 33). Proof and prediction (33).	237
Page 12	34. The philosophical problem is: how can we tell the truth and at the same time <i>pacify</i> these strong prejudices?	242
Page 12	35-36. The mathematical proposition.--We acknowledge it <i>by</i> turning our back on it (35). The effect of the proof: one plunges into the new rule (36).	243
Page 12	39, 42. Synthetic character of mathematical propositions.--The distribution of primes as an example (42).	245
Page 12	40. The result set up as equivalent to the operation.	245
Page 12	41. That proof must be perspicuous means that causality plays no part in proof.	246
Page Break 13		
Page 13	43-44. Intuition in mathematics.	246
Page 13	47. The mathematical proposition as determination of a concept, following upon the discovery of a new form.	248
Page 13	48. The working of the mathematical machine is only the <i>picture</i> of the working of a machine.	249
Page 13	49. The picture as a proof.	249
Page 13	50-51. Reversal of a word.	250
Page 13	52-53. Mathematical and empirical propositions.--The assumption of a mathematical concept expresses the confident expectation of certain experiences; but the establishment of this measure is not equivalent to the expression of the expectations (53).	253
Page 13	55-60. Contradiction.--The liar (58). Contradiction conceived as something supra-propositional, as a monument with a Janus head enthroned above the propositions of logic (59).	254

PART V

Page 13	1-4. Mathematics as a game and as a machine-like activity.--Does the calculating machine calculate? (2). How far is it necessary to have a concept of 'proposition' in order to understand Russell's mathematical logic? (4).
---------	---

Page 13

5-8. Is a misunderstanding about the possible application of mathematics any objection to a calculation as part of mathematics?--Set theory (7). 259

Page 13

9-13. The law of excluded middle in mathematics.--Where there is nothing to base a decision on, we must invent something in order to give the application of the law of excluded middle a sense. 266

Page Break 14

Page 14

14-16 and 21-23. 'Alchemy' of the concept of infinity and of other mathematical concepts whose application is not understood.--Infinite predictions (23). 272

Page 14

17-20. The law of excluded middle. The mathematical proposition as a commandment. Mathematical existence. 275

Page 14

24-27. Existence proofs in mathematics.--"The harmful invasion of mathematics by logic" (24; see also 46 and 48). The mathematically general does not stand to the mathematically particular in the same relation as does the general to the particular elsewhere (25). Existence proofs which do not admit of the construction of what exists (26-27). 281

Page 14

28. Proof by *reductio ad absurdum*. 285

Page 14

29-40. Extensional and intensional in mathematics; the Dedekind cut--geometrical illustration of analysis (2q) [[sic, 9?]]. Dedekind's theorem without irrational numbers (30). How does this theorem come by its deep content? (31) The picture of the number-line (32, 37). Discussion of the concept "cut" (33, 34). The totality of functions is an unordered totality (38). Discussion of the mathematical concept of a function; extension and intension in analysis (39-40). 285

Page 14

41. Concepts occurring in 'necessary' propositions must also have a meaning in non-necessary ones. 295

Page 14

42-46. On proof and understanding of a mathematical proposition.--The proof conceived as a *movement* from one concept to another (42). Understanding a mathematical proposition (45-46). The proof introduces a new concept. The proof serves to convince one of something (45). Existence proof and construction (46). 295

Page 14

47. A concept is not essentially a predicate. 299

Page Break 15

Page 15

48. 'Mathematical logic' has completely blinded the thinking of mathematicians and philosophers. 300

Page 15

49. The numerical sign goes along with the sign for a concept and only together with this is it a measure. 300

Page 15

50. On the concept of generality. 300

Page 15

51. The proof shews *how* the result is yielded. 301

Page 15

52-53. General remarks.--The philosopher is the man who has to cure himself of many sicknesses of the understanding before he can reach the notions of the healthy human understanding. 301

PART VI

Page 15

1. Proofs give propositions an order. 303

Page 15

2. Only within a *technique* of transformation is a proof a formal test. The addition of certain numbers is called a formal test of the numerals, but only because adding is a practised technique. The proof also hangs together with the application. 303

Page 15

3. When the proposition in application does not seem to be right, the proof must shew one why and how it *must* be right. 305

Page 15

4. The proof shews how, and thus why the rule--e.g., that 8×9 makes 72--can be used. 305

Page 15

5. The queer thing is that the picture, not the reality, is supposed to prove a proposition. 306

Page 15

6. The Euclidean proof teaches us a technique of finding a prime number between p and $p!$ And we become convinced that this technique must always lead to a prime number $> p$. 307

Page Break 16

Page 16

7. The spectator sees the impressive procedure and judges "I realise that it must be like that."--This "must" shews what kind of instruction he has drawn from the scene. 308

Page 16

8. This *must* shew that he has adopted a concept, i.e., a method; as opposed to the application of the method. 309

Page 16

9. "Shew me how 3 and 2 make 5." Child and abacus.--One would ask someone "how?" if one wanted to get him to shew that he understands what is in question here. 310

Page 16

10. "Shew me how..." in distinction from "Shew me that..." 312

Page 16

11. The proof of a proposition doesn't mention the whole system of calculation behind the proposition, which gives it sense. 313

Page 16

12. The domain of the tasks of philosophy. 314

Page 16

13. Ought we to say that mathematicians don't understand Fermat's last theorem? 314

Page 16

14. What would it be to "shew how there are infinitely many prime numbers"? 315

Page 16

15. The process of copying. The process of construction according to a rule. Must one always have a clear idea whether his prediction is intended mathematically or otherwise? 316

Page 16

16. The inexorable proposition is that by this rule this number follows after that one. The result of the operation here turns into the criterion for this operation's having been carried out. So we are able to judge in a new sense whether someone has followed the rule. 318

Page Break 17

Page 17

17. The learning of a rule.--"It's supposed to keep on as I have shewn him."--What I understand by 'uniform' I would explain by means of examples. 320

Page 17

18. Here definitions are no help to me. 321

Page 17

19. Paraphrasing the rule only makes it more intelligible to someone who can already obey the paraphrase. 321

Page 17

20. Teaching someone to multiply: we reject different patterns of multiplication with the same initial segment. 322

Page 17

21. It would be nonsense to say: just once in the history of the world, someone followed a rule.--Disputes do not break out about whether a proceeding has been according to a rule or not.--This belongs to the structure from which our language goes out to give a description, for example. 322

Page 17

22. As if we had hardened an empirical proposition into a rule and now experience is compared with it and it is used to judge experience. 324

Page 17

23. In calculating everything depends on whether one calculates right or wrong.--The arithmetical proposition is withdrawn from experiential checking. 324

Page 17

24. "If I follow the rule, then this is the only number I can get to from that one." That is how I proceed; don't ask for a reason! 326

Page 17

25. Suppose someone were to work out the multiplication tables, log tables, etc., because he didn't trust them?--Does it make any difference whether we utter a sentence of a calculus as a proposition of arithmetic or an empirical proposition? 327

Page 17

26. "According to the rule that *I* see in this sequence, *this* is how it continues." Not: according to experience! Rather, that just is the sense of the rule. 327

Page Break 18

Page 18

27. When I see a rule in the series--can this consist in my seeing an algebraic expression before me? Must it not belong to a language? 328

Page 18

28. The certainty with which I call the colour "red" is not to be called in question when I give the description. For this characterises what we call describing.--Following according to a rule is the *bottom* of our language-game. Because *this* (e.g., $25^2 = 625$) is the proceeding upon which we build all judging. 329

Page 18

29. Law, and the empirical proposition that we give this law.--"If I obey the order, I do *this*!" does not mean: If I obey the order, I obey the order. So I must have a different way of identifying the "this." 330

Page 18

30. If humans who have been educated in this fashion calculate like this anyway, then what do we need the rule for? "25² = 625" does not mean that human beings calculate like this, for $25^2 \neq 625$ would not be the proposition that humans get not this but a different result.

"Apply the rule to those numbers."--If I want to follow it, have I any choice left? 332

Page 18

31. How far is it possible to describe the function of a rule?

If you aren't master of any rule, all I can do is train you.

But how can I explain the nature of the rule to myself? 333

Page 18

32. What surrounding is requisite for someone to be able to invent chess (e.g.)? Is regularity possible *without* repetition? Not: how often must he have calculated right to prove to *others* that he can calculate, but: how often, to prove it to himself? 334

Page 18

33. Can we imagine someone's knowing that he can calculate although he has never done any calculating? 335

Page Break 19

Page 19

34. In order to describe the phenomenon of language, one has to describe a practice.

A country that exists for two minutes, and is a projection of part of England, with everything that is going on in two minutes. Someone is doing the same as a mathematician in England, who is calculating. In this two-minute-man calculating? 335

Page 19

35. How do I know that the name of this colour is "green"? If I asked other people and they did not agree with me, I should become totally confused and take them or myself for crazy. Here I react with this word ("green"); and *that* is also how I know how I have to follow the rule now.

How a polygon of forces gets drawn according to the given arrows. 336

Page 19

36. "The word OBEN has four sounds."--Is someone who counts the letters making an experiment? It may be one.

Compare: (1) The word there has 7 sounds

(2) The sound-picture "Dædalus" has 7 sounds.

The second proposition is tenseless. The employment of the two propositions must be different.

"By counting off the sounds one may obtain an empirical proposition--or again, a rule".

338

Page 19

37. Definitions--new ways of belonging together. 340

Page 19

38. "How can one follow a rule?"--Here we misunderstand the facts that stare us in the face.

341

Page 19

39. It is important that the enormous majority of us agree in certain things.

Languages of different tribes who all had the same vocabulary, but the meanings of the words were different.--In order to communicate the people would have to agree about meanings--they would have to agree not merely about definitions, but also in their judgments.

342

Page 19

40. The temptation to say "I can't understand language-game (2)

Page Break 20

because the explanation consists only in examples of the application." 343

Page 20

41. A cave-man who produces regular sequences of signs for himself. We do not say that he is acting according to a rule because we can form the general expression of such a rule.

344

Page 20

42. Under what kind of circumstances should we say: someone is giving a rule by drawing this figure? Under what kind of circumstances: that someone is following this rule, when he draws a series of such figures?

345

Page 20

43. Only within a particular technique of acting, speaking, thinking can anyone resolve upon something. (This "can" is the "can" of grammar.)

345

Page 20

44. Two procedures: (1) deriving number after number in sequence according to an algebraic expression; (2) this procedure: as he looks at a certain sign, someone has a digit occur to him; when he looks again at the sign and the digit, again a digit occurs to him, and so on. Acting according to a rule presupposes some kind of *uniformity*.

347

Page 20

45. Instruction in acting according to a rule. The effect of "and so on" will be that we almost all count and calculate the same. It only makes sense to say "and so on" when the other continues in the same way as I.

348

Page 20

46. If something *must* come out, then it is a ground of judgment that I do not assail. 350

Page 20

47. Is it not enough that this certainty exists? Why should I seek a source for it? 350

Page 20

48. As we use the word "order" and "obey", gestures in less than

Page Break 21

words are engulfed in a set of many relationships. In a strange tribe, is the man whom the rest obey unconditionally the chief?--What is the difference between making a wrong inference and not inferring at all?

351

Page 21

49. "That logic belongs to the natural history of mankind"--is not combinable with the logical 'must.'" The agreement of human beings which is a presupposition of the phenomenon of logic, is not an agreement in *opinions*, much less in opinions about questions of logic. 352

PART VII

Page 21

1. The role of propositions that treat of measures and are not empirical propositions. Such a proposition (e.g. 12 inches = 1 foot) is embedded in a technique, and so in the conditions of this technique; but it is not a statement of those conditions. 355

Page 21

2. The role of a rule. It can also be used to make predictions. This depends on properties of the measuring rods and of the people who use them. 355

Page 21

3. A mathematical proposition--a transformation of the expression. The rule considered from the point of view of usefulness and from that of dignity. How are two arithmetical expressions supposed to say the same thing? They are made equivalent in arithmetic. 357

Page 21

4. Someone who learns arithmetic simply by following my examples. If I say, "If you do with these numbers what I did for you with the others, you will get such-and-such a result"--this seems to be both a prediction and a mathematical proposition. 359

Page 21

5. The difference between being surprised that the figures on paper

Page Break 22

seem to behave like *this* and being surprised that *this* is what comes out. 361

Page 22

6. Isn't the contrast between rules of representation and descriptive propositions one which falls away on every side? 363

Page 22

7. What is common to a mathematical proposition and a mathematical proof, that they should both be called "mathematical"? 364

Page 22

8. If we regard proving as the transformation of a proposition by an experiment, and the man who does the calculation as an apparatus, then the intermediate steps are an uninteresting by-product. 364

Page 22

9. Proof as a picture. It is not approval alone which makes this picture into a calculation, but the consensus of approvals. 365

Page 22

10. Does the sense of the proposition change when a proof has been found? The new proof gives the proposition a place in a new system. 366

Page 22

11. Let us say we have got some of our results because of a hidden contradiction. Does that make them illegitimate? Might we not let a contradiction stand? 369

Page 22

12. "A method for avoiding a contradiction mechanically." It is not bad mathematics that is amended here, but a new bit of mathematics is invented. 371

Page 22

13. Must logical axioms always be convincing? 372

Page 22

14. The people who sometimes cancel out by expressions of value 0. 373

Page 22

15. If the calculation has lost its point for me, as soon as I know that

Page Break 23

I can get any arbitrary result from it--did it have no point as long as I did *not* know this?

One thinks that contradiction *has* to be senseless. 374

Page 23	16. What does mathematics need a foundation for? A good angel will always be necessary.	378
Page 23	17. The practical value of calculating. Calculation and experiment. A calculation as part of the technique of an experiment. The activity of calculating may also be an experiment.	379
Page 23	18. Is mathematics supposed to bring facts to light? Does it not take mathematics to determine the character of what we call a 'fact'? Doesn't it teach us how to enquire after facts? In mathematics there are no causal connexions, only the connexions of the pattern.	381
Page 23	19. Remarks.	383
Page 23	20. The network of joins in a wall. Why do we call this a mathematical problem? Does mathematics make experiments with <i>units</i> ?	384
Page 23	21. "The proposition that says of itself that it is unprovable"--how is this to be understood?	385
Page 23	22. The construction of a propositional sign from axioms according to rules; it appears that we have demonstrated the actual sense of the proposition to be false, and at the same time proved it.	387
Page 23	23. The question "How many?" Measurement and unit.	389
Page 23	24. What we call the mathematical conception of a proposition belongs together with the special place calculation has among our other activities.	389
Page Break 24		
Page 24	25. What is the criterion that here I have followed the paradigm?	391
Page 24	26. Anyone who describes learning how to 'proceed according to the rule' for me, will himself be applying the expression of a rule in his description and will presuppose that I understand it.	392
Page 24	27. Not allowing contradiction to stand characterizes the technique of our application of truth-functions--a man's understanding of "and so on" is shown by his saying <i>this</i> and acting <i>thus</i> in certain cases.	393
Page 24	28. Does the "heterological" contradiction shew a logical property of this concept?	395
Page 24	29. A game. And after a certain move any attempt to go on playing proves to be against the rules.	396
Page 24	30. Logical inference is part of a language game. Logical inference and non-logical inference. The rules of logical inference cannot be either wrong or right. They determine the meaning of the signs.	397
Page 24	31. A reasonable procedure with numerals need not be what we call "calculating".	398
Page 24	32. Is not a mathematics with an application that is sheer fantasy, still mathematics?	399
Page 24	33. The formation of concepts may be essential to a great part of mathematics; and have no role in other parts.	399

34. A people who do not notice a contradiction, and draw conclusions from it.
Can it be a mathematical task to make mathematics into mathematics? 400

35. If a contradiction were actually found in arithmetic, this would shew that an arithmetic with such a contradiction can serve us very well. 401

36. "The class of lions is not a lion, but the class of classes is a class." 401

37. "I always lie." What part might this sentence play in human life? 404

38. Logical inference. Is not a rule something arbitrary?
"It is impossible for human beings to recognize an object as different from itself." 404

39. "Correct--i.e. it conforms to the rule." 405

40. "Bringing the *same*"--how can I explain this to someone? 406

41. When should we speak of a proof of the existence of '777' in an expansion? 407

42. "Concept formation" may mean various things.
The concept of a rule for forming an infinite decimal. 408

43. Is it essential to the concept of calculating, that people generally reach this result? 409

44. If I ask, e.g., whether a certain body moves according to the equation of a parabola--what does mathematics do in this case? 410

45. Questions about the way in which mathematics forms concepts. 411

46. Can one not make mathematical experiments after all? 413

47. The pupil has got hold of the rule when he reacts to it in such-and-such a way. This reaction presupposes a surrounding of particular circumstances, forms of life and of language. 413

48. "The line intimates to me how I am to go." 414

49. In some circumstances: the line seems to intimate to him how he is to go, but it isn't a rule. 415

50. How are we to decide if he is always doing the same thing? 415

51. Whether he is doing the same, or a different thing every time--does not yet determine whether he is obeying a rule. 416

52. If you enumerate examples and then say "and so on", this last expression is not explained in the same way as the examples. 416

53. Suppose an inner voice, a sort of inspiration, tells me how to follow the line. What is the difference between this procedure and following a rule? 417

54. Doing the same thing is linked with following a rule. 418

55. Can I play the language-game if I don't have such and such spontaneous reactions? 419

56. What we do when following a rule, we see from the point of view of "Always the same thing."
419

57. Calculating prodigies who get the right result but can't say how--are we to say they don't calculate?
419

58. "Thinking you are following a rule."
420

59. How can I explain the word "same"--how do I get the feeling that something lies in my understanding beyond what I can say?
420

60. What is *impalpable* about intimation: there is *nothing* between the rule and my action.
421

61. Adding shapes. Possibilities in folding a piece of paper. Suppose we did not separate geometrical and physical possibility?

Might not people in certain circumstances calculate with figures, without a particular result's *having* to come out?

If the calculation shews you a causal connexion, you are not calculating.

Mathematics is normative.
422

62. The introduction of a new rule of inference as a transition to a new language game. 425

63. Observation that a surface is red and blue, but not that it is red. Inferences from this.
Can logic tell us what we must observe?
425

64. A surface with stripes of changing colours.
Could implications be observed?
426

65. Someone says he sees a red and yellow star, but not anything yellow. 428

66. "I hold to a rule."
429

67. The mathematical *must*--the expression of an attitude towards the technique of calculating. The expression of the fact that mathematics forms concepts.
430

68. The case of seeing the complex formed from A and B, but seeing neither A nor B.
Can I see A and B, but only observe $A \vee B$?
And *vice versa*.
431

69. Experiences and timeless propositions.
432

70. In what sense can a proposition of arithmetic be said to give us a concept? 432

71. Not every language-game contains something that we want to call a "concept". 433

72. Proof and picture.
434

73. A language-game in which there are axioms, proofs and proved propositions. 435

74. Any proof in applied mathematics can be regarded as a proof in pure mathematics proving that *this* proposition can be got from *these* propositions by such and such operations--Any empirical proposition can serve as a rule if it

Page Break 29

EDITORS' PREFACE TO THE REVISED EDITION

Page 29

THE posthumously published writings of Wittgenstein which first appeared in 1956 with the title "Remarks on the Foundations of Mathematics" almost all take their origin from the period September 1937-April 1944. Wittgenstein did not return to this subject matter in the last years of his life. On the other hand, he wrote a great deal on the philosophy of mathematics and logic from 1929 to about 1934. A considerable part of this--together with other material from these years--has been published under the titles "Philosophische Bemerkungen" (1964) and "Philosophische Grammatik" (1969).

Page 29

The present revised edition of the "Remarks on the Foundations of Mathematics" contains the *whole* text of the first (1956) edition. In editing it we have thus left out nothing that was already in print. On the other hand, we have included additional material. Only Parts II and III of the first edition are here reprinted, practically unaltered, as Parts III and IV.

Page 29

We have taken the second Appendix to Part I of the first edition, enlarged by a few additions from the MSS, and placed it as an independent Part II of this edition.

Page 29

Part VI of the present edition is entirely new. The MS includes perhaps the most satisfactory presentation of Wittgenstein's thoughts on the problem of following a rule--one of his most frequently recurring themes. The MS (164) was written in the period 1941-1944; we have not been able to date it more precisely.†1 With the exception of a few remarks at the end, which do not quite fit in with the circle of problems that are otherwise the topic of the MS, it is here printed *in extenso*.

Page 29

Part I is the earliest of this collection and to a certain extent it has a peculiar position. It is the only part that existed in typescript and is the most worked over of them all. The typescript itself goes back to manuscripts which were composed for the most part in the period from September 1937 to about the end of that year (117, 118, 119). But the remarks on negation form an exception; they stem from a MS belonging to about the turn of the year 1933-1934 (115).

Page 29

In its original form the typescript that is the basis for Part I formed

Page Break 30

the second half of an earlier version of "Philosophical Investigations". Wittgenstein then split up this half of that version into clippings, supplied them with extensive alterations and additions, and only then constructed that order of the individual remarks that is reproduced here. In a notebook as late as 1944 he proposed a few alterations to this typescript. (See p. 80, n.)

Page 30

The last section of the rearranged collection consisted of papers that had not been cut up, though there were many manuscript additions, and it is not quite clear whether Wittgenstein regarded them as belonging with the preceding text. This section deals with the concept of negation, and as we have already mentioned, it was written 3-4 years earlier than the remainder of Part I. Its content occurs in great part in the "Investigations" §§ 547-568. The editors left it out of the first edition, but have included it here as Appendix I to Part I.

Page 30

The collection had two further appendices. They come from the same typescript as the second half of the (earlier) "Investigations"; nevertheless they were separated from the rest of the collection of clippings. The first deals with 'mathematical surprise'. The second discusses among other things Gödel's theories of the existence of unprovable but true propositions in the system of "Principia Mathematica." In the first edition we included only the second appendix, but here both are published (Appendices II and III.)

Page 30

With the exception of a few remarks which Wittgenstein himself had left out in the arrangement of the clippings, what is here published as Part I comprises the whole content of the second half of the early version of "Philosophical Investigations."

It must have been Wittgenstein's intention also to attach appendices on Cantor's theory of infinity and Russell's logic to the contributions on problems of the foundations of mathematics that he planned to include in the "Philosophical Investigations." Under the heading 'Additions' he wrote a certain amount on the problems connected with set theory: about the diagonal procedure and the different kinds of number-concept. In the time from April 1938 to January 1939 he wrote a MS book where, together with other remarks on the philosophy of psychological concepts, he put in a good deal on probability and truth (Gödel) and also on infinity and kinds of number (Cantor). These writings he immediately continued in a notebook (162a and the beginning of 162b). In the later war-years too he occasionally comes back to these topics. The confrontation with Cantor was never brought to a terminus.

What is here published as Part II consists of the above-mentioned "Additions" in 117 and of a selection of remarks from 121. The whole presents an inconsiderable expansion of Appendix II of Part I of the earlier (1956) edition. The arrangement of sentences and paragraphs into numbered Remarks corresponds to the original text (which was not wholly the case in the 1956 edition). The sections have been numbered by the editors.

Wittgenstein's confrontation with Russell, that is to say with the thought of the derivability of mathematics from the calculi of logic, is found in Part III of this collection (Part II of the edition of 1956). These writings stem from the period from October 1939 to April 1940. The MS (122, continued in the second half of 117) was the most extensive of all the MSS which form the basis of this collection. Neither in style nor in content has it been perfected. The author keeps on renewing the attempt to elucidate his thoughts on the nature of mathematical proof: what it means, for example, to say that a proof must be surveyable; that it presents us with a new picture; that it creates a new concept; and the like. His effort is to declare "the motley of mathematics" and to make clear the connexion between the different techniques of calculation. In so striving he simultaneously sets his face against the idea of a "foundation" of mathematics, whether in the form of a Russellian calculus or in that of the Hilbertian conception of a meta-mathematics. The idea of contradiction and of a consistency proof is extensively discussed.

The editors were of the opinion that this manuscript contained a wealth of valuable thoughts as they are nowhere otherwise to be encountered in Wittgenstein's writings. On the other hand it also seemed clear to them that this MS could not be published unabridged. Thus a selection was requisite. The task was difficult, and the editors are not entirely satisfied with the result.

In the autumn of 1940 Wittgenstein began to occupy himself anew with the philosophy of mathematics and wrote something about the question of following a rule. These writings (MS 123) are not published here. In May 1941 the work was taken up again and soon led to investigations from which a considerable selection is published here as Part VII.

The first part of Part VII (§§ 1-23) was mostly written in June 1941. It discusses the relation between mathematical and empirical propositions, between calculation and experiment, treats the concept of contradiction and consistency anew and ends in the neighbourhood of the

Gödelian problem. The second half was written in the spring of 1944. It deals principally with the concept of following a rule, of mathematical proof and logical inference, and with the connexion between proof and concept formation in mathematics. There are here numerous points of contact, on the one side with the manuscripts of the intervening period (Parts IV and V) and with thoughts in the "Philosophical Investigations" on the other. §§ 47-60 essentially form an earlier version of what can now be found in the "Investigations" §§ 209 to 237. The sequence of the remarks is different here; and some have not been taken up into the later version.--Both halves of this Part VII were in the same MS book, which is one of the indications that the author regarded them as belonging together.

Part V is taken from two MSS (126 and 127) belonging to the years 1942 and 1943--while Part IV derives mainly from one MS (125) from the year 1942, with some additions from the two MSS on which Part V is based. Much on these two parts has the character of "preliminary studies" for the second half of Part VII; but they also contain a wealth of material that the author did not use there.

In Part V Wittgenstein discusses topics that connect up with Brouwer and Intuitionism: the law of excluded

middle and mathematical existence; the Dedekind cut and the extensional and intensional way of looking at things in mathematics. In the second half of this part there are remarks on the concept of generality in mathematics and especially on a theme that makes its appearance still more strongly in Part VII: the role of concept-formation and the relation between concept and truth in mathematics.

Page 32

The chronological arrangement of the material has the consequence that one and the same theme is sometimes treated in different places. If Wittgenstein had put his remarks together into a book, he would presumably have avoided many of these repetitions.

Page 32

It must once more be emphasized: Part I and, practically speaking also Part VI, but only these, are complete reproductions of texts of Wittgenstein's. Thus what is here published as Parts II, III, IV, V and VII is a *selection* from extensive MSS. In their preface to the first edition the editors conjectured that it might be desirable later to print what they had omitted. They are still of the same opinion--but also of the opinion that the time has not yet come to print the whole of Wittgenstein's MSS on these and other topics.

Page 32

The editors alone are responsible for the numbering of the selected paragraphs. (Even in Part I.) But the articulation of the writing into

Page Break 33

"remarks"--here separated from one another by larger gaps--is Wittgenstein's own. With a few exceptions we did not want to interfere with the order of the sections. Nevertheless we have sometimes (especially at the end of Part IV and V) brought together material belonging to the same subject matter from different places.

Page 33

The list of contents and the index are meant to help the reader to look over the whole and to make it easier to look things up. We alone are responsible for the thematic articulation of the material indicated in the list of contents.

Page Break 34

Page Break 35

PART I

Circa 1937-1938

Page 35

1. We use the expression: "The steps are determined by the formula...". How is it used?--We may perhaps refer to the fact that people are brought by their education (training) so to use the formula $y = x^2$, that they all work out the same value for y when they substitute the same number for x . Or we may say: "These people are so trained that they all take the same step at the same point when they receive the order 'add 3'". We might express this by saying: for these people the order "add 3" completely determines every step from one number to the next. (In contrast with other people who do not know what they are to do on receiving this order, or who react to it with perfect certainty, but each one in a different way.)

Page 35

On the other hand we can contrast different kinds of formula, and the different kinds of use (different kinds of training) appropriate to them. Then we *call* formulae of a particular kind (with the appropriate methods of use) "formulae which determine a number y for a given value of x ", and formulae of another kind, ones which "do not determine the number y for a given value of x ". ($y = x^2 + 1$ would be of the first kind, $y > x^2 + 1$, $y = x^2 \pm 1$, $y = x^2 + z$ of the second.) The proposition "The formula... determines a number y " will then be a statement about the form of the formulae--and now we must distinguish such a proposition as "The formula which I have written down determines y ", or "Here is a formula which determines y ", from one of the following kind: "The formula, $y = x^2$ determines the number y for a given value of x ". The question "Is the formula written down there one that determines y ?" will then mean the same as "Is what is there a formula of this kind or that?"--but it is not clear off-hand what we are to make of the question "Is $y = x^2$ a formula which determines y for a given value of x ?" One might address this question to a pupil in order to test whether he understands the use of the word "to

Page Break 36

determine"; or it might be a mathematical problem to work out whether there was only one variable on the right-hand side of the formula, as e.g. in the case: $y = (x^2 + z)^2 - z(2x^2 + z)$.

Page 36

2. "The way the formula is meant determines which steps are to be taken." What is the criterion for the way the formula is meant? Presumably the way we always use it, the way we were taught to use it.

We say, for instance, to someone who uses a sign unknown to us: "If by 'x!2' you mean x^2 , then you get this value for y, if you mean $\sqrt{2}$, that one".--Now ask yourself: how does one *mean* the one thing or the other by "x!2"?

That will be how meaning it can determine the steps in advance.

3. *How do I know* that in working out the series + 2 I must write

"20004, 20006"

and not

"20004, 20008"?

--(The question: "How do I know that this colour is 'red'?" is similar.)

"But you surely know for example that you must always write the *same* sequence of numbers in the units: 2, 4, 6, 8, 0, 2, 4, etc."--Quite true: the problem must already appear in this sequence, and even in *this* one: 2, 2, 2, 2, etc.--For how do I know that I am to write "2" after the five hundredth "2"? i.e. that 'the same figure' in that place is "2"? And if I know it *in advance*, what use is this knowledge to me later on? I mean: how do I know what to do with this earlier knowledge when the step actually has to be taken?

(If intuition is needed to continue the series + 1, then it is also needed to continue the series + 0.)

Page Break 37

Page 37

"But do you mean to say that the expression '+ 2' leaves you in doubt what you are to do e.g. after 2004?"--No; I answer "2006" without hesitation. But just for that reason it is superfluous to suppose that this was determined earlier on. My having no doubt in face of the question does *not* mean that it has been answered in advance.

"But I surely also know that whatever number I am given I shall be able, straight off and with certainty, to give the next one.--Certainly my dying first is excluded, and a lot of other things too. But my being so certain of being able to go on is naturally very important.--

Page 37

4. "But then what does the peculiar inexorability of mathematics consist in?"--Would not the inexorability with which two follows one and three two be a good example?--But presumably this means: follows in the *series of cardinal numbers*; for in a different series something different follows. And isn't *this* series just *defined* by this sequence?--"Is that supposed to mean that it is equally correct whichever way a person counts, and that anyone can count as he pleases?"--We should presumably not call it "counting" if everyone said the numbers one after the other *anyhow*; but of course it is not simply a question of a name. For what we call "counting" is an important part of our life's activities. Counting and calculating are not--e.g.--simply a pastime. Counting (and that means: counting like *this*) is a technique that is employed daily in the most various operations of our lives. And that is why we learn to count as we do: with endless practice, with merciless exactitude; that is why it is inexorably insisted that we shall all say "two" after "one", "three" after "two" and so on.--But is this counting only a *use*, then; isn't there also some truth corresponding to this sequence?" The *truth* is that counting has proved to pay.--"Then do you want to say that 'being true' means: being usable (or

Page Break 38

useful)?"--No, not that; but that it can't be said of the series of natural numbers--any more than of our language--that it is true, but: that it is usable, and, above all, *it is used*.

Page 38

5. "But doesn't it follow with logical necessity that you get two when you add one to one, and three when you add one to two? and isn't this inexorability the same as that of logical inference?"--Yes! it is the same.--"But isn't there a truth corresponding to logical inference? Isn't it *true* that this follows from that?"--The proposition: "It is true that this follows from that" means simply: this follows from that. And how do we use this proposition?--What would happen if we made a different inference--*how* should we get into conflict with truth?

Page 38

How should we get into conflict with truth, if our footrules were made of very soft rubber instead of wood and steel?--"Well, we shouldn't get to know the correct measurement of the table."--You mean: we should not get, or could not be sure of getting, *that* measurement which we get with our rigid rulers. So if you had measured the table with the elastic rulers and said it measured five feet by our usual way of measuring, you would be wrong; but if you say that it measured five feet by your way of measuring, that is correct.--"But surely that isn't measuring at all!"--It is similar to our measuring and capable, in certain circumstances, of fulfilling 'practical purposes'. (A shopkeeper might

use it to treat different customers differently.)

Page 38

If a ruler expanded to an extraordinary extent when slightly heated, we should say--in normal circumstances--that that made it *unusable*. But we could think of a situation in which this was just what was wanted. I am imagining that we perceive the expansion with the naked eye; and we ascribe the same numerical measure of length to bodies in rooms of different temperatures, if they measure the same by the ruler which to the eye is now longer, now shorter.

Page Break 39

Page 39

It can be said: What is here called "measuring" and "length" and "equal length", is something different from what we call those things. The use of these words is different from ours; but it is *akin* to it; and we too use these words in a variety of ways.

Page 39

6. We must get clear what inferring really consists in: We shall perhaps say it consists in the transition from one assertion to another. But does this mean that inferring is something that takes place when we are making a transition from one assertion to another, and so *before* the second one is uttered--or that inferring consists in making the one assertion follow upon the other, that is, e.g., in uttering it after the other? Misled by the special use of the verb "infer" we readily imagine that inferring is a peculiar activity, a process in the medium of the understanding, as it were a brewing of the vapour out of which the deduction arises. But let's look at what happens here.--There is a transition from one proposition to another *via* other propositions, that is, a chain of inferences; but we don't need to talk about this; for it presupposes another kind of transition, namely that from one link of the chain to the next. Now a process of forming the transition may occur between the links. There is nothing occult about this process; it is a derivation of one sentence from another according to a rule; a comparison of both with some paradigm or other, which represents the schema of the transition; or something of the kind. This may go on on paper, orally, or 'in the head'.--The conclusion may however also be drawn in such a way that the one proposition is uttered after the other, without any such process; or the process may consist merely in our saying "Therefore" or "It follows from this", or something of the kind. We call it a "conclusion" when the inferred proposition *can* in fact be derived from the premise.

Page Break 40

Page 40

7. Now what does it mean to say that one proposition *can* be derived from another by means of a rule? Can't anything be derived from anything by means of *some* rule--or even according to any rule, with a suitable interpretation? What does it mean for me to say e.g.: this number can be got by multiplying these two numbers? This is a rule telling us that we must get this number if we multiply *correctly*; and we can obtain this rule by multiplying the two numbers, or again in a different way (though any procedure that leads to this result might be called 'multiplication'). Now I am said to have multiplied when I have carried out the multiplication 265×463 , and also when I say: "twice four is eight", although here no calculating procedure led to the product (which, however, I could also have *worked out*). And so we also say a conclusion is drawn, where it is not calculated.

Page 40

8. But still, I must only infer what really *follows*!--Is this supposed to mean: only what follows, going by the rules of inference; or is it supposed to mean: only what follows, going by *such* rules of inference as somehow agree with some (sort of) reality? Here what is before our minds in a vague way is that this reality is something very abstract, very general, and very rigid. Logic is a kind of ultra-physics, the description of the 'logical structure' of the world, which we perceive through a kind of ultra-experience (with the understanding e.g.). Here perhaps inferences like the following come to mind: "The stove is smoking, so the chimney is out of order again". (And *that* is how this conclusion is drawn! Not like this: "The stove is smoking, and whenever the stove smokes the chimney is out of order; and so...".)

Page 40

9. What we call 'logical inference' is a transformation of our expression. For example, the translation of one measure into another. One edge of a ruler is marked in inches, the other in centimetres. I

Page Break 41

measure the table in inches and go over to centimetres *on the ruler*.--And of course there is such a thing as right and wrong in passing from one measure to the other; but what is the reality that 'right' accords with here? Presumably a *convention*, or a *use*, and perhaps our practical requirements.

10. "But doesn't e.g. '*fa*' have to follow from ' $(x).fx$ if ' $(x).fx$ ' is meant in the way we mean it?"--And how does *the way* we mean it come out? Doesn't it come out in the constant practice of its use? and perhaps further in certain *gestures*--and similar things.--But it is as if there were also something attached to the word "all", when *we* say it; something with which a different use could not be combined; namely, the *meaning*. "'All' surely means: *all!*" we should like to say, when we have to explain this meaning; and we make a particular gesture and face.

Cut down all these trees!--But don't you understand what '*all*' means? (He had left one standing.) How did he learn what 'all' means? Presumably by practice.--And of course this practice did not only bring it about that he *does this* on receiving the order--it surrounded the word with a whole lot of pictures (visual and others) of which one or another comes up when we hear and speak the word. (And if we are supposed to give an account of what the 'meaning' of the word is, we first pull out *one* from this mass of pictures--and then reject it again as non-essential when we see that now this, now that, picture presents itself, and sometimes none at all.)

One learns the meaning of "all" by learning that '*fa*' follows from ' $(x).fx$ '.--The exercises which drill us in the use of this word, which teach its meaning, always make it natural to rule out any exception.

11. For how do we *learn* to infer? Or don't we learn it?

Does a child know that an affirmative follows from a double negative?--And how does one *shew* him that it does? Presumably by shewing him a process (a double inversion, two turns through 180° and similar things) which he then takes as a picture of negation.

And the meaning of ' $(x).fx$ ' is made clear by our insisting on '*fa*'s following from it.

12. "From '*all*', if it is meant *like this*, *this* must surely follow!"--If it is meant like *what*? Consider how you mean it. Here perhaps a further picture comes to your mind--and that is all you have got.--No, it is not true that it *must*--but it *does* follow: we *perform* this transition.

And we say: If this does not follow, then it simply wouldn't be *all*--and that only shews how we react with words in such a situation.--

13. It strikes us as if something else, something over and above the *use* of the word "all", must have changed if '*fa*' is no longer to follow from ' $(x).fx$ '; something attaching to the word itself.

Isn't this like saying: "If this man were to act differently, his character would have to be different". Now this may mean something in some cases and not in others. We say "behaviour flows from character" and that is how use flows from meaning.

14. This shews you--it might be said--how closely certain gestures, pictures, reactions, are linked with a constantly practised use.

'The picture forces itself on us....' It is very interesting that pictures do *force* themselves on us. And if it were not so, how could

such a sentence as "What's done cannot be undone" mean anything to us?

15. It is important that in our language--our natural language--'all' is a fundamental concept and 'all but one' less fundamental; i.e. there is not a *single* word for it, nor yet a characteristic gesture.

16. The *point* of the word "all" is that it admits no exception.--True, that is the point of its use in our language; but the kinds of use we feel to be the 'point' are connected with the role that such-and-such a use has in our whole life.

17. When we ask what inferring consists in, we hear it said e.g.: "If I have recognized the truth of the propositions..., then I am justified in further writing down..."--In what sense justified? Had I no right to write that

down before?--"Those propositions convince me of the truth of this proposition." But of course that is not what is in question either.--"The mind carries out the special activity of logical inference according to these laws." That is certainly interesting and important; but then, is it true? Does the mind always infer according to *these* laws? And what does the special activity of inferring consist in?--This is why it is necessary to look and see how we carry out inferences in the practice of language; what kind of procedure in the language-game inferring is.

For example: a regulation says "All who are taller than five foot six are to join the ... section". A clerk reads out the men's names and heights. Another allots them to such-and-such sections.--"N.N. five foot nine." "So N.N. to the ... section." That is inference.

Page Break 44

Page 44

18. Now, what do we call 'inferences' in Russell or Euclid? Am I to say: the transitions from one proposition to the next one in the proof? But where is the *passage* to be found?--I say that in Russell one proposition follows from another if the one can be derived from the other according to the position of both in a proof and the appended signs--when we read the book. For reading this book is a game that has to be learnt.

Page 44

19. One is often in the dark about what following and inferring really consists in; what kind of fact, and what kind of procedure, it is. The peculiar use of these verbs suggests to us that following is the existence of a connexion between propositions, which connexion we follow up when we infer. This comes out very instructively in Russell's account (*Principia Mathematica*). That a proposition $\vdash q$ follows from a proposition $\vdash p \supset q.p$ is here a fundamental law of logic:

$$\vdash p \supset q.p. \supset. \vdash q \dagger 1$$

Now this, one says, justifies us in inferring $\vdash q$ from $\vdash p \supset q.p$. But what does 'inferring', the procedure that is now justified, consist in? Surely in this: that in some language-game we utter, write down (etc.), the one proposition as an assertion after the other; and how can the fundamental law justify me in *this*?

Page 44

20. Now Russell wants to say: "*This* is how I am going to infer, and it is *right*". So he means to tell us how he means to infer: this is done by a *rule* of inference. How does it run? That this proposition implies that one?--Presumably that in the proofs in this book a proposition like this is to come after a proposition like this.--But it is supposed to be a fundamental law of logic that it is

Page Break 45

correct to infer in this way!--Then the fundamental law would have to run: "It is correct to infer ... from ..."; and this fundamental law should presumably be self-evident--in which case the rule itself will self-evidently be correct, or justified. "But after all this rule deals with sentences in a book, and that isn't part of logic!"--Quite correct, the rule is really only a piece of information that in this book only *this* transition from one proposition to another will be used (as it were a piece of information in the index); for the correctness of the transition must be evident where it is made; and the expression of the 'fundamental law of logic' is then the *sequence of propositions* itself.

Page 45

21. In his fundamental law Russell seems to be saying of a proposition: "It already follows--all I still have to do is, to infer it". Thus Frege somewhere says that the straight line which connects any two points is really already there before we draw it; and it is the same when we say that the transitions, say in the series + 2, have really already been made before we make them orally or in writing--as it were tracing them.

Page 45

22. One might reply to someone who said this: Here you are using a picture. One *can determine* the transitions which someone is to make in a series, by doing them for him first. E.g. by writing down in another notation the series which he is to write, so that all that remains for him to do is to translate it; or by actually writing it down very faint, and he has to trace it. In the first case we can also say that we don't write down *the* series that he has to write, and so that we do not ourselves make the transitions of that series; but in the second case we shall certainly say that the series which he is to write is already there. We should also say this if we *dictate* what he has to write down, although then we are producing a series of sounds and he a series of

Page Break 46

written signs. It is at any rate a sure way of *determining* the transitions that someone has to make, if we in some sense make them first.--If, therefore, we determine these transitions in a quite different sense, namely, by subjecting

our pupil to such a training as e.g. children get in the multiplication tables and in multiplying, so that all who are so trained do random multiplications (not previously done in the course of being taught) in the same way and with results that agree--if, that is, the transitions which someone is to make on the order 'add 2' are so determined by training that we can predict with certainty how he will go, even when he has never up to now taken *this* step--then it may be natural to us to use this as a picture of the situation: the steps are all already taken and he is just writing them down.

Page 46

23. "But we surely infer this proposition from that because it actually follows! We ascertain that it follows."--We ascertain that what is written here follows from what is written there. And this proposition is being used *temporally*.

Page 46

24. Separate the feelings (gestures) of agreement, from what you *do* with the proof.

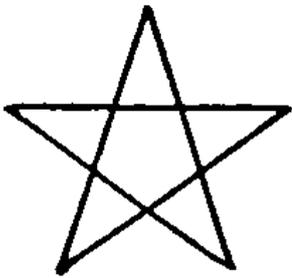

Page 46

25. But how about when I ascertain that this pattern of lines:

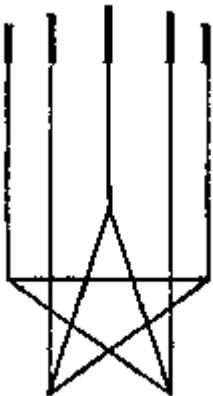

is like-numbered with this pattern of angles:

Page Break 47

(b)

(I have made the patterns memorable on purpose) by correlating them:

(c)

Page 47

Now what do I ascertain when I look at this figure? What I see is a star with threadlike appendages.--

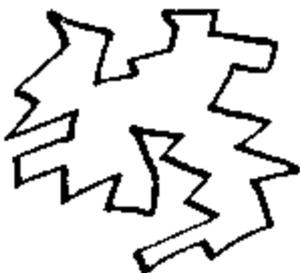

Page 47

26. But I can make use of the figure like this: five people stand arranged in a pentagon; against the wall are wands, like the strokes in (a); I look at the figure (c) and say: "I can give each of the people a wand".

I could regard figure (c) as a schematic *picture* of my giving the five men a wand each.

Page 47

27. For if I first draw some arbitrary polygon:

Page Break 48

and then some arbitrary series of strokes

|||||

I can find out by correlating them whether I have as many angles in the top figure as strokes in the bottom one. (I do not know how it would turn out.) And so I can also say that by drawing projection-lines I have ascertained that there are as many strokes at the top of figure (c) as the star beneath has points. (Temporally!) In this way of taking it the figure is not like a mathematical proof (any more than it is a mathematical proof when I divide a bag of apples among a group of people and find that each can have just *one* apple).

I can however conceive figure (c) as a mathematical proof. Let us give names to the shapes of the patterns (a) and (b): let (a) be called a "hand", H , and (b) a "pentacle", P . I have proved that H has as many strokes as P has angles. And this proposition is once more non-temporal.

Page 48

28. A proof--I might say--is a *single* pattern, at one end of which are written certain sentences and at the other end a sentence (which we call the 'proved proposition'.)

To describe such a pattern we may say: in it the proposition... follows from.... This is one way of describing a *design*, which might also be for example an ornament (a wallpaper design). I can say, then, "In the proof on that blackboard the proposition p follows from q and r ", and that is simply a description of what can be seen there. But it is not the mathematical proposition that p follows from q and r . That has a different application. It says--as one might put it--that it makes sense to speak of a proof (pattern) in which p follows from q and r . Just as one can say that the proposition "white is lighter than black" asserts that it makes sense to speak of two objects, the lighter one white and the other black, but not of two objects, the lighter one black and the other white.

Page Break 49

Page 49

29. Let us imagine that we had given a paradigm of 'lighter' and 'darker' in the shape of a white and a black patch, and now, so to speak, we use it to deduce that red is darker than white.

Page 49

30. The proposition proved by (c) now serves as a new prescription for ascertaining numerical equality: if one set of objects has been arranged in the form of a hand and another as the angles of a pentacle, we say the two sets are equal in number.

Page 49

31. "But isn't that merely because we have already correlated H and P and seen that they are the same in number?"--Yes, but if they were so in one case, how do I know that they will be so again now?--"Why, because it is of the *essence* of H and P to be the same in number."--But how can you have brought *that* out by correlating them? (I thought the counting or correlation merely yielded the result that these two groups before me were--or were not--the same in number.)

--"But now, if he has an H of things and a P of things, and he actually correlates them, it surely isn't *possible* for him to get any result but that they are the same in number.--And that it is not possible can surely be seen from the proof."--But *isn't* it possible? If, e.g., he--as someone else might say--omits to draw one of the correlating lines. But I admit that in an enormous majority of cases he will always get the same result, and, if he did not get it, would think something had put him out. And if it were not like this the ground would be cut away from under the whole proof. For we decide to use the proof-picture instead of correlating the groups; we do *not* correlate them, but *instead* compare the groups with those of the proof (in which indeed two groups are correlated with one another).

Page Break 50

Page 50

32. I might also say as a result of the proof: "From now on an H and a P are called 'the same in number'".

Or: The proof doesn't *explore* the essence of the two figures, but it does express what I am going to count as belonging to the essence of the figures from now on.--I deposit what belongs to the essence among the paradigms of language.

The mathematician creates *essences*.

Page 50

33. When I say "This proposition follows from that one", that is to accept a rule. The acceptance is *based* on the proof. That is to say, I find this chain (this figure) acceptable as a *proof*.--"But could I do otherwise? Don't I *have* to find it acceptable?"--Why do you say you have to? Because at the end of the proof you say e.g.: "Yes--I have to accept this conclusion". But that is after all only the expression of your unconditional acceptance.

I.e. (I believe): the words "I have to admit this" are used in *two kinds* of case: when we have got a proof--and also with reference to the individual steps of the proof.

34. And how does it come out that the proof *compels* me? Well, in the fact that once I have got it I go ahead in such-and-such a way, and refuse any other path. All I should further say as a final argument against someone who did not want to go that way, would be: "Why, don't you see...!"--and that is no *argument*.

35. "But, if you are right, how does it come about that all men (or at any rate all normal men) accept these patterns as proofs of these propositions?"--It is true, there is great--and interesting--agreement here.

36. Imagine you have a row of marbles, and you number them with Arabic numerals, which run from 1 to 100; then you make a big gap after every 10, and in each 10 a rather smaller gap in the middle with 5 on either side: this makes the 10 stand out clearly as 10; now you take the sets of 10 and put them one below another, and in the middle of the column you make a bigger gap, so that you have five rows above and five below; and now you number the rows from 1 to 10.--We have, so to speak, done drill with the marbles. I can say that we have unfolded properties of the hundred marbles.--But now imagine that this whole process, this experiment with the hundred marbles, were filmed. What I now see on the screen is surely not an experiment, for the picture of an experiment is not itself an experiment.--But I see the 'mathematically essential' thing about the process in the projection too! For here there appear first a hundred spots, and then they are arranged in tens, and so on and so on.

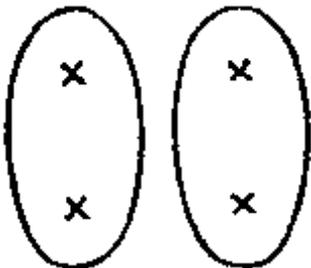

Thus I might say: the proof does not serve as an experiment; but it does serve as the picture of an experiment.

37. Put two apples on a bare table, see that no one comes near them and nothing shakes the table; now put another two apples on the table; now count the apples that are there. You have made an experiment; the result of the counting is probably 4. (We should present the result like this: when, in such-and-such circumstances, one puts first 2 apples and then another 2 on a table, mostly none disappear and none get added.) And analogous experiments can be carried out, with the same result, with all kinds of solid bodies.--This is how our children learn sums; for one makes them put down three beans and then another three beans and then count what is there. If the result at one time were 5, at another 7 (say because, *as we should now say*, one sometimes got added, and one sometimes vanished of itself), then the first thing we said would be that beans were no good for teaching

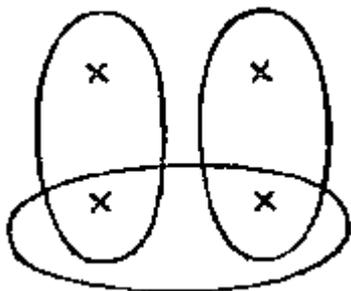

sums. But if the same thing happened with sticks, fingers, lines and most other things, that would be the end of all sums.

"But shouldn't we then still have $2 + 2 = 4$?"--This sentence would have become unusable.

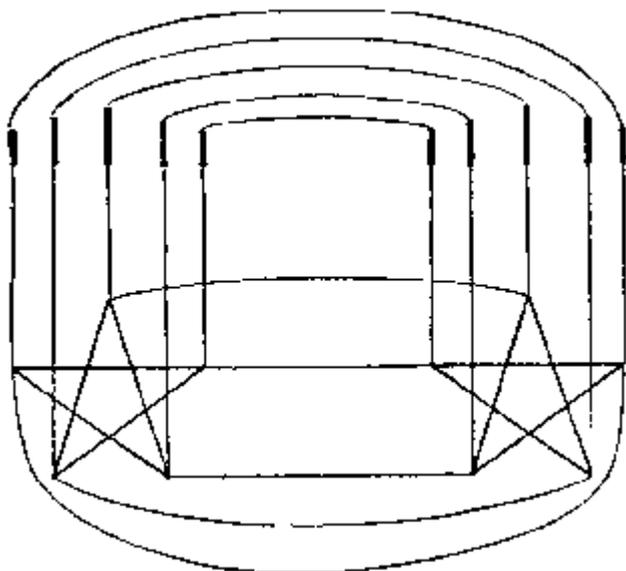

38. "You only need to look at the figure

to see that $2 + 2$ are 4."--Then I only need to look at the figure

to see that $2 + 2 + 2$ are 4.

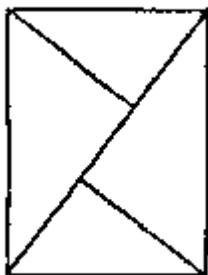

--This figure teaches me a new way of checking whether I have really drawn the same figures; but can't I still get into difficulties when I now want to use this model as a guide? But I say that I am certain I shall

Page Break 55

not normally get into any difficulties.

Page 55

42. There is a puzzle which consists in making a particular figure, e.g. a rectangle, out of given pieces. The division of the figure is such that we find it difficult to discover the right arrangement of the parts. Let it for example be this:

Page 55

What do you discover when you succeed in arranging it?--You discover a position--of which you did not think before.--Very well; but can't we also say: you find out that these triangles can be arranged like this?--But 'these triangles': are they the actual ones in the rectangle above, or are they triangles which have yet to be arranged like that?

Page 55

43. If you say: "I should never have thought that these shapes could be arranged like that", we can't point to the solution of the puzzle and say: "Oh, you didn't think the pieces could be arranged like that?"--You would reply: "I mean, I didn't think of this way of arranging them at all".

Page 55

44. Let us imagine the physical properties of the parts of the puzzle to be such that they can't come into the desired position. Not, however, that one feels a resistance if one tries to put them in this

Page Break 56

position; but one simply tries everything else, only not *this*, and the pieces don't get into this position by accident either. This position is as it were excluded from space. As if there were e.g. a 'blind spot' in our brain here.--And *isn't* it like this when I believe I have tried all *possible* arrangements and have always passed this one by, as if bewitched?

Can't we say: the figure which shews you the solution removes a blindness, or again changes your geometry? It as it were shews you a new dimension of space. (As if a fly were shewn the way out of the fly-bottle.)

Page 56

45. A demon has cast a spell round this position and excluded it from our space.

Page 56

46. The new position has as it were come to be out of nothingness. Where there was nothing, now there suddenly is something.

Page 56

47. In what sense has the solution shewn you that such-and-such can be done? Before, you could *not* do it--and now perhaps you can.--

Page 56

48. I said, "I accept such-and-such as proof of a proposition"--but is it possible for me *not* to accept the figure shewing the arrangement of the pieces as proof that these pieces can be arranged to have this periphery?

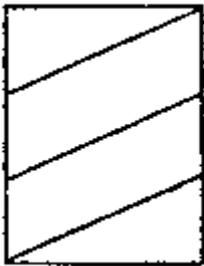

Page Break 57

Page 57

49. But now imagine that one of the pieces is lying so as to be the *mirror-image* of the corresponding part of the pattern. Now you want to arrange the figure according to the pattern; you see it must work, but you never hit on the idea of turning the piece over, and you find that you do not succeed in fitting the puzzle together.

Page 57

50. A rectangle can be made of two parallelograms and two triangles. Proof:

A child would find it difficult to hit on the composition of a rectangle with these parts, and would be surprised by the fact that two sides of the parallelograms make a straight line, when the parallelograms are, after all, askew. It might strike him as if the rectangle came out of these figures by something like magic. True, he has to admit that they do form a rectangle, but it is by a trick, by a distorted arrangement, in an unnatural way.

I can imagine the child, after having put the two parallelograms together in *this* way, not believing his eyes when he sees that they fit like *that*. '*They don't look* as if they fitted together like that.' And I could imagine its being said: It's only through some hocus-pocus that it looks to us as if *they* yielded the rectangle--in reality they have changed their nature, they aren't the parallelograms any more.

Page 57

51. "You admit *this*--then you must admit *this* too."--He *must* admit it--and all the time it is possible that he does not admit it! You want to say: "if he *thinks*, he must admit it".

Page Break 58

Page 58

"I'll shew you why you have to admit it."--I shall bring a case before your eyes which will determine you to judge this way if you think about it.

Page 58

52. Now, how can the manipulations of the proof make him admit anything?

Page 58

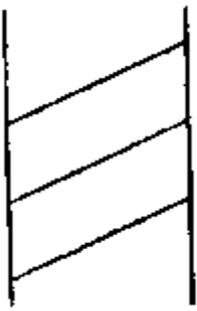

53. "Now you will admit that 5 consists of 3 and 2."

I will only admit it, if that is not to admit anything.--Except that I want to use *this picture*.

Page 58

54. One might for example take this figure

as a proof of the fact that 100 parallelograms arranged like this must yield a straight strip. Then, when one actually does put 100 together, one gets e.g. a slightly curved strip.--But the proof has determined us to use this picture and form of expression: if they don't yield a straight strip, they were not accurately constructed.

Page Break 59

Page 59

55. Just think, how can the picture (or procedure) that you shew me now oblige me always to judge in such-and-such a way?

Page 59

If what we have here is an experiment, then surely *one* is too little to bind me to any judgment.

Page 59

56. The one who is offering the proof says: "Look at this figure. What shall we say about it? Surely that a rectangle consists of...?--"

Or again: "Now, surely you call this a 'parallelogram' and this a 'triangle', and *this* is what it is like for one figure to consist of others".

Page 59

57. "Yes, you have convinced me that a rectangle always consists of..."--Should I also say: "Yes, you have convinced me that *this* rectangle (the one in the proof) consists of..."? For wouldn't this be the more modest proposition, which you ought to grant even if perhaps you don't yet grant the general proposition? But oddly enough if *that* is what you grant, you seem to be granting, not the more modest geometrical proposition, but what is not a proposition of geometry at all. Of course not--for as regards the rectangle in the proof he didn't convince me of anything. (I shouldn't have been in any doubt about this figure, if I had seen it previously.) As far as concerns this figure I acknowledged everything of my own accord. And he merely used it to make me realize something.--But on the other hand, if he didn't convince me of anything as regards this rectangle, then how has he convinced me of a property of other rectangles?

Page 59

58. "True, this shape doesn't look as if it could consist of two skew parts."

What are you surprised at? Surely not at seeing this figure. It is something *in* the figure that surprises me.--But there isn't anything going on in the figure!

Page Break 60

Page 60

What surprises me is the way straight and skew go together. It makes me as it were dizzy.

Page 60

59. But I do actually say: "I have convinced myself that this figure can be constructed with these pieces", e.g. I have seen a picture of the solution of the puzzle.

Now if I say this to somebody it is surely supposed to mean: "Just try: these bits, properly arranged, really do yield the figure". I want to encourage him to do something and I forecast that he will succeed. And the forecast is founded on the ease with which we can construct the figure from the pieces as soon as we know *how*.

Page 60

60. You say you are astonished at what the proof shews you. But are you astonished at its having been possible to draw these lines? No. You are only astonished when you tell yourself that two bits like this *yield* this shape. When, that is, you think yourself into the situation of seeing the result after having expected something different.

Page 60

61. "*This* follows inexorably from *that*."--True, in this demonstration this issues from that.

This is a demonstration for whoever acknowledges it as a demonstration. If anyone *doesn't* acknowledge it, doesn't go by it as a demonstration, then he has parted company with us even before anything is said.

62.

Here we have something that looks inexorable--. And yet it can be 'inexorable' only in its consequences! For otherwise it is nothing but a picture.

What does the action at a distance--as it might be called--of this pattern consist in?

Page 61

63. I have read a proof--and now I am convinced.--What if I straightway forgot this conviction?

For it is a peculiar procedure: I *go through* the proof and then accept its result.--I mean: this is simply what we *do*. This is use and custom among us, or a fact of our natural history.

Page 61

64. 'If I have *five*, then I have *three* and *two*.'--But how do I know that I have five?--Well, if it looks like this: |||||.--And is it also certain that when it looks like *this*, I can always split it up into groups like *those*?

It is a fact that we can play the following game: I teach someone what a group of two, three, four, or five, is like, and I teach him how to put strokes into one-to-one correspondence; then I always make him carry out the order "Draw a group of five" twice--and then I teach him to carry out the order: "Correlate these two groups"; and here it proves that he practically *always* correlates the strokes without remainder.

Or again: it is a fact that I *practically never* get into difficulties in correlating what I have drawn as groups of five.

Page Break 62

Page 62

65. I have to assemble the puzzle, I try it this way and that, am doubtful whether I shall do it. Next someone shows me a picture of the solution, and I say without any sort of doubt--"Now I can do it!"--Then am I *certain* to do it now?--The fact, however, is: I don't have any doubt.

Suppose someone now asked: "What does the action at a distance of the picture consist in?"--In the fact that I apply it.

Page 62

66. *In a demonstration we get agreement* with someone. If we do not, then we've parted ways before ever starting to communicate in this language.

It is not essential that one should talk the other over by means of the demonstration. Both might see it (read it), and accept it.

Page 62

67. "But you can see--there can't be any doubt, that a group like *A* consists essentially of one like *B* and one like *C*."--I too say--i.e.

this is how I too express myself--that the group drawn there consists of the two smaller ones; but I don't know whether every group which I should call the same in kind (or form) as the first will necessarily be composed of two groups of the same kind as the smaller ones.--But I believe that it will probably always be so (perhaps experience has taught me this), and that is why I am willing to accept the rule: I will say that a group is of the form *A* if and only if it can be split up into two groups like *B* and *C*.

Page Break 63

Page 63

68. And this too is how the drawing (50) works as a proof. "True enough! Two parallelograms together do make this shape!" (That is very much as if I were to say: "Actually, a curve can consist of straight bits.")--I shouldn't have thought it. Thought what? That the parts of this figure yield this figure? No, not *that*. For that doesn't mean anything.--My surprise is only when I think of myself unwittingly fitting the top parallelogram on to the bottom one, and then seeing the result.

Page 63

69. And it could be said: What the proof made me realize--*that's* what can surprise me.

Page 63

70. For why do I say that the figure (50) makes me realize something any more than this one:

After all it too shews that two bits like that yield a rectangle. "But that isn't interesting", we want to say. And why is it uninteresting?

Page 63

71. When one says: "This shape consists of these shapes"--one is thinking of the shape as a fine drawing, a fine frame of this shape, on which, as it were, things which have this shape are stretched. (Compare Plato's conception of properties as ingredients of a thing.)

Page Break 64

Page 64

72. "This shape consists of these shapes. You have shewn the essential property of this shape."--You have shewn me a new *picture*.

It is as if *God* had constructed them like that.--*So we are employing a simile*. The *shape* becomes an ethereal entity which has this shape; it is as if it had been constructed like this once for all (by whoever put the essential properties into things). For if the shape is to be a thing consisting of parts, then the pattern-maker who made the shape is he who also made light and dark, colour and hardness, etc. (Imagine someone asking: "The shape... is made up of these parts; who made it? You?")

The word "being" has been used for a sublimed ethereal kind of existence. Now consider the proposition "Red *is*" (e.g.). Of course no one ever uses it; but if I had to invent a use for it all the same, it would be this: as an introductory formula to statements which went on to make use of the word "red". When I pronounce the formula I look at a sample of the colour red.

One is tempted to pronounce a sentence like "red *is*" when one is looking attentively at the colour; that is, in the same *situation* as that in which one observes the existence of a thing (of a leaflike insect, for example).

And I want to say: when one uses the expression, "the proof has taught me--shewn me--that this is the case", one is still using this simile.

Page 64

73. I could also have said: it is not the property of an object that is ever 'essential', but rather the mark of a concept.

Page 64

74. "If the form of the group was the same, then it must have had the same aspects, the same possibilities of division. If it has different ones then it isn't the same form; perhaps it somehow made the same

Page Break 65

impression on you; but it is the *same form* only if you can divide it up in the same way."

It is as if this expressed the essence of form.--I say, however: if you talk about *essence*--, you are merely noting a convention. But here one would like to retort: there is no greater difference than that between a proposition about the depth of the essence and one about--a mere convention. But what if I reply: to the *depth* that we see in the essence there corresponds the *deep* need for the convention.

Thus if I say: "It's as if this proposition expressed the *essence* of form"--I mean: it is as if this proposition expressed a property of the entity *form*!--and one can say: the entity of which it asserts a property, and which I here call the entity 'form', is the picture which I cannot help having when I hear the word "form".

Page 65

75. But what sort of properties of the hundred marbles did you unfold, or display?†1--Well, that these things can be done with them.--But *what* things? Do you mean that you were able to move them about like that, that they weren't glued on to the table top?--Not so much that, as that they have gone into these formations without any loss or addition.--So you have shewn the physical properties of the row. But why did you use the expression "unfolded"? You would not have spoken of unfolding the properties of a bar of iron by shewing that it melts at such

and such a temperature. And mightn't you as well say that you unfolded the properties of our memory for numbers, as the properties of the row (e.g.)? For what you really do *unfold*, or *lay out*, is the row of marbles.--And you shew e.g. that if a row looks thus and thus, or is numbered with roman numerals in this way, it can be brought into that other memorable arrangement in a simple way, and without addition or loss of any marble. But this could after all equally well have been a psychological experiment shewing that you *now* find memorable certain patterns into which 100 spots are made merely by shifting them about.

Page Break 66

Page 66

"I have shewn what can be done with 100 marbles."--You have shewn that *these* 100 marbles (or those marbles over there), can be laid out in this way. The experiment was one of laying out (as opposed say to one of burning).

And the psychological experiment might for example have shewn how easy it is for you to be deceived: i.e. that you don't notice if marbles are smuggled into or out of the row. One could also say *this*: I have shewn what can be made of a row of 100 spots by means of apparent shifts,--what figures can be got out of it by apparent shifts.--But what did I unfold in this case?

Page 66

76. Imagine it were said: we unfold the properties of a polygon by using diagonals to take the sides together three at a time. It then proves to be a figure with 24 angles. Do I want to say I have unfolded a property of the 24-angled polygon? No. I want to say I have unfolded a property of this polygon (the one drawn here). I now know that there is drawn here a figure with 24 angles.

Is this an experiment? It shews me e.g. what kind of polygon is drawn here now. What I did can be called an experiment in counting.

But what if I perform such an experiment on a pentagon, which I can already take in at a glance?--Well, let us assume for a moment that I could not take it in at a glance,--which (e.g.) may be the case if it is very big. Then drawing the diagonals would be a way of finding out that this is a pentagon. I could once more say I had unfolded the properties of the polygon drawn here.--Now if I can take it in at a glance then surely nothing *about it* can be changed. It was, perhaps, superfluous to unfold this property, as it is superfluous to count two apples which are before my eyes.

Page Break 67

Page 67

Ought I to say now: "It was an experiment again, but I was certain of the result"? But am I certain of the result in the way I am certain of the result of the electrolysis of a mass of water? No, but in another way. If the electrolysis of the liquid did not yield..., I should consider myself crazy, or say that I no longer have any idea what to say.

Imagine I were to say: "Yes, here is a square,--but still let's look and see whether a diagonal divides it into two triangles". Then I draw the diagonal and say: "Yes, here we have two triangles". Here I should be asked: Couldn't you *see* that it could be divided into two triangles? Have you only just convinced yourself that there is a square here; and why trust your eyes now rather than before?

Page 67

77. Exercises: Number of notes--the internal property of a tune; number of leaves--the external property of a tree. How is this connected with the identity of the concept? (Ramsey.)

Page 67

78. If someone splits up four marbles into two and two, puts them together again, splits them up again and so on, what is he shewing us? He is impressing on us a physiognomy and a typical alteration of this physiognomy.

Page 67

79. Think of the possible postures of a puppet. Or suppose you had a chain of, say, ten links, and you were shewing what kind of characteristic (i.e. memorable) figures it can be made into. Let the links be numbered; in this way they become an easily memorable structure even when they lie in a straight line.

So I impress characteristic positions and movements of this chain on you.

If I now say: "Look, *this* can be made of it too" and display it, am I shewing you an experiment?--It may be; I am shewing for

Page Break 68

example that it can be got into this shape: but that you didn't doubt. And what interests you is not something to do

with this individual chain.--But all the same isn't what I am displaying a property of this chain? Certainly: but I only display such movements, such transformations, as are of a memorable kind; and it interests you to *learn* these transformations. But the reason why it interests you is that it is so easy to reproduce them again and again in different objects.

Page 68

80. The words "look what I can make with it--" are indeed the same as I should use if I were shewing what I can make with a lump of clay, for example. E.g. that I am clever enough to make such things with this lump. In another case: that this material can be dealt with like *this*. Here I should hardly be said to be 'drawing your attention to' the fact that I can do this, or that the material can stand this;--while in the case of the chain one would say: I draw your attention to the fact that this can be done with it.--For you could also have *imagined* it. But of course you can't get to know any property of the material by imagining.

The experimental character disappears when one looks at the process simply as a memorable picture.

Page 68

81. What I unfold may be said to be the *role* which '100' plays in our calculating system.

Page 68

82. (I once wrote: "In mathematics process and result are equivalent.")† 1

Page Break 69

Page 69

83. And yet I feel that it is a property of '100' that it is, or can be, produced in this way. But then how can it be a property of the structure '100' to be produced in this way, if e.g. it didn't get produced in this way at all? If no one multiplied in this way? Surely only if one could say, it is a property of this sign to be the subject of this rule. For example it is the property of '5' to be the subject of the rule ' $3 + 2 = 5$ '. For only as the subject of the rule is this number *the* result of the addition of the other numbers.

But suppose I now say: it is a property of the number... to be the result of the addition of... according to the rule...?--So it is a property of the number that it arises when we apply this rule to these numbers. The question is: should we call it 'application of the rule', if this number were *not* the result? And that is the same question as: "What do you understand by 'application of this rule': what you e.g. do with it (and you may apply it at one time in this way, at another in that), or is 'its application' otherwise explained?"

Page 69

84. "It is a property of this number that this process leads to it.--"But, mathematically speaking, a process does not lead to it; it is the end of a process (is itself part of the process).

Page 69

85. But why do I feel that a property of the row is unfolded, is shewn?--Because I alternately look at what is shewn as essential and as nonessential to the row. Or again: because I think of these properties alternately as external and as internal. Because I alternately take something as a matter of course and find it noteworthy.

Page 69

86. "You surely unfold the properties of the hundred marbles

Page Break 70

when you shew what can be made of them."--Can be made of them *how*? For, that it *can* be made of them no one has doubted, so the point must be the *kind of way* it is produced from them. But look at that, and see whether it does not perhaps itself presuppose the result.--

For suppose that in *that way* you got one time this and another time a different result; would you accept this? Would you not say: "I must have made a mistake; the *same* kind of way would always have to produce the same result". This shows that you are incorporating the result of the transformation into the kind of way the transforming is done.

Page 70

87. Exercise: am I to call it a fact of experience that *this* face turns into *that* through *this* alteration? (How must '*this* face', '*this* alteration' be explained so as to...?)

Page 70

88. One says: this division *makes it clear* what kind of row of marbles we have here. Does it make it clear what kind of row it *was* before the division, or does it make it clear what kind of row it is now?

Page 70

89. "I can see at a glance how many there are." Well, how many are there? Is the answer "*so* many"?--(pointing to the group of objects). How does the answer go, though? There are '50', or '100', etc.

90. "The division makes it clear to me what kind of row it is." Well, what kind of row is it? Is the answer "*this kind*"? How does a significant answer run?

91. Now I am surely also unfolding the geometrical properties of this chain, if I display the transformations of another, similarly constructed, chain. What I do, however, does not shew what I can in fact do with the first one, if it in fact should prove inflexible or in some other way physically unsuitable.

So after all I cannot say: I unfold the *properties of this chain*.

92. Can one unfold properties of the chain which it doesn't possess at all?

93. I measure a table; it is one yard long.--Now I put one yardstick up against another yardstick. Am I measuring it by doing that? Am I finding out that the second yardstick is a yard long? Am I making the same experiment of measuring, only with the difference that I am certain of the outcome?

94. And when I put the ruler up against the table, am I always measuring the table; am I not sometimes checking the ruler? And in what does the distinction between the one procedure and the other consist?

95. The experiment of laying a row out may shew us, among other things, how many marbles the row consists of, or on the other hand that we can move these (say) 100 marbles in such-and-such ways.

But when we calculate how the row can be laid out, the calculation shews us what we call a 'transformation merely by laying out'.

96. Examine this proposition: it is not an *empirical* *[[sic]]* fact that the tangent of a visual curve partly coincides with the curve; and if a figure shews this, then it does not do so as the result of an experiment.

It could also be said: here you can see that segments of a continuous visual curve are straight.--But ought I not to have said:--"Now you call this a 'curve'.--And do you call this little bit of it 'curved' or 'straight'?--Surely you call it a 'straight line'; and the curve contains this bit."

But why should one not use a new name for visual stretches of a curve which themselves exhibit no curvature?

"But the experiment of drawing these lines has shewn that they do not touch at a *point*."--That *they* do not touch at a point? How are '*they*' defined? Or again: can you point to a picture of what it is like for them to 'touch at a point'? Why shouldn't I simply say the experiment has yielded the result that they, i.e. a curved and a straight line, touch one another? For *isn't* this what I call a "touching" of such lines?

97. Let us draw a circle composed of black and white segments getting smaller and smaller.

"Which is the first of these segments--going from left to right--that strikes you as straight?" Here I am making an experiment.

98. What if someone were to say "Experience tells me that this line

is curved"?--Here it would have to be said that the words "this line" mean the line drawn on the paper. The experiment can actually be made, one can show this line to different people and ask: "What do you see, a straight line or a curved one?"--

But suppose someone were to say: "I am now imagining a curved line", whereupon we tell him: "So you see that the line is a curved one"--what kind of sense would that make?

One can however also say: "I am imagining a circle made of black and white segments; one is big and curved, the ones that come after it keep on getting smaller, the sixth is quite straight". Where is the experiment here?

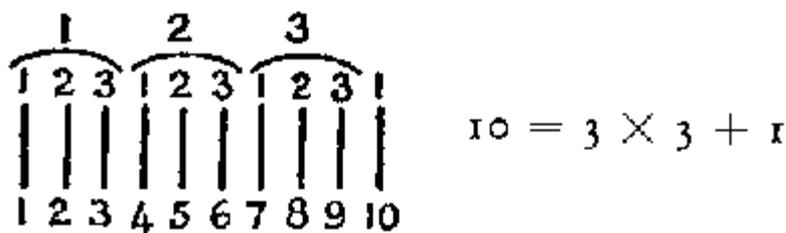

I can *calculate* in the medium of imagination, but not experiment.

Page 73

99. What is the characteristic use of the derivation procedure as a *calculation*--as opposed to its use as an experiment?

We regard the calculation as demonstrating an *internal property* (a property of the *essence*) of the structures. But what does that mean?

The following might serve as a model of an 'internal property':

$$10 = 3 \times 3 + 1$$

Now when I say: 10 strokes necessarily consist of 3 times 3 strokes and 1 stroke--that does not mean: if there are 10 strokes there, then

Page Break 74

they have always got these figures and loops round them.--But if I put them in, I say that I was only demonstrating the nature of the group of strokes.--But are you certain that the group did not change while you were writing those symbols in?--"I don't know; but *a* definite number of strokes was there; and if it was not 10 then it was another number, and in that case it simply had different properties.--"

Page 74

100. One says: calculation 'unfolds' the property of a hundred.--What does it really mean to say that 100 consists of 50 and 50? One says: the contents of the box consist of 50 apples and 50 pears. But if someone were to say: "The contents of the box consist of 50 apples and 50 apples"--, to begin with we shouldn't know what he meant.--If one says: "The contents of the box consist of twice 50 apples", this means either that there are two compartments each containing 50 apples; or what is in question is, say, a distribution in which each person is supposed to get 50 apples, and now I hear that two people can be given their share out of this box.

Page 74

101. "The 100 apples in this box consist of 50 and 50"--here the non-temporal character of 'consist' is important. For it doesn't mean that *now*, or just for a time, they consist of 50 and 50.

Page 74

102. For what is the characteristic mark of 'internal properties'? That they persist always, unalterably, in the whole that they constitute; as it were independently of any outside happenings. As the construction of a machine on paper does not break when the machine itself succumbs to external forces.--Or again, I should like to say that they are not subject to wind and weather like physical things; rather are they unassailable, like shadows.

Page Break 75

Page 75

103. When we say: "This proposition follows from that one" here again "to follow" is being used *non-temporally*. (And this shews that the proposition does not express the result of an experiment.)

104. Compare "White is lighter than black". This expression too is non-temporal and it too expresses the existence of an *internal* relation.

105. "But this relation *holds*"--one would like to say. The question is: has this proposition a use--and what use? For at the moment all I know is that a picture comes before my mind as I say it (but that does not guarantee the use for me) and that the words form an English sentence. But it sticks out that the words are being used otherwise here than in the everyday case of a useful statement. (As, say, a wheelwright may notice that the statements that he ordinarily makes about what is circular and straight are of a different kind from what are to be found in Euclid.) For we say: this *object* is lighter than that one, or the colour of this thing is lighter than the colour of that one, and in this case something is lighter now and may be darker later on.

Whence comes the feeling that "white is lighter than black" expresses something about the *essence* of the two colours?--

But is this the right question to ask? For what do we mean by the 'essence' of white or black? We think perhaps of 'the inside', 'the constitution', but this surely makes no sense here. We also say e.g.: "It is part of white to be lighter than...".

Is it not like this: the picture of a black and a white patch

serves us *simultaneously* as a paradigm of what we understand by "lighter"

and "darker" and as a paradigm for "white" and for "black". Now darkness 'is part of black *inasmuch as* they are *both* represented by this patch. It is dark *by* being black.--But to put it better: it *is called* "black" and hence in our language "dark" too. That connexion, a connexion of the paradigms and the names, is set up in our language. And our proposition is non-temporal because it only expresses the connexion of the words "white", "black" and "lighter" with a paradigm.

Misunderstandings can be avoided by declaring it nonsense to say: "the colour of this body is brighter than the colour of that one"; what would have to be said is "this body is brighter than that one". I.e. the former way of putting it is excluded from our language.

Whom do we tell "White is lighter than black"? What information does it give?

106. But can't I believe the geometrical proposition even without a proof, for example on someone else's assurance?--And what does the proposition lose in losing its proof?--Here I presumably ought to ask: "What can I do with it?", for that is the point. *Accepting* the proposition on someone else's assurance--how does my doing this come out? I may for example use it in further calculating operations, or I use it in judging some physical fact. If someone assures me, for example, that 13×13 are 196 and I believe him, then I shall be surprised that I can't arrange 196 nuts in 13 rows of 13 each, and I shall perhaps assume that the nuts have increased of themselves.

But I feel a temptation to say: one can't *believe* that $13 \times 13 = 196$, one can only *accept* this number mechanically from somebody else. But why should I not say I believe it? For is believing it a mysterious act with as it were an underground connexion with the correct calculation? At any rate I can *say*: "I believe it", and act accordingly.

One would like to ask: "What are you doing in believing that $13 \times 13 = 196$?" And the answer may be: Well, that will depend on whether, for instance, you did the sum and made a slip of the pen in doing so,--or whether somebody else did it, but you yourself know how such a calculation is done,--or whether you cannot multiply but know that the product is the number of people to be found in 13 rows of 13 each,--in short it depends on what you can do with the equation $13 \times 13 = 196$. For testing it is doing something with it.

107. The thing is, if one thinks of an arithmetical equation as the expression of an internal relation, then one would like to say: "You can't believe at all that 13×13 yields *this*, because that isn't a multiplication of 13 by 13, or is not a case of something *yielded*, if 196 comes at the end." But that means that one is not willing to use the word "believe" for the case of a calculation and its result,--or is willing only in the case in which one has a correct

calculation before one.

Page 77

108. "What are you believing if you believe $13 \times 13 = 196$?--"How deep do you penetrate, one might say, with your belief, into the relation of these numbers? For--one wants to say--you cannot be penetrating all the way, or you could not believe it.

But when have you penetrated into the relations of the numbers? Just while you say that you believe...? You will not take your stand on that--for it is easy to see that this appearance is merely produced by the superficial form of our grammar (as it might be called).

Page 77

109. For I want to say: "One can only *see* that $13 \times 13 = 169$, and even that one can't *believe*. And one can--more or less blindly--accept a rule". And what am I doing if I say this? I am *drawing a line* between

Page Break 78

the *calculation* with its result (that is to say a particular picture, a particular model), and an experiment with its outcome.

Page 78

110. I should like to say: "When I believe that $a \times b = c$ --and I do sometimes have such beliefs--do say that I have them--I am not believing the mathematical proposition, for that comes at the end of a proof, is the end of a proof; I am believing that this is the formula that comes in such-and-such a place, which I shall obtain in such-and-such a way, and so on".--And this does sound as if I were penetrating the process of believing such a proposition. Whereas I am merely--in an unskilful fashion--pointing to the *fundamental* difference, together with an apparent similarity, between the roles of an arithmetical proposition and an empirical proposition.

For in certain circumstances I do *say*: "I believe that $a \times b = c$ ". What do I *mean* by this?--What I *say*!--But what *is* interesting is the question in what circumstances I say this and what is characteristic of them in contrast to those of a statement like: "I believe it is going to rain". For what preoccupies us is this contrast. What we require is a picture of the employment of mathematical propositions and of sentences beginning "I believe that...", where a mathematical proposition is the object of belief.

Page 78

111. "But you surely don't believe a mathematical proposition."--That means: 'Mathematical proposition' signifies a role for the proposition, a function, in which believing does not occur.

Compare: "If you say: 'I believe that castling takes place in such and such a way', then you are not believing the rule of chess, but believing e.g. that a rule of chess runs like *that*".

Page Break 79

Page 79

112. "One can't *believe* that the multiplication 13×13 yields 169, because the result is part of the calculation."--What am I calling "the multiplication 13×13 "? Only the correct pattern of multiplication, at the end of which comes 169? Or a 'wrong multiplication' too?

How is it established which pattern is the multiplication 13×13 ?--Isn't it *defined* by the rules of multiplication?--But what if, using these rules, you get different results today from what all the arithmetic books say? Isn't that possible?--"Not if you apply the rules as *they* do!" Of course not! But that is a mere pleonasm. And where does it say how they are to be applied--and if it does say somewhere, where does it say how *that* is to be applied? And that does not mean only: in what book does it say, but also: in what *head*?--What then is the multiplication 13×13 --or what am I to take as a guide in multiplying--the rules, or the multiplication that comes in the arithmetic books--if, that is, these two do not agree?--Well, it never in fact happens that somebody who has learnt to calculate goes on obstinately getting different results, when he does a given multiplication, from what comes in the arithmetic books. But if it should happen, then we should declare him abnormal, and take no further account of his calculation.

Page 79

113. "But am I not compelled, then, to go the way I do in a chain of inferences?"--Compelled? After all I can presumably go as I choose!--"But if you want to remain in accord with the rules you *must* go this way."--Not at all, I call *this* 'accord'.--"Then you have changed the meaning of the word 'accord', or the meaning of the rule."--No;--who says what 'change' and 'remaining the same' mean here?

However many rules you give me--I give a rule which justifies *my* employment of your rules.

Page Break 80

Page 80

114. We might also say: when we *follow* the laws of inference (inference-rules) then following always

involves interpretation too.

Page 80

115. "But you surely can't suddenly make a different application of the law now!"--If my reply is: "Oh yes of course, *that* is how I was applying it!" or: "Oh! *That's* how I ought to have applied it--!"; then I am playing your game. But if I simply reply: "Different?--But this surely *isn't* different!"--what will you do? That is: somebody may reply like a rational person and yet not be playing our game.†1

Page 80

116. "Then according to you everybody could continue the series as he likes; and so infer *anyhow!*" In that case we shan't call it "continuing the series" and also presumably not "inference". And thinking and inferring (like counting) is of course bounded for us, not by an arbitrary definition, but by natural limits corresponding to the body of what can be called the role of thinking and inferring in our life.

For we are at one over this, that the laws of inference do not compel him to say or to write such and such like rails compelling a locomotive. And if you say that, while he may indeed *say* it, still he can't *think* it, then I am only saying that that means, not: try as he may he can't think it, but: it is for us an essential part of 'thinking' that--in talking, writing, etc.--he makes *this sort* of transition. And I say further that the line between what we include in 'thinking' and what we no longer include in 'thinking' is no more a hard and fast one than the line between what is still and what is no longer called "regularity".

Nevertheless the laws of inference can be said to compel us; in the

Page Break 81

same sense, that is to say, as other laws in human society. The clerk who infers as in (17) *must* do it like that; he would be punished if he inferred differently. If you draw different conclusions you do indeed get into conflict, e.g. with society; and also with other practical consequences.

And there is even something in saying: he can't *think* it. One is trying e.g. to say: he can't fill it with personal content; he can't really *go along with it*--personally, with his intelligence. It is like when one says: this sequence of notes makes no sense, I can't sing it with expression. I cannot *respond* to it. Or, what comes to the same thing here: I don't respond to it.

"If he says it"--one might say--"he can only say it without thinking". And here it merely needs to be noticed that 'thoughtless' talk and other talk do indeed sometimes differ as regards what goes on in the talker, his images, sensations and so on while he is talking, but that this accompaniment does not constitute the thinking, and the lack of it is not enough to constitute 'thoughtlessness'.

Page 81

117. In what sense is logical argument a compulsion?--"After all you grant *this* and *this*; so you must also grant *this!*" That is the way of compelling someone. That is to say, one can in fact compel people to admit something in this way.--Just as one can e.g. compel someone to go over there by pointing over there with a bidding gesture of the hand.

Suppose in such a case I point with two fingers at once in different directions, thus leaving it open to the man to go in which of the two directions he likes,--and another time I point in only *one* direction; then this can also be expressed by saying: my first order did not compel him to go just in *one* direction, while the second one did. But this is a statement to tell us what kind of orders I gave; not the way they operate, not whether they do in fact compel such-and-such a person, i.e. whether he obeys them.

Page Break 82

Page 82

118. It looked at first as if these considerations were meant to shew that 'what seems to be a logical compulsion is in reality only a psychological one'--only here the question arose: am I acquainted with both kinds of compulsion, then?!

Imagine that people used the expression: "The law §... punishes a murderer with death". Now this could only mean: this law runs so and so. That form of expression, however, might force itself on us, because the law is an instrument when the guilty man is brought to punishment.--Now we talk of 'inexorability' in connexion with people who punish. And here it might occur to us to say: "The law is *inexorable*--men can let the guilty go, the law executes him". (And even: "the law *always* executes him".)--What is the use of such a form of expression?--In the first instance, this proposition only says that such-and-such is to be found in the law, and human beings sometimes do not go by the law. Then, however, it does give us a picture of a single inexorable judge, and many lax judges. That is why it serves to express respect for the law. Finally, the expression can also be so used that a law is called inexorable when it makes no provision for a possible act of grace, and in the opposite case it is perhaps called 'discriminating'.

Now we talk of the 'inexorability' of logic; and think of the laws of logic as inexorable, still more inexorable than the laws of nature. We now draw attention to the fact that the word "inexorable" is used in a variety of ways. There correspond to our laws of logic very general facts of daily experience. They are the ones that make it possible for us to keep on demonstrating those laws in a very simple way (with ink on paper for example). They are to be compared with the facts that make measurement with a yardstick easy and useful. This suggests the use of precisely these laws of inference, and now it is *we* that are inexorable in applying these laws. Because we '*measure*'; and it is part of measuring for everybody to have the same measures. Besides this, however, inexorable, i.e. *unambiguous* rules of inference can be distinguished from ones that are not unambiguous, I mean from such as leave an alternative open to us.

Page Break 83

Page 83

119. "But I can infer only what actually does follow."--That is to say: what the logical machine really does produce. The logical machine--that would be an all-pervading ethereal mechanism.--We must give warning against this picture.

Imagine a material harder and more rigid than any other. But if a rod made of this stuff is brought out of the horizontal into the vertical, it shrinks; or it bends when set upright and at the same time it is so hard that there is no other way of bending it.--(A mechanism made of this stuff, say a crank, connecting-rod and crosshead. The different way the crosshead would move.)

Or again: a rod bends if one brings a certain mass near it; but it is completely rigid in face of all forces that we subject it to. Imagine that the guide-rails of the crosshead bend and then straighten again as the crank approaches and retreats. My assumption would be, however, that no particular external force is necessary to cause this. This behaviour of the rails would give an impression as of something alive.

When we say: "If the parts of the mechanism were quite rigid, they would move so and so", what is the criterion for their being quite rigid? Is it that they resist certain forces? Or that they do move so and so?

Suppose I say: "This is the law of motion of the crosshead (the correlation of its position and the position of the crank perhaps) when the lengths of the crank and connecting-rod remain constant". This presumably means: If the crank and crosshead keep these relative positions, I say that the length of the connecting-rod remains constant.

Page 83

120. "If the parts were perfectly rigid this is how they would move"; is that a hypothesis? It seems not. For when we say: "Kinematics describes the movements of the mechanism on the assumption that its parts are completely rigid", on the one hand we are admitting that this assumption never squares with reality, and on the other hand it

Page Break 84

is not supposed to be in any way doubtful that completely rigid parts would move in this way. But whence this certainty? The question here is not really one of certainty but of something stipulated by us. We do not *know* that bodies would move in these ways if (by such and such criteria) they were quite rigid; but (in certain circumstances) we should certainly *call* 'rigid' such parts as did move in those ways.--Always remember in such a case that geometry (or kinematics) does not specify any method of measuring when it talks about the same, or constant, length.

When therefore we call kinematics the theory, say, of the movement of perfectly rigid parts of a mechanism, on the one hand this contains an indication as to (mathematical) method--we stipulate certain distances as the lengths of machine parts that do not alter--and on the other hand an *indication* about the application of the calculus.

Page 84

121. The hardness of the logical *must*. What if one were to say: the *must* of kinematics is much harder than the causal *must* compelling a machine part to move like *this* when another moves like *this*?--

Suppose we represented the movement of the 'perfectly rigid' mechanism by a cinematographic picture, a cartoon film. Suppose this picture were said to be *perfectly hard*, and this meant that we had taken this picture as our method of description--whatever the facts may be, however the parts of the real mechanism may bend or expand.

Page 84

122. The machine (its structure) as symbolizing its action: the action of a machine--I might say at first--seems to be there in it from the start. What does that mean?--

Page 84

If we know the machine, everything else, that is its movement, seems

to be already completely determined.

"We talk as if these parts *could* only move in this way, as if they could not do anything else."

How is this--do we forget the possibility of their bending, breaking off, melting, and so on? Yes; in *many* cases we don't think of that at all. We use a machine, or the picture of a machine, to symbolize a particular action of the machine. For instance, we give someone such a picture and assume that he will derive the movement of the parts from it. (Just as we can give someone a number by telling him that it is the twenty-fifth in the series 1, 4, 9, 16,)

"The machine's action seems to be in it from the start" means: you are inclined to compare the future movements of the machine in definiteness to objects which are already lying in a drawer and which we then take out.

But we do not say this kind of thing when we are concerned with predicting the actual behaviour of a machine. Here we do not in general forget the possibility of a distortion of the parts and so on.

We do talk like that, however, when we are wondering at the way we can use a machine to symbolize a given way of moving--since it can also move in quite *different* ways.

Now, we might say that a machine, or the picture of it, is the first of a series of pictures which we have learnt to derive from this one.

But when we remember that the machine could also have moved differently, it readily seems to us as if the way it moves must be contained in the machine-as-symbol far more determinately than in the actual machine. As if it were not enough here for the movements in question to be empirically determined in advance, but they had to be really--in a mysterious sense--already *present*. And it is quite true: the movement of the machine-as-symbol is predetermined in a different sense from that in which the movement of any given actual machine is predetermined.

123. "It is as if we could grasp the whole use of the word in a flash." Like *what* e.g.?--Can't the use--in a certain sense--be grasped in a flash? And in *what* sense can it not? The point is, that it is as if we could 'grasp it in a flash' in yet another and much more direct sense than that.--But have you a model for this? No. It is just that this expression suggests itself to us. As the result of crossing similes.

124. You have no model of this superlative fact, but you are seduced into using a *super-expression*.

125. When does one have the thought: the possible movements of a machine are already there in it in some mysterious way?--Well, when one is doing philosophy. And what leads us into thinking that? The way we talk about machines. We say, for example, that a machine *has* (*possesses*) such-and-such possibilities of movement; we speak of the ideally rigid machine which *can* only move in such-and-such a way.--What is this *possibility* of movement? It is not the *movement*, but it does not seem to be the mere physical *conditions* for moving either, e.g. that there is a certain space between socket and pin, the pin not fitting too tight in the socket. For while this is the *empirical* condition for movement, one could also imagine it to be otherwise. The possibility of a movement is, rather, supposed to be a shadow of the movement itself. But do you know of such a shadow? And by a shadow I do not mean some picture of the movement; for such a picture would not necessarily be a picture of just *this* movement. But the possibility of this movement must be the possibility of just this movement. (See how high the seas of language run here!)

The waves subside as soon as we ask ourselves: how do we use the

phrase "possibility of movement" when we are talking about a given machine?--But then where did our queer ideas come from? Well, I shew you the possibility of a movement, say by means of a *picture* of the movement: 'so possibility is something which is like reality'. We say: "It isn't moving yet, but it already has the possibility of moving"--'so possibility is something very near reality'. Though we may doubt whether such-and-such physical

conditions make this movement possible, we never discuss whether *this* is the possibility of this or of that movement: 'so the possibility of the movement stands in a unique relation to the movement itself; closer than that of a picture to its subject'; for it can be doubted whether a picture is the picture of this thing or that. We say "Experience will shew whether this gives the pin this possibility of movement", but we do not say "Experience will shew whether this is the possibility of this movement": 'so it is not an empirical fact that this possibility is the possibility of precisely this movement'.

Page 87

We pay attention to the expressions we use concerning these things; we do not understand them, however, but misinterpret them. When we do philosophy we are like savages, primitive people, who hear the expressions of civilized men, put a false interpretation on them, and then draw queer conclusions from it.

Page 87

Imagine someone not understanding our past tense: "he has had it".--He says: "he *has*'--that's present, so the proposition says that in some sense the past is present."

Page 87

126. "But I don't mean that what I do now (in grasping a sense) determines the future use *causally* and as a matter of experience, but that in a *queer* way, the use itself is in some sense present." But of course it is, 'in *some* sense'! (And don't we also say: "the events of the years that are past are present to me"?) Really the only thing wrong with what you say is the expression "in a queer way". The rest is

Page Break 88

correct; and the sentence only seems queer when one imagines a different language-game for it from the one in which we actually use it. (Someone once told me that as a child he had wondered how a tailor '*sewed a dress*'--he thought this meant that a dress was produced *just by sewing*, by sewing one thread on to another.)

Page 88

127. In our failure to understand the use of a word we take it as the expression of a queer *process*. (As we think of time as a queer medium, of the mind as a queer kind of being.)

The difficulty arises in all these cases through mixing up "is" and "is called".

Page 88

128. The connexion which is not supposed to be a causal, experiential one, but much stricter and harder, so rigid even, that the one thing somehow already *is* the other, is always a connexion in grammar.

Page 88

129. How do I know that this picture is my image of the *sun*?--I *call* it an image of the sun. I *use* it as a picture of the *sun*.

Page 88

130. "It's as if we could grasp the whole use of the word in a flash."--And that is just what we say we do. That is to say: we sometimes describe what we do in these words. But there is nothing astonishing, nothing queer, about what happens. It becomes queer when we are led to think that the future development must in some way already be

Page Break 89

present in the act of grasping the use and yet isn't present.--For we say that there isn't any doubt that we understand the word..., and on the other hand its meaning lies in its use. There is no doubt that I now want to play *chess*, but chess is the game it is in virtue of *all its rules* (and so on). Don't I know, then, which game I wanted to play until I *have* played it? Or are all the rules contained in my act of intending? Is it experience that tells me that this sort of play usually follows this act of intention? So is it impossible for me to be certain what I am intending to do? And if that is nonsense, what kind of super-strong connexion exists between the act of intending and the thing intended?--Where is the connexion effected between the sense of the expression "Let's play a game of chess" and all the rules of the game?--Well, in the list of rules of the game, in the teaching of it, in the day-to-day practice of playing.

Page 89

131. The laws of logic are indeed the expression of 'thinking habits' but also of the habit of *thinking*. That is to say they can be said to shew: how human beings think, and also *what* human beings call "thinking".

Page 89

132. Frege calls it 'a law about what men take for true' that 'It is impossible for human beings... to recognize an object as different from itself'.†1--When I think of this as impossible for me, then I think of *trying* to do it. So I look at my lamp and say: "This lamp is different from itself". (But nothing stirs.) It is not that I see it is false, I can't do anything with it at all. (Except when the lamp shimmers in sunlight; then I can quite well use the sentence to

Page Break 90

express that.) One can even get oneself into a thinking-cramp, in which one *does* someone trying to think the impossible and not succeeding. Just as one can also *do* someone trying (vainly) to draw an object to himself from a distance by mere willing (in doing this one makes e.g. certain faces, as if one were trying, by one's expression, to give the thing to understand that it should come here.)

Page 90

133. The propositions of logic are 'laws of thought', 'because they bring out the essence of human thinking'--to put it more correctly: because they bring out, or shew, the essence, the technique, of thinking. They shew what thinking is and also shew kinds of thinking.

Page 90

134. Logic, it may be said, shews us what we understand by 'proposition' and by 'language'.

Page 90

135. Imagine the following queer possibility: we have always gone wrong up to now in multiplying 12×12 . True, it is unintelligible how this can have happened, but it has happened. So everything worked out in this way is wrong!--But what does it matter? It does not matter at all!--And in that case there must be something wrong in our idea of the truth and falsity of arithmetical propositions.

Page 90

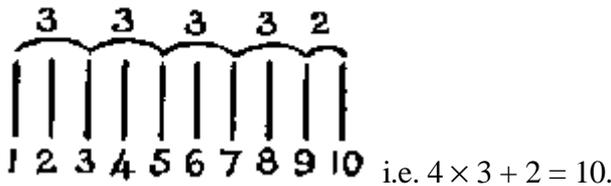

136. But then, is it impossible for me to have gone wrong in my calculation? And what if a devil deceives me, so that I keep on overlooking something however often I go over the sum step by step? So that if I were to awake from the enchantment I should say: "Why, was I blind?"--But what difference does it make for me to 'assume'

Page Break 91

this? I might say: "Yes to be sure, the calculation is wrong--but that is how I calculate. And this is what I now call adding, and this 'the sum of these two numbers'."

Page 91

137. Imagine someone bewitched so that he calculated:

Now he is to apply this calculation. He takes 3 nuts four times over, and then 2 more, and he divides them among 10 people and each one gets *one* nut; for he shares them out in a way corresponding to the loops of the calculation, and as often as he gives someone a second nut it disappears.

Page 91

138. One might also say: in a proof you advance from one proposition to another; but do you also accept a check on whether you have gone right?--Or do you merely say "It *must* be right" and measure everything else by the proposition you arrive at?

Page 91

139. For if *that* is how it is, then you are only advancing from one picture to another.

Page 91

140. It might be practical to measure with a ruler which had the property of shrinking to, say, half its length when it was taken from this room to that. A property which would make it useless as a ruler in other circumstances.

Page Break 92

Page 92

It might be practical, in certain circumstances, to leave numbers out when you were counting a set: to count them: 1, 2, 4, 5, 7, 8, 10.

Page 92

141. What goes on when someone tries to make a shape coincide with its mirror-image by moving it about in the plane, and does not succeed? He puts them one on top of the other in various ways; looks at the parts that don't coincide; is dissatisfied; says perhaps: "But it *must* work", and puts the figures together again in another way.

What happens when someone tries to lift a weight and does not succeed because the weight is too heavy? He assumes such and such a posture, takes hold of the weight, tenses such and such muscles, and then lets go and perhaps shews dissatisfaction.

How does the geometrical, logical impossibility of the first task come out?

"Well, he could surely have shewn, in a picture or in some other way, what the thing he is attempting in the second case looks like." But he asserts that he can do that in the first case too by putting two similar *congruent* figures together so that they coincide.--What are we to say now? That the two examples are different? But so are the picture and the reality in the second case.

Page 92

142. What we are supplying are really remarks on the natural history of man: not curiosities however, but rather observations on facts which no one has doubted and which have only gone unremarked because they are always before our eyes.

Page 92

143. We teach someone a method of sharing out nuts among

Page Break 93

people; a part of this method is multiplying two numbers in the decimal system.

We teach someone to build a house; and at the same time how he is to obtain a sufficient quantity of material, boards, say; and for this purpose a technique of calculation. The technique of calculation is part of the technique of house-building.

People pile up logs and sell them, the piles are measured with a ruler, the measurements of length, breadth and height multiplied together, and what comes out is the number of pence which have to be asked and given. They do not know 'why' it happens like this; they simply do it like this: that is how it is done.--Do these people not calculate?

Page 93

144. If somebody calculates like this must he utter any 'arithmetical *proposition*'? Of course, we teach children the multiplication tables in the form of little *sentences*, but is that essential? Why shouldn't they simply: *learn to calculate*? And when they can do so haven't they learnt arithmetic?

Page 93

145. But in that case how is the *foundation* of a calculating procedure related to the calculation itself?

Page 93

146. "Yes, I understand that this proposition follows from that."--Do I understand *why* it follows or do I only understand *that* it follows?

Page 93

147. Suppose I had said: those people pay for wood on the *ground of calculation*; they accept a calculation as proof that they have to pay so much.--Well, that is simply a description of their procedure (of their behaviour).

Page Break 94

Page 94

148. Those people--we should say--sell timber by cubic measure--but are they right in doing so? Wouldn't it be more correct to sell it by weight--or by the time that it took to fell the timber--or by the labour of felling measured by the age and strength of the woodsman? And why should they not hand it over for a price which is independent of all this: each buyer pays the same however much he takes (they have found it possible to live like that). And is there anything to be said against simply giving the wood away?

Page 94

149. Very well; but what if they piled the timber in heaps of arbitrary, varying height and then sold it at a price proportionate to the area covered by the piles?

And what if they even justified this with the words: "Of course, if you buy more timber, you must pay more"?

Page 94

150. How could I shew them that--as I should say--you don't really buy more wood if you buy a pile covering a bigger area?--I should, for instance, take a pile which was small by their ideas and, by laying the logs around, change it into a 'big' one. This *might* convince them--but perhaps they would say: "Yes, now it's a *lot* of wood and costs more"--and that would be the end of the matter.--We should presumably say in this case: they simply do not mean the same by "a lot of wood" and "a little wood" as we do; and they have a quite different system of payment from us.

Page 94

151. (A society acting in this way would perhaps remind us of the Wise Men of Gotham.)

Page Break 95

152. Frege says in the preface to the *Grundgesetze der Arithmetik*†1: "... here we have a hitherto unknown kind of insanity"--but he never said what this 'insanity' would really be like.

153. What does people's agreement about accepting a structure as a proof consist in? In the fact that they use words as *language*? As what we call "language".

Imagine people who used money in transactions; that is to say coins, looking like our coins, which are made of gold and silver and stamped and are also handed over for goods--but each person gives just what he pleases for the goods, and the merchant does not give the customer more or less according to what he pays. In short this money, or what looks like money, has among them a quite different role from among us. We should feel much less akin to these people than to people who are not yet acquainted with money at all and practise a primitive kind of barter.--"But these people's coins will surely also have some purpose!"--Then has everything that one does a purpose? Say religious actions--.

It is perfectly possible that we should be inclined to call people who behaved like this insane. And yet we don't call everyone insane who acts similarly within the forms of our culture, who uses words 'without purpose'. (Think of the coronation of a King.)

154. Perspicuity is part of proof. If the process by means of which I get a result were not surveyable, I might indeed make a note that this number is what comes out--but what fact is this supposed to confirm for me? I don't know 'what is *supposed* to come out'.

155. Would it be possible that people should go through one of our calculations to-day and be satisfied with the conclusions, but to-morrow want to draw quite different conclusions, and other ones again on another day?

Why, isn't it imaginable that it should *regularly* happen like that: that when we make *this* transition one time, the next time, '*just for that reason*', we make a different one, and therefore (say) the next time the first one again? (As if in some language the colour which is called "red" one time is for that reason called another name the next time, and "red" again the next time after that and so on; people might find this natural. It might be called a need for variety.)

[*Note in margin: Are our laws of inference eternal and immutable?*]

156. Isn't it like this: so long as one thinks it can't be otherwise, one draws logical conclusions. This presumably means: so long as *such-and-such is not brought in question at all*.

The steps which are not brought in question are logical inferences. But the reason why they are not brought in question is not that they 'certainly correspond to the truth'--or something of the sort,--no, it is just this that is called 'thinking', 'speaking', 'inferring', 'arguing'. There is not any question at all here of some correspondence between what is said and reality; rather is logic *antecedent* to any such correspondence; in the same sense, that is, as that in which the establishment of a method of measurement is *antecedent* to the correctness or incorrectness of a statement of length.

157. Is it experimentally settled whether one proposition can be derived from another?--It looks as if it were. For I write down certain sequences of signs, am guided in doing so by certain paradigms--in doing which it is indeed essential that no sign should get overlooked

or otherwise lost--and of what I get in this procedure I say: it follows.--One argument against this is: If 2 and 2 apples add up to only 3 apples, i.e. if there are 3 apples there after I have put down two and again two, I don't say: "So after all 2 + 2 are not always 4"; but "Somehow one must have gone".

158. But how am I making an experiment when I merely *follow* a proof which has already been written out? It might be said: "When you look at this chain of transformations,--*don't they strike you as being in agreement with the paradigms?*".

159. So if this is to be called an experiment it is presumably a psychological one. For the appearance of agreement may of course be founded on sense-deception. And so it sometimes is when we make a slip in

calculating.

One also says: "This is my result". And what shews that this is *my* result is presumably an experiment.

Page 97

160. One might say: the result of the experiment is that at the end, having reached the result of the proof, I say with conviction: "Yes, that's right".

Page 97

161. Is a calculation an experiment?--Is it an experiment for me to get out of bed in the morning? But might it not be an experiment,--to shew whether I have the strength to raise myself up after so and so many hours' sleep?

And how does the action fall short of being this experiment?--Merely by not being carried out with this purpose, i.e. in connexion

Page Break 98

with an investigation of this kind. It is the use that is made of something that turns it into an experiment.

Is an experiment in which we observe the acceleration of a freely falling body a physical experiment, or is it a psychological one shewing what people see in such circumstances?--Can't it be either? Doesn't it depend on its *surroundings*: on what we do with it, say about it?

Page 98

162. If a proof is conceived as an experiment, at any rate the result of the experiment is not what is called the result of the proof. The result of the calculation is the proposition with which it concludes; the result of the experiment is that from these propositions, by means of these rules, I was led to this proposition.

Page 98

163. But our interest does not attach to the fact that such-and-such (or all) human beings have been led this way by these rules (or have gone this way); we take it as a matter of course that people--'if they can think correctly'--go *this* way. We have now been given a *road*, as it were by means of the footsteps of those who have gone this way. And the traffic now proceeds on this road--to various purposes.

Page 98

164. Certainly experience tells me how the calculation comes out; but that is not all there is to my accepting it.

Page 98

165. I learned empirically that this came out this time, that it usually does come out; but does the proposition of mathematics say

Page Break 99

that? I learned empirically that this is the road I travelled. But is *that* the mathematical statement?--What does it say, though? What relation has it to these empirical propositions? The mathematical proposition has the dignity of a rule.

So much is true when it's said that mathematics is logic: its moves are from rules of our language to other rules of our language. And this gives it its peculiar solidity, its unassailable position, set apart.

(Mathematics deposited among the standard measures.)

Page 99

166. What, then--does it just twist and turn about within these rules?--It forms ever new rules: is always building new roads for traffic; by extending the network of the old ones.

Page 99

167. But then doesn't it need a sanction for this? Can it extend the network *arbitrarily*? Well, I could say: a mathematician is always inventing new forms of description. Some, stimulated by practical needs, others, from aesthetic needs,--and yet others in a variety of ways. And here imagine a landscape gardener designing paths for the layout of a garden; it may well be that he draws them on a drawing-board merely as ornamental strips without the slightest thought of someone's sometime walking on them.

Page 99

168. The mathematician is an inventor, not a discoverer.

Page 99

169. We know by experience that when we count anything off on the fingers of one hand, or on some group of things that looks like this ||||, and say: I, you, I, you, etc., the first word is also the last.

Page Break 100

"But doesn't it *have* to be like that, then?"--Well, is it unimaginable for someone to see the group |||| (e.g.) as the group |||| with the two middle strokes fused, and should accordingly count the middle stroke twice? (True, it is not the usual case.--)

170. But how about when I draw someone's attention for the first time to the fact that the result of counting off is determined in advance by the beginning, and he understands and says: "Yes, of course,--that's how it has to be". What sort of knowledge is this?--He e.g. drew himself the schema:

I Y I Y I
| | | | |

and his reasoning is e.g.: "*That's* what it's like when I count off.--So it has to...."

(171. Connected with this: We should sometimes like to say "There must surely be a reason why--in a movement of a sonata, for example--just *this* theme follows that one." What we should acknowledge as a reason would be a certain relation between the themes, a kinship, a contrast or the like.--But we may even construct such a relation: an operation, so to speak, that produces the one theme from the other; but this serves only when this relation is one that we are familiar with. So it is as if the sequence of these themes had to correspond to a paradigm that is already present in us.

Similarly one might say of a picture that shews two human figures: "There must be a reason why precisely *these* two faces make such an impression upon us." That means: we should like to find this impression from the pair of faces again somewhere else--in another region.--But could we?

One might ask: what arrangement of themes together has a *point*, and what has *no* point? Or again: *Why* has this arrangement a point and *this* one none? That may not be easy to say! Often we may say: "This one corresponds to a gesture, this one doesn't.")†1

APPENDIX I (1933-1934)

1. Might I not say that two words--let's write them "non" and "ne"--had the same meaning, that they were both negation signs--but

non non $p = p$

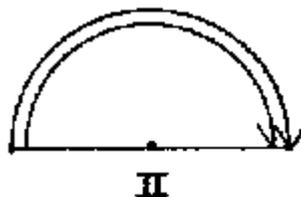

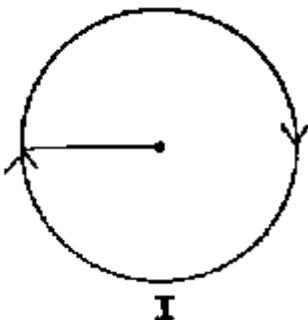

and

ne ne $p = ne p$

(In spoken language a double negation very often means a negation.) But then why do I call them both "negations"? What have they in common with one another? Well, it is clear that a great part of their employment is common. But that does not solve our problem. For we should after all like to say: "It must also hold for both of them that the double negation is an affirmation, at least if the doubling is thought of appropriately". But *how?*--Well, as for example we expressed it using brackets:

(ne ne) $p = ne p$, ne(ne p) = p

We think at once of an analogous case in geometry: "Two half turns added together cancel one another out," "Two half turns added together make one half turn."

It just depends how we add them. (Whether we put them side by side or one after the other.)

2. (Here we stumble on a remarkable and characteristic phenomenon in philosophical investigation: The difficulty--I might say--isn't one

Page Break 103

of finding the solution; it is one of recognizing something as the solution. We have already said everything. Not something that follows from this; no, just *this* is the solution!

This, I believe, hangs together with our wrongly expecting an explanation; whereas a description is the solution of the difficulty, if we give it the right place in our consideration. If we dwell upon it and do not try to get beyond it.)

Page 103

3. "That's already all there is to say about it." *Taking* "non non p " as the negation of the negated proposition in the particular case is, say, giving an explanation of the kind "non non $p = \text{non}(\text{non } p)$ ".

Page 103

4. "If 'ne' is a negation, then 'ne ne p ' must be the same as p , if only it is taken appropriately."

"If one takes 'ne ne p ' as negating p , one must be taking the doubling in a different way."

One would like to say: "'Doubling' *means* something different in this case and *that's* why it yields a negation here;" and so, its yielding a negation here is the consequence of this difference of nature. "Now I mean it as a strengthening", one would say. *We* use the expression of meaning to assess meaning.†1

Page 103

5. When I was uttering the double negation, what may it have

Page Break 104

consisted in that I meant it as a strengthening? In the circumstances in which I use the expression, perhaps in the image that comes before my mind as I use it or which I employ, in my tone of voice (as I can even reproduce the brackets in "ne (ne p)" in my tone of voice). In that case, meaning the doubling as a strengthening corresponds to pronouncing it as a strengthening. The activity of meaning the doubling as a cancellation was e.g., putting brackets.--"Yes, but these brackets themselves may have a variety of roles; for who says that they are to be taken as brackets in the ordinary sense in 'non (non p)' and not for example the first as a hyphen between the two 'non's and the second as the full stop for the sentence? No one says it. And haven't you yourself replaced your conception by words? What the brackets mean will come out in their use; and in another sense perhaps lies in the rhythm of the optical impression of 'non (non p)'.

Page 104

6. Am I now to say: the meanings of "non" and "ne" are *somewhat* different? That they are different species of negation?--That no one would say. For it would be objected, in that case won't "do not go into this room" perhaps fail to mean exactly the same as usual if we set up the rule that "not not" is to be used as a negation?--But this might be countered: "If the two propositions 'ne p ' and 'non p ' say exactly the same, then how can 'ne ne' not mean exactly the same as 'non non'?" But here we are presupposing a symbolism--i.e., we are taking it as a model--in which from "ne $p = \text{non } p$ " it follows that "ne" and "non" are used in the same way in all cases.

Turning through 180° and negation are in fact the same in the particular case, and the application of 'non non $p = p$ ' is of the same kind as the application of a particular geometry.

Page Break 105

Page 105

7. What does one mean by saying: 'ne ne p ', even if by convention it means 'ne p ', *could* also be used as a cancelled negation?--One would like to say: "with the meaning that we have given it, 'ne' could cancel itself, if only we apply it right." What does one mean by that? (The two half turns in the same direction could cancel one another, if they are put together appropriately.) "The *movement* of the negation 'not' is capable of cancelling itself." But where is this movement? One would like of course to speak of a mental movement of negation, for the execution of which the sign 'ne' merely gives the signal.

Page 105

8. We can imagine human beings with a 'more primitive' logic, in which only for certain sentences is there anything corresponding to our negation: say for such as contain no negation. In the language of these people, then, a sentence like "He is going into this house" could be negated; but they would understand a doubling of the negation as mere repetition, never as cancelling the negation.

Page 105

9. The question whether negation had the same meaning for these people as for us would be analogous to the

question whether the digit '2' means the same, for people whose number series ends with 5, as it does for us.

Page 105

10. Suppose I were to ask: When we pronounce the proposition "this rod is 1 metre long" and 'here is 1 soldier', is it quite apparent to us that "1" has different meanings here?--It is not at all apparent. Especially when we say a sentence like: "On every 1 metre there stands 1 soldier, every 2 metres 2 soldiers, and so on." Asked, "Do you

Page Break 106

mean the same by the two ones?" we should reply: "of course I mean the same:--*one*" (perhaps holding up one finger).

Page 106

11. Whoever calls " $\sim\sim p = p$ " (or again " $\sim\sim p \equiv p$ ") a "necessary proposition of logic" (not a stipulation about the method of presentation that we adopt) also has a tendency to say that this proposition proceeds from the meaning of negation. When double negation is used as negation in some dialect, as in "he found nothing nowhere", we are inclined to say: *really* that would mean that he found something everywhere. Let us consider what this "really" means.

Page 106

12. Suppose we had two systems for measuring length; in both a length is expressed by a numeral, followed by a word that gives the system of measurement. One system designates a length as "*n* foot" and foot is a unit of length in the ordinary sense; in the other system a length is designated by "*n* W" and

$$1 \text{ foot} = 1 \text{ W}$$

But: $2 \text{ W} = 4 \text{ foot}$, $3 \text{ W} = 9 \text{ foot}$ and so on.

So the sentence "this post is 1 W long" says the same as "this post is 1 foot long".

Question: Have "W" and "foot" the same meaning in these two sentences?

Page 106

13. The question is framed wrong. One sees this when we express identity of meaning by means of an equation. Then the question has to run: "Does $\text{W} = \text{foot}$ or not?"--The sentences in which these signs occur disappear in this way of looking at it. Of course in this terminology one can just as little ask whether "is" means the same as "is";

Page Break 107

but one *can* ask whether " ϵ " means the same as " $=$ ". What we *said* was: $1 \text{ foot} = 1 \text{ W}$, but: $\text{foot} \neq \text{W}$.

Page 107

14. Has "ne" the same meaning as "non"?--Can I replace "non" by "ne"?--"Well, I can in certain places, but not in others."--But I wasn't asking about that. My question was: can one, without any further qualification, use "ne" in place of "non"?--No.

Page 107

15. "'ne' and 'non' mean exactly the same in this case."--And *what* do they mean?--"Well, one is *not* to do such and such."--But by saying this you have only said that in this case $\text{ne } p = \text{non } p$ and that we don't deny.

When you explain: $\text{ne } p = \text{ne } p$, $\text{non } p = p$, you are indeed using the two words in different ways; and if one holds on to the conception that what they yield in certain combinations 'depends' on their meaning, or the meaning that they carry around with them, then one has to say that they must have different meanings if, compounded in the same way, they may yet yield different results.

Page 107

16. One would like to speak of the *function* of the word, of what it does, in this sentence. As of the function of a lever in a machine. But what does this function consist in? How does it come to light? For there isn't anything hidden, is there? We see the whole sentence all right. The function must reveal itself in the course of the calculus.

But one wants to say: "'non' *does* the same with the proposition '*p*' as 'ne' does: it reverses it". But that is just " $\text{non } p = \text{ne } p$ " in other words.†1 Over and over the thought, the picture, that what we

Page Break 108

see of the sign is only the exterior of some inner thing in which the real operations of meaning run on.

Page 108

17. But if the use of a sign is its meaning is it not remarkable that I say the word "is" gets used with two different meanings (as 'ε' and '=') and should not like to say that its meaning is its use as copula and as sign of identity?

One would like to say that these two kinds of use do not yield a *single* meaning; the personal union through the same word is inessential, is mere accident.

Page 108

18. But how can I decide what is an essential and what is an inessential, accidental feature of the notation? Is there a reality behind the notation, then, which its grammar is aiming at?

Think of a similar case in a game: In draughts a king is distinguished by putting two pieces one on top of the other. Won't one say that it is inessential to draughts that this is the way a king is distinguished?

Page 108

19. Let us say: the meaning of a piece (a figure) is its role in the game.--Now before the start of any chess-game let it be decided by lot which of the players gets white. For this purpose one player holds a king in each closed hand and the other chooses one of the hands at random. Will it be reckoned as part of the role of the king in chess that it is used for drawing by lot?

Page Break 109

Page 109

20. Thus even in a game I am inclined to distinguish between essential and inessential. The game, I should like to say, does not just have rules; it has a point.

Page 109

21. What is the word the same for? For in the calculus we make no use of this identity! What do both players have the same pieces for? But what does "making use of the identity" mean here? For isn't it a use, if we do use the same word?

Page 109

22. Here it looks now as if the use of the same word, the same piece, had a *purpose*--if the identity was not accidental, not inessential. And as if the purpose were that one should recognize the piece and be able to tell how to play. Is it a physical or a logical possibility that is in question here? If the latter, then the identity of the pieces does indeed belong to the game.

Page 109

23. The game is supposed to be defined by the rules! So if a rule of the game prescribes that the kings are to be taken for choosing by lot before the game starts then that belongs essentially to the game. What objection might be made to this?--That one does not see the point of this rule. As, say, one wouldn't see the point of a prescription either, that required one to turn any piece round three times before making a move with it. If we found this rule in a board-game, we should be surprised, and form conjectures about the origin, the purpose, of such a rule. ("Is this prescription supposed to prevent one from moving without consideration?")

Page Break 110

Page 110

24. "If I understand the character of the game right," I might say, "this is not essential to it."

Page 110

25. But let us think of the two offices joined in one person as an old convention.

Page 110

26. One says: the use of the same word is inessential *here*, because the identity of the shape of the word does not here serve to mediate a transition. But in saying that one is merely describing the character of the game that one wants to play.

Page 110

27. †1 "What does the word 'a' mean in the sentence 'F(a)'?" "What does the word 'a' mean in the sentence 'Fa' which you have just spoken?" "What does the word mean in this sentence?"

Page Break 111

APPENDIX II

Page 111

1. The surprising may play two completely different parts in mathematics.

One may see the value of a mathematical train of thought in its bringing to light something that surprises us:--because it is of great interest, of great importance, to see how such and such a kind of representation of it makes a situation surprising, or astonishing, even paradoxical.

But different from this is a conception, dominant at the present day, which values the surprising, the astonishing, because it shews the depths to which mathematical investigation penetrates;--as we might measure the

value of a telescope by its shewing us things that we'd have had no *inkling* of without this instrument. The mathematician says as it were: "Do you see, this is surely important, this you would never have known without me." As if, by means of these considerations, as by means of a kind of higher experiment, astonishing, nay *the most* astonishing facts were brought to light.

Page 111

2. But the mathematician is not a discoverer: he is an inventor.

"The demonstration has a surprising result!"--If you are surprised, then you have not understood it yet. For surprise is not legitimate here, as it is with the issue of an experiment. *There*--I should like to say--it is permissible to yield to its charm; but not when the surprise comes to you at the end of a chain of inference. For here it is only a sign that unclarity or some misunderstanding still reigns.

"But why should I not be surprised that I have been led *hither*?"--Imagine you had a long algebraic expression before you; at first it looks as if it could not be essentially shortened; but then you see a possibility of shortening it and now it goes on until the expression

Page Break 112

is shrunk into a compact form. May we not be surprised at this result? (Something similar happens in playing Patience.) Certainly, and it is a pleasant surprise; and it is of psychological interest, for it shows a phenomenon of failure to command a clear view and of the change of aspect of a seen complex. It is interesting that one does not always see in this complex that it can be shortened in this way; but if we are able to survey the way of shortening it, the surprise disappears.

When one says that one just is surprised at having been led *to this*, that does not represent the situation quite correctly. For one surely has this surprise only when one does not yet know the way. Not when one has the whole of it before one's eyes. The fact that this way, that I have completely in view, begins where it begins and ends where it ends, that's no surprise. The surprise and the interest, then come, so to speak, from outside. I mean: one can say "This mathematical investigation is of great psychological interest" or "of great physical interest."

Page 112

3. I keep on being astonished at this turn of the theme; though I have heard it countless times and know it by heart. It is perhaps its *sense* to arouse astonishment.

What is it supposed to mean, then, when I say "You *oughtn't* be astonished?"

Think of mathematical puzzles. They are framed because they surprise: that is their whole sense.

I want to say: You ought not to believe that there is something hidden here, into which one can get no insight--as if we had walked through an underground passage and now come up somewhere into the light, without being able to tell how we got here, or how the entry of the tunnel lay in relation to its exit.

But then how was it possible for us to fancy this at all? What is there about a calculation that is like a movement underground? What can have suggested this picture to us? I believe it is this: no daylight

Page Break 113

falls on these steps; that we understand the starting point and the end of the calculation in a sense in which we do not understand the remaining course of the calculation.

Page 113

4. "There's no mystery here!"--but then how can we have so much as believed that there was one?--Well, I have retraced the path over and over again and over and over again been surprised; and I never had the idea that here one can *understand* something.--So "There's no mystery here!" means "Just look about you!"

Page 113

5. Isn't it as if one saw a sort of turning up of a card in a calculation? One mixed up the cards; one doesn't know what was going on among them; but in the end this card came out on top, and this means that rain is coming.

Page 113

6. The difference between casting lots and counting out before a game. But might not naive people even when it is a serious matter use counting out instead of choosing a man by lot?

Page 113

7. What is someone doing when he makes us realize that in counting out the result is already fixed?

Page 113

8. I want to say: "We don't command a clear view of what we have done, and that is why it strikes us as mysterious. For now there is a result in front of us and we no longer know how we got there,

Page Break 114

it is not perspicuous to us, but we say (we have learnt to say): "this is how it has to be"; and we accept it--and marvel

at it. Might we not imagine the following case: Someone has a series of orders of the form "You must now do such and such", each one written on a card. He mixes these cards up together, reads the one that comes out on top and says: so I *must* do *that*?--For the reading of a written order now makes a particular impression, has a particular effect on him. And so equally has the reaching of the conclusion of an inference.--However, one might perhaps break the spell of such an order, by bringing it clearly before the man's eyes again *how* he arrived at these words, and comparing what happened here with other cases--by saying, e.g.: "After all, no one has given you the order!"

And isn't it like *that*, when I say "There's no mystery here"?--Indeed, in a certain sense he had not believed that there was a mystery in the case. But he was under the *impression* of mystery (as the other was under the *impression* of an order). In *one* sense he was indeed acquainted with the situation, but he related to it (in feeling and in action) 'as if there were something else involved'--as we would say.

Page 114

9. "A definition surely only takes you one step further back, to something that is not defined." What does that tell us? Did anyone not know that?--No--but may he not have lost sight of it?

Page 114

10. Or: "If you write

'1, 4, 9, 16...',

you have merely written down four numbers and four dots"--what are you bringing to our notice here? Could anyone think anything else? It would also be natural to say: "You have written nothing there except four numerals and a fifth sign--the dots." Well didn't he know

Page Break 115

this? Still, he might say, mightn't he, "I never really looked on the dots as *one* further sign in this series of signs--but rather as a way of suggesting further numerals."

Page 115

11. Or suppose someone gets us to notice that a line, in Euclid's sense, is a boundary of two coloured surfaces, and not a mark? and a point the intersection of such colour boundaries and not a dot? (How often has it been said that you cannot imagine a point.)

Page 115

12. It is possible for one to live, to think, in the fancy that things are thus and so, without *believing* it; that is to say, when one is asked, then one knows, but if one does not have to answer the question one does *not* know, but acts and thinks according to another opinion.

Page 115

13. For a form of expression makes us act thus and so. When it dominates our thinking, then in spite of all objections we should like to say: "But surely it *is* so in some sense." Although the 'some sense' is just what matters. (Roughly like the way it signifies a man's dishonesty when we say "He's *not* a *thief*".)

Page Break 116

APPENDIX III

Page 116

1. It is easy to think of a language in which there is not a form for questions, or commands, but question and command are expressed in the form of statements, e.g. in forms corresponding to our: "I should like to know if..." and "My wish is that..."

No one would say of a question (e.g. whether it is raining outside) that it was true or false. Of course it is English to say so of such a sentence as "I want to know whether...". But suppose this form were always used instead of the question?--

Page 116

2. The great majority of sentences that we speak, write and read, are statement sentences.

And--you say--these sentences are true or false. Or, as I might also say, the game of truth-functions is played with them. For assertion is not something that gets added to the proposition, but an essential feature of the game we play with it. Comparable, say, to that characteristic of chess by which there is winning and losing in it, the winner being the one who takes the other's king. Of course, there could be a game in a certain sense very near akin to chess, consisting in making the chess moves, but without there being any winning and losing in it; or with different conditions for winning.

Page 116

3. Imagine it were said: A command consists of a proposal ('assumption') and the commanding of the thing proposed.

4. Might we not do arithmetic without having the idea of uttering arithmetical *propositions*, and without ever having been struck by the similarity between a multiplication and a proposition?

Should we not shake our heads, though, when someone shewed us a multiplication done wrong, as we do when someone tells us it is raining, if it is not raining?--Yes; and here is a point of connexion. But we also make gestures to stop our dog, e.g. when he behaves as we do not wish.

We are used to saying "2 times 2 is 4", and the verb "is" makes this into a proposition, and apparently establishes a close kinship with everything that we call a 'proposition'. Whereas it is a matter only of a very superficial relationship.

5. Are there true propositions in Russell's system, which cannot be proved in his system?--What is called a true proposition in Russell's system, then?

6. For what does a proposition's '*being true*' mean? '*p is true = p*'. (That is the answer.)

So we want to ask something like: under what circumstances do we assert a proposition? Or: how is the assertion of the proposition used in the language-game? And the 'assertion of the proposition' is here contrasted with the utterance of the sentence e.g. as practice in elocution,--or as *part* of another proposition, and so on.

If, then, we ask in this sense: "Under what circumstances is a proposition asserted in Russell's game?" the answer is: at the end of one of his proofs, or as a 'fundamental law' (Pp.). There is no other way in this system of employing asserted propositions in Russell's symbolism.

7. "But may there not be true propositions which are written in this symbolism, but are not provable in Russell's system?"--'True propositions', hence propositions which are true in *another* system, i.e. can rightly be asserted in another game. Certainly; why should there not be such propositions; or rather: why should not propositions--of physics, e.g.--be written in Russell's symbolism? The question is quite analogous to: Can there be true propositions in the language of Euclid, which are not provable in his system, but are true?--Why, there are even propositions which are provable in Euclid's system, but are *false* in another system. May not triangles be--in another system--similar (*very* similar) which do not have equal angles?--"But that's just a joke! For in that case they are not 'similar' to one another in the same sense!"--Of course not; and a proposition which cannot be proved in Russell's system is "true" or "false" in a different sense from a proposition of *Principia Mathematica*.

8. I imagine someone asking my advice; he says: "I have constructed a proposition (I will use '*P*' to designate it) in Russell's symbolism, and by means of certain definitions and transformations it can be so interpreted that it says: '*P* is not provable in Russell's system'. Must I not say that this proposition on the one hand is true, and on the other hand is unprovable? For suppose it were false; then it is true that it is provable. And that surely cannot be! And if it is proved, then it is proved that it is not provable. Thus it can only be true, but unprovable."

Just as we ask: "'provable' in what system?", so we must also ask: "'true' in what system?" 'True in Russell's system' means, as was said: proved in Russell's system; and 'false in Russell's system' means: the opposite has been proved in Russell's system.--Now what does your "suppose it is false" mean? *In the Russell sense* it means 'suppose the opposite is proved in Russell's system'; *if that is your assumption*, you will now presumably give up the interpretation that it is

unprovable. And by 'this interpretation' I understand the translation into this English sentence.--If you assume that the proposition is provable in Russell's system, that means it is true *in the Russell sense*, and the interpretation "*P* is not provable" again has to be given up. If you assume that the proposition is true in the Russell sense, *the same* thing follows. Further: if the proposition is supposed to be false in some other than the Russell sense, then it does not contradict this for it to be proved in Russell's system. (What is called "losing" in chess may constitute winning in another game.)

9. For what does it mean to say that *P* and "*P* is unprovable" are the same proposition? It means that these *two* English sentences have a *single* expression in such-and-such a notation.

10. "But surely P cannot be provable, for, supposing it were proved, then the proposition that it is not provable would be proved." But if this were now proved, or if I believed--perhaps through an error--that I had proved it, why should I not let the proof stand and say I must withdraw my interpretation "*unprovable*"?

Page 119

11. Let us suppose I prove the unprovability (in Russell's system) of P ; then by this proof I have proved P . Now if this proof were one in Russell's system--I should in that case have proved at once that it belonged and did not belong to Russell's system.--That is what comes of making up such sentences.--But there is a contradiction here!--Well, then there is a contradiction here. Does it do any harm here?

Page Break 120

Page 120

12. Is there harm in the contradiction that arises when someone says: "I am lying.--So I am not lying.--So I am lying.--etc."? I mean: does it make our language less usable if in this case, according to the ordinary rules, a proposition yields its contradictory, and vice versa?--the proposition *itself* is unusable, and these inferences equally; but why should they not be made?--It is a profitless performance!--It is a language-game with some similarity to the game of thumb-catching.

Page 120

13. Such a contradiction is of interest only because it has tormented people, and because this shews both how tormenting problems can grow out of language, and what kind of things can torment us.

Page 120

14. A proof of unprovability is as it were a geometrical proof; a proof concerning the geometry of proofs. Quite analogous e.g. to a proof that such-and-such a construction is impossible with ruler and compass. Now such a proof contains an element of prediction, a physical element. For in consequence of such a proof we say to a man: "Don't exert yourself to find a construction (of the trisection of an angle, say)--it can be proved that it can't be done". That is to say: it is essential that the proof of unprovability should be capable of being applied in this way. It must--we might say--be a *forcible reason* for giving up the search for a proof (i.e. for a construction of such-and-such a kind).

A contradiction is unusable as such a prediction.

Page 120

15. Whether something is rightly called the proposition " X is unprovable" depends on how we prove this proposition. The proof

Page Break 121

alone shews what counts as the criterion of unprovability. The proof is part of the system of operations, of the game, in which the proposition is used, and shews us its 'sense'.

Thus the question is whether the 'proof of the unprovability of P ' is here a forcible reason for the assumption that a proof of P will not be found.

Page 121

16. The proposition " P is unprovable" has a different sense afterwards--from before it was proved.

If it is proved, then it is the terminal pattern in the proof of unprovability.--If it is unproved, then *what* is to count as a criterion of its truth is not yet *clear*, and--we can say--its sense is still veiled.

Page 121

17. Now how am I to take P as having been proved? By a proof of unprovability? Or in some other way? Suppose it is by a proof of unprovability. Now, in order to see *what* has been proved, look at the proof. Perhaps it has here been proved that such-and-such forms of proof do not lead to P .--Or, suppose P has been proved in a direct way--as I should like to put it--and so in that case there follows the proposition " P is unprovable", and it must now come out how this interpretation of the symbols of P collides with the fact of the proof, and why it has to be given up here.

Suppose however that not- P is proved.--Proved *how*? Say by P 's being proved directly--for from that follows that it is provable, and hence not- P . What am I to say now, " P " or "not- P "? Why not both? If someone asks me "Which is the case, P , or not- P ?" then I reply: P stands at the end of a Russellian proof, so you write P in the Russellian system; on the other hand, however, it is then provable and this is expressed by not- P , but this proposition does not stand at the end of a Russellian proof, and so does not belong to the Russellian system.

Page Break 122

--When the interpretation " P is unprovable" was given to P , this proof of P was not known, and so one cannot say that P says: *this* proof did not exist.--Once the proof has been constructed, this has created a *new situation*: and

now we have to decide whether we will call *this* a proof (a *further* proof), or whether we will still call *this* the statement of unprovability.

Suppose not- P is directly proved; it is therefore proved that P can be directly proved! So this is once more a question of interpretation--unless we now also have a direct proof of P . If it were like that, well, that is how it would be.

(The superstitious dread and veneration by mathematicians in face of contradiction.)

Page 122

18. "But suppose, now, that the proposition were *false*--and hence provable?"--Why do you call it 'false'? Because you can see a proof?--Or for other reasons? For in that case it doesn't matter. For one can quite well call the Law of Contradiction false, on the grounds that we very often make good sense by answering a question "Yes and no". And the same for the proposition ' $\sim\sim p = p$ ' because we employ double negation as a *strengthening* of the negation and not merely as its cancellation.

Page 122

19. You say: "..., so P is true and unprovable". That presumably means: "Therefore P ". That is all right with me--but for what purpose do you write down this 'assertion'? (It is as if someone had extracted from certain principles about natural forms and architectural style the idea that on Mount Everest, where no one can live, there belonged a ch  let in the Baroque style. And how could you make the truth of the assertion plausible to me, since you can make no use of it except to do these bits of legerdemain?)

Page Break 123

Page 123

20. Here one needs to remember that the propositions of logic are so constructed as to have *no* application as *information* in practice. So it could very well be said that they were not *propositions* at all; and one's writing them down at all stands in need of justification. Now if we append to these 'propositions' a further sentence-like structure of another kind, then we are all the more in the dark about what kind of application this system of sign-combinations is supposed to have; for the mere *ring of a sentence* is not enough to give these connexions of signs any meaning.

Page Break 124

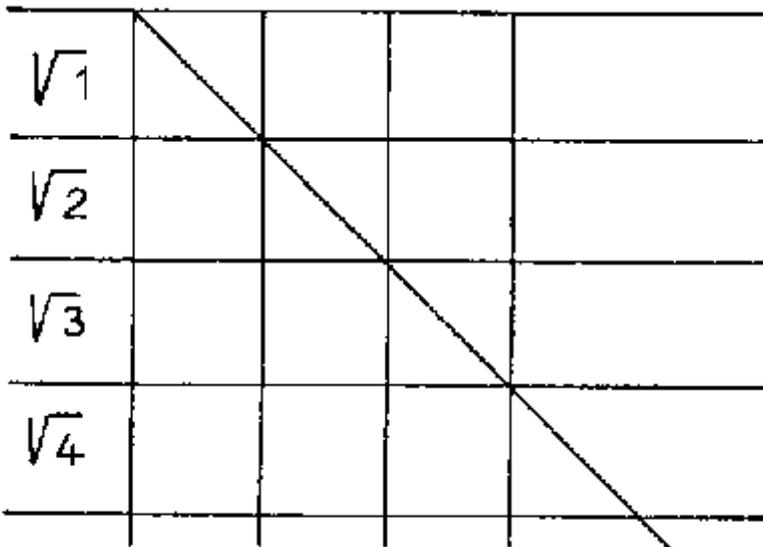

Page Break 125

PART II

1938

Page 125

1. How far does the diagonal method prove that there is a number which--let's say--is not a square root? It is of course extremely easy to shew that there are numbers that aren't square roots--but how does *this* method shew it?

Have we a general concept of what it means to shew that there is a number that is not included in this infinite set?

Let us suppose that someone had been given the task of naming a number different from every \sqrt{n} ; but that he knew nothing of the diagonal procedure and had named the number $\sqrt[3]{2}$; and had shewn that it was not a value of \sqrt{n} . Or that he had said: assume that $\sqrt{2} = 1.4142\dots$ and subtract 1 from the first decimal, but have the rest of the places agree with $\sqrt{2}$. 1.3142 cannot be a value of \sqrt{n} .

Page 125

2. "Name a number that agrees with $\sqrt{2}$ at every second decimal place." What does this task demand? The question is: is it performed by the answer: It is the number got by the rule: develop $\sqrt{2}$ and add 1 or -1 to every second decimal place?

It is the same as the way the task: *Divide an angle into three* can be

Page Break 126

regarded as carried out by laying 3 equal angles together.

Page 126

3. If someone says: "Shew me a number different from all these", and is given the rule of the diagonal for answer, why should he not say: "But I didn't mean it like that!?" What you have given me is a rule for the step-by-step construction of numbers that are successively different from each of these.

"But why aren't you willing to call this too a method of calculating a number?"--But what is the method of calculating, and what the result, here? You will say that they are *one*, for it makes sense now to say: the number *D* is bigger than... and smaller than...; it can be squared etc. etc.

Is the question not really: What can this number be *used* for? True, that sounds queer.--But what it means is: what are its mathematical surroundings?

Page 126

4. So I am comparing methods of calculating--only here there are certainly very different ways of making comparisons. However, I am supposed in some sense to be comparing the *results* of the methods with one another. But this is enough to make everything unclear, for in one sense they don't each have a single result, or it is not clear in advance what is to be regarded here as *the* result in each case. I want to say that here we are afforded every opportunity of twisting and turning the meanings.

Page 126

5. Let us say--not: "This method gives a result", but rather: "it gives an infinite series of results". How do I compare infinite series of results? Well, there are very different things that I may call doing that.

Page Break 127

Page 127

6. The motto here is always: Take a *wider* look round.

Page 127

7. The result of a calculation expressed verbally is to be regarded with suspicion. The *calculation* illumines the meaning of the expression in words. It is the *finer* instrument for determining the meaning. If you want to know what the verbal expression means, look at the calculation; not the other way about. The verbal expression casts only a dim general glow over the calculation: but the calculation a brilliant light on the verbal expression. (As if you wanted to compare the heights of two mountains, not by the technique of measurement of heights, but by their apparent relation when looked at from below.)

Page 127

8. "I want to shew you a method by which you can serially *avoid* all these developments." The diagonal procedure is such a method.--"So it produces a series that is different--from all of these." Is that right?--Yes; if, that is, you want to apply these words to the described case.

Page 127

9. How would it be with the following method of construction? The diagonal number is produced by addition or subtraction of 1, but whether to add or subtract is only found out by continuing the original series to several places. Suppose it were now said: the development of the diagonal series never catches up with the development of the other series:--certainly the diagonal series avoids each of those series when it encounters it, but that is no help to it, as the development of the other series is again ahead of it. Here I can surely say: There is always one of the series for which it is not determined whether or not it is different from the diagonal series. It may be said: they run after one another to infinity, but the original series is always ahead.

Page Break 128

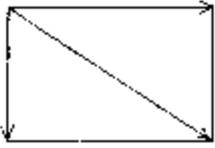

Page 128

"But your rule already reaches to infinity, so you already know quite precisely that the diagonal series will be different from any other!"--

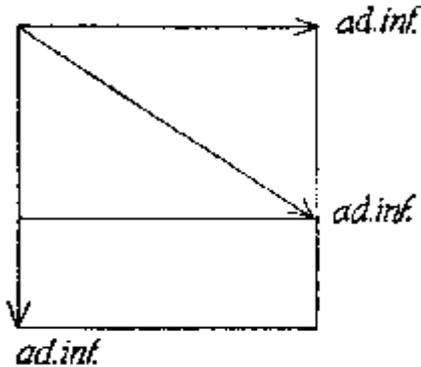

Page 128

10. It means nothing to say: "*Therefore* the X numbers are not denumerable". One might say something like this: I call number-concept X non-denumerable if it has been stipulated that, whatever numbers falling under this concept you arrange in a series, the diagonal number of this series is also to fall under that concept.

11. Since my drawing is after all only the *indication* of infinity, why must it be like this

and not like this

Here what we have is different pictures; and to them correspond different ways of talking. But does anything useful emerge if we have a dispute about the justification of *them*? What is important must reside

Page Break 129

somewhere else; even though these pictures fire our imagination most strongly.

Page 129

12. What can the concept 'non-denumerable' be used for?

Page 129

13. Surely--if anyone tried day-in day-out 'to put all irrational numbers into a series' we could say: "Leave it alone; it means nothing; don't you see, if you established a series, I should come along with the diagonal series!" This might get him to abandon his undertaking. Well, that would be useful. And it strikes me as if this were the whole and proper purpose of this method. It makes use of the vague notion of this man who goes on, as it were idiotically, with his work, and it brings him to a stop by means of a picture. (But one could get him to resume his undertaking by means of another picture.)

Page 129

14. The procedure exhibits something--which can in a very vague way be called the demonstration that *these* methods of calculation cannot be ordered in a series. And here the meaning of "*these*" is just kept vague.

Page 129

15. A clever man got caught in this net of language! So it must be an interesting net.

Page 129

16. The mistake begins when one says that the cardinal numbers can be ordered in a series. For what concept has one of this ordering? One has of course a concept of an infinite series, but here that gives

Page Break 130

us at most a vague idea, a guiding light for the formation of a concept. For the concept itself is *abstracted* from this and from other series; or: the expression stands for a certain analogy between cases, and it can e.g. be used to define provisionally a domain that one wants to talk about.

That, however, is not to say that the question: "Can the set R be ordered in a series?" has a clear sense. For this question means e.g.: Can one do something with these formations, corresponding to the ordering of the cardinal numbers in a series? Asked: "Can the real numbers be ordered in a series?" the conscientious answer might be: "For the time being I can't form any precise idea of that" -- "But you can order the roots and the algebraic numbers for example in a series; so you surely understand the expression!" -- To put it better, I *have got* certain analogous formations, which I call by the common name 'series'. But so far I haven't any certain bridge from these cases to that of 'all real numbers'. Nor have I any general method of trying whether such-and-such a set 'can be ordered in a series'.

Now I am shewn the diagonal procedure and told: "Now here you have the proof that this ordering can't be done here". But I can reply: "I don't know--to repeat--what it is that *can't be done* here". Though I can see that you want to shew a difference between the use of "root", "algebraic number", etc. on the one hand, and "real number" on

the other. Such a difference as e.g. this: roots are called "real numbers", *and so too* is the diagonal number formed from the roots. And similarly for all series of real numbers. For this reason it makes no sense to talk about a "series of all real numbers", just because the diagonal number for each series is also called a "real number".--Would this not be as if any row of books were itself ordinarily called a book, and now we said: "It makes no sense to speak of 'the row of all books', since this row would itself be a book."

Page Break 131

Page 131

17. Here it is very useful to imagine the diagonal procedure for the production of a real number as having been well-known before the invention of set theory, and familiar even to school-children, as indeed might very well have been the case. For this changes the aspect of Cantor's discovery. The discovery might very well have consisted *merely* in the interpretation of this long familiar elementary calculation.

Page 131

18. For this kind of calculation is itself useful. The question set would be perhaps: write down a decimal number which is different from the numbers:

0.1246798...

0.3469876...

0.0127649...

0.3426794...

..... (Imagine a long series.)

The child thinks to itself: how am I to do this, when I should have to look at all the numbers at once, to prevent what I write down from being one of them? Now the method says: Not at all: change the first place of the first number, the second of the second one etc. etc., and you are sure of having written down a number that does not coincide with any of the given ones. The number got in this way might always be called the diagonal number.

Page 131

19. The dangerous, deceptive thing about the idea: "The real numbers cannot be arranged in a series", or again "The set... is not denumerable" is that it makes the determination of a concept--concept formation--look like a fact of nature.

Page 131

20. The following sentence sounds sober: "If something is called a series of real numbers, then the expansion given by the diagonal

Page Break 132

procedure is also called a 'real number', and is moreover said to be different from all members of the series".

Page 132

21. Our suspicion ought always to be aroused when a proof proves more than its means allow it. Something of this sort might be called 'a puffed-up proof'.

Page 132

22. The usual expression creates the fiction of a procedure, a method of ordering which, though applicable here, nevertheless fails to reach its goal because of the number of objects involved, which is greater even than the number of all cardinal numbers.

If it were said: "Consideration of the diagonal procedure shews you that the *concept* 'real number' has much less analogy with the concept 'cardinal number' than we, being misled by certain analogies, are inclined to believe", that would have a good and honest sense. But just the *opposite* happens: one pretends to compare the 'set' of real numbers in magnitude with that of cardinal numbers. The difference in kind between the two conceptions is represented, by a skew form of expression, as difference of extension. I believe, and hope, that a future generation will laugh at this hocus pocus.

Page 132

23. The sickness of a time is cured by an alteration in the mode of life of human beings, and it was possible for the sickness of philosophical problems to get cured only through a changed mode of thought and of life, not through a medicine invented by an individual.

Think of the use of the motor-car producing or encouraging certain sicknesses, and mankind being plagued by such sickness until, from some cause or other, as the result of some development or other, it abandons the habit of driving.

Page Break 133

Page 133

24. For how do we make use of the proposition: "There is no greatest cardinal number"? When and on what occasion would it be said? This use is at any rate quite different from that of the mathematical proposition ' $25 \times 25 = 625$ '.

Page 133

25. First and foremost, notice that we ask this question at all; this points to the fact that the answer is not ready to hand.

Moreover, if one tries to answer the question in a hurry, it is easy to trip up. The case is like that of the question: what experience shews us that our space is three-dimensional?

Page 133

26. We say of a *permission* that it has no end.

Page 133

27. And it can be said that the permission to play language-games with cardinal numbers has no end. This would be said e.g. to someone to whom we were teaching our language and language-games. So it would again be a grammatical proposition, but of an *entirely* different kind from ' $25 \times 25 = 625$ '. It would however be of great importance if the pupil were, say, inclined to expect a definitive end to this series of language-games (perhaps because he had been brought up in a different culture).

Page 133

28. Why should we say: The irrational numbers cannot be ordered?--We have a method by which to upset any order.

Page 133

29. Cantor's diagonal procedure does not shew us an irrational

Page Break 134

number different from all in the system, but it gives sense to the mathematical proposition that the number so-and-so is different from all those of the system. Cantor could say: You can prove that a number is different from all the numbers in the system *by* proving that it differs in its first place from its first number and in its second place from its second number and so on.

Cantor is saying something about the multiplicity of the concept "Real number different from all the ones of a system".

Page 134

30. Cantor shews that if we have a system of expansions it makes sense to speak of an expansion that is different from them all.--But that is not enough to determine the grammar of the word "expansion".

Page 134

31. Cantor gives a sense to the expression "expansion which is different from all the expansions in a system", by proposing that an expansion should be so called when it can be proved that it is diagonally different from the expansions in a system.

Page 134

32. Thus it can be *set* as a question: Find a number whose expansion is diagonally different from those in this system.

Page 134

33. It might be said: Besides the rational points there are *diverse systems* of irrational points to be found in the number line.

There is no system of irrational numbers--but also no super-system, no 'set of irrational numbers' of higher-order infinity.

Page Break 135

Page 135

34. Cantor defines a *difference of higher order*, that is to say a difference of an expansion from a *system* of expansions. This definition can be used so as to shew that a number is in this sense different from a system of numbers: let us say π from the system of algebraic numbers. But we cannot very well say that the rule of altering the places in the diagonal in such-and-such a way is as such proved different from the rules of the system, because this rule is itself of 'higher order'; for it *treats of* the alteration of a system of rules, and for that reason it is not clear in advance in which cases we shall be willing to declare the expansion of *such a* rule different from all the expansions of the system.

Page 135

35. These considerations may lead us to say that $2^{\aleph_0} > \aleph_{0.1}$

That is to say: we can *make* the considerations lead us to that.

Or: we can say *this* and give *this* as our reason.

But if we do say it--what are we to do next? In what practice is this proposition anchored? It is for the time being a piece of mathematical architecture which hangs in the air, and looks as if it were, let us say, an architrave, but not supported by anything and supporting nothing.

Page 135

36. Certain considerations may lead us to say that 10^{10} souls fit into a cubic centimetre. But why do we nevertheless not say it? Because it is of no use. Because, while it does conjure up a picture, the picture is one with which we cannot go on to do anything.

Page 135

37. The proposition is worth as much as its grounds are.

It supports as much as the grounds that support it do.

Page 135

Page Break 136

Page 136

38. An interesting question is: what is the connexion of \hat{A}_0 with the cardinal numbers whose number it is supposed to be? \hat{A}_0 would obviously be the *predicate "infinite series"* in its application to the series of cardinal numbers and to similar mathematical formations. Here it is important to grasp the relationship between a series in the nonmathematical sense and one in the mathematical sense. It is of course clear that in mathematics we do *not* use the word "series of numbers" in the sense "series of numerical signs", even though, of course, there is also a connexion between the use of the one expression and of the other. A railway is not a railway train; nor is it something similar to a railway train. A 'series' in the mathematical sense is a method of construction for series of linguistic expressions.

Thus we have a grammatical class "infinite sequence", and equivalent with this expression a word whose grammar has (a certain) similarity with that of a numeral: "infinity" or " \hat{A}_0 ". This is connected with the fact that among the calculi of mathematics we have a technique which there is a certain justice in calling "1-1 correlation of the members of two infinite series", since it has a similarity to such a mutual correlation of the members of what are called 'finite' classes.

From the fact, however, that we have an employment for a *kind* of numeral which, as it were, gives the number of the members of an infinite series, it does not follow that it also makes some kind of sense to speak of the number of the concept 'infinite series'; that we have *here* some kind of employment for something like a numeral. For there is no grammatical technique suggesting employment of such an expression. For I can of course form the expression: "class of all classes which are equinumerous with the class 'infinite series'" (as also: "class of all angels that can get on to a needlepoint") but this expression is empty so long as there is no employment for it. Such an employment is not: yet to be discovered, but: still to be *invented*.

Page Break 137

Page 137

39. Imagine that I put a playing-board divided into squares in front of you, and put pieces like chess pieces on it--and stated: "This piece is the '*King*', these are the '*Knights*', these the '*Commoners*'.--So far that's all we know about the game; but that's always something.--And perhaps more will be discovered."

Page 137

40. "Fractions cannot be arranged in an order of magnitude."--First and foremost, this sounds extremely interesting and remarkable.

It sounds interesting in a quite different way from, say, a proposition of the differential calculus. The difference, I think, resides in the fact that *such* a proposition is easily associated with an application to physics, whereas *this* proposition belongs simply and solely to mathematics, seems to concern as it were the natural history of mathematical objects themselves.

One would like to say of it e.g.: it introduces us to the mysteries of the mathematical world. *This* is the aspect against which I want to give a warning.

Page 137

41. When it looks as if..., we should look out.

Page 137

42. When, on hearing the proposition that the fractions cannot be arranged in a series in order of magnitude, I form the picture of an unending row of things, and between each thing and its neighbour new things appear, and more new ones again between each of these things and its neighbour, and so on without end, then certainly there is

something here to make one dizzy.

But once we see that this picture, though very exciting, is all the same not appropriate; that we ought not to let ourselves be trapped by the words "series", "order", "exist", and others, we shall fall back on the *technique* of calculating fractions, about which there is no longer anything *queer*.

Page Break 138

Page 138

43. The fact that in a technique of calculating fractions the expression "the next greatest fraction" has no sense, that we have not given it any sense, is nothing to marvel at.

Page 138

44. If we apply a technique of continuous interpolation of fractions, we shall not be willing to call any fraction the "next biggest".

Page 138

45. To say that a technique is unlimited does *not* mean that it goes on without ever stopping--that it increases immeasurably; but that it lacks the institution of the end, that it is not finished off. As one may say of a sentence that it is not finished off if it has no period. Or of a playing-field that is unlimited, when the rules of the game do not prescribe any boundaries--say by means of a line.

Page 138

46. For the point of a new technique of calculation is to supply us with a *new* picture, a *new form of expression*; and there is nothing so absurd as to try and describe this new schema, this new kind of scaffolding, by means of the old expressions.

Page 138

47. What is the function of such a proposition as: "A fraction has not a next biggest fraction but a cardinal number has a next biggest cardinal number"? Well, it is as it were a proposition that compares two games. (Like: in draughts pieces jump over one another, but not in chess.)

Page Break 139

Page 139

48. We call something "constructing the next biggest cardinal number" but nothing "constructing the next biggest fraction".

Page 139

49. How do we compare games? By describing them--by describing one as a variation of another--by describing them and *emphasizing* their differences and analogies.

Page 139

50. "In draughts there isn't a King"--what does this mean? (It sounds childish.) Does it mean that none of the pieces in draughts is called "King"; and if we did call one of the pieces that, would there be a King in draughts? But what about *this* proposition: "In draughts all the pieces have the same rights, but not in chess"? Whom am I telling this? One who already knows both games, or else someone who does not yet know them. Here it looks as if the first one stands in no need of our information and the second can do nothing with it. But suppose I were to say: "See! In draughts all the pieces have the same rights,..." or better still: "See! In these games all the pieces have the same rights, in those not." But what does such a proposition do? It introduces a new *concept*, a new ground of classification. I teach you to answer the question: "Name games of the first sort" etc. But in a similar way it would be possible to set questions like: "Invent a game with a King".

Page 139

51. 'We cannot arrange fractions in a series in order of magnitude but we *can* order them in an infinite series.' If someone did not know this, what has he now learnt? He has learnt a new kind of calculation, e.g.: "Determine the number of the fraction

Page Break 140

Page 140

52. He learns this technique--but doesn't he also learn that there is such a technique? I have indeed, in an important sense, learned that there is such a technique; that is, I have got to know a technique which can now be applied to all sorts of other things.

Page 140

53. 'What would you call *this*'?

	1	2	3	4	•	•	•
1	1	3	6	10	•		
2	2	5	9	•			
3	4	8	•				
4	7	•					
•	•						

Surely "a method of numbering the pairs of numbers"? And might I not also say: "of ordering pairs of numbers in a series"?

Page 140

54. Now does mathematics teach me that I can order the pairs of numbers in a series? Can I say: it teaches me that I can do *this*? For does it make sense to say that I teach a child that it is possible to multiply--by teaching him to multiply? It would rather be natural to say I teach him that it is possible to multiply fractions, after he has learned to multiply cardinal numbers together. For now, it might be said, he knows what "multiplying" means. But wouldn't this be misleading too?

Page 140

55. If someone says I have proved the proposition that we can order pairs of numbers in a series, it should be answered that this is not a mathematical proposition, since one doesn't calculate with the words "we", "can", "the", "pairs of numbers", etc. The proposition

Page Break 141

"one can..." is rather a mere approximate description of the technique one is teaching, say a not unsuitable *title*, a heading to this chapter. But a title with which it is not possible to *calculate*.

Page 141

56. But, you say, this is just what the logical calculus of Frege and Russell does: in it every word that is spoken in mathematics has exact significance, is an element of the calculus. Thus in this calculus we can really prove that "multiplying is possible". Very well, now it is a mathematical proposition; but who says that anything can be done with this proposition? Who says *what* use it can be? For its sounding interesting is not enough.

Just because when we are teaching we may use the proposition "So you see, we can order the fractions in a series", don't say that we have any other use for this proposition than of attaching a memorable picture to this sort of calculation.

If the interest here attaches to the proposition that has been proved, then it attaches to a picture which has an extremely weak justification, but which fascinates us by its queerness, like e.g. the picture of the "direction" of time. It produces a slight reeling of one's thoughts.

Page 141

57. Here I can only say: depart as quickly as possible from this picture, and see the interest of this calculation in its application. (It is as if we were at a masked ball at which every calculation appears in a queer guise.)

Page 141

58. "Ought the word 'infinite' to be avoided in mathematics?" Yes; where it appears to confer a meaning upon the calculus; instead of getting one from it.

Page Break 142

Page 142

59. This way of talking: "But when one examines the calculus there is nothing infinite there" is of course

clumsy--but it means: is it really necessary here to conjure up the picture of the infinite (of the enormously big)? And how is this picture connected with the *calculus*? For its connexion is not that of the picture |||| with 4.

Page 142

60. To act as if one were disappointed to have found nothing infinite in the calculus is of course funny; but not to ask: what is the everyday employment of the word "infinite", which gives it its meaning for us; and what is its connexion with these mathematical calculi?

Page 142

61. Finitism and behaviourism are quite similar trends. Both say, but surely, all we have here is.... Both deny the existence of something, both with a view to escaping from a confusion.

Page 142

62. What I am doing is, not to shew that calculations are wrong, but to subject the *interest* of calculations to a test. I test e.g. the justification for still using the word... here. Or really, I keep on urging such an investigation. I shew that there is such an investigation and what there is to investigate there. Thus I must say, not: "We must not express ourselves like this", or "That is absurd", or "That is uninteresting", but: "Test the justification of this expression in this way". You cannot survey the justification of an expression unless you survey its employment; which you cannot do by looking at some facet of its employment, say a picture attaching to it.

Page Break 143

PART III 1939-40

Page 143

1. 'A mathematical proof must be perspicuous.' Only a structure whose reproduction is an easy task is called a "proof". It must be possible to decide with certainty whether we really have the same proof twice over, or not. The proof must be a configuration whose exact reproduction can be certain. Or again: we must be sure we can exactly reproduce what is essential to the proof. It may for example be written down in two different handwritings or colours. What goes to make the reproduction of a proof is not anything like an exact reproduction of a shade of colour or a hand-writing.

Page 143

It must be easy to write down *exactly* this proof again. This is where a written proof has an advantage over a drawing. The essentials of the latter have often been misunderstood. The drawing of a Euclidian proof may be inexact, in the sense that the straight lines are not straight, the segments of circles not exactly circular, etc. etc. and at the same time the drawing is still an exact proof; and from this it can be seen that this drawing does not--e.g.--demonstrate that such a construction results in a polygon with five equal sides; that what it proves is a proposition of geometry, not one about the properties of paper, compass, ruler and pencil.

[Connects with: proof a *picture* of an experiment.]

Page 143

2. I want to say: if you have a proof-pattern that cannot be taken in, and by a change in notation you turn it into one that can, then you are producing a proof, where there was none before.

Page Break 144

Page 144

Now let us imagine a proof for a Russellian proposition stating an addition like ' $a + b = c$ ', consisting of a few thousand signs. You will say: Seeing whether this proof is correct or not is a purely external difficulty, of no mathematical interest. ("One man takes in easily what someone else takes in with difficulty or not at all" etc. etc..)

The assumption is that the definitions serve merely to abbreviate the expression for the convenience of the calculator; whereas they are part of the calculation. By their aid expressions are produced which could not have been produced without it.

Page 144

3. But how about the following: "While it is true that we cannot--in the ordinary sense--multiply 234 by 537 in the Russellian calculus, still there is a Russellian calculation corresponding to this multiplication."--What kind of correspondence is this? It might be like this: we can carry out this multiplication in the Russellian calculus too, only in a different symbolism,--just as, as we should certainly say, we can carry it out in a different number system. In that case, then, we could e.g. solve the practical problems for which we use that multiplication by means of the calculation in the Russellian calculus too, only in a more roundabout way.

Page 144

Now let us imagine the cardinal numbers explained as 1, 1 + 1, (1 + 1) + 1, ((1 + 1) + 1) + 1, and so on. You say that the definitions introducing the figures of the decimal system are a mere matter of convenience; the

calculation 703000×40000101 could be done in that wearisome notation too. But is that true?--"Of course it's true! I can surely write down, construct, a calculation in that notation corresponding to the calculation in the decimal notation."--But how do I know that it corresponds to it? Well, because I have derived it from the other by a given method.--But now if I look at it again

Page Break 145

half an hour later, may it not have altered? For one cannot command a clear view of it.

Page 145

Now I ask: could we also find out the truth of the proposition $7034174 + 6594321 = 13628495$ by means of a proof carried out in the first notation?--Is there such a proof of this proposition?--The answer is: no.

Page 145

4. But still doesn't Russell teach us *one* way of adding?

Page 145

Suppose we proved by Russell's method that $(\exists a \dots g) (\exists a \dots l) \supset (\exists a \dots s)$ is a tautology; could we reduce our result to $g + l$'s being s ? Now this presupposes that I can take the three bits of the alphabet as representatives of the proof. But does Russell's proof shew this? After all I could obviously also have carried out Russell's proof with groups of signs in the brackets whose sequence made no characteristic impression on me, so that it would not have been possible to represent the group of signs between brackets by its last term.

Page 145

Even assuming that the Russellian proof were carried out with a notation such as $x_1x_2\dots x_{10}x_{11}\dots x_{100}\dots$ as in the decimal notation, and there were 100 members in the first pair of brackets, 300 in the second and 400 in the third, does the proof itself shew that $100 + 300 = 400$?--What if this proof led at one time to this result, and at another to a different one, for example $100 + 300 = 420$? What is

Page Break 146

needed in order to see that the result of the proof, if it is correctly carried out, always depends solely on the last figures of the first two pairs of brackets?

Page 146

But still for small numbers Russell does teach us to add; for then we take the groups of signs in the brackets in at a glance and we can take *them* as numerals; for example 'xy', 'xyz', 'xyzuv'.

Thus Russell teaches us a new calculus for reaching 5 from 2 and 3; and that is true even if we say that a logical calculus is only--frills tacked on to the arithmetical calculus.

Page 146

The *application* of the calculation must take care of itself. And that is what is correct about 'formalism'.

Page 146

The reduction of arithmetic to symbolic logic is supposed to shew the point of application of arithmetic, as it were the attachment by means of which it is plugged in to its application. As if someone were shewn, first a trumpet without the mouthpiece--and then the mouthpiece, which shews how a trumpet is used, brought into contact with the human body. But the attachment which Russell gives us is on the one hand too narrow, on the other hand too wide; too general and too special. The calculation takes care of its own application.

Page 146

We extend our ideas from calculations with small numbers to ones with large numbers in the same kind of way as we imagine that, if the distance from here to the sun *could* be measured with a footrule, then we should get the very result that, as it is, we get in a quite different way. That is to say, we are inclined to take the measurement of length with a footrule as a model even for the measurement of the distance between two stars.

Page Break 147

Page 147

And one says, e.g. at school: "If we imagine rulers stretching from here to the sun..." and seems in this way to explain what we understand by the distance between the sun and the earth. And the use of such a picture is all right, so long as it is clear to us that we can measure the distance from us to the sun, and that we cannot measure it with footrules.

Page 147

5. Suppose someone were to say: "The only real proof of $1000 + 1000 = 2000$ is after all the Russellian one, which shews that the expression... is a tautology"? For can I not prove that a tautology results if I have 1000 members in each of the two first pairs of brackets and 2000 in the third? And if I can prove that, then I can look at it as a proof of the arithmetical proposition.

In philosophy it is always good to put a *question* instead of an answer to a question.

For an answer to the philosophical question may easily be unfair; disposing of it by means of another question is not.

Then should I put a *question* here, for example, instead of the answer that that arithmetical proposition cannot be proved by Russell's method?

$$\begin{matrix} 1 & 2 & 3 \\ (&) & (&) \supset (&) \end{matrix}$$

6. The proof that is a tautology consists in always crossing out a term of the third pair of brackets for a term of (1) or (2). And there are many methods for such collating. Or one might even

say: there are many ways of establishing the success of a 1-1 correlation. One way, for example, would be to construct a star-shaped pattern for the left-hand side of the implication and another one for the right-hand side and then to compare these in their turn by making an ornament out of the two of them.

Thus the rule could be given: "If you want to know whether the numbers A and B together actually yield C, write down an expression of the form... and correlate the variables in the brackets by writing down (or trying to) the proof that the expression is a tautology".

My objection to this is *not* that it is arbitrary to prescribe just this way of collating, but that it cannot be established in this way that $1000 + 1000 = 2000$.

7. Imagine that you had written down a 'formula' a mile long, and you shewed by transformation that it was tautologous ('if *it* has not altered meanwhile', one would have to say). Now we *count* the terms in the brackets or we divide them up and make the expression into one that can be taken in, and it comes out that there are 7566 terms in the first pair of brackets, 2434 in the second, 10000 in the third. Now have I proved that $2434 + 7566 = 10000$?--That depends--one might say--on whether you are certain that the counting has really yielded the number of terms which stood between the brackets in the course of the proof.

Could one say: "Russell teaches us to write as many variables in the third pair of brackets as were in the first two together"? But really: he teaches us to write a variable in (3) for every variable in (1) and (2).

But do we learn from this what number is the sum of two given

numbers? Perhaps it is said: "Of course, for in the third pair of brackets we have the paradigm, the prototype of the new number". But in what sense is ||| the paradigm of a number? Consider how it can be used as such.

8. Above all, the Russellian tautology corresponding to the proposition $a + b = c$ does not shew us in what notation the number c is to be written, and there is no reason why it should not be written in the form $a + b$.--For Russell does not teach us the technique of, say, adding in the decimal system.--But could we perhaps derive it from his technique?

Let us just ask the following question: Can one derive the technique of the decimal system from that of the system 1, 1 + 1, (1 + 1) + 1, etc.?

Could this question not also be formulated as follows: if one has one technique of calculation in the one system and one in the other,--how is it shewn that the two are equivalent?

9. "A proof ought to shew not merely that this is how it is, but this is how it has to be."

In what circumstances does counting shew this?

One would like to say: "When the figures and the thing being counted yield a memorable configuration. When this configuration is now used in place of any fresh counting."--But here we seem to be talking only of *spatial* configurations: but if we know a series of words by heart and then co-ordinate two such series, one to one, saying for example: "First--Monday; second--Tuesday; third--Wednesday;

1, $(1 + 1) + 1, \dots$ can one then use the recursive explanation of the decimal system to reach a sign of the form $1 + 1 + 1 \dots$ from any number?

Page 152

Suppose someone were to say: Russellian arithmetic agrees with ordinary arithmetic up to numbers less than 10^{10} ; but then it diverges from it. And now he produces a Russellian proof that $10^{10} + 1 = 10^{10}$. Now why should I not trust such a proof? How will anybody convince me that I must have miscalculated in the Russellian proof?

Page 152

But then do I need a proof from another system in order to ascertain

Page Break 153

whether I have miscalculated in the first proof? Is it not enough for me to write down that proof in a way that makes it possible to take it in?

Page 153

14. Is not my whole difficulty one of seeing how it is possible, without abandoning Russell's logical calculus, to reach the concept of the *set of variables* in the expression ' $(\exists xyz\dots)$ ', where this expression cannot be taken in?--

Well, but it can be made surveyable by writing: $(\exists x_1, x_2, x_3, \text{etc.})$. And still there is something that I do not understand: the criterion for the identity of such an expression has now surely been changed: I now see in a different way that the set of signs in two such expressions is the same.

Page 153

What I am tempted to say is: Russell's proof can indeed be continued step by step, but at the end one does not rightly know what one has proved--at least not by the old criteria. By making it possible to command a clear view of the Russellian proof, I prove something about this proof.

I want to say: one need not acknowledge the Russellian technique of calculation at all--and can prove by means of a different technique of calculation that there *must* be a Russellian proof of the proposition. But in that case, of course, the proposition is no longer based upon the Russellian proof.

Or again: its being possible to imagine a Russellian proof for every proved proposition of the form $m + n = l$ does not shew that the proposition is based on this proof. For it is conceivable that the Russellian proof of one proposition should not be distinguishable from the Russellian proof of another and should be called different only because they are the translations of two recognizably different proofs.

Page Break 154

Page 154

Or again: something stops being a proof when it stops being a paradigm, for example Russell's logical calculus; and on the other hand any other calculus which serves as a paradigm is acceptable.

Page 154

15. It is a fact that different methods of counting practically always agree.

Page 154

When I count the squares on a chess-board I practically always reach '64'.

Page 154

If I know two series of words by heart, for example numerals and the alphabet, and I put them into one-one correspondence:

a 1
b 2
c 3
etc.

at 'z' I practically always reach '26'.

Page 154

There is such a thing as: knowing a series of words by heart. When am I said to know the poem... by heart? The criteria are rather complicated. Agreement with a printed text is one. What would have to happen to make me doubt that I really know the *ABC* by heart? It is difficult to imagine.

But I use reciting or writing down a series of words from memory as a criterion for equality of numbers, equality of sets.

Page Break 155

Page 155

Ought I now to say: all that doesn't matter--logic still remains the fundamental calculus, only whether I have the same formula twice is of course differently established in different cases?

16. It is not logic--I should like to say--that compels me to accept a proposition of the form $(\exists)(\exists) \supset (\exists)$, when there are a million variables in the first two pairs of brackets and two million in the third. I want to say: logic would not compel me to accept any proposition at all in this case. Something *else* compels me to accept such a proposition as in accord with logic.

Logic compels me only so far as the logical calculus compels me.

But surely it is essential to the calculus with 1000000 that this number must be capable of resolution into a sum $1 + 1 + 1 \dots$, and in order to be certain that we have the right number of units before us, we can number the

$$\mathbf{1} + \mathbf{1} + \mathbf{1} + \mathbf{1} + \dots + \mathbf{1}$$

units: $\mathbf{1} \quad \mathbf{2} \quad \mathbf{3} \quad \mathbf{4} \quad \dots \quad \mathbf{1000000}$. This notation would be like: '100,000.000,000' which also makes the numeral surveyable. And I can surely imagine someone's having a great sum of money in pennies entered in a book in which perhaps they appear as numbers of 100 places, with which I have to calculate. I should now begin to translate them into a surveyable notation, but still I should call them 'numerals', should treat them as a record of numbers. For I should even regard it as the record of a number if someone were to tell me that N has as many shillings as this vessel will hold peas. Another case again: "He has as many shillings as the Song of Songs has letters".

17. The notation ' x_1, x_2, x_3, \dots ' gives a shape to the expression ' $(\exists \dots)$ ', and so to the R-proved tautology.

Let me ask the following question: Is it not conceivable that the 1-1 correlation could not be trustworthily carried out in the Russellian proof, that when, *for example*, we try to use it for adding, we regularly get a result contradicting the usual one, and that we blame this on fatigue, which makes us leave out certain steps unawares? And might we not then say:--if only we didn't get tired we should get the same result--? Because *logic* demands it? Does it demand it, then? Aren't we here rectifying logic by means of another calculus?

Suppose we took 100 steps of the logical calculus at a time and now got trustworthy results, while we don't get them if we try to take all the steps singly--one would like to say: the calculation is still based on unit steps, since 100 steps at a time is defined by means of unit steps.--But the definition says: to take 100 steps at a time is the same thing as..., and yet we take the 100 steps at a time and *not* 100 unit steps.

Still, in the shortened calculation I am obeying a *rule*--and how was this rule justified?--What if the shortened and the unshortened proof yielded different results?

18. What I am saying surely comes to this: I can e.g. define '10' as $1 + 1 + 1 + 1 \dots$ and ' 100×2 ' as ' $2 + 2 + 2 \dots$ ' but I cannot therefore necessarily define ' 100×10 ' as ' $10 + 10 + 10 \dots$ ', nor yet as ' $1 + 1 + 1 + 1 \dots$ '

I can find out that 100×100 equals 10000 by means of a 'shortened' procedure. Then why should I not regard *that* as the original proof procedure?

A shortened procedure tells me what *ought* to come out with the unshortened one. (Instead of the other way round.)

19. "But the calculation is surely based on the unit steps...." Yes; but in a different way. For the procedure of proof is a different one.

I could say for example: $10 = 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1$ and in like manner $100 = 10 + 10 + 10 + 10 + 10 + 10 + 10 + 10 + 10 + 10$. Have I not based the definition of 100 on the successive addition of 1? But in the same way as if I had added 100 units? Is there any need at all in my notation for a sign of the form--' $1 + 1 + 1 \dots$ ' with 100 components of the sum?

The danger here seems to be one of looking at the shortened procedure as a pale shadow of the unshortened

one. The rule of counting is not counting.

Page 157

20. What does taking 100 steps of the calculus 'at once' consist in? Surely in one's regarding, not the unit step, but a different step, as decisive.

Page Break 158

Page 158

In ordinary addition of whole numbers in the decimal system we make steps in units, steps in tens, etc. Can one say that the procedure is founded on one of only making unit steps? One might justify it like this: the result of the addition does indeed look so--'7583'; but the explanation of this sign, its meaning, which must ultimately receive expression in its application too, is surely of this sort: $1 + 1 + 1 + 1 + 1$ and so on. But is it so? Must the numerical sign be explained in this way, or this explanation receive expression implicitly in its application? I believe that if we reflect it turns out that that is not the case.

Page 158

Calculating with graphs or with a slide-rule.

Of course when we check the one kind of calculation by the other, we normally get the same result. But if there are several kinds--who says, if they do not agree, which is the proper method of calculation, with its roots at the source of mathematics?

Page 158

21. Where a doubt can make its appearance whether *this* is really the pattern of *this* proof, where we are prepared to doubt the identity of the proof, the derivation has lost its proving power. For the proof serves as a measure.

Page 158

Could one say: it is part of proof to have an accepted criterion for the correct reproduction of a proof?

Page 158

That is to say, e.g.: we must be able to be certain, it must hold as certain for us, that we have not overlooked a sign in the course of the

Page Break 159

proof. That no demon can have deceived us by making a sign disappear without our noticing, or by adding one, etc.

Page 159

One might say: When it can be said: "Even if a demon had deceived us, still everything would be all right", then the prank he wanted to play on us has simply failed of its purpose.

Page 159

22. Proof, one might say, does not merely shew *that* it is like this, but: *how* it is like this. It shows *how* 13 + 14 yield 27.

Page 159

"A proof must be capable of being taken in" means: we must be prepared to use it as our guide-line in judging.

Page 159

When I say "a proof is a picture"--it can be thought of as a cinematographic picture.

Page 159

We construct the proof once for all. A proof must of course have the character of a model.

Page 159

The proof (the pattern of the proof) shews us the result of a procedure (the construction); and we are convinced that a procedure regulated in *this* way always leads to this configuration.

(The proof exhibits a fact of synthesis to us.)

Page Break 160

Page 160

23. When we say that a proof is a model,--we must, of course, not be saying anything new.

Page 160

Proof must be a procedure of which I say: Yes, this is how it has to be; this must come out if I proceed according to this rule.

Page 160

Proof, one might say, must originally be a kind of experiment--but is then taken simply as a picture.

Page 160

If I pour two lots of 200 apples together and count them, and the result is 400, that is not a proof that $200 + 200 = 400$. That is to say, we should not want to take this fact as a paradigm for judging all similar situations.

Page 160

To say: "these 200 apples and these 200 apples come to 400"--means: when one puts them together, none are lost or added, they behave *normally*.

Page 160

24. "This is the model for the addition of 200 and 200"--not: "this is the model of the fact that 200 and 200 added together yield 400". The process of adding *did* indeed yield 400, but now we take this result as the criterion for the correct addition--or simply: for the addition--of these numbers.

Page Break 161

Page 161

The proof must be our model, our picture, of how these operations have a *result*.

Page 161

The 'proved proposition' expresses what is to be read off from the proof-picture.

Page 161

The proof is now our model of correctly counting 200 apples and 200 apples together: that is to say, it defines a new concept: 'the counting of 200 and 200 objects together'. Or, as we could also say: "a new criterion for nothing's having been lost or added".

Page 161

The proof *defines* 'correctly counting together'.

Page 161

The proof is our model for a particular *result's being yielded*, which serves as an object of comparison (yardstick) for real changes.

Page 161

25. The proof convinces us of something--though what interests us is, not the mental state of conviction, but the applications attaching to this conviction.

Page 161

For this reason the assertion that the proof convinces us of the truth of this proposition leaves us cold,--since this expression is capable of the most various constructions.

Page Break 162

Page 162

When I say: "the proof convinces me of something", still the proposition expressing this conviction need not be constructed in the proof. As e.g. we multiply, but do not necessarily write down the result in the form of the proposition ' $\dots \times \dots = \dots$ '. So we shall presumably say: the multiplication gives us this conviction without our ever uttering the *sentence* expressing it.

Page 162

A psychological disadvantage of proofs that construct *propositions* is that they easily make us forget that the *sense* of the result is not to be read off from this by itself, but from the *proof*. In this respect the intrusion of the Russellian symbolism into the proofs has done a great deal of harm.

Page 162

The Russellian signs veil the important forms of proof as it were to the point of unrecognizability, as when a human form is wrapped up in a lot of cloth.

Page 162

26. Let us remember that in mathematics we are convinced of *grammatical* propositions; so the expression, the result, of our being convinced is that we *accept a rule*.

Page 162

Nothing is more likely than that the verbal expression of the result of a mathematical proof is calculated to delude us with a myth.

Page 162

27. I am trying to say something like this: even if the proved mathematical proposition seems to point to a reality outside itself, still it is only the expression of acceptance of a new measure (of reality).

Page Break 163

Page 163

Thus we take the constructability (provability) of this symbol (that is, of the mathematical proposition) as a

sign that we are to transform symbols in such and such a way.

Page 163

We have won through to a piece of knowledge in the proof? And the final proposition expresses this knowledge? Is this knowledge now independent of the proof (is the navel string cut)?--Well, the proposition is now used by itself and without having the proof attached to it.

Page 163

Why should I not say: in the proof I have won through to a *decision*?

Page 163

The proof places this decision in a system of decisions.

Page 163

(I might of course also say: "the proof convinces me that this rule serves my purpose". But to say this might easily be misleading.)

Page 163

28. The proposition proved by means of the proof serves as a rule--and so as a paradigm. For we *go by* the rule.

But does the proof only bring us to the point of going by this rule

Page Break 164

(accepting it), or does it also shew us *how* we are to go by it?

Page 164

For the mathematical proposition is to shew us what it makes SENSE to say.

Page 164

The proof constructs a proposition; but the point is *how* it constructs it. Sometimes, for example, it first constructs a *number* and then comes the proposition that there is such a number. When we say that the construction must *convince* us of the proposition, that means that it must lead us to apply this proposition in such-and-such a way. That it must determine us to accept this as sense, that not.

Page 164

29. What is in common between the purpose of a Euclidean construction, say the bisection of a line, and the purpose of deriving a rule from rules by means of logical inferences?

Page 164

The common thing seems to be that by the construction of a sign I compel the acceptance of a sign.

Page 164

Could we say: "mathematics creates new *expressions*, not new propositions"?

Inasmuch, that is, as mathematical propositions are instruments taken up into the language once for all--and their proof shews the place where they stand.

Page Break 165

Page 165

But in what sense are e.g. Russell's tautologies 'instruments of language'?

Russell at any rate would not have held them to be so. His mistake, if there was one, can however only have consisted in his not paying attention to their *application*.

Page 165

The proof makes one structure generate another.

It exhibits the generation of one from others.

That is all very well--but still it does quite different things in different cases! What is the *interest* of this transition?

Page 165

Even if I think of a proof as something deposited in the archives of language--who says *how* this instrument is to be employed, what it is for?

Page 165

30. A proof leads me to say: this *must* be like this.--Now, I understand this in the case of a Euclidean proof or the proof of '25 times 25 = 625', but is it also like this in the case of a Russellian proof, e.g. of ' $\vdash p \supset q.p : \supset : q$ '? What does 'it *must* be like this' mean here in contrast with 'it is like this'? Should I say: "Well, I accept this expression as a paradigm for all non-informative propositions of this form"?

Page 165

I go through the proof and say: "Yes, this is how it *has* to be; I must fix the use of my language in *this* way".

I want to say that the *must* corresponds to a track which I lay down in language.

31. When I said that a proof introduces a new concept, I meant something like: the proof puts a new paradigm among the paradigms of the language; like when someone mixes a special reddish blue, somehow settles the special mixture of the colours and gives it a name.

But even if we are inclined to call a proof such a new paradigm--what is the exact similarity of the proof to such a concept-model?

One would like to say: the proof changes the grammar of our language, changes our concepts. It makes new connexions, and it creates the concept of these connexions. (It does not establish that they are there; they do not exist until it makes them.)

32. What concept is created by ' $p \supset p$ '? And yet I feel as if it would be possible to say that ' $p \supset p$ ' serves as the sign of a concept.

' $p \supset p$ ' is a formula. Does a formula establish a concept? One can say: "by the formula... such-and-such follows from this". Or again: "such-and-such follows from this in the following way:..." But is that the sort of proposition I want? What, however, about: "Draw the consequences of this in the following way:..."?

33. If I call a proof a model (a picture), then I must also be able to say this of a Russellian primitive proposition (as the egg-cell of a proof).

It can be asked: how did we come to utter the sentence ' $p \supset p$ ' as

a true assertion? Well, it was not used in practical linguistic intercourse,--but still there was an inclination to utter it in particular circumstances (when for example one was doing logic) *with conviction*.

But what about ' $p \supset p$ '? I see in it a degenerate proposition, which is on the side of truth.

I fix it as an important point of intersection of significant sentences. A pivotal point of our method of description.

34. The construction of a proof begins with some signs or other, and among these some, the 'constants', must already have meaning in the language. In this way it is essential that ' \forall ' and ' \sim ' already possess a familiar application, and the construction of a proof in *Principia Mathematica* gets its importance, its sense, from this. But the signs of the proof do *not* enable us to see this meaning.

The 'employment' of the proof has of course to do with that employment of its signs.

35. To repeat, in a certain sense even Russell's primitive propositions convince me.

Thus the conviction produced by a proof cannot simply arise from the proof-construction.

36. If I were to see the standard metre in Paris, but were not

acquainted with the institution of measuring and its connexion with the standard metre--could I say, that I was acquainted with the concept of the standard metre?

Is a proof not also part of an institution in this way?

A proof is an instrument--but why do I say "an instrument of language"?

Is a calculation necessarily an instrument of language, then?

37. What I always do seems to be--to emphasize a distinction between the determination of a sense and the employment of a sense.

38. Accepting a proof: one may accept it as the paradigm of the pattern that arises when *these* rules are

correctly applied to certain patterns. One may accept it as the correct derivation of a rule of inference. Or as a correct derivation from a correct empirical proposition; or as the correct derivation from a false empirical proposition; or simply as the correct derivation from an empirical proposition, of which we do not know whether it is true or false.

Page 168

But now can I say that the conception of a proof as 'proof of constructability' of the proved proposition is in some sense a simpler, more primary, one than any other conception?

Page Break 169

Page 169

Can I therefore say: "Any proof proves *first and foremost* that this formation of signs must result when I apply these rules to these formations of signs"? Or: "The proof proves first and foremost that this formation can arise when one operates with these signs according to these transformation-rules".--

This would point to a geometrical application. For the proposition whose truth, as I say, is proved here, is a geometrical proposition--a proposition of grammar concerning the transformations of signs. It might for example be said: it is proved that it makes *sense* to say that someone has got the sign ... according to these rules from ... and ...; but no sense etc. etc.

Page 169

Or again: when mathematics is divested of all content, it would remain that certain signs can be constructed from others according to certain rules.--

Page 169

The least that we have to accept would be: that these signs etc. etc.--and accepting this is a basis for accepting anything else.

Page 169

I should now like to say: the sequence of signs in the proof does not necessarily carry with it any kind of acceptance. If however it's to be a matter of accepting, this does not have to be 'geometrical' acceptance.

Page 169

A proof could surely consist of only two steps: say one proposition ' $(x).fx$ ' and one ' fa '--does the correct transition according to a rule play an important part here?

Page Break 170

Page 170

39. *What* is unshakably certain about what is proved?

Page 170

To accept a proposition as unshakably certain--I want to say--means to use it as a grammatical rule: this removes uncertainty from it.

Page 170

"Proof must be capable of being taken in" really means nothing but: a proof is not an experiment. We do not accept the result of a proof because it results once, or because it often results. But we see in the proof the reason for saying that this *must* be the result.

Page 170

What *proves* is not that this correlation leads to this result--but that we are persuaded to take these appearances (pictures) as models for what it is like if....

Page 170

The proof is our new model for what it is like if nothing gets added and nothing taken away when we count correctly etc.. But these words shew that I do not quite know what the proof is a model of.

Page 170

I want to say: with the logic of *Principia Mathematica* it would be possible to justify an arithmetic in which $1000 + 1 = 1000$; and all that would be necessary for this purpose would be to doubt the sensible correctness of calculations. But if we do not doubt it, then it is not our conviction of the truth of logic that is responsible.

Page Break 171

Page 171

When we say in a proof: "This *must* come out"--then this is not for reasons that we do not *see*.

Page 171

It is not our getting this result, but its being the end of this route, that makes us accept it.

Page 171

What convinces us--*that* is the proof: a configuration that does not convince us is not the proof, even when it

can be shewn to exemplify the proved proposition.

Page 171

That means: it must not be necessary to make a physical investigation of the proof-configuration in order to shew us what has been proved.

Page 171

40. If we have a picture of two men, we do not say *first* that the one appears smaller than the other, and *then* that he seems to be further away. It is, one can say, perfectly possible that the one figure's being shorter should not strike us at all, but only its being behind. (This seems to me to be connected with the question of the 'geometrical' conception of proof.)

Page 171

41. "It (the proof) is the model for what is called such-and-such."

Page 171

But what is the transition from '(x).fx' to 'fa' supposed to be a model for? At most for how inferences can be drawn from signs like '(x).fx'.

I thought of the model as a justification, but here it is not a justification.

Page Break 172

The pattern $(x).fx \therefore fa$ does not *justify* the conclusion. If we want to talk about a justification of the conclusion, it lies outside this schema of signs.

Page 172

And yet there is something in saying that a mathematical proof creates a new concept.--Every proof is as it were an avowal of a particular employment of signs.

Page 172

But what is it an avowal of? Only of *this* employment of the rules of transition from formula to formula? Or is it also an avowal in some sense, of the 'axioms'?

Page 172

Could I say: I avow $p \supset p$ as a tautology?

Page 172

I accept ' $p \supset p$ ' as a maxim, e.g. of inference.

Page 172

The idea that proof creates a new concept might also be roughly put as follows: a proof is not its foundations plus the rules of inference, but a *new* building--although it is an example of such and such a style. A proof is a *new* paradigm.

Page 172

The concept which the proof creates may for example be a new concept of inference, a new concept of correct inferring. But as for *why* I accept this as *correct* inferring, the reasons for that lie outside the proof.

Page Break 173

Page 173

The proof creates a new concept by creating or being a new sign. Or--by giving the proposition which is its result a new place. (For the proof is not a movement but a route.)

Page 173

42. It must not be *imaginable* for *this* substitution in *this* expression to yield anything else. Or: I must declare it unimaginable. (The result of an experiment, however, can turn out this way or that.)

Page 173

Still, the case could be imagined in which a proof altered in appearance--engraved in rock, it is stated to be the same whatever the appearance says.

Page 173

Are you really saying anything but: a proof is taken as *proof*?

Page 173

Proof must be a procedure plain to view. Or again: the proof is the procedure that is *plain to view*.

Page 173

It is not something behind the proof, but the proof, that proves.

Page 173

43. When I say: "it must first and foremost be evident that *this* substitution really yields *this* expression"--I might also say: "I must accept it as indubitable"--but then there must be good reasons for this: for example, that the same substitution practically always yields

Page Break 174

the same result etc.. And isn't this exactly what surveyability consists in?

Page 174

I should like to say that where surveyability is not present, i.e. where there is room for a doubt whether what we have really is the result of this substitution, the *proof* is destroyed. And not in some silly and unimportant way that has nothing to do with the *nature* of proof.

Page 174

Or: logic as the foundation of all mathematics does not work, and to shew this it is enough that the cogency of logical proof stands and falls with its geometrical cogency.†1

Page 174

We incline to the belief that *logical* proof has a peculiar, absolute cogency, deriving from the unconditional certainty in logic of the fundamental laws and the laws of inference. Whereas propositions proved in this way can after all not be more certain than is the correctness of the way those laws of inference are *applied*.

Page 174

That is to say: logical proof, e.g. of the Russellian kind, is cogent only so long as it also possesses geometrical cogency.†1 And an abbreviation of such a logical proof may have this cogency and so be a proof, when the Russellian construction, completely carried out, is not.

Page Break 175

Page 175

The logical certainty of proofs--I want to say--does not extend beyond their geometrical certainty.

Page 175

44. Now if a proof is a model, then the point must be what is to count as a correct reproduction of the proof.

Page 175

If, for example, the sign '| | | | | | | |' were to occur in a proof, it is not clear whether merely 'the same number' of strokes (or perhaps little crosses) should count as the reproduction of it, or whether some other, not too small, number does equally well. Etc.

Page 175

But the question is what is to count as the criterion for the reproduction of a proof--for the identity of proofs. How are they to be compared to establish the identity? Are they the same if they look the same?

Page 175

I should like, so to speak, to shew that we can get away from logical proofs in mathematics.

Page 175

45. "By means of suitable definitions, we can prove ' $25 \times 25 = 625$ ' in Russell's logic."--And can I define the ordinary technique of proof by means of Russell's? But how can one technique of proof be *defined* by means of another? How can one explain the *essence* of another? For if the one is an 'abbreviation' of the other, it must surely be a *systematic*

Page Break 176

abbreviation. Proof is surely required that I can systematically shorten the long proofs and thus once more get a system of proofs.

Long proofs at first always go along with the short ones and as it were tutor them. But in the end they can no longer follow the short ones and these shew their independence.

Page 176

The consideration of *long* unsurveyable logical proofs is only a means of shewing how this technique--which is based on the geometry of proving--may collapse, and new techniques become necessary.

Page 176

46. I should like to say: mathematics is a MOTLEY of techniques of proof.--And upon this is based its manifold applicability and its importance.

Page 176

But that comes to the same thing as saying: if you had a system like that of Russell and produced systems like the differential calculus out of it by means of suitable definitions, you would be producing a new bit of mathematics.

Page 176

Now surely one could simply say: if a man had invented calculating in the decimal system--that would have

been a mathematical invention!--Even if he had already got Russell's *Principia Mathematica*--

Page 176

What is it to co-ordinate one system of proofs with another? It involves a translation rule by means of which proved propositions of

Page Break 177

the one can be translated into proved propositions of the other.

Now it is possible to imagine some--or all--of the proof systems of present-day mathematics as having been co-ordinated in such a way with one system, say that of Russell. So that all proofs could be carried out in this system, even though in a roundabout way. So would there then be only the single system--no longer the many?--But then it must surely be possible to shew of the *one* system that it can be resolved into the many.--*One* part of the system will possess the properties of trigonometry, another those of algebra, and so on. Thus one *can* say that different techniques are used in these parts.

Page 177

I said: whoever invented calculation in the decimal notation surely made a mathematical discovery. But could he not have made this discovery all in Russellian symbols? He would, so to speak, have discovered a new *aspect*.

Page 177

"But in that case the truth of true mathematical propositions can still be proved from those general foundations."--It seems to me there is a snag here. When do we say that a mathematical proposition is true?--

Page 177

It seems to me as if we were introducing new concepts into the Russellian logic without knowing it.--For example, when we settle what signs of the form ' $\exists x, y, z...$ ' are to count as equivalent to one another, and what are not to count as equivalent.

Is it a matter of course that ' $\exists x, y, z$ ' is not the same sign as ' $\exists x, y, z, n$ '?

Page Break 178

Page 178

But suppose I first introduce ' $p \vee q$ ' and ' $\sim p$ ' and use them to construct some tautologies--and then produce (say) the series $\sim p, \sim\sim p, \sim\sim\sim p$, etc. and introduce a notation like $\sim^1 p, \sim^2 p, \dots \sim^{10} p \dots$. I should like to say: we should perhaps originally never have thought of the possibility of such a sequence and we have now introduced a new concept into our calculation. Here is a 'new aspect'.

Page 178

It is clear that I could have introduced the concept of number in this way, even though in a very primitive and inadequate fashion--but this example gives me all I need.

Page 178

In what sense can it be correct to say that one would have introduced a new concept into logic with the series $\sim p, \sim\sim p, \sim\sim\sim p$, etc.?--Well, first of all one could be said to have done it with the '*etc.*'. For this '*etc.*' stands for a law of sign formation which is new to me. A characteristic mark of this is the fact that *recursive* definition is required for the explanation of the decimal notation.

Page 178

A new *technique* is introduced.

Page 178

It can also be put like this: having the concept of the Russellian formation of proofs and propositions does *not* mean you have the concept of every *series* of Russellian signs.

Page Break 179

Page 179

I should like to say: Russell's foundation of mathematics postpones the introduction of new techniques--until finally you believe that this is no longer necessary at all.

Page 179

(It would perhaps be as if I were to philosophize about the concept of measurement of length for so long that people forgot that the actual fixing of a unit of length is necessary before you can measure length.)

Page 179

47. Can what I want to say be put like *this*: "If we had learnt from the beginning to do all mathematics in Russell's system, the differential calculus, for example, would not have been invented just by our having Russell's calculus. So if someone discovered this kind of calculation *in Russell's calculus*----."

Page 179

Suppose I had Russellian proofs of the propositions

$$'p \equiv \sim\sim p'$$

$$' \sim p \equiv \sim\sim\sim p'$$

$$'p \equiv \sim\sim\sim\sim p'$$

and I were now to find a shortened way of proving the proposition

$$'p \equiv \sim 10p'.$$

It is as if I had discovered a new kind of calculation within the old calculus. What does its having been discovered consist in?

Page 179

Tell me: have I discovered a new kind of calculation if, having once learnt to multiply, I am struck by multiplications with all the factors the same, as a special branch of these calculations, and so I introduce the notation ' $a^n = \dots$ '?

Page Break 180

Page 180

Obviously the mere 'shortened', or *different*, notation--' 16^2 ' instead of ' 16×16 '--does not amount to that. What is important is that we now merely *count* the factors.

Is ' 16^{15} ' merely another notation for ' $16 \times 16 \times 16$ '?

Page 180

The proof that $16^{15} = \dots$ does not simply consist in my multiplying 16 by itself fifteen times and getting this result--the proof must shew that I take the number as a factor 15 times.

Page 180

When I ask "What is new about the 'new kind of calculation'--exponentiation"--that is difficult to say. The expression 'new aspect' is vague. It means that we now look at the matter differently--but the question is: what is the essential, the *important* manifestation of this 'looking at it differently'?

First of all I want to say: "It need never have *struck* anyone that in certain products all the factors are equal"--or: "Product of all equal factors' is a new concept"--or: "What is new consists in our classifying calculations differently". In exponentiation the essential thing is evidently that we look at the *number* of the factors. But who says we ever attended to the number of factors? It *need* not have struck us that there are products with 2, 3, 4 factors etc. although we have often worked out such products. A new aspect--but once more: what is *important* about it? For what purpose do I use what has struck me?--Well, first of all perhaps I put it down in a notation. Thus I write e.g. ' a^2 ' instead of ' $a \times a$ '. By this means I refer to the series of numbers (allude to it), which did not happen before. So I am surely setting up a new connexion!--A connexion--between what objects? Between the technique of counting factors and the technique of multiplying.

Page Break 181

Page 181

But in that way every proof, each individual calculation makes new connexions!

Page 181

But the *same* proof as shews that $a \times a \times a \times \dots = b$, surely also shews that $a^n = b$; it is only that we have to make the transition according to the definition of ' a^n '.--

But this transition is exactly what is new. But if it is only a transition to the old proof, how can it be important?

Page 181

'It is only a different notation.' Where does it stop being--just a different notation?

Page 181

Isn't it where only the one notation and not the other can be used in such-and-such a way?

Page 181

It might be called "finding a new aspect", if someone writes ' $a(f)$ ' instead of ' $f(a)$ '; one might say: "He *looks at* the function as an argument of its argument". Or if someone wrote ' $\times(a)$ ' instead of ' $a \times a$ ' one could say: "he looks at what was previously regarded as a special case of a function with two argument places as a function with *one* argument place".

If anyone does this he has certainly altered the aspect in a sense, he has for example classified *this* expression with others, compared it with others, with which it was not compared before.--But now, is that an

important change of aspect? *No*, not so long as it does not have certain consequences.

Page Break 182

Page 182

It is true enough that I changed the aspect of the logical calculation by introducing the concept of the *number* of negations: "I never looked at it like that"--one might say. But this alteration only becomes important when it connects with the application of the sign.

Page 182

Conceiving one foot as *12 inches* would indeed mean changing the aspect of 'a foot', but this change would only become important if one now also *measured* lengths in inches.

Page 182

If you introduce the counting of negation signs, you bring in a new way of reproducing signs.

Page 182

For arithmetic, which does talk about the equality of numbers, it is indeed a matter of complete indifference how equality of number of two classes is established--but for its inferences it is not indifferent how its signs are compared with one another, and so e.g. what is the method of establishing whether the number of figures in two numerical signs is the same.

Page 182

It is not the introduction of numerical signs as abbreviations that is important, but the *method* of counting.

Page 182

48. I want to give an account of the motley of mathematics.

Page 182

49. "I can carry out the proof that $127 : 18 = 7.05$ in Russell's system too." Why not.--But must the same result be reached in the

Page Break 183

Russellian proof as in ordinary division? The two are of course connected by means of a type of *calculation* (by rules of translation, say--); but still, is it not risky to work out the division by the new technique,--since the truth of the result is now dependent on the geometry of the rendering?

Page 183

But now suppose someone says: "Nonsense--such considerations play no part in mathematics".--

Page 183

--But the question is not one of uncertainty, for we *are* certain of our conclusions, but of whether we are still doing (Russellian) logic when we e.g. divide.

Page 183

50. Trigonometry has its original importance in connexion with measurements of lengths and angles: it is a bit of mathematics adapted to employment on measurements of lengths and angles.

Applicability to this field might also be called an 'aspect' of trigonometry.

Page 183

When I divide a circle into equal sectors and determine the cosine of one of these sectors by measurement--is that a calculation or an experiment?

Page 183

If a calculation--is it SURVEYABLE?

Is calculation with a slide-rule *surveyable*?

Page Break 184

Page 184

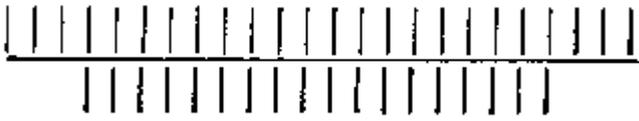

If the cosine of an angle has to be determined by measurement, is a proposition of the form ' $\cos \alpha = n$ ' a *mathematical* proposition? What is the criterion for this decision? Does the proposition say something external about our rulers etc.; or something internal about our concepts?--How is this to be decided?

Page 184

Do the figures (drawings) in trigonometry belong to pure mathematics, or are they only examples of a possible *application*?

Page 184

51. If there is something true about what I am trying to say, then--e.g.--calculating in the decimal notation must have its own life.--One can of course represent any decimal number in the form:

and hence carry out the four species of calculation in this notation. But the life of the decimal notation would have to be independent of calculating with unit strokes.

Page 184

52. In this connexion the following point constantly occurs to me: while indeed a proposition ' $a: b = c$ ' can be *proved* in Russell's logic, still that logic does not teach us to construct a correct sentence of this form, i.e. does not teach us to *divide*. The procedure of dividing would correspond e.g. to that of a *systematic testing* of Russellian proofs with a view, say, to getting the proof of a proposition of the form ' $37 \times 15 = x$ '. "But the technique of such a systematic testing is in its turn founded on logic. It can surely be logically proved in turn that

Page Break 185

this technique must lead to the goal." So it is like proving in Euclid that such-and-such can be constructed in such-and-such a way.

Page 185

53. If someone tries to shew that mathematics is not logic, what is he trying to shew? He is surely trying to say something like:--If tables, chairs, cupboards, etc. are swathed in enough paper, certainly they will look spherical in the end.

Page 185

He is not trying to shew that it is impossible that, for every mathematical proof, a Russellian proof can be constructed which (somehow) 'corresponds' to it, but rather that the acceptance of such a correspondence does not lean on logic.

Page 185

"But surely we can always go back to the primitive logical method!" Well, assuming that we can--how is it that we don't *have* to? Or are we hasty, reckless, if we do not?

But how do we get back to the primitive expression? Do we e.g. take the route through the secondary proof and back from the end of it into the primary system, and then look to see where we have got; or do we go forward in both systems and then connect the end points? And how do we know that we reach the same result in the primary system in the two cases?

Does not proceeding in the secondary system carry the power of conviction with it?

Page 185

"But at every step in the secondary system, we can imagine that it

Page Break 186

could be taken in the primary one too!"--That is just it: *we can imagine that it could be done*--without doing it.

Page 186

And why do we accept the one in place of the other? On grounds of *logic*?

Page 186

"But can't one prove logically that both transformations must lead to the same result?"--But what is in question here is surely the result of transformations of signs! How can logic decide this?

Page 186

54. How can the proof in the stroke system prove that the proof in the decimal system is a proof?

Page 186

Well--isn't it the same for the proof in the decimal system, as it is for a *construction* in Euclid of which it is proved that it really is the construction of such-and-such a figure?

Page 186

Can I put it like this: "The translation of the stroke system into the decimal system presupposes a recursive definition. This definition, however, does not introduce the abbreviation of *one* expression to another. Yet of course inductive proof in the decimal system does not contain the whole set of those signs which would have to be translated by means of the recursive definition into stroke signs. Therefore this general proof cannot be translated by recursive definition into a proof in the stroke system."?

Page Break 187

Page 187

Recursive definition introduces a new sign-technique.--It must therefore make the transition to a new

'geometry'. We are taught a new method of recognizing signs. A new criterion for the identity of signs is introduced.

Page 187

55. A proof shews us what OUGHT to come out.--And since every reproduction of the proof must demonstrate the same thing, while on the one hand it must reproduce the result automatically, on the other hand it must also reproduce the *compulsion* to get it.

That is: we reproduce not merely the *conditions* which once yielded this result (as in an experiment), but the result itself. And yet the proof is not a stacked game, inasmuch as it must always be capable of guiding us.

Page 187

On the one hand we must be able to reproduce the proof *in toto* automatically, and on the other hand this reproduction must once more be *proof* of the result.

Page 187

"Proof must be surveyable": this aims at drawing our attention to the difference between the concepts of 'repeating a proof', and 'repeating an experiment'. To repeat a proof means, not to reproduce the conditions under which a particular result was once obtained, but to repeat every step *and the result*. And although this shews that proof is something that must be capable of being reproduced *in toto* automatically, still every such reproduction must contain the force of proof, which compels acceptance of the result.

Page Break 188

Page 188

56. When do we say that one calculus 'corresponds' to another, is only an abbreviated form of the first?--"Well, when the results of the latter can be translated by means of suitable definitions into the results of the former." But has it been said how one is to calculate with these definitions? What makes us accept this translation? Is it a stacked game in the end? It is, if we are decided on only accepting the translation that leads to the accustomed result.

Page 188

Why do we call a part of the Russellian calculus the part corresponding to the differential calculus?--Because the propositions of the differential calculus are proved in it.--But, ultimately, after the event.--But does that matter? Sufficient that proofs of these propositions can be found in the Russellian system! But aren't they proofs of these propositions only when their results can be translated only into *these* propositions? But is that true even in the case of multiplying in the stroke system with numbered strokes?

Page 188

57. Now it must be clearly stated that calculations in the stroke notation will normally always agree with those in the decimal notation. Perhaps, in order to make sure of agreement, we shall at some point have to take to getting the stroke-calculation worked over by *several* people. And we shall do the same for calculations with still higher numbers in the decimal system.

But that of course is enough to shew that it is not the proofs in the stroke notation that make the proofs in the decimal system cogent.

Page Break 189

Page 189

"Still, if we did not have the latter, we could use the former to prove the same thing."--The same thing? What is the same thing?--Well, the stroke proof will convince me of the same thing, though not in the same way.--Suppose I were to say: "The place to which a proof leads us cannot be determined independently of this proof."--Did a proof in the stroke system demonstrate to me that the proved proposition possesses the applicability given it by the proof in the decimal system--was it e.g. proved in the stroke system that the proposition is also provable in the decimal system?

Page 189

58. Of course it would be nonsense to say that *one* proposition cannot have two proofs--for we do say just that. But can we not say: *this* proof shews that... results when we do *this*; the other proof shews that this expression results when we do something else?

For is e.g. the mathematical fact that 129 is divisible by 3 independent of the fact that *this* is the result in *this* calculation? I mean: is the fact of this divisibility independent of the *calculus* in which it is a result; or is it a fact of this calculus?

Page 189

Suppose it were said: "By calculating we get acquainted with the properties of numbers".

But do the properties of numbers *exist* outside the calculating?

Page 189

"Two proofs prove the same when what they convince me of is the same."--And when is what they convince me of the same?--How do I know that what they convince me of is the same? Not of course by introspection.

Page Break 190

Page 190

I can be brought to accept this rule by a variety of paths.

Page 190

59. "Each proof proves not merely the truth of the proposition proved, but also that it can be proved *in this way*."--But this latter can also be proved in another way.--"Yes, but the proof proves this in a particular way and in doing so proves that it can be demonstrated in this way."--But even *that* could be shewn by means of a different proof.--"Yes, but then not in this way."--

But this means e.g.: this proof is a mathematical entity that cannot be replaced by any other; one can say that it can convince us of something that nothing else can, and this can be given expression by our assigning to it a proposition that we do not assign to any other proof.

Page 190

60. But am I not making a crude mistake? For just this is essential to the propositions of arithmetic and to the propositions of the Russellian logic: various proofs lead to them. Even: infinitely many proofs lead to any one of them.

Page 190

Is it correct to say that every proof demonstrates something to us which it alone can demonstrate? Would not--so to speak--the proved proposition then be superfluous, and the proof itself also be the thing proved?

Page 190

Is it only the proved proposition that the proof convinces me of?

Page Break 191

Page 191

What is meant by: "A proof is a mathematical entity which cannot be replaced by any other"? It surely means that every single proof has a usefulness which no other one has. It might be said: "--that every proof, even of a proposition which has already been proved, is a contribution to mathematics". But why is it a contribution if its only point was to prove the proposition? Well, one can say: "the new proof shews (or *makes*) a new connexion". (But in that case is there not a mathematical proposition saying that this connexion exists?)

Page 191

What do we *learn* when we see the new proof--apart from the proposition, which we already know anyhow? Do we learn something that cannot be expressed in a mathematical proposition?

Page 191

61. How far does the application of a mathematical proposition depend on what is allowed to count as a proof of it and what is not?

Page 191

I can surely say: if the proposition ' $137 \times 373 = 46792$ ' is true in the ordinary sense, *then there must be a multiplication-sum*, at the ends of which stand the two sides of this equation. And a multiplication-sum is a pattern satisfying certain rules.

I want to say: if I did not accept the multiplication-sum as *one* proof of the proposition, then that would mean that the application of the proposition to multiplication-sums would be gone.

Page 191

62. Let us remember that it is not enough that two proofs meet in the same propositional sign. For how do we know that this sign

Page Break 192

says the same thing both times? *That* must proceed from other connexions.

Page 192

63. The *exact* correspondence of a correct (convincing) transition in music and in mathematics.

Page 192

64. Suppose I were to set someone the problem: "Find a proof of the proposition..."--The answer would surely be to shew me certain signs. Very well: *what* condition must these signs satisfy? They must be a proof of that proposition--but is that, say, a *geometrical* condition? Or a psychological one? Sometimes it could be called a geometrical condition; where the means of proof are already prescribed and all that is being looked for is a particular arrangement.

65. Are the propositions of mathematics anthropological propositions saying how we men infer and calculate?--Is a statute book a work of anthropology telling how the people of this nation deal with a thief etc.?--Could it be said: "The judge looks up a book about anthropology and thereupon sentences the thief to a term of imprisonment"? Well, the judge does not USE the statute book as a manual of anthropology.

66. The prophecy does *not* run, that a man will get *this* result when he follows this rule in making a transformation--but that he will get this result, when we *say* that he is following the rule.

What if we said that mathematical propositions were prophecies in *this* sense: they predict what result members of a society who have learnt this technique will get in agreement with other members of the society? '25 × 25 = 625' would thus mean that men, if we judge them to obey the rules of multiplication, will reach the result 625 when they multiply 25 × 25.--That this is a correct prediction is beyond doubt; and also that calculating is in essence founded on such predictions. That is to say, we should not call something 'calculating' if we could not make such a prophecy with certainty. This really means: calculating is a technique. And what we have said pertains to the essence of a technique.

67. This consensus belongs to the essence of *calculation*, so much is certain. I.e.: this consensus is part of the phenomenon of our calculating.

In a technique of *calculating* prophecies must be possible.

And that makes the technique of calculating similar to the technique of a *game*, like chess.

But what about this consensus--doesn't it mean that *one* human being by himself could not calculate? Well, *one* human being could at any rate not calculate just *once* in his life.

It might be said: all *possible* positions in chess can be conceived as propositions saying that they (themselves) are *possible* positions, or again as prophecies that people will be able to reach these positions

by moves which they agree in saying are in accordance with the rules. A position *reached* in this way is then a proved proposition of this kind.

"A calculation is an experiment."--A calculation can be an experiment. The teacher makes the pupil do a calculation in order to see whether he can calculate; that is an experiment.

When the stove is lit in the morning, is that an experiment? But it could be one.

And in the same way moves in chess are *not* proofs either, and chess positions are not propositions. And mathematical propositions are not positions in a game. And in *this* way they are not prophecies either.

68. If a calculation is an experiment, then what is a mistake in calculation? A mistake in the experiment? Surely not; it would have been a mistake in the experiment, if I had not observed the *conditions* of the experiment--if, e.g., I had made someone calculate when a terrible noise was going on.

But why should I not say: while a mistake in calculating is not a *mistake* in the experiment, still, it is a *miscarriage* of the experiment--sometimes explicable, sometimes inexplicable?

69. "A calculation, for example a multiplication, is an experiment: *we do not know what will result* and we learn it once the multiplication is done."

--Certainly; nor do we know when we go for a walk where exactly we shall be in five minutes' time--but does that make going for a walk into an experiment?--Very well; but in the calculation I surely wanted from the beginning to know what the result was going to be; *that* was what I was interested in. I am, after all, curious about the result. Not,

however, as what I am *going* to say, but as what I *ought* to say.

Page 195

But isn't this just what interests you about this multiplication--how the generality of men will calculate? No--at least not usually--even if I am running to a common meeting point with everybody else.

But surely this is just what the calculation shews me experimentally--where this meeting point is. I as it were let myself unwind and see where I get. And the correct multiplication is the pattern of the way we all work, when we are wound up like *this*.

Page 195

Experience teaches that we all find this calculation correct.

Page 195

We let ourselves unwind and get the result of the calculation. But now--I want to say--we aren't interested in having--under such and such conditions say--actually produced this result, but in the pattern of our working; it interests us as a convincing, harmonious, pattern--not, however, as the result of an experiment, but as a *path*.

Page 195

We say, not: "So *that's* how we go!", but: "So *that's* how it goes!"

Page Break 196

Page 196

70. In what we accept we all work the same way, but we do not make use of this identity merely to predict what people will accept. Just as we do not *use* the proposition "this notebook is red" only to predict that most people will call it 'red'.

Page 196

"And that's what we *call* 'the same'." If there did not exist an agreement in what we call 'red', etc. etc., language would stop. But what about the agreement in what we call 'agreement'?

We can describe the phenomenon of a confusion of language; but what are our tokens of confusion of language? Not necessarily tumult and muddle in action. But rather that, e.g. I am lost when people talk, I cannot react in agreement with them.

Page 196

"For me this is not a language-game." But in this case I might also say: though they accompany their actions with spoken sounds and I cannot call their actions 'confused', still they haven't a *language*--But perhaps their actions would become confused if they were prevented from emitting those sounds.

Page 196

71. It could be said: a proof helps communication. An experiment presupposes it.
Or even: a mathematical proof moulds our language.

Page 196

But it surely remains the case that we can use a mathematical proof to make scientific predictions about the proving done by other people.--

Page Break 197

Page 197

If someone asks me: "What colour is this book?" and I reply: "It's green"--might I as well have given the answer: "The generality of English-speaking people call that 'green'"?

Might he not ask: "And what do *you* call it?" For he wanted to get my reaction.

Page 197

The limits of empiricism.†1

Page 197

72. But there is such a thing as a science of conditioned calculating reflexes;--is that mathematics? That science will rely on experiments: and these experiments will be *calculations*. But suppose this science became quite exact and in the end even a 'mathematical' science?

Now is the result of these experiments that human beings agree in their calculations, or that they agree in what they call "agreeing"? And it goes on like that.

Page 197

It could be said: that science would not function if we did not agree regarding the idea of agreement.

Page 197

It is clear that we can make use of a mathematical work for a study in anthropology. But then one thing is not clear:--whether we

ought to say: "This writing shews us how operating with signs was done among these people", or: "This writing shews us what parts of mathematics these people had mastered".

73. Can I say, on reaching the end of a multiplication: "So *this* is what I agree with!--"?--But can I say it at a single *step* of the multiplication? E.g. at the step ' $2 \times 3 = 6$ '? Any more than I can say: "So this is what I call '*white*'!", looking at this paper?

It seems to me it would be a similar case if someone were to say: "When I call to mind what I have done to-day, I am making an experiment (starting myself off), and the memory that then comes serves to shew me what other people, who saw me, will reply to the question what I did".

What would happen if we rather often had this: we do a calculation and find it correct; then we do it again and find it isn't right; we believe we overlooked something before--then when we go over it again our second calculation doesn't seem right, and so on.

Now should I call this calculating or not?--At any rate he cannot use this calculation to predict that he will land there again next time.--But could I say that he calculated *wrong* this time, because the next time he did not calculate again the same way? I might say: where *this* uncertainty existed there would be no calculating.

But on the other hand I say again: 'Calculating is right--as it is done'. There *can* be no mistake of calculation in ' $12 \times 12 = 144$ '. Why? This proposition has assumed a place among the rules.

But is ' $12 \times 12 = 144$ ' the assertion that it is natural to all men to work out 12×12 in such a way that the answer is 144?

74. If I go over a calculation several times so as to be sure of having done it right, and if I then accept it as correct,--haven't I repeated an experiment so as to be sure that I shall tick the same way the next time?--But why should going over the calculation three times convince me that I shall tick the same way the fourth time?--I'd say: I went over the calculation 'so as to be sure of not having overlooked anything'.

The danger here, I believe, is one of giving a justification of our procedure where there is no such thing as a justification and we ought simply to have said: *that's how we do it*.

When somebody makes an experiment repeatedly 'always with the same result', has he at the same time made an experiment which tells him *what* he will call 'the same result', i.e. how he uses the word "the same"? If you measure a table with a yardstick, are you also measuring the yardstick? If you are measuring the yardstick, then you cannot be measuring the table at the same time.

Suppose I were to say: "When someone measures the table with a yardstick he is making an experiment which tells him the results of measuring this table with *all other* yardsticks"? It is after all beyond doubt that a measurement with one yardstick can be used to predict the results of measurement with others. And, further, that if it could

not--our whole system of measuring would collapse.

No yardstick, it might be said, would be correct, if in general they did not agree.--But when I say that, I do not mean that then they would all be *false*.

75. Calculating would lose its point, if *confusion* supervened. Just as the use of the words "green" and "blue" would lose its point. And yet it seems to be nonsense to say--that a proposition of arithmetic *asserts* that there will not be confusion.--Is the solution simply that the arithmetical proposition would not be *false* but useless, if confusion supervened?

Just as the proposition that this room is 16 foot long would not become *false*, if rulers and measuring fell into confusion. Its sense, not its truth, is founded on the regular working of measurements. (But don't be dogmatic here. There are transitional cases which complicate the discussion.)

Suppose I were to say: an arithmetical proposition expresses confidence that confusion will not supervene. Then the use of all words expresses confidence that confusion will not supervene.

Page 200

We cannot say, however, that use of the word "green" signifies that confusion will not supervene--because then the use of the word "confusion" would have in its turn to assert just the same thing about *this* word.

Page 200

If ' $25 \times 25 = 625$ ' expresses the confidence that we shall always find it easy to agree on taking the road that ends with this proposition--

Page Break 201

then why doesn't this last clause express confidence in something different, viz. that we should always be able to agree about *its* use?

Page 201

We do not play the same language-game with the two propositions.

Page 201

Or can one equally well be confident that one will see the same colour over there as here--and also: that one will be inclined to call the colour the same, if it is the same?

Page 201

What I want to say is: mathematics as such is always measure, not thing measured.

Page 201

76. The concept of calculating excludes *confusion*.--Suppose someone were to get different results at different times when he did a multiplication, and saw this, but found it all right?--But then surely he could not use the multiplication for the same purposes as we!--Why not? Nor is there anything to say that he would necessarily fare ill if he did.

Page 201

The conception of calculation as an experiment tends to strike us as the only *realistic* one.

Page 201

Everything else, we think, is moonshine. In an experiment we have

Page Break 202

something tangible. It is almost as if one were to say: "When a poet composes he is making a psychological experiment; that is the only way of explaining how a poem can have value". We mistake the nature of '*experiment*',--believing that whenever we are keen on knowing the end of a process, it is what we call an "experiment".

Page 202

It looks like obscurantism to say that a calculation is not an experiment. And in the same way so does the statement that mathematics does not *treat* of signs, or that pain is not a form of behaviour. But only because people believe that one is asserting the existence of an intangible, i.e. a shadowy, object side by side with what we all can grasp. Whereas we are only pointing to different modes of employment of words.

It is almost as if one were to say: 'Blue' has to stand for a blue object--otherwise we could not see what the word was for.

Page 202

77. I have invented a game--realize that whoever begins must always win: so it isn't a game. I alter it; now it is all right.

Did I make an experiment, whose result was that whoever begins must always win? Or that we are inclined to play in such a way that this happens? No.--But the result was not what you would have expected! Of course not; but that does not make the game into an experiment.

Page 202

But what does it mean not to know *why* it always has to work out like that? Well, it is because of the rules.--I want to know how I must alter the rules in order to get a proper game.--But you can e.g. alter them *entirely*--and so give a quite different game in place of this

Page Break 203

one.--But that is not what I want. I want to keep the general outline of the rules and only eliminate a mistake.--But that is vague. It is now simply *not clear* what is to be considered as the mistake.

Page 203

It is almost like when one says: What is the mistake in this piece of music? It doesn't sound well on the

instruments.--Now the mistake is not necessarily to be looked for in the instrumentation; it *could* be looked for in the themes.

Page 203

Let us suppose, however, that the game is such that whoever begins can always win by a particular simple trick. But this has not been realized;--so it is a game. Now someone draws our attention to it;--and it stops being a game.

Page 203

What turn can I give this, to make it clear to myself?--For I want to say: "and it stops being a game"--not: "and we now see that it wasn't a game".

Page 203

That means, I want to say, it can also be taken like this: the other man did not *draw our attention* to anything; he taught us a different game in place of our own.--But how can the new game have made the old one obsolete?--We now see something different, and can no longer naïvely go on playing.

On the one hand the game consisted in our actions (our play) on the board; and these actions I could perform as well now as before. But on the other hand it was essential to the game that I blindly tried to

Page Break 204

win; and now I can no longer do that.

Page 204

78. Let us suppose that people originally practised the four kinds of calculation in the usual way. Then they began to calculate with bracketed expressions, including ones of the form $(a - a)$. Then they noticed that multiplications, for example, were becoming ambiguous. Would this have to throw them into confusion? Would they have to say: "Now the solid ground of arithmetic seems to wobble"?

Page 204

And if they now demand a proof of consistency, because otherwise they would be in danger of falling into the bog at every step--what are they demanding? Well, they are demanding a kind of *order*. But was there *no* order before?--Well, they are asking for an order which appeases them now.--But are they like small children, that merely have to be lulled asleep?

Page 204

Well, multiplication would surely become unusable in practice because of its ambiguity--that is for the former normal purposes. Predictions based on multiplications would no longer hit the mark.--(If I tried to predict the length of the line of soldiers that can be formed from a square 50×50 , I should keep on arriving at wrong results.)

Is this kind of calculation wrong, then?--Well, it is unusable for *these* purposes. (Perhaps usable for other ones.) Isn't it as if I were once to divide instead of multiplying? (As can actually happen.)

Page Break 205

Page 205

What is meant by: "You have to *multiply* here; not divide!"--

Page 205

Now is ordinary multiplication a *proper* game; is it *impossible* to trip up? And is the calculation with $(a - a)$ not a proper game--is it impossible *not* to trip up?

Page 205

(What we want is to *describe*, not to explain.)

Page 205

Now, what is it for us not to know our way about in our calculus?

Page 205

We went sleepwalking along the road between abysses.--But even if we now say: "Now we are awake",--can we be certain that we shall not wake up one day? (And then say:--so we were asleep again.)

Page 205

Can we be certain that there are not abysses now that we do not see?

But suppose I were to say: The abysses in a calculus are not there if I don't see them!

Page 205

Is no demon deceiving us at present? Well, if he is, it doesn't matter. What the eye doesn't see the heart doesn't grieve over.

Page Break 206

Page 206

Suppose I were to divide by 3 sometimes like this:

sometimes like this

without noticing it.--Then someone draws my attention to it.

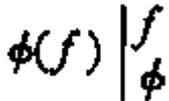

To a mistake? Is it necessarily a mistake? And in what circumstances do we call it one?

Page 206

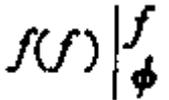

$$\left. \begin{array}{l} \sim f(f) = \phi(f) \text{ Def.} \\ \vdots \\ \phi(\phi) = \sim \phi(\phi) \end{array} \right\} 79.$$

Page 206

The propositions ' $\phi(\phi)$ ' and ' $\sim\phi(\phi)$ ' sometimes seem to say the same thing and sometimes opposite things. According as we look at it the proposition ' $\phi(\phi)$ ' sometimes seems to say $\sim\phi(\phi)$, sometimes the opposite. And we sometimes see it as the product of the substitution:

At other times as:

We should like to say: "Heterological' is not heterological; so by definition it can be called 'heterological'." And it sounds all right, goes quite smoothly, and the contradiction need not strike us at all. If we become aware of the contradiction, we should at first like to say that we do not mean the same thing by the assertion, ξ is heterological, in the two cases. The one time it is the unabbreviated assertion,

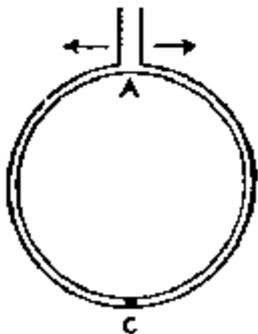

Page Break 207

the other time the assertion abbreviated according to the definition.

We should then like to get out of the thing by saying: ' $\sim\phi(\phi) = \phi_1(\phi)$ '. But why should we lie to ourselves like this? Here two *contrary* routes really do lead--to the *same* thing.

Or again:--*it is equally natural* in this case to say ' $\sim\phi(\phi)$ ' and ' $\phi(\phi)$ '.

According to the rule it is an equally natural expression to say that C lies to the right of the point A and that it lies to the left.

According to this rule--which says that a place lies in the direction of the arrow if the street that begins in that direction leads to it.

Page 207

Let us look at it from the point of view of the language-games.--

Originally we played the game only with straight streets.----

Page 207

80. Could it perhaps be imagined that where I see *blue*, this means that the object that I see is *not* blue--that the colour that appears to me always counts as the one that is *excluded*? I might for example believe that God always shews me a colour in order to say: *not* this.

Or does this work: the colour that I see merely tells me that this colour plays a part in the description of the object. It corresponds, not to a proposition, but merely to the word "blue". And the description

Page Break 208

of the object can then equally well run: "it is blue", and "it is not blue". Then one says: the eye only shows me blue, but not the role of this blue.--We compare seeing the colour with hearing the word "blue" when we have not heard the rest of the sentence.

Page 208

I should like to shew that we could be led to want to describe something's being blue, both by saying it was blue, and by saying it was not blue.

And so that it is in our hands to make such a shift in the method of projection that '*p*' and '*~p*' get the same sense. By which, however, they lose it, if I do not introduce something new as negation.

Page 208

Now a language-game can lose its sense through a contradiction, can lose the character of a language-game.

And here it is important to say that this character is not described by saying that the sounds must have a certain *effect*. For our language-game (2)†1 would lose the character of a language-game if the builders kept on uttering different sounds instead of the 4 orders; even if it could be shewn, say physiologically, that it was always these noises that moved the assistant to bring the stones that he did bring.

Page 208

Even here it could be said that of course the examination of language-games gets its importance from the fact that language-games continue to function. And so that it gets its importance from the fact that human beings can be trained to such a reaction to sounds.

Page Break 209

Page 209

It seems to me that there is a connexion between this and the question whether a calculation is an experiment made with a view to predicting the course of calculations. For suppose that one did a calculation and--correctly--predicted that one would calculate differently the next time, since the circumstances have changed then precisely by one's already having done the calculation *so-and-so* many times.

Calculating is a phenomenon which we know from calculating. As language is a phenomenon which we know from our language.

Page 209

Can we say: 'Contradiction is harmless if it can be sealed off'? But what prevents us from sealing it off? That we do not know our way about in the calculus. Then *that* is the harm. And this is what one means when one says: the contradiction indicates that there is something wrong about our calculus. It is merely the (local) *symptom* of a sickness of the whole body. But the body is only sick if we do not know our way about.

The calculus has a secret sickness, means: what we have got is, as it is, not a calculus, and *we do not know our way about*--i.e. cannot give a calculus which corresponds 'in essentials' to this simulacrum of a calculus, and only excludes what is wrong in it.

Page 209

But how is it possible not to know one's way about in a calculus: isn't it there, open to view?

Let us imagine having been taught Frege's calculus, contradiction and all. But the contradiction is not presented as a disease. It is, rather, an accepted part of the calculus, and we calculate with it. (The calculations

Page Break 210

do not serve the usual purpose of logical calculations.)--Now we are set the task of changing this calculus, of which the contradiction is an entirely respectable part, into another one, in which this contradiction is not to exist, as the new calculus is wanted for purposes which make a contradiction undesirable.--What sort of problem is this? And what sort of inability is it, if we say: "We have not yet found a calculus satisfying this condition"?

Page 210

When I say: "I don't know my way about in the calculus"--I do not mean a mental state, but an inability to *do* something.

Page 210

It is often useful, in order to help clarify a philosophical problem, to imagine the historical development, e.g. in mathematics, as quite different from what it actually was. If it had been different no one would have had the idea of saying what is actually said.

Page 210

I should like to ask something like: "Is it usefulness you are out for in your calculus?--In that case you do not get any contradiction. And if you aren't out for usefulness--then it doesn't matter if you do get one."

Page 210

81. Our task is, not to discover calculi, but to describe the *present* situation.

Page Break 211

Page 211

The idea of the predicate which is true of itself etc. does of course lean on *examples*--but these examples were *stupidities*, for they were not thought out at all. But that is not to say that such predicates could not be applied, and that the contradiction would not then have its application!

I mean: if one really fixes one's eye on the application, it does not occur to one at all to write ' $f(f)$ '. On the other hand, if one is using the signs in the calculus, *without presuppositions* so to speak, one may also write ' $f(f)$ ', and must then draw the consequences and not forget that one has not yet an *inkling* of a possible practical application of this calculus.

Page 211

Is the question this: "Where did we forsake the region of usability?"?--

Page 211

For might we not possibly have *wanted* to produce a contradiction? Have said--with pride in a mathematical discovery: "Look, this is how we produce a contradiction"? Might not e.g. a lot of people possibly have tried to produce a contradiction in the domain of logic, and then at last *one* person succeeded?

But why should people have tried to do *this*? Perhaps I cannot at present suggest the most plausible purpose. But why not e.g. in order to show that everything in this world is uncertain?

Page 211

These people would then never actually employ expressions of the form $f(f)$, but still would be glad to lead their lives in the *neighbourhood* of a contradiction.

Page Break 212

Page 212

"Can I see an *order* which prevents me from unwittingly arriving at a contradiction?" That is like saying: shew me an order in my calculus to convince me that I can never in this way arrive at a number which.... Then I shew him e.g. a recursive proof.

Page 212

But is it wrong to say: "Well, I shall go on. If I *see* a contradiction, then will be the time to do something about it."?--Is that: not really doing mathematics? Why should that *not* be calculating? I travel this road untroubled; if I should come to a precipice I shall try to turn round. Is that not 'travelling'?

Page 212

Let us imagine the following case: the people of a certain tribe only know oral calculation. They have no acquaintance with writing. They teach their children to count in the decimal system. Among them mistakes in counting are very frequent, digits get repeated or left out without their noticing. Now a traveller makes a gramophone record of their counting. He teaches them writing and written calculation, and then shews them how often they make mistakes when they calculate just by word of mouth.--Would these people now have to admit that they had not really calculated before? That they had merely been groping about, whereas now they walk? Might they not perhaps even say: our affairs went better before, our intuition was not burdened with the dead stuff of writing? You cannot lay hold of the spirit with a machine. They say perhaps: "If we repeated a digit then, as your machine asserts--well, that will have been right".

Page 212

We may trust 'mechanical' means of calculating or counting more than our memories. Why?--Need it be like this? I may have

Page Break 213

miscounted, but the machine, once constructed by us in such-and-such a way, cannot have miscounted. Must I adopt this point of view?--"Well, experience has taught us that calculating by machine is more trustworthy than by memory. It has taught us that our life goes smoother when we calculate with machines." But must smoothness

necessarily be our ideal (must it be our ideal to have everything wrapped in cellophane)?

Might I not even trust memory and not trust the machine? And might I not mistrust the *experience* which 'gives me the illusion' that the machine is more trustworthy?

Page 213

82. Earlier I was not certain that, among the kinds of multiplication corresponding to *this* description, there was none yielding a result different from the accepted one. But say my uncertainty is such as only to arise at a certain distance from calculation of the normal kind; and suppose that we said: there it does no harm; for if I calculate in a very abnormal way, then I must just reconsider everything. Wouldn't this be all right?

Page 213

I want to ask: *must* a proof of consistency (or of non-ambiguity) necessarily give me greater certainty than I have without it? And, if I am really out for adventures, *may* I not go out for ones where this proof no longer offers me any certainty?

Page 213

My aim is to alter the *attitude* to contradiction and to consistency proofs. (*Not* to shew that this proof shews something unimportant. How *could* that be so?)

Page Break 214

Page 214

If for example I were anxious to produce contradictions, say for aesthetic purposes, then I should now unhesitatingly accept the inductive proof of consistency and say: it is hopeless to try and produce a contradiction in this calculus; the proof shews that it won't work. (Proof in theory of harmony.)----

Page 214

83. It is a good way of putting things to say: "this order (this method) is unknown to this calculus, but not to that one".

What if one said: "A calculus to which this order is unknown is really not a calculus"?

(An office system to which this order is unknown is not really an office system.)

Page 214

It is--I should like to say--for practical, not for theoretical purposes, that the disorder is avoided.

Page 214

A kind of order is introduced because one has fared ill without it--or again, it is introduced, like streamlining in perambulators and lamps, because it has perhaps proved its value somewhere else and in this way has become the style or fashion.

Page 214

The misuse of the idea of *mechanical* insurance against contradiction. But what if the parts of the mechanism fuse together, break or bend?

Page Break 215

Page 215

84. "Only the proof of consistency shews me that I can rely on the calculus."

Page 215

What sort of proposition is it, that only *then* can you rely on the calculus? But what if you do rely on it *without* that proof! What sort of mistake have you made?

Page 215

I introduce order; I say: "There are only *these* possibilities: ...". It is like determining the set of possible permutations of *A, B, C*: before the order was there, I had perhaps only a foggy idea of this set.--Am I now quite certain that I have overlooked nothing? The order is a method for not overlooking anything. But--for not overlooking any possibility in the calculus, or: for not overlooking any possibility in reality?--Is it now certain that people will never want to calculate differently? That people will never look at our calculus as we look at the counting of aborigines whose numbers only go up to 5?--that we shall never want to look at reality differently? But *that* is not at all the certainty that this order is supposed to give us. It is not the eternal correctness of the calculus that is supposed to be assured, but only, so to speak, the temporal.

Page 215

'But these are the possibilities that you *mean*!--Or do you mean other ones?'

Page 215

The order convinces me that I have overlooked nothing when I have these 6 possibilities. But does it also convince me that nothing is going to be able to upset my present conception of such possibilities?

85. Could I imagine our fearing a possibility of constructing the heptagon, like the construction of a contradiction; and that the proof that the construction of the heptagon is impossible should have a settling effect, like a consistency proof?

How does it come about that we are at all tempted (or at any rate come near it) to divide through by $(3 - 3)$ in $(3 - 3) \times 2 = (3 - 3) \times 5$? How does it come about that by the rules this step looks plausible, and that even so it is still unusable?

When one tries to describe this situation it is enormously easy to make a mistake in the description. (So it is very difficult to describe.) The descriptions which immediately suggest themselves are all misleading--that is how our language in this field is arranged.

And there will be constant lapses from description into explanation here.

It was, or appears to be, *roughly* like this: we have a calculus, let us say, with the beads of an abacus; we then replace it by a calculus with written signs; this calculus suggests to us an extension of the method of calculating which the first calculus did not suggest--or perhaps better: the second calculus *obliterates* a distinction which was not to be overlooked in the first one. Now if it was the point of the first calculus that this distinction was made, and it is not made in the second one then the latter thereby lost its usability as an equivalent of the former. And now--it seems--the problem might arise: *where* did we depart from the original calculus, what frontiers in the new one correspond to the natural frontiers of the old?

I formed a system of rules of calculation which were modelled on those of another calculus. I took the latter as a model. But exceeded its limits. This was even an advantage; but now the new calculus became unusable in certain parts (at least for the former purposes). I therefore seek to alter it: that is, to replace it by one that is *to some extent* different. And by one that has the advantages without the disadvantages of the new one. But is that a clearly *defined* task?

Is there such a thing--it might also be asked--as *the right* logical calculus, only without the contradictions?

Could it be said, e.g., that while Russell's Theory of Types avoids the contradiction, still Russell's calculus is not THE universal logical calculus but perhaps an artificially restricted, mutilated one? Could it be said that the *pure, universal* logical calculus has yet to be found?

I was playing a game and in doing so I followed certain rules: but as for *how* I followed them, that depended on circumstances and the way it so depended was not laid down in black and white. (This is to some extent a misleading account.) Now I wanted to play this game in such a way as to follow rules 'mechanically' and I 'formalized' the game. But in doing this I reached positions where the game lost *all* point; I therefore wanted to avoid these positions 'mechanically'.--The formalization of logic did not work out satisfactorily. But what was the attempt made for at all? (What was it useful for?) Did not this need, and the idea that it must be capable of satisfaction, arise from a lack of clarity in another place?

The question "what was it useful for?" was a quite *essential* question. For the calculus was not invented for some practical purpose, but in order 'to give arithmetic a foundation'. But who says that arithmetic is logic, or what has to be done with logic to make it in some sense into a substructure for arithmetic? If we had e.g. been led to attempt this

by aesthetic considerations, who says that it can succeed? (Who says that this English poem can be translated into German to our satisfaction?!)

(Even *if* it is clear that there is in *some* sense a translation of any English sentence into German.)

Philosophical dissatisfaction disappears by our seeing *more*.

By my allowing the cancelling of $(3 - 3)$ this type of calculation loses its point. But suppose that, for example, I were to introduce a new sign of equality which was supposed to express: 'equal after *this* operation'? Would it, however, make sense to say: "Won in *this* sense", if in this sense I should win *every* game?

At certain places the calculus led me to its own abrogation. Now I want a calculus that does not do this and that excludes these places.--Does this mean, however, that any calculus in which such an exclusion does not occur is an uncertain one? "Well, the discovery of these places was a warning to us."--But did you not *misunderstand* this 'warning'?

Page 218

86. Can one prove that one has not overlooked anything?--Certainly. And must one not perhaps admit later: "Yes, I did overlook something; but not in the field for which my proof held"?

Page 218

The proof of consistency must give us reasons for a prediction; and

Page Break 219

that is its *practical purpose*. That does not mean that this proof is a proof from the physics of our technique of calculation--and so a proof from applied mathematics--but it does mean that that prediction is the application that first suggests itself to us, and the one for whose sake we have this proof at heart. The prediction is not: "No disorder will arise *in this way*" (for that would not be a prediction: it is the mathematical proposition) but: "no disorder will arise".

Page 219

I wanted to say: the consistency-proof can only set our minds at rest, if it is a cogent reason for this prediction.

Page 219

87. Where it is enough for me to get a proof that a contradiction or a trisection of the angle cannot be constructed in *this way*, the recursive proof achieves what is required of it. But if I had to fear that something somehow might at some time be interpreted as the construction of a contradiction, then no proof can take this indefinite fear from me.

Page 219

The fence that I put round contradiction is not a super-fence.
How can a proof have put the calculus right in principle?

Page 219

How can it have failed to be a proper calculus until this proof was found?

Page Break 220

Page 220

"This calculus is purely mechanical; a machine could carry it out." What sort of machine? One constructed of the usual materials--or a super-machine? Are you not confusing the hardness of a rule with the hardness of a material?

Page 220

We shall see contradiction in a quite different light if we look at its occurrence and its consequences as it were anthropologically--and when we look at it with a mathematician's exasperation. That is to say, we shall look at it differently, if we try merely to *describe* how the contradiction influences language-games, and if we look at it from the point of view of the mathematical law-giver.

Page 220

88. But wait--isn't it clear that no one wants to reach a contradiction? And so that if you shew someone the possibility of a contradiction, he will do everything to make such a thing impossible? (And so that if someone does not do this, he is a sleepyhead.)

Page 220

But suppose he replied: "I can't imagine a contradiction in my

Page Break 221

calculus.--You have indeed shewn me a contradiction in another, but not in *this* one. In this *there is none*, nor can I see the possibility of one."

Page 221

"If my conception of the calculus should sometime alter; if its aspect should alter because of some context that I cannot see now--then we'll talk some more about it."

"I do *not* see the possibility of a contradiction. Any more than you--as it seems--see the possibility of there being one in your consistency-proof."

Page 221

Do I know whether, if I ever should see a contradiction where at present I can see no possibility of such a

thing, it will then look dangerous to me?

Page 221

89. "What does a proof teach me, apart from its result?"--What does a new tune teach me? Am I not under a temptation to say it teaches me something?--

Page 221

90. I have not yet made the role of miscalculating clear. The role of the proposition: "I must have miscalculated". It is really the key to an understanding of the 'foundations' of mathematics.

Page Break 222

Page Break 223

PART IV 1942-1944

Page 223

1. "The axioms of a mathematical axiom-system ought to be self-evident." How are they self-evident, then? What if I were to say: *this* is how I find it easiest to imagine.

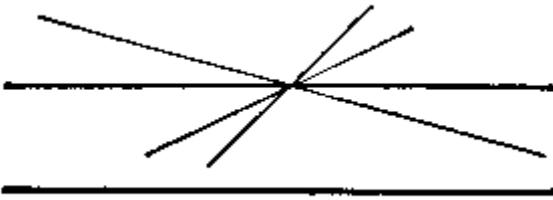

And here imagining is not a particular mental process during which one usually shuts one's eyes or covers them with one's hands.

Page 223

2. What do we say when we are presented with such an axiom, e.g. the parallel axiom? Has experience shewn us that this is how it is? Well perhaps; but *what* experience? I mean: experience plays a part; but not the one that one would *immediately expect*. For we haven't made experiments and found that in reality only *one* straight line through a given point fails to cut another. And yet the proposition is evident.--Suppose I now say: it is quite indifferent why it is evident. It is enough that we accept it. All that is important is how we use it.

Page 223

The proposition describes a picture. Namely:

We find this picture acceptable. As we find it acceptable to indicate our rough knowledge of a number by rounding it off at a multiple of 10.

Page Break 224

Page 224

'We accept this proposition.' But as *what* do we accept it?

Page 224

3. I want to say: when the words of e.g. the parallel-axiom are given (and we understand the language) the kind of use this proposition has and hence its sense are as yet quite undetermined. And when we say that it is evident, this means that we have already chosen a definite kind of employment for the proposition without realizing it. The proposition is not a mathematical axiom if we do not employ it precisely *for this purpose*.

Page 224

The fact, that is, that here we do not make experiments, but accept the self-evidence, is enough to fix the employment. For we are not so naïf as to make the self-evidence count in place of experiment.

Page 224

It is not our finding the proposition self-evidently true, but our making the self-evidence count, that makes it into a mathematical proposition.

Page 224

4. Does experience tell us that a straight line is possible between any two points? Or that two different colours cannot be at the same place?

It might be said: *imagination* tells us it. And the germ of truth is here; only one must understand it right.

Page 224

Before the proposition the concept is still pliable.

Page Break 225

Page 225

But might not experience determine us to reject the axiom?! Yes. And nevertheless it does not play the part of an empirical proposition.

Page 225

Why are the Newtonian laws not axioms of mathematics? Because we could quite well imagine things being otherwise. But--I want to say--this only assigns a certain role to those propositions in contrast to another one. I.e.: to say of a proposition: 'This could be imagined otherwise' or 'We can imagine the opposite too', ascribes the role of an empirical proposition to it.

Page 225

A proposition which it is supposed to be impossible to imagine as other than true has a different *function* from one for which this does not hold.

Page 225

5. The functioning of the axioms of mathematics is such that, if experience moved us to give up an axiom, that would not make its opposite into an axiom.

' $2 \times 2 \neq 5$ ' does not mean:

' $2 \times 2 = 5$ ' has not worked.

Page 225

One might, so to speak, preface axioms with a special assertion sign.

Page 225

Something is an axiom, *not* because we accept it as extremely probable, nay certain, but because we assign it a particular function, and

Page Break 226

one that conflicts with that of an empirical proposition.

Page 226

We give an axiom a different kind of acknowledgment from an empirical proposition. And by this I do not mean that the 'mental act of acknowledgment' is a different one.

Page 226

An axiom, I should like to say, is a different part of speech.

Page 226

6. When one hears the mathematical axiom that such and such is possible, one assumes offhand that one knows what 'being possible' means here; because this form of sentence is naturally familiar to us.

Page 226

We are not made aware how various the employment of the assertion "... is possible" is! And that is why it does not occur to us to ask about the special employment in this case.

Page 226

Lacking the slightest survey of the whole use, we are here quite unable to doubt that we understand the proposition.

Page 226

Does the proposition that there is no such thing as action at a distance belong to the family of mathematical propositions? Here again one would like to say: the proposition is not designed to express any experience, but rather to express the impossibility of imagining anything different.

Page Break 227

Page 227

To say that between two points a straight line is--geometrically--always possible means: the proposition "The points... lie on a straight line" is an assertion about the position of the points only if more than 2 points are involved.

Page 227

Just as one does not ask oneself, either, what is the meaning of a proposition of the form "There is no..." (e.g. "there is no proof of this proposition") in a particular case. Asked what it means, one replies both to someone else and to oneself with an example of nonexistence.

Page 227

7. A mathematical proposition stands on four feet, not on three; it is over-determined.

Page 227

8. When we describe what a man does, e.g., by means of a rule, we want the person to whom we give the description to know, by applying the rule, what happens in the particular case. Now do I give him an *indirect* description by means of the rule?

Page 227

There is of course such a thing as a proposition saying: if anyone tries to multiply the numbers... according to such and such rules, he gets....

Page 227

One application of a mathematical proposition must always be the calculating itself. That determines the relation of the activity of calculating to the sense of mathematical propositions.

Page Break 228

Page 228

We judge identity and agreement by the results of our calculating; that is why we cannot use agreement to explain calculating.

Page 228

We describe by means of the rule. What for? Why? That is another question.

Page 228

'The rule, applied to these numbers, yields those' might mean: the expression of the rule, applied to a human being, makes him produce those numbers from these.

Page 228

One feels, quite rightly, that that would *not* be a mathematical proposition.

Page 228

The mathematical proposition determines a path, lays down a path for us.

Page 228

It is no contradiction of this that it is a rule, and not simply stipulated but produced according to rules.

Page 228

If you use a rule to give a description, you yourself do not know more than you say. I.e. you yourself do not foresee the application that you will make of the rule in a particular case. If you say "and so on", you yourself do not know more than "and so on".

Page Break 229

Page 229

9. How could one explain to anybody what you have to do if you are to follow a rule?

Page 229

One is tempted to explain: first and foremost do the *simplest* thing (if the rule e.g. is always to repeat the same thing). And there is of course something in this. It is significant that we can say that it is simpler to write down a sequence of numbers in which each number is the same as its predecessor than a sequence in which each number is greater by 1 than its predecessor. And again that this is a simpler law than that of alternately adding 1 and 2.

Page 229

10. Isn't it over-hasty to apply a proposition that one has tested on sticks and stones, to wavelengths of light? I mean: that $2 \times 5000 = 10,000$.

Does one actually count on it that what has proved true in so many cases must hold for these too? Or is it not rather that with the arithmetical assumption we have not committed ourselves *at all*?

Page 229

11. Arithmetic as the natural history (mineralogy) of numbers. But *who* talks like this about it? Our whole thinking is penetrated with this idea.

Page 229

The numbers (I don't mean the numerals) are shapes, and arithmetic tells us the properties of these shapes. But the difficulty here is that these properties of the shapes are *possibilities*, not the properties in respect to shape of the things of this shape. And these possibilities in turn emerge as physical, or psychological possibilities (of separation, arrangement, etc.). But the role of the shapes is merely that of pictures

Page Break 230

which are used in such-and-such a way. What we give is not properties of shapes, but transformations of shapes, set up as paradigms of some kind or other.

Page 230

12. We do not judge the pictures, we judge by means of the pictures.

We do not investigate them, we use them to investigate something else.

Page 230

You get him to decide on accepting this picture. And you do so by means of the proof, i.e. by exhibiting a series of pictures, or simply by shewing him the picture. What moves him to decide does not matter here. The main

thing is that it is a question of accepting a picture.

Page 230

The picture of combining is not a combining; the picture of separating is not a separating; the picture of something's fitting not a case of fitting. And yet these pictures are of the greatest significance. *That is what it is like*, if a combination is made; if a separation; and so on.

Page 230

13. What would it be for animals or crystals to have as beautiful properties as numbers? There would then be e.g. a series of forms, each bigger than another by a unit.

Page 230

I should like to be able to describe how it comes about that mathematics appears to us now as the natural history of the domain of numbers, now again as a collection of rules.

Page Break 231

Page 231

But could one not study transformations of (e.g.) the forms of animals? But *how* 'study'? I mean: might it not be useful to pass transformations of animal shapes in review? And yet this would not be a branch of zoology.

Page 231

It would then be a mathematical proposition (e.g.), that this shape is derived from *this* one by way of *this* transformation. (The shapes and transformations being recognizable.)

Page 231

14. We must remember, however, that by its transformations a mathematical proof proves not only propositions of sign-geometry, but propositions of the most various *content*.

In this way the transformation in a Russellian proof proves that this logical proposition can be formed from the fundamental laws by the use of these rules. But the proof is looked at as a proof of the truth of the conclusion, or as a proof that the conclusion says *nothing*.

Now this is possible only through a relation of the proposition to something outside itself; I mean, e.g., through its relation to other propositions and to their application.

Page 231

"A tautology (e.g. ' $p \vee \sim p$ ') says nothing" is a proposition referring to the language-game in which the proposition p has application. (E.g. "It is raining or it is not raining" tells us nothing about the weather.)

Page 231

Russellian logic says nothing about kinds of *propositions*--I don't mean *logical* propositions--and their employment: and yet logic gets its whole sense simply from its presumed application to propositions.

Page Break 232

Page 232

15. People can be imagined to have an applied mathematics without any pure mathematics. They can e.g.--let us suppose--calculate the path described by certain moving bodies and predict their place at a given time. For this purpose they make use of a system of co-ordinates, of the equations of curves (*a form of description of actual movement*) and of the technique of calculating in the decimal system. The idea of a proposition of pure mathematics may be quite foreign to them.

Thus these people have rules in accordance with which they transform the appropriate signs (in particular, e.g., numerals) with a view to predicting the occurrence of certain events.

Page 232

But when they now multiply, for example, will they not arrive at a proposition saying that the result of the multiplication is the same, however the factors are shifted round? That will not be a primary rule of notation, nor yet a proposition of their physics.

They do not *need* to obtain any such proposition--even if they allow the shift of factors.

Page 232

I am imagining the matter as if this mathematics were done entirely in the form of orders. "You must do *such-and-such*"--so as to get the answer, that is, to the question 'where will this body be at such-and-such a time?' (It does not matter at all how these people have arrived at this method of prediction.)

Page 232

The centre of gravity of their mathematics lies for these people *entirely* in *doing*.

Page Break 233

Page 233

16. But is this possible? Is it possible that they should not pronounce the commutative law (e.g.) to be a *proposition*?

Page 233

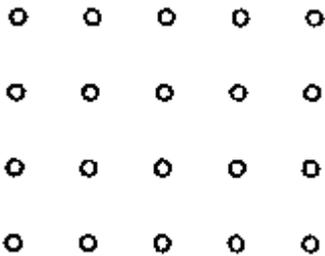

But I want to say: these people are not supposed to arrive at the conception of making mathematical discoveries--but *only* of making physical discoveries.

Page 233

Question: Must they make mathematical discoveries as discoveries? What do they miss if they make none? Could they (for example) use the proof of the commutative law, but without the conception of its culminating in a *proposition*, and so having a result which is in some way comparable with their physical propositions?

Page 233

17. The mere picture

regarded now as four rows of five dots, now as five columns of four dots, might convince someone of the commutative law. And he might thereupon carry out multiplications, now in the one direction, now in the other.

Page 233

One look at the pattern and pieces convinces him that he will be able to make them into that shape, i.e. he thereupon *undertakes* to do so.

Page Break 234

Page 234

"Yes, but only if the pieces don't change."--If they don't change, and we don't make some unintelligible mistake, or pieces disappear or get added without our noticing it.

"But it is surely essential that the pieces can as a matter of fact always be made into that shape! What would happen if they could not?"--Perhaps we should think that something had put us out. But--what then?--Perhaps we should even accept the thing as it was. And then Frege might say: "Here we have a new kind of insanity!"†1

Page 234

18. It is clear that mathematics as a technique for transforming signs for the purpose of prediction has nothing to do with grammar.

Page 234

19. The people whose mathematics was only such a technique, are now also supposed to accept proofs convincing them of the replaceability of one sign-technique by another. That is to say, they find transformations, series of pictures, on the strength of which they can venture to use one technique in place of another.

Page 234

20. If calculating looks to us like the action of a machine, it is *the human being* doing the calculation that is the machine.

Page 234

In that case the calculation would be as it were a diagram drawn by a part of the machine.

Page Break 235

Page 235

21. And that brings me to the fact that a picture may very well convince us that a particular part of a mechanism will move in such-and-such a way when the mechanism is set in motion.

Page 235

The effect of such a picture (or series of pictures) is like that of a proof. In this way I might e.g. make a construction for how the point X of the mechanism

will move.

Page 235

Is it not *queer* that it is not instantly clear *how* the picture of the period in division convinces us of the recurrence of that row of digits?

Page 235

(I find it so difficult to separate the inner from the outer--and the picture from the prediction.)

Page 235

The twofold character of the mathematical proposition--as *law* and as *rule*.

Page 235

22. Suppose that one were to say "guessing right" instead of "intuition"? This would shew the value of an intuition in a quite

Page Break 236

different light. For the phenomenon of guessing is a psychological one, but not that of guessing right.

Page 236

23. Our having learned a technique brings it about that we now alter it in such and such a way after seeing this picture.

Page 236

'We decide on a new language-game.'

'We decide *spontaneously*' (I should like to say) 'on a new language-game.'

Page 236

24. True;--it looks as though, if our memory functioned differently, we could not calculate as we do. But in that case could we give definitions as we do; talk and write as we do?

But how can we describe the foundation of our language by means of empirical propositions?

Page 236

25. Suppose that when we worked out a division it did not lead to the same result as the copying of its period. That might arise e.g. from our altering our tables, without being aware of it. (Though it might also arise from our copying in a different way.)

Page 236

26. What is the difference between *not* calculating and calculating *wrong*?--Or: is there a sharp dividing line between *not* measuring time and measuring it *wrong*? Not knowing any measurement of time and knowing a wrong one?

Page Break 237

Page 237

27. Pay attention to the patter by means of which we convince someone of the truth of a mathematical proposition. It tells us something about the function of this conviction. I mean the patter by which intuition is awakened.

By which, that is, the machine of a calculating technique is set in motion.

Page 237

28. Can it be said that if you learn a technique, that convinces you of the uniformity of its results?

Page 237

29. The limit of the empirical†1--is *concept-formation*.

Page 237

What is the transition that I make from "It will be like this" to "it *must* be like this"? I form a different concept. One involving something that was not there before. When I say: "If these derivations are the same, then it *must* be that...", I am making something into a criterion of identity. So I am recasting my concept of identity.

Page 237

But what if someone now says: "I am not aware of these *two* processes, I am only aware of the empirical, not of a formation and transformation of concepts which is independent of it; everything seems to me to be in the service of the empirical"?

In other words: we do not seem to become now more, now less, rational, or to alter the form of our thinking,

so as to alter *what we call "thinking"*. We only seem always to be fitting our thinking to experience.

Page Break 238

Page 238

So much is clear: when someone says: "If you follow the *rule*, it *must* be like this", he has not any *clear* concept of what experience would correspond to the opposite.

Page 238

Or again: he has not any clear concept of what it would be like for it to be otherwise. And this is very important.

Page 238

30. What compels us *so* to form the concept of identity as to say, e.g., "If you really do the same thing both times, then the result must be the same too"?--What compels us to proceed according to a rule, to conceive something as a rule? What compels us to talk to ourselves in the forms of the languages we have learnt?

Page 238

For the word "must" surely expresses our inability to depart from *this* concept. (Or ought I to say "refusal"?)

Page 238

And even if I have made the transition from one concept-formation to another, the old concept is still there in the background.

Page 238

Can I say: "A proof induces us to make a certain decision, namely that of accepting a particular concept-formation"?

Page 238

Do not look at the proof as a procedure that *compels* you, but as one

Page Break 239

that *guides* you.--And what it guides is your *conception* of a (particular) situation.

Page 239

But how does it come about that it guides *each one* of us in such a way that we agree in the influence it has on us? Well, how does it come about that we agree in *counting*? "That is just how we are trained" one may say, "and the agreement produced in this way is carried further by the proofs."

Page 239

In the course of this proof we formed our way of looking at the trisection of the angle, which excludes a construction with ruler and compass.

Page 239

By accepting a proposition as self evident, we also release it from all responsibility in face of experience.

Page 239

In the course of the proof our way of seeing is changed--and it does not detract from this that it is connected with experience.

Page 239

Our way of seeing is remodelled.

Page 239

31. It must be like this, does not mean: it will be like this. On the contrary: 'it will be like this' chooses between one possibility and another. 'It must be like this' sees only *one* possibility.

Page Break 240

Page 240

The proof as it were guides our experience into definite channels. Someone who has tried again and again to do such-and-such gives the attempt up after the proof.

Page 240

Someone tries to arrange pieces to make a particular pattern. Now he sees a model in which one *part* of that pattern is seen to be composed of all his pieces, and he gives up his attempt. The model was the *proof* that his proposal is impossible.

Page 240

That model too, like the one that shews that he will be able to make a pattern of these pieces, changes his *concept*. For, one might say, he never looked at the task of making the pattern of these pieces in this way before.

Page 240

Is it obvious that if anyone sees that part of the pattern can be made with these pieces, he realizes that there is no way of making the whole pattern with them? May it not be that he goes on trying and trying whether after all some arrangement of the pieces does not achieve this end? And may he not achieve it? (Use of one piece twice over, e.g.)

Page 240

Must we not distinguish here between thinking and the practical success of the thinking?

Page 240

32. "... who do not have immediate knowledge of certain truths, as we do, but perhaps are reduced to the roundabout path of

Page Break 241

induction", says Frege.†1 But what interests me is this immediate insight, whether it is of a truth or of a falsehood. I am asking: what is the characteristic demeanour of human beings who 'have insight into' something 'immediately', whatever the practical result of this insight is?

Page 241

What interests me is not having immediate insight into a truth, but the phenomenon of immediate insight. Not indeed as a special mental phenomenon, but as one of human action.

Page 241

33. Yes: it is as if the formation of a concept guided our experience into particular channels, so that one experience is now seen together with another one in a new way. (As an optical instrument makes light come from various sources in a particular way to form a pattern.)

Page 241

Imagine that a proof was a work of fiction, a stage play. Cannot watching a play lead me to something?

Page 241

I did not know how it would go,--but I saw a picture and became convinced that it would go as it does in the picture.

The picture helped me to make a prediction. Not as an experiment--it was only midwife to the prediction.

Page Break 242

For, whatever my experience is or has been, I surely still have to *make* the prediction. (Experience does not make it for me.)

Page 242

No great wonder, then, that proof helps us to *predict*. Without this picture I should not have been able to say how it will be, but when I see it I seize on it with a view to prediction.

Page 242

I cannot predict the colour of a chemical compound by means of a picture exhibiting the substances in the test-tube and the reaction. If the picture shewed frothing, and finally red crystals, I should not be able to say: "Yes, *that* is how it has to be" or "No, it cannot be like that". It is otherwise, however, when I see the picture of a mechanism in motion; that can tell me how a part actually will move. Though if the picture represented a mechanism whose parts were composed of a very soft material (dough, say), and hence bent about in various ways in the picture, then this picture might not help me to make a prediction either.

Page 242

Can we say that a concept is so formed as to be adapted to a certain prediction, i.e. it enables it to be made in the simplest terms--?

Page 242

34. The philosophical problem is: how can we tell the truth and *pacify* these strong prejudices in doing so?

Page Break 243

Page 243

It makes a difference whether I think of something as a deception of my senses or an external event, whether I take this object as a measure of that or the other way round, whether I resolve to make two criteria decide or only one.

Page 243

35. If the calculation has been done right, then this must be the result. Must *this always* be the result, in that case? Of course.

By being educated in a technique, we are also educated to have a way of looking at the matter which is just as firmly rooted as that technique.

Mathematical propositions seem to treat neither of signs nor of human beings, and therefore they *do* not.

They shew *those* connexions that we regard as rigid. But to a certain extent we look away from these connexions and at something else. We turn our back upon them, so to speak. Or: we rest, or lean, on them.

Once more: we do not look at the mathematical proposition as a proposition dealing with signs, and hence it *is* not that.

We acknowledge it *by* turning our back on it.

What about e.g. the fundamental laws of mechanics? If you understand them you must know how experience supports them. It is otherwise with the propositions of pure mathematics.

36. A proposition may describe a picture and this picture be variously anchored in our way of looking at things, and so in our way of living and acting.

Is not the proof too flimsy a reason for entirely giving up the search for a construction of the trisection? You have only gone through the sequence of signs once or twice; will you decide on the strength of that? Just because you have seen this one transformation, will you give up the search?

The effect of proof is, I believe, that we plunge into the new rule.

Hitherto we have calculated according to such and such a rule; now someone shews us the proof that it can also be done in another way, and we switch to the other technique--not because we tell ourselves that it will work this way too, but because we feel the new technique as identical with the old one, because we have to give it the same sense, because we recognize it as the same just as we recognize this colour as green.

That is to say: insight into mathematical relations has a role similar to that of seeing an identity. It might almost be said to be a more complicated kind of identity.

It might be said: the reasons why we now shift to a different technique are of the same kind as those which make us carry out a new multiplication as we do; we accept the technique as the *same* as we have applied in doing other multiplications.

37. A human being is *imprisoned* in a room, if the door is unlocked but opens inwards; he, however, never gets the idea of *pulling* instead of pushing against it.

38. When white turns black some people say "Essentially it is still the same"; and others, when the colour turns a shade darker: "It is *completely* different".

39. The proposition ' $a = a$ ', ' $p \supset p$ ', "The word 'Bismarck' has 8 letters", "There is no such thing as reddish-green", are all obvious and are propositions about essence: what have they in common? They are evidently each of a different kind and differently used. The last but one is the most like an empirical proposition. And it can understandably be called a synthetic *a priori* proposition.

It can be said: unless you put the series of numbers and the series of letters side by side, you cannot know how many letters the word has.

40. One pattern derived from another according to a rule. (Say the reversal of a theme.)

Then the result put as equivalent to the operation.

41. When I wrote "proof must be perspicuous" that meant: *causality* plays no part in the proof.

Or again: a proof must be capable of being reproduced by mere copying.

42. That, if you go on dividing $1 : 3$, you must keep on getting 3 in the result is not known by intuition, any more than that the multiplication 25×25 yields the same product every time it is repeated.

43. It might perhaps be said that the synthetic character of the propositions of mathematics appears most obviously in the unpredictable occurrence of the prime numbers.

But their being synthetic (in this sense) does not make them any the less *a priori*. They could be said, I want to say, not to be got out of their concepts by means of some kind of analysis, but really to determine a concept by synthesis, e.g. as crossing prisms can be made to determine a body.

The distribution of primes would be an ideal example of what could be called synthetic *a priori*, for one can say that it is at any rate not discoverable by an analysis of the concept of a prime number.

44. Might one not really talk of intuition in mathematics? Though it would not be a *mathematical* truth that was grasped intuitively, but a physical or psychological one. In this way I know with *great* certainty that if I multiply 25 by 25 ten times I shall get 625 every time. That is to say I know the psychological fact that this calculation will keep on seeming correct to me; as I know that if I write down the series of numbers from 1 to 20 ten times my lists will prove identical on collation.--Now is that an empirical fact? Of course--and yet it would be difficult to mention experiments that would convince me of it. Such a thing might be called an intuitively known *empirical* fact.

45. You want to say that every new proof alters the concept of proof in one way or another.

But then by what principle is something recognized as a new proof? Or rather there is certainly no 'principle' here.

46. Now ought I to say: "we are convinced that the same result will always come out"? No, that is not enough. We are convinced that the same *calculation* will always come out, be calculated. Now is *that* a mathematical conviction? No--for if it were not always the same that was calculated, we could not conclude that the calculation yields at one time one result and at another time another.

We are *of course* also convinced that when we repeat a calculation we shall repeat the pattern of the calculation.--

47. Might I not say: if you do a multiplication, in any case you do not find the mathematical fact, but you do find the mathematical proposition? For what you *find* is the non-mathematical fact, and in this way the mathematical proposition. For a mathematical proposition is the determination of a concept following upon a discovery.

Page 248

You *find* a new physiognomy. Now you can e.g. memorize or copy it.

Page 248

A *new* form has been found, constructed. But it is used to give a new concept together with the old one.

Page 248

The concept is altered so that this *had* to be the result.

Page 248

I find, not the result, but that I reach it.

Page Break 249

Page 249

And it is not this route's beginning here and ending here that is an empirical fact, but my having gone this road, or some road to this end.

Page 249

48. But might it not be said that the *rules* lead this way, even if no one went it?

Page 249

For that is what one would like to say--and here we see the mathematical machine, which, driven by the rules themselves, obeys only mathematical laws and not physical ones.

Page 249

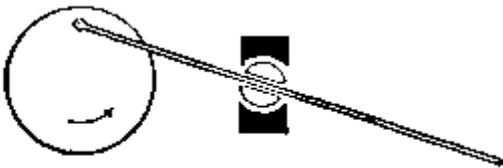

I want to say: the working of the mathematical machine is only the *picture* of the working of a machine.

Page 249

The rule does not do work, for whatever happens according to the rule is an interpretation of the rule.

Page 249

49. Let us suppose that I have the stages of the movement of

in a picture in front of me; then this enables me to form a proposition, which I as it were read off from this picture. The proposition contains the word "roughly" and is a proposition of geometry.

Page Break 250

Page 250

It is queer that I should be able to read off a proposition from a *picture*.

Page 250

The proposition, however, does not treat of the picture that I see. It does not say that such-and-such can be seen in this picture. But nor does it say what the actual mechanism will do, although it suggests it.

Page 250

But could I draw the movement of the mechanism in other ways too, if its parts do not alter? That is to say, am I not *compelled, under these conditions*, to accept just this as the picture of the movement?

Page 250

Let us imagine the construction of the phases of the mechanism carried out with lines of changing colour. Let the lines be partly black on a white ground, partly white on a black ground. Imagine the constructions in Euclid carried out in this way; they will lose all obviousness.

Page 250

50. A word in reverse has a *new* face.

Page 250

What if it were said: If you reverse the sequence 1 2 3, you *learn* about it that it yields 3 2 1 when reversed? And what you learn is not a property of these ink-marks, but of the sequence of *forms*. You learn a *formal* property of forms. The proposition asserting this formal property is proved by experience, which shews you the one form arising in this way out of the other.

Page Break 251

Page 251

Now, if you learn this, do you have *two* impressions? One of the fact that the sequence is *reversed*, the other of the fact that 3 2 1 arises? And could you not have the experience, the impression, of 1 2 3's being reversed and yet not of 3 2 1's arising? Perhaps it will be said: "Only by a queer illusion".--

Page 251

The reason why one really cannot say that one learns that formal proposition from experience is--that one only calls it this experience when this process leads to this result. The experience meant consists as such of this process with this result.

Page 251

That is why it is more than the experience: seeing a pattern.

Page 251

Can one row of letters have two reverses?

Say one acoustic, and another, optical, reverse. Suppose I explain to someone what the reverse of a word on paper is, what we call that. And now it turns out that he has an acoustic reverse of the word, i.e., something that he would like to call that, but it does not quite agree with the written reverse. So that one can say: he hears *this* as the reverse of the word. As if, as it were, the word got distorted for him in being turned round. And this might perhaps occur if he pronounced the word and its reverse fluently, as opposed to the case of spelling it out. Or the reverse might seem different when he spoke the word forwards and backwards in a single utterance.

Page 251

It might be that the exact mirror-image of a profile, seen immediately

Page Break 252

after it, was never pronounced to be the same thing, merely turned in the other direction; but that in order to give the impression of exact reversal, the profile had to be altered a little in its measurements.

Page 252

But I want to say that we have no right to say: though we may indeed be in doubt about the correct reverse of, for example, a long word, still we *know* that the word has only *one* reverse.

Page 252

"Yes, but if it is supposed to be a reverse in *this* sense there can be only one." Does 'in this sense' here mean: by these rules, or: with this physiognomy? In the first case the proposition would be tautological, in the second it need not be true.

Page 252

51. Think of a machine which 'is so constructed' that it reverses a row of letters. And now of the proposition that in the case of

O V E R

the result is

R E V O.--

Page 252

The rule, as it is actually meant, seems to be a driving power which reverses an ideal sequence like *this*,--whatever a human being may do with an actual sequence.

This is the mechanism which is the yardstick, the ideal, for the actual mechanism.

Page Break 253

Page 253

And that is *intelligible*. For if the result of the reversal becomes the criterion for the row's really having been reversed, and if we express this as our imitating an ideal machine, then this machine must produce this result *infallibly*.

Page 253

52. Now can it be said that the concepts which mathematics produces are a convenience, that essentially we could do without them?

Page 253

First and foremost the adoption of these concepts expresses the *sure* expectation of certain experiences.

Page 253

We do not accept e.g. a multiplication's not yielding the same result every time.

Page 253

And what we expect with certainty is essential to our whole life.

Page 253

53. Why, then, should I not say that mathematical propositions just express those special expectations, i.e., therefore, that they express matters of experience? Only because they just do not. Perhaps I should not take the measure of adopting a certain concept if I did not quite definitely expect the occurrence of certain facts; but for that reason laying down this measure and expressing the expectations are not equivalent.

Page Break 254

Page 254

54. It is difficult to put the body of fact right side up: to regard the given as given. It is difficult to place the body differently from the way one is accustomed to see it. A table in a lumber room may always lie upside down, in order to save space perhaps. Thus I have always seen the body of fact placed like *this*, for reasons of various kinds; and now I am supposed to see something else as its beginning and something else as its end. That is difficult. It as it were will not stand like that, unless one supports it in this position by means of other contrivances.

Page 254

55. It is one thing to use a mathematical technique consisting in the avoidance of contradiction, and another to philosophize against contradiction in mathematics.

Page 254

56. Contradiction. Why just this *one* bogy? That is surely very suspicious.

Page 254

Why should not a calculation made for a practical purpose, with a contradictory result, tell me: "Do as you please, I, the calculation, do not decide the matter"?

Page 254

The contradiction might be conceived as a hint from the gods that I am to act and *not* consider.

Page 254

57. "Why should contradiction be disallowed in mathematics?" Well, why is it not allowed in our simple language-games? (There is

Page Break 255

certainly a connexion here.) Is this then a fundamental law governing all thinkable language-games?

Page 255

Let us suppose that a contradiction in an order, e.g. produces astonishment and indecision--and now we say: that is just the purpose of contradiction in this language-game.

Page 255

58. Someone comes to people and says: "I always lie". They answer: "Well, in that case we can trust you!"--But could *he* mean what he said? Is there not a feeling of being incapable of saying something really true; let it be what it may?--

Page 255

"I always lie!"--Well, and what about *that*?--"It was a lie too!"--But in that case you don't always lie!--"No, it's all lies!"

Perhaps we should say of this man that he doesn't mean the same thing as we do by "true" and by "lying". He means perhaps something like: What he says flickers; or nothing really comes from his heart.

Page 255

It might also be said: his "I always lie" was not really an *assertion*. It was rather an exclamation.

Page 255

And so it can be said: "If he was saying that sentence, not thoughtlessly--then he must have meant the words in such-and-such a way, he *cannot* have meant them in the usual way"?

Page Break 256

Page 256

59. Why should Russell's contradiction not be conceived as something supra-propositional, something that towers above the propositions and looks in both directions like a Janus head? N.B. the proposition $F(F)$ --in which $F(\xi) = \sim\xi(\xi)$ --contains no variables and so might hold as something supra-logical, as something unassailable, whose negation itself in turn only *asserts* it. Might one not even begin logic with this contradiction? And as it were descend from it to propositions.

Page 256

The proposition that contradicts itself would stand like a monument (with a Janus head) over the propositions of logic.

Page 256

60. The pernicious thing is not: to produce a contradiction in the region in which neither the consistent nor the contradictory proposition has any kind of work to accomplish; no, what *is* pernicious is: not to know how one reached the place where contradiction no longer does any harm.

Page Break 257

PART V 1942-1944

Page 257

1. It is of course clear that the mathematician, in so far as he really is 'playing a game' *does not infer*. For here 'playing' must mean: *acting* in accordance with certain rules. And it would already be something outside the mere game for him to infer that he could act in this way according to the general rule.

Page 257

2. Does a calculating machine *calculate*?

Page 257

Imagine that a calculating machine had come into existence by accident; now someone accidentally presses its knobs (or an animal walks over it) and it calculates the product 25×20 .

Page 257

I want to say: it is essential to mathematics that its signs are also employed in *mufti*.

It is the use outside mathematics, and so the *meaning* of the signs, that makes the sign-game into mathematics.

Page 257

Just as it is not logical inference either, for me to make a change from one formation to another (say from one arrangement of chairs to another) if these arrangements have not a linguistic function apart from this transformation.

Page 257

3. But is it not true that someone with no idea of the meaning

Page Break 258

of Russell's symbols could *work over* Russell's proofs? And so could in an important sense test whether they were right or wrong?

Page 258

A human calculating machine might be trained so that when the rules of inference were shewn it and perhaps exemplified, it read through the proofs of a mathematical system (say that of Russell), and nodded its head after every correctly drawn conclusion, but shook its head at a mistake and stopped calculating. One could imagine this creature as otherwise perfectly imbecile.

Page 258

We call a proof something that can be worked over, but can also be copied.

Page 258

4. If mathematics is a game, then playing some game is doing mathematics, and in that case why isn't dancing mathematics too?

Page 258

Imagine that calculating machines occurred in nature, but that people could not pierce their cases. And now suppose that these people use these appliances, say as we use calculation, though of that they know nothing. Thus e.g. they make predictions with the aid of calculating machines, but for them manipulating these queer objects is experimenting.

Page 258

These people lack concepts which we have; but what takes their place?

Think of the mechanism whose movement we saw as a geometrical (kinematic) proof clearly it would not normally be said of someone turning the wheel that he was proving something. Isn't it the same with someone who makes and changes arrangements of signs as a game; even when what he produces could be seen as a proof?

To say mathematics is a game is supposed to mean: in proving, we need never appeal to the meaning of the signs, that is to their extra-mathematical application. But then what does appealing to this mean at all? How can such an appeal be of any avail?

Does it mean passing out of mathematics and returning to it again, or does it mean passing from *one* method of mathematical inference to another?

What does it mean to obtain a new concept of the surface of a sphere? How is it then a concept of the surface of a *sphere*? Only in so far as it can be applied to real spheres.

How far does one need to have a concept of 'proposition', in order to understand Russellian mathematical logic?

5. If the intended application of mathematics is essential, how about parts of mathematics whose application--or at least *what*

mathematicians take for their application--is quite fantastic? So that, as in set theory, one is doing a branch of mathematics of whose application one forms an entirely false idea. Now, isn't one doing mathematics *none the less*?

If the operations of arithmetic only served to construct a cipher, its application would of course be fundamentally different from that of our arithmetic. But would these operations then be mathematical operations at all?

Can someone who is applying a decoding rule be said to be performing mathematical operations? And yet his transformations can be so conceived. For he could surely say that he was calculating what had to come out in decoding the symbols... with such-and-such a key. And the proposition: the signs..., decoded according to this rule, yield... is a mathematical one. As is the proposition that you can get to this position from *that* one in chess.

Imagine the geometry of four-dimensional space done with a view to learning about the living conditions of spirits. Does that mean that it is not mathematics? And can I now say that it determines concepts?

Would it not sound queer to say that a child could already do thousands and thousands of multiplications--by which is supposed to be meant that it can already calculate in the unlimited number domain. And indeed this might be reckoned an extremely modest way of putting it, as it says only 'thousands and thousands' instead of 'infinitely many'.

Could people be imagined, who in their ordinary lives only calculated up to 1000 and kept calculations with higher numbers for mathematical investigations about the world of spirits?

"Whether or not this holds of the surface of a *real* sphere--it does hold for the mathematical one"--this makes it look as if the special difference between the mathematical and an empirical proposition was that, while the truth of the empirical proposition is rough and oscillating, the mathematical proposition describes *its* object precisely and absolutely. As if, in fact, the 'mathematical sphere' were a sphere. And it might e.g. be asked whether there was only *one* such sphere, or several (a Fregean question).

Does a misunderstanding about the possible application constitute an objection to the calculation as a part of mathematics?

And apart from misunderstanding,--what about mere lack of clarity?

Page 261

Imagine someone who believes that mathematicians have discovered a queer thing, $\sqrt{-1}$, which when squared does yield - 1, can't he nevertheless calculate quite well with complex numbers, and apply such calculations in physics? And does this make them any the less *calculations*?

In *one* respect of course his understanding has a weak foundation; but he will draw his conclusions with certainty, and his calculus will have a *solid* foundation.

Page Break 262

Page 262

Now would it not be ridiculous to say this man wasn't doing mathematics?

Page 262

Someone makes an addition to mathematics, gives new definitions and discovers new theorems--and in a *certain* respect he can be said not to know what he is doing.--He has a vague imagination of having *discovered* something like a space (at which point he thinks of a room), of having opened up a kingdom, and when asked about it he would talk a great deal of nonsense.

Page 262

Let us imagine the primitive case of someone carrying out enormous multiplications in order, as he says, to conquer gigantic new provinces of the domain of numbers.

Page 262

Imagine calculating with $\sqrt{-1}$ invented by a madman, who, attracted merely by the paradox of the idea, does the calculation as a kind of service, or temple ritual, of the absurd. He imagines that he is writing down the impossible and operating with it.

Page 262

In other words: if someone believes in mathematical *objects* and their queer properties--can't he nevertheless do mathematics? Or--isn't he also doing mathematics?

Page 262

'Ideal object.' "The symbol 'a' stands for an ideal object" is evidently supposed to assert something about the meaning, and so about the use, of 'a'. And it means of course that this use is in a certain respect

Page Break 263

similar to that of a sign that has an object, and that it does not stand for any object. But it is interesting what the expression 'ideal object' makes of this fact.

Page 263

6. In certain circumstances we might speak of an endless row of marbles.--Let us imagine such an endless straight row of marbles at equal distances from one another; we calculate the force exerted by all these marbles on a certain body according to a certain law of attraction. We regard the number yielded by this calculation as the ideal of exactness for certain measurements.

Page 263

The feeling of something *queer* here comes from a misunderstanding. The kind of misunderstanding that is produced by a thumb-catching of the intellect--to which I want to call a halt.

Page 263

The objection that 'the finite cannot grasp the infinite' is *really* directed against the idea of a psychological act of grasping or understanding.

Page 263

Or imagine that we simply say: "This force corresponds to the attraction of an endless row of marbles which we have arranged in such-and-such a way and which attract the body according to such-and-such a law of attraction". Or again: "Calculate the force which an endless row of marbles of such-and-such a kind exerts on the body".--It certainly makes sense to give such an order. It describes a particular calculation.

Page Break 264

Page 264

What about the following question: "Calculate the weight of a pillar composed of as many slabs lying on top of one another as there are cardinal numbers; the undermost slab weighs 1 kg., and every higher one weighs half of the one just below it".

The difficulty is *not* that we can't form an image. It is easy enough to form some kind of image of an endless row, for example. The question is what use the image is to us.

Imagine infinite numbers used in a fairy tale. The dwarves have piled up as many gold pieces as there are cardinal numbers--etc. What can occur in this fairy tale must surely make sense.--

7. Imagine set theory's having been invented by a satirist as a kind of parody on mathematics.--Later a reasonable meaning was seen in it and it was incorporated into mathematics. (For if one person†1 can see it as a paradise of mathematicians, why should not another see it as a joke?)

The question is: even as a joke isn't it evidently mathematics?--

And why is it evidently mathematics?--Because it is a game with signs according to rules?

But isn't it evident that there are concepts formed here--even if we are not clear about their application? But how is it possible to have a concept and not be clear about its application?

8. Take the construction of the polygon of forces: isn't that a bit of applied mathematics? And where is the proposition of *pure* mathematics which is invoked in connexion with this graphical calculation? Is this case not like that of the tribe which has a technique of calculating in order to make certain predictions, but no propositions of pure mathematics?

Calculation that belongs to the performance of a ceremony. For example, let the number of words in a form of blessing that is to be applied to a home be derived by a particular technique from the ages of the father and mother and the number of their children. We could imagine procedures of calculating described in such a law as the Mosaic law. And couldn't we imagine that the nation with these ceremonial prescriptions for calculating never calculated in practical life?

This would indeed be a case of *applied* calculation, but it would not serve the purpose of a prediction.

Would it be any wonder if the technique of calculating had a family of applications?

9. We only see how queer the question is whether the pattern ϕ (a particular arrangement of digits e.g. '770') will occur in the infinite expansion of π , when we try to formulate the question in a quite common or garden way: men have been trained to put down signs according to certain rules. Now they proceed according to this training and we say that it is a problem whether they will *ever* write down the pattern ϕ in following the given rule.

But what are you saying if you say that one thing is clear: either one will come on ϕ in the infinite expansion, or one will not?

It seems to me that in saying this you are yourself setting up a rule or postulate.

What if someone were to reply to a question: 'So far there is no such thing as an answer to this question'?

So, e.g., the poet might reply when asked whether the hero of his poem has a sister or not--when, that is, he has not yet decided anything about it.

The question--I want to say--changes its status, when it becomes

decidable. For a connexion is made then, which formerly *was not there*.

Of someone who is trained we can ask 'How *will* he interpret the rule for this case?', or again 'How *ought* he to interpret the rule for this case?'--but what if no decision about this question has been made?--Well, then the answer is, not: 'he ought to interpret it in such a way that ϕ occurs in the expansion' or: 'he ought to interpret it in such a way that it does not occur', but: 'nothing has so far been decided about this'.

However queer it sounds, the further expansion of an irrational number is a further expansion of mathematics.

We do mathematics with concepts.--And with certain concepts more than with other ones.

I want to say: it *looks* as if a ground for the decision were already there; and it has yet to be invented.

Would this come to the same thing as saying: in thinking about the technique of expansion, which we have learnt, we use the false picture of a completed expansion (of what is ordinarily called a "row") and this forces us to ask unanswerable questions?

For after all in the end every question about the expansion of $\sqrt{2}$ must be capable of formulation as a practical question concerning the technique of expansion.

And what is in question here is of course not merely the case of the expansion of a real number, or in general the production of mathematical signs, but every analogous process, whether it is a game, a dance, etc., etc..

10. When someone hammers away at us with the law of excluded middle as something which cannot be gainsaid, it is clear that there is something wrong with his question.

When someone sets up the law of excluded middle, he is as it were putting two pictures before us to choose from, and saying that one must correspond to the fact. But what if it is questionable whether the pictures can be applied here?

And if you say that the infinite expansion must contain the pattern ϕ or not contain it, you are so to speak shewing us the picture of an unsurveyable series reaching into the distance.

But what if the picture began to flicker in the far distance?

11. To say of an unending series that it does *not* contain a particular

pattern makes sense only under quite special conditions.

That is to say: this proposition has been given a sense for certain cases.

Roughly, for those where it is in the *rule* for this series, not to contain the pattern....

Further: when I calculate the expansion further, I am deriving new rules which the series obeys.

"Good,--then we can say: 'It must either reside in the rule for this series that the pattern occurs, or the opposite.'" But is it like that?--"Well, doesn't the rule of expansion *determine* the series completely? And if it does so, if it allows of no ambiguity, then it must implicitly determine all questions about the structure of the series."--Here you are thinking of finite series.

"But surely all members of the series from the 1st up to 1,000th, up to the 10¹⁰-th and so on, are determined; so surely *all* the members are determined." That is correct if it is supposed to mean that it is not the case that e.g. the so-and-so-many'th is *not* determined. But you can see that *that* gives you no information about whether a particular pattern is going to appear in the series (if it has not appeared so far). *And so we can see* that we are using a misleading *picture*.

If you want to know more about the series, you have, so to speak, to get into another dimension (as it were from the line into a surrounding plane).--But then isn't the plane *there*, just like the line, and merely something to be *explored*, if one wants to know what the facts are?

No, the mathematics of this further dimension has to be invented just as much as any mathematics.

In an arithmetic in which one does not count further than 5 the question what $4 + 3$ makes doesn't yet make sense. On the other hand the problem may very well exist of giving this question a sense. That is to say: the question makes *no more* sense than does the law of excluded middle in application to it.

12. In the law of excluded middle we think that we have already got something solid, something that at any rate cannot be called in doubt. Whereas in truth this tautology has just as shaky a sense (if I may put it like that), as the question whether p or $\sim p$ is the case.

Suppose I were to ask: what is meant by saying "the pattern... occurs in this expansion"? The reply would be: "you surely *know* what it means. It occurs as the pattern... in fact occurs in the expansion."--So *that* is the way it occurs?--But *what way* is that?

Imagine it were said: "Either it occurs in that way, or it does not occur in that way"!

"But don't you really understand what is meant?"--But may I not believe I understand it, and be wrong?--

For how do I know what it means to say: the pattern... occurs in the expansion? Surely by way of examples--which shew me what it is like for.... But these examples do not shew me what it is like for this pattern to occur in the expansion!

Might one not say: if I really had a right to say that these examples tell me what it is like for the pattern to occur in the expansion, then they would also have to shew me what the opposite means.

13. The general proposition that that pattern does not occur in the expansion can only be a *commandment*.

Suppose we look at mathematical propositions as commandments, and even utter them as such? "Let 25^2 be 625."

Well--a commandment has an internal and an external negation.

The symbols " $(x).\phi x$ " and " $(\exists x).\phi x$ " are certainly useful in mathematics so long as one is acquainted with the technique of the proofs of the existence or non-existence to which the Russellian signs *here* refer. If however this is left open, then these concepts of the old logic are extremely misleading.

If someone says: "But you surely know what 'this pattern occurs in the expansion' means, namely *this*"--and points to a case of occurring,--then I can only reply that what he shews me is capable of illustrating a *variety* of facts. For that reason I can't be said to know what the proposition means just from knowing that he will certainly use it in this case.

The opposite of "there exists a law that p " is not: "there exists a law that $\sim p$ ". But if one expresses the first by means of P , and the second by means of $\sim P$, one will get into difficulties.

14. Suppose children are taught that the earth is an infinite flat surface; or that God created an infinite number of stars; or that a star keeps on moving uniformly in a straight line, without ever stopping.

Queer: when one takes something of this sort as a matter of course, as it were in one's stride, it loses its whole paradoxical aspect. It is as if I were to be told: Don't worry, this series, or movement, goes on without ever stopping. We are as it were excused the labour of thinking of an end.

Page 272

'We won't bother about an end.'

Page 272

It might also be said: 'for us the series is infinite'.

Page 272

'We won't worry about an end to this series; for us it is always beyond our ken.'

Page 272

15. The rational numbers cannot be *enumerated*, because they cannot be counted--but one can count with them, as with the cardinal numbers. That squint-eyed way of putting things goes with the whole system of pretence, namely that by using the new apparatus we deal with

Page Break 273

infinite sets with the same certainty as hitherto we had in dealing with finite ones.

Page 273

It should not have been called 'denumerable', but on the other hand it would have made sense to say 'numberable'. And this expression also informs us of an application of the concept. For one cannot set out to enumerate the rational numbers, but one can perfectly well set out to assign numbers to them.

Page 273

But where is the problem here? Why should I not say that what we call mathematics is a family of activities with a family of purposes?

Page 273

People might for example use calculating as a kind of competitive activity. As children do sometimes have races in doing sums; only this use of sums plays a quite subordinate role among us.

Page 273

Or multiplication might strike us as much more difficult than it does--if e.g. we only calculated orally, and in order to take note of, and so to grasp, a multiplication it were necessary to bring it into the form of rhyming verse. When someone succeeded in doing this he would have the feeling of having discovered a wonderful great truth.

Every new multiplication would require a new individual piece of work.

If these people believed that numbers were spirits and that they were

Page Break 274

exploring the domain of spirits by means of their calculations, or compelling the spirits to manifest themselves--would this now be arithmetic? Again--would it be arithmetic even in the case where these people used the calculations for nothing else?

Page 274

16. The comparison with alchemy seems natural. We might speak of a kind of alchemy in mathematics.

Page 274

Is it already mathematical alchemy, that mathematical propositions are regarded as statements about mathematical objects,--and mathematics as the exploration of these objects?

Page 274

In a certain sense it is not possible to appeal to the meaning of the signs in mathematics, just because it is only mathematics that gives them their meaning.

Page 274

What is typical of the phenomenon I am talking about is that a *mysteriousness* about some mathematical concept is not *straight away* interpreted as an erroneous conception, as a mistake of ideas; but rather as something that is at any rate not to be despised, is perhaps even rather to be respected.

Page 274

All that I can do, is to shew an easy escape from this obscurity and this glitter of the concepts.

Page Break 275

Page 275

Strangely, it can be said that there is so to speak a solid core to all these glistening concept-formations. And I should like to say that that is what makes them into mathematical productions.

Page 275

It might be said: what you see does of course look more like a gleaming Fata Morgana; but look at it from another quarter and you can see the solid body, which only looks like a gleam without a corporeal substrate when seen from that other direction.

17. 'The pattern is in the series or it is not in the series' means: either the thing looks like *this* or it does not look like this.

How does one know what is meant by the opposite of the proposition " ϕ occurs in the series", or even of the proposition " ϕ does not occur in the series"? This question sounds like nonsense, but does make sense all the same.

Namely: how do I know that I understand the proposition " ϕ occurs in this series"?

True, I can give examples illustrating the use of such statements, and also of the opposite ones. And they are examples of there being a rule prescribing the occurrence in a definite region or series of regions, or determining that such an occurrence is excluded.

If "you do it" means: you must do it, and "you do not do it" means: you must not do it--then "Either you do it, or you do not" is not the law of excluded middle.

Everyone feels uncomfortable at the thought that a proposition can state that such-and-such does not occur in an infinite series--while on the other hand there is nothing startling about a command's saying that this must not occur in this series however far it is continued.

But what is the source of this distinction between: "however far you go you will never find this"--and "however far you go you must never do this"?

On hearing the proposition one can ask: "how can we know anything like that?" but nothing analogous holds for the command.

The statement seems to overreach itself, the command not at all.

Can we imagine all mathematical propositions expressed in the imperative? For example: "Let 10×10 be 100".

And if you now say: "Let it be like this, or let it not be like this", you are not pronouncing the law of excluded middle--but you are pronouncing a *rule*. (As I have already said above.)

18. But is this really a way out of the difficulty? For how about all

the other mathematical propositions, say ' $25^2 = 625$ '; isn't the law of excluded middle valid for these *inside* mathematics?

How is the law of excluded middle applied?

"Either there is a rule that prescribes it, or one that forbids it."

Assuming that there is no rule forbidding the occurrence,--why is there then supposed to be one that prescribes it?

Does it make sense to say: "While there isn't any rule forbidding the occurrence, as a matter of fact the pattern does not occur"?--And if this does not make sense, how can the opposite make sense, namely, that the pattern does occur?

Well, when I say it occurs, a picture of the series from its beginning up to the pattern floats before my mind--but if I say that the pattern *does* not occur, then no such picture is of any use to me, and my supply of pictures gives out.

What if the rule should bend in use without my noticing it? What I mean is, that I might speak of different spaces in which I use it.

The opposite of "it must not occur" is "it can occur". For a finite segment of the series, however, the opposite of "it must not occur in it" seems to be: "it must occur in it".

The queer thing about the alternative " ϕ occurs in the infinite series or it does not", is that we have to imagine the two possibilities individually, that we look for a distinct idea of each, and that *one* is not adequate for the negative and for the positive case, as it is elsewhere.

19. How do I know that the general proposition "There is..." makes sense here? Well, if it can be used to tell something about the technique of expansion in a language game.

In *one* case what we are told is: "it must not occur"--i.e.: if it occurs you calculated wrong.

In one case what we are told is: "it can occur", i.e., no such interdict exists. In another: "it must occur in such-and-such a region (always in this place in these regions)". But the opposite of this seems to be: "it must not occur in such-and-such places"--instead of "it *need* not occur there".

But what if the rule were given that, e.g., everywhere where the formation rule for π yields 4, any arbitrary digit other than 4 can be put in its place?

Consider also the rule which forbids one digit in certain places, but otherwise leaves the choice open.

Isn't it like this? The concepts of infinite decimals in mathematical

propositions are not concepts of series, but of the unlimited technique of expansion of series.

We learn an endless technique: that is to say, something is done for us first, and then we do it; we are told rules and we do exercises in following them; perhaps some expression like "and so on *ad inf.*" is also used, but what is in question here is not some gigantic extension.

These are the facts. And now what does it mean to say: " ϕ either occurs in the expansion, or does not occur"?

20. But does this mean that there is no such problem as: "Does the pattern ϕ occur in this expansion?"--To ask this is to ask for a rule regarding the occurrence of ϕ . And the alternative of the existence or non-existence of such a rule is at any rate not a mathematical one.

Only within a mathematical structure which has yet to be erected does the question allow of a *mathematical* decision, and at the same time become a demand for such a decision.

21. Then is infinity not actual--can I not say: "these two edges of the slab meet at infinity"?

Say, not: "the circle has this property because it passes through the two points at infinity..."; but: "the properties of the circle can be regarded in this (extraordinary) perspective".

It is essentially a perspective, and a far-fetched one. (Which does not express any reproach.) But it must always be quite clear *how far-fetched* this way of looking at it is. For otherwise its real *significance* is dark.

22. What does it mean to say: "the mathematician does not know what he is doing", or: "he knows what he is doing"?

23. Can one make infinite predictions?--Well, why should one not for example call the law of inertia one? Or the proposition that a comet describes a parabola?

In a certain sense of course the infinity of the prediction is not taken very seriously.

Now what about a *prediction* that if you expand π , however far you go, you will never come across the pattern ϕ ?--Well, we could say that this is either a *non-mathematical* prediction, or alternatively a mathematical rule.

Page 280

Someone who has learned to expand $\sqrt{2}$ goes to a fortune-teller, and she tells him that however far he may expand $\sqrt{2}$ he will never arrive at the pattern....--Is her soothsaying a mathematical proposition?

Page Break 281

No.--Unless she says: "If you always expand correctly you will never reach it". But is that still a prediction?

Page 281

Now it looks as if such a *prediction* of the correct expansion were imaginable and were distinct from a mathematical law that it *must* be thus and thus. So that in the mathematical expansion there would be a distinction between what as a matter of fact comes out like this--as it were accidentally--and what must come out.

Page 281

How is it to be decided whether an infinite prediction makes sense?

Page 281

At any rate not by one's saying: "I am certain I *mean* something when I say...".

Page 281

Besides, the question is not so much whether the prediction makes some kind of sense, as: what kind of sense it makes. (That is, in what language games it occurs.)

Page 281

24. "The disastrous invasion" of mathematics by logic.

Page 281

In a field that has been prepared in this way *this* is a proof of existence.

Page 281

The harmful thing about logical technique is that it makes us forget the special mathematical technique. Whereas logical technique is only an auxiliary technique in mathematics. For example it sets up certain

Page Break 282

connexions between different techniques.

Page 282

It is almost as if one tried to say that cabinet-making consisted in glueing.

Page 282

25. A proof convinces you that there is a root of an equation (without giving you any idea *where*)--how do you know that you understand the proposition that there is a root? How do you know that you are really convinced of anything? You may be convinced that the application of the proved proposition will turn up. But you do not understand the proposition so long as you have not found the application.

Page 282

When a proof proves in a general way that *there* is a root, then everything depends on the form in which it proves this. On what it is that here leads to this verbal expression, which is a mere shadow, and keeps mum about *essentials*. Whereas to logicians it seems to keep mum only about incidentals.

Page 282

Generality in mathematics does not stand to particularity in mathematics in the same way as the general to the particular elsewhere.

Page 282

Everything that I say really amounts to this, that one can know a proof thoroughly and follow it step by step, and yet at the same time not *understand* what it was that was proved.

Page Break 283

Page 283

And this in turn is connected with the fact that one can form a mathematical proposition in a grammatically correct way without understanding its meaning.

Now when does one understand it?--I believe: when one can apply it.

It might perhaps be said: when one has a clear picture of its application. For this, however, it is not enough to connect a clear picture with it. It would rather have been better to say: when one commands a clear view of its application. And even that is bad, for the matter is simply one of not imagining that the application is where it is not; of not being deceived by the verbal form of the proposition.

Page 283

But how does it come about that one can fail to understand, or can misunderstand, a proposition or proof in this way? And what is then necessary in order to produce understanding?

Page 283

There are here, I believe, cases in which someone can indeed apply the proposition (or proof), but is unable to give a clear account of the kind of application. And the case in which he is even unable to apply the proposition. (Multiplicative axiom.)†1

Page 283

How is it as regards $0 \times 0 = 0$?

Page Break 284

Page 284

One would like to say that the understanding of a mathematical proposition is not guaranteed by its verbal form, as is the case with most non-mathematical propositions. This means--so it appears--that the words don't determine the *language-game* in which the proposition functions.

Page 284

The logical notation swallows the structure.

Page 284

26. In order to see how something can be called an 'existence-proof', though it does not permit a construction of what exists, think of the different meanings of the word "where". (For example the topological and the metrical.)

Page 284

For it is not merely that the existence-proof can leave the place of the 'existent' undetermined: there need not be any question of such a place.

That is to say: when the proved proposition runs: "there is a number for which..." then it need not make sense to ask "and which number is it?", or to say "and this number is...".

Page 284

27. A proof that 777 occurs in the expansion of π , without shewing where, would have to look at this expansion from a totally new point of view, so that it shewed e.g. properties of regions of the expansion about which we only knew that they lay very far out. Only the picture floats before one's mind of having to assume as it were a dark zone of indeterminate length very far on in π , where we can no longer rely on our devices for calculating; and then still further out a zone where in a *different* way we can once more see something.

Page Break 285

Page 285

28. We can always imagine proof by *reductio ad absurdum* used in argument with someone who puts forward a non-mathematical assertion (e.g. that he has seen a checkmate with such-and-such pieces) which can be mathematically refuted.

Page 285

The difficulty which is felt in connexion with *reductio ad absurdum* in mathematics is this: what goes on in this proof? Something mathematically absurd, and hence unmathematical? How--one would like to ask--can one so much as assume the mathematically absurd at all? That I can assume what is physically false and reduce it *ad absurdum* gives me no difficulty. But how to think the--so to speak--unthinkable?

Page 285

What an indirect proof says, however, is: "If you want *this* then you cannot assume *that*: for only the opposite of what you do not want to abandon would be combinable with *that*".

Page 285

29. The geometrical illustration of Analysis is indeed inessential; not, however, the geometrical application. Originally the geometrical illustrations were *applications of Analysis*. Where they cease to be this they can be wholly misleading.

What we have then is the imaginary application. The fanciful application.

The idea of a 'cut' is one such dangerous illustration.

Page Break 286

Page 286

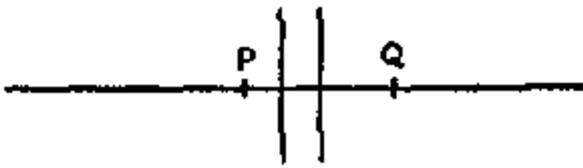

Only in so far as the illustrations are also applications do they avoid producing that special feeling of dizziness which the illustration produces in the moment at which it ceases to be a possible application; when, that is, it becomes stupid.

30. Dedekind's theorem could be derived, if what we call irrational numbers were *quite unknown*, but if there were a technique of deciding the places of decimals by throwing dice. And this theorem would then have its application even if the mathematics of irrational numbers did not exist. It is not as if Dedekind's expansions already foresaw all the special real numbers. It merely *looks* like that as soon as Dedekind's calculus is joined to the calculi of the special real numbers.

31. It might be asked: what is there about the proof of Dedekind's theorem that a child 10 years old could *not* understand?--For isn't this proof far simpler than all the calculations which the child has to master?--And if now someone were to say: it can't understand the deeper content of the proposition--then I ask: how does this proposition come to have a deep content?

32. The picture of the number line is an absolutely natural one up to a certain point; that is to say so long as it is not used for a general theory of real numbers.

33. If you want to divide the *real* numbers into an upper and lower class, then do it first crudely by means of

two rational points P and Q . Then halve PQ and decide in which half (if not at the point of division) the cut is supposed to lie; if for example in the lower one, halve this and make a more exact decision and so on.

If you have a principle for unlimited repetition of this procedure then you can say that this principle executes a cut, as it decides for each number whether it lies to the right or to the left.--Now the question is whether I can go all the way by means of such a principle of division, or whether some other way of deciding is still needed; and again, whether this would be *after* finishing the use of the principle, or *before*. Now in any case, not before the completion; for so long as the question still is, in which finite bit of the straight line the point is supposed to lie, further division may decide the matter.--But *after* the decision by a principle is there still room for a further decision?

It is the same with Dedekind's theorem as with the law of excluded middle: it seems to exclude a third possibility, whereas a third possibility is not in question here.

The proof of Dedekind's theorem works with a picture which cannot justify *it*; which ought rather to be justified by the theorem.

You readily see a principle of division as an unendingly repeated division, for at any rate it does not correspond to any finite division and seems to lead you on and on.

34. Couldn't we make a more *extensional preparation* for the theory of limits, functions, real numbers, than we do? Even if this preparatory calculus should seem *very* trivial and in itself useless?

The difficulty of looking at the matter now in an intensional, now again in an extensional way, is already there with the concept of a 'cut'. That every rational number can be called a principle of division of the rational numbers is perfectly clear. Now we discover something else that we can call a principle of division, e.g. what corresponds to $\sqrt{2}$. Then other similar ones--and now we are already quite familiar with the possibility of such divisions, and see them under the aspect of a cut made somewhere along the straight line, *hence extensionally*. For if I *cut*, I can of course choose where I want to cut.

But if a *principle* of division is a cut, it surely is so only because it is possible to say of any arbitrary rational number that it is on one side or the other of the cut. Can the idea of a cut now be said to have led us from the rational to the irrational numbers? Are we for example led to $\sqrt{2}$ by way of the concept of a cut?

Now what is a cut of the real numbers? Well, a principle of division into an upper and a lower class. Thus such a principle yields every rational and irrational number. For even if we have no system of irrational numbers, still

those *that we have* divide into upper and lower by reference to the cut (so far, that is, as they are comparable with it).

But now Dedekind's idea is that the division into an upper and lower class (under the known conditions) is the real number.

Page 288

The cut is an extensional *image*.

Page Break 289

Page 289

It is of course true that, if I have a mathematical criterion for establishing, for any arbitrary rational number, whether it belongs to the upper or the lower class, then it is easy for me systematically to approximate as close as I like to the place where the two classes meet.

Page 289

In Dedekind we do not make a cut by cutting, i.e. pointing to the place, but--as in finding $\sqrt{2}$ --by approaching the adjacent ends of the upper and the lower class.

Page 289

The thing now is to prove that no other numbers except the real numbers can perform such a cut.

Page 289

Let us not forget that the division of the rational numbers into two classes did not *originally* have any meaning, until we drew attention to a particular thing that could be so described. The concept *is taken over from the everyday use of language* and that is why it immediately looks as if it had to have a meaning for numbers too.

Page 289

When the idea of a cut of the *real* numbers is now introduced by saying that we simply have to extend the concept of a cut of the rational numbers to the real numbers--all that we need is a property dividing the real numbers into two classes (etc.)--then *first of all* it is not clear what is meant by such a property, which thus divides *all* real numbers. Now our attention can be drawn to the fact that any real number can serve this purpose. But that gets us only so far and no further.

Page Break 290

Page 290

35. The extensional definitions of functions, of real numbers etc. pass over--although they presuppose--everything intensional, and refer to the ever-recurring outward form.

Page 290

36. Our difficulty really already begins with the infinite straight line; although we learn even as children that a straight line has no end, and I do not know that this idea has ever given anyone any difficulty. Suppose a finitist were to try to replace this concept by that of a straight segment of definite length?!

But the straight line is a *law* for producing further.

Page 290

The concept of the limit and of continuity, as they are introduced nowadays, depend, without its being said, on the concept of *proof*. For we say

$$\lim_{x \rightarrow \infty} F(x)$$

= 1 when it can be proved that...

This means we use concepts which are infinitely harder to grasp than those that we make explicit.

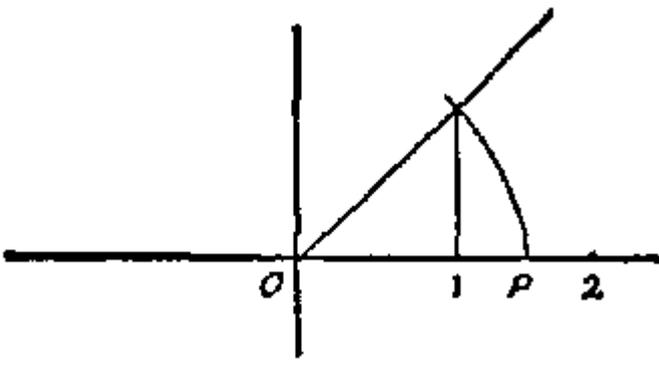

Page 290

37. The misleading thing about Dedekind's conception is the idea that the real numbers are there spread out in the number line. They may be known or not; that does not matter. And in this way all that one needs to do is to cut or divide into classes, and one has dealt with them all.

Page 290

It is by *combining calculation and construction* that one gets the idea that there must be a point left out on the straight line, namely *P*,

Page Break 291

if one does not admit $\sqrt{2}$ as a measure of distance from O . 'For, if I were to construct really accurately, then the circle would have to cut the straight line *between* its points.'

Page 291

This is a frightfully confusing picture.

Page 291

The irrational numbers are--so to speak--special cases.

Page 291

What is the *application* of the concept of a straight line in which a point is missing?! The application must be 'common or garden'. The expression "straight line with a point missing" is a fearfully misleading picture. The yawning gulf between illustration and application.

Page 291

38. The generality of functions is so to speak an *unordered* generality. And our mathematics is built up on such an unordered generality.

Page 291

39. If one imagines the general calculus of functions without the existence of examples, then the vague explanations by means of value-tables

Page Break 292

and diagrams, such as are found in the textbooks, are in place as *indications* of how e.g. a sense might sometime be given to this calculus.

Page 292

Imagine someone's saying: "I want to hear a composition which goes like this":

Page 292

Would that necessarily be senseless? Couldn't there be a composition whose correspondence to this line, in some important sense, could be shewn?

Page 292

Or suppose one looked at continuity as a property of the sign ' $x^2 + y^2 = z^2$ '--of course only if this equation and others were *ordinarily* subjected to a known method of testing. *This* is the relation of this rule (equation) to this particular test.' A test, which goes with a sidelong glance at a kind of extension.

Page 292

In this test of the equation something is undertaken which is connected with certain extensions. Though not as if what were in question here were an extension which would be somehow equivalent to the equation itself. It is just that certain extensions are, so to speak, alluded to.--The real thing here is not the extension, which is only *faute de mieux* described intensionally; rather is the *intension* described--or

Page Break 293

presented--by means of certain extensions, which are yielded by it then and there.

Page 293

The range of certain extensions casts a *sidelight* on the algebraic property of the function. In this sense, then, the drawing of a hyperbola could be said to cast a sidelight on the equation of the hyperbola.

Page 293

It is no contradiction of this for those extensions to be the most important application of the rule; for it is *one* thing to draw an ellipse, and another to construct it *by means of its equation*--

Page 293

Suppose I were to say: extensional considerations (for example the Heine-Borel theorem) shew: *This* is how to deal with intensions.

Page 293

The theorem gives us the main features of a method of proceeding with intensions. It says e.g.: '*this* is what it will have to be like'.

Page 293

And it will then be possible to attach a diagram as a particular illustration, e.g. to a procedure with particular intensions. The illustration is a sign, a description, which is particularly easy to take in, particularly memorable.

Page 293

To give the illustration here will in fact be to give a procedure.

Page Break 294

Page 294

A theory of the placing of figures in a picture (a painting),--say on general aesthetic grounds--*apart from* whether these figures are engaged in fighting, or love-making etc..

Page 294

The theory of functions as a schema, into which on the one hand a host of examples fits, and which on the other hand is there as a standard for the classification of cases.

Page 294

The misleading thing about the usual account consists in its looking as if the *general* account could be quite understood even without examples, without a thought of intensions (in the plural), since really everything could be managed extensionally, if that were not impossible for external reasons.

Page 294

Compare the two forms of definition: "We say

$$\lim_{x \rightarrow \infty} \phi(x) = L \text{ when it can be shewn that..."}$$

and

$$\text{"}\lim_{n \rightarrow \infty} \phi(n) = L \text{ means: for every } \epsilon \text{ there is a } \delta \text{..."}$$

Page 294

40. Dedekind gives a general pattern of expression; so to speak a logical form of reasoning.

A general formulation of a procedure. The effect is similar to that of introducing the word "correlation" with a view to the general definition of functions. A general way of talking is introduced, which is very useful for the characterization of a mathematical procedure (as in Aristotelian logic). But the danger is that one will think one is in

Page Break 295

possession of the complete explanation of the individual cases when one has this general way of talking (the same danger as in logic).

Page 295

We determine the concept of *the rule* for the construction of a non-terminating decimal further and further.

But the content of the concept?!--Well, can we not complete the construction of the concept as a receptacle for whatever application may turn up? May I not complete the construction of the *form* (the form for which some content has supplied me with the *stimulus*) and as it were prepare a form of language for possible employment? For, so long as it remains empty, the form will contribute to determining the form of mathematics.

Page 295

For isn't the subject-predicate form open in this way; and waiting for the most various new applications?

Page 295

That is to say: is it true that the whole difficulty about the generality of the concept of a mathematical

function is already to be found in Aristotelian logic, since we can no more survey the generality of propositions and of predicates than that of mathematical functions?

Page 295

41. Concepts which occur in 'necessary' propositions must also occur and have a meaning in non-necessary ones.

Page 295

42. Would one say that someone understood the proposition ' $563 + 437 = 1000$ ' if he did not know how it can be proved? Can

Page Break 296

one deny that it is a sign of understanding a proposition, if a man knows how it could be proved?

Page 296

The problem of finding a mathematical decision of a theorem might with some justice be called the problem of giving mathematical sense to a formula.

Page 296

An equation links two concepts; so that I can now pass from one to the other.

Page 296

An equation constructs a conceptual path. But is a conceptual path a concept? And if not, is there a sharp distinction between them?

Page 296

Imagine that you have taught someone a technique of multiplying. He uses it in a language-game. In order not to have to keep on multiplying afresh, he writes the multiplication in an abbreviated form as an equation, and he uses this where he multiplied before.

Now he says that the technique of multiplying establishes connexions between the concepts. He will also say the same thing about a multiplication as a picture of this transition. And finally he will say the same thing about the equation itself: for it is essential that the transition should be capable of being represented simply by the pattern of the equation. That is, that the transition should *not* always have to be made anew.

Now will he also be inclined to say that the process of multiplying is a concept?

Page Break 297

Page 297

It is surely a *movement*. It seems to be a movement between two stationary points; these are the concepts.

Page 297

If I conceive a proof as my *movement* from one concept to another, then I shall not want also to say that it is a new concept. But can I not conceive the written multiplication as *one* picture, comparable to a number-sign, and may not its functioning include functioning as a concept-sign?

Page 297

43. I should like to say: when we employ now the one, now the other side of the equation, we are employing two sides of the same concept.

Page 297

44. Is the conceptual apparatus a concept?

Page 297

45. How does anyone shew that he understands a mathematical proposition? E.g. by applying it. So not also by proving it?

Page 297

I should like to say: the proof shews me a new connexion, and hence it also gives me a new concept.

Page 297

Is not the new concept the proof itself?

Page Break 298

Page 298

But a proof certainly does enable you to form a new judgment. For you can after all say of a particular pattern that it is or is not this proof.

Page 298

Yes, but is the proof, regarded, interpreted, as a *proof*, a pattern? As a *proof*, I might say, it has to convince me of something. In consequence of it I will do or not do something. And in consequence of a new concept I don't do or not do anything. So I want to say: the proof is the pattern of proof employed in a particular way.

And what it convinces me of can be of very various kinds. (Think of the proofs of Russellian tautologies, or proofs in geometry and in algebra.)

Page 298

A mechanism can convince me of something (can prove something). But under what circumstances--in the context of what activities and problems--shall I say that it convinces me of something?

Page 298

"But a concept surely does not convince me of anything, for it does not shew me a fact."--But why should a concept not first and foremost convince me that I want to use *it*?

Page 298

Why should not the new concept, once formed, immediately license my transition to a judgment?

Page 298

46. 'Understanding a mathematical proposition'--that is a very vague concept.

Page Break 299

Page 299

But if you say "The point isn't understanding at all. Mathematical propositions are only positions in a game" that too is nonsense! 'Mathematics' is *not* a sharply delimited concept.

Page 299

Hence the issue whether an existence-proof which is not a construction is a real proof of existence. That is, the question arises: Do I *understand* the proposition "There is..." when I have no possibility of finding where it exists? And here there are two points of view: as an English sentence for example I understand it, so far, that is, as I can explain it (and note how far my explanation goes). But what can I do with it? Well, not what I can do with a constructive proof. And in so far as what I can do with the proposition is the criterion of understanding it, thus far it is not clear *in advance* whether and to what extent I understand it.

The curse of the invasion of mathematics by mathematical logic is that now any proposition can be represented in a mathematical symbolism, and this makes us feel obliged to understand it. Although of course this method of writing is nothing but the translation of vague ordinary prose.

Page 299

47. A concept is not essentially a predicate.†1 We do indeed sometimes say: "This thing is not a bottle" but it is certainly not essential to the language-game with the concept 'bottle' that such judgments occur in it. The thing is to pay attention to how a concept word ("slab", e.g.) is used in a language-game.

Page Break 300

Page 300

There need not e.g. be such a sentence as "This is a slab" at all; but e.g. merely: "Here is a slab."

Page 300

48. 'Mathematical logic' has completely deformed the thinking of mathematicians and of philosophers, by setting up a superficial interpretation of the forms of our everyday language as an analysis of the structures of facts. Of course in this it has only continued to build on the Aristotelian logic.

Page 300

49. It is quite true: the numerical sign belongs with a concept-sign, and only together with this is it, so to speak, a measure.

Page 300

50. If you look into this mouse's jaw you will see two long incisor teeth.--How do you know?--I know that all mice have them, so this one will too. (And one does not say: "And this thing is a mouse, so it too...") Why is this such an important move? Well, we investigate e.g. animals, plants etc. etc.; we form general judgments and apply them in particular cases.--But it surely is a truth that this mouse has the property, *if all* mice have it! That is a determination about the application of the word "all". The factual generality is to be found somewhere else. Namely, for example, in the general occurrence of that method of investigation and its application.

Page 300

Or: "This man is a student of mathematics." How do you know?--"All the people in this room are mathematicians; only such people have been admitted."

Page Break 301

Page 301

The interesting case of generality is this: we often have a means of ascertaining the general proposition before

considering particular cases: and we then use the general method to judge the particular case.

We gave the porter the order only to admit people with invitations and now we count upon it that this man, who has been admitted, has an invitation.

Page 301

The interesting generality in the case of the logical proposition is not the fact that it appears to express, but the ever-recurring situation in which this transition is made.

Page 301

51. If it is said that the proof shews *how* (e.g.) 25×25 yield 625, that is of course a queer way of talking, since for this to be the arithmetical result is not a temporal process. But the proof does not shew any temporal process either.

Page 301

Imagine a sequence of pictures. They shew how two people fence with rapiers according to such-and-such rules. A sequence of pictures can surely shew that. Here the picture refers to a reality. It cannot be said to shew *that* fencing is done like this, but *how* fencing is done. In another sense we can say that the pictures shew how one can get from this position into that in three movements. And now they also shew *that* one can get into that position in this way.

Page 301

52. The philosopher must twist and turn about so as to pass by the mathematical problems, and not run up against one,--which would have to be solved before he could go further.

Page Break 302

Page 302

His labour in philosophy is as it were an idleness in mathematics.

Page 302

It is not that a new building has to be erected, or that a new bridge has to be built, but that the geography, *as it now is*, has to be described.

Page 302

We certainly see bits of the concepts, but we don't clearly see the declivities by which one passes into others.

Page 302

This is why it is of no use in the philosophy of mathematics to recast proofs in new forms. Although there is a strong temptation here.

Page 302

Even 500 years ago a philosophy of mathematics was possible, a philosophy of what mathematics was then.

Page 302

53. The philosopher is the man who has to cure himself of many sicknesses of the understanding before he can arrive at the notions of the sound human understanding.

Page Break 303

PART VI

ca. 1943/1944

Page 303

1. Proofs give propositions an order. They organize them.

Page 303

2. The concept of a formal test presupposes the concept of a transformation-rule, and hence of a technique.

Page 303

For only through a technique can we *grasp* a regularity.

Page 303

The technique is external to the pattern of the proof. One might have a perfectly accurate view of the proof, yet not understand it as a transformation according to such-and-such rules.

Page 303

One will certainly call adding up the numbers ... to see whether they come to 1000, a formal test of the numerals. But all the same that is *only* when adding is a practised technique. For otherwise how could the procedure be called any kind of test?

Page 303

It is only within a *technique* of transformation that the proof is a formal test.

Page Break 304

Page 304

When you ask what right you have to pronounce this rule, the proof is the answer to your question.

Page 304

What right have you to say that? *What* right have you to say it?

Page 304

How do you test a theme for a contrapuntal property? You transform it according to *this* rule, you put it together with another one in *this* way; and the like. In this way you get a definite result. You get it, as you would also get it by means of an experiment. So far what you are doing may even have been an experiment. The word "get" is here used temporally; you got the result at three o'clock.--In the mathematical proposition which I then frame the verb ("get", "yields" etc.) is used non-temporally.

The activity of testing produced such and such a result.

So up to now the testing was, so to speak, experimental. Now it is taken as a proof. And the proof is the *picture* of a test.

Page 304

The proof, like the application, lies in the background of the proposition. And it hangs together with the application.

Page 304

The proof is the route taken by the test.

Page 304

The test is a formal one only in so far as we conceive the result as the result of a formal proposition.

Page Break 305

Page 305

3. And if this picture justifies the prediction--that is to say, if you only have to see it and you are convinced that a procedure will take such-and-such a course--then naturally this picture also justifies the rule. In this case the proof stands behind the rule as a picture that justifies the rule.

Page 305

For why does the picture of the movement of the mechanism justify the belief that this kind of mechanism will always move in *this* way?--It gives our belief a particular direction.

Page 305

When the proposition seems not to be right in application, the proof must surely shew me why and how it *must* be right; that is, *how* I must reconcile it with experience.

Page 305

Thus the proof is a blue-print for the employment of the rule.

Page 305

4. How does the proof justify the rule?--It shews how, and therefore why, the rule can be used.

Page 305

The King's Bishop†1 shews us how 8×9 makes 72--but here the rule of counting is not acknowledged as a rule.

The King's Bishop shews us *that* 8×9 makes 72: Now we are acknowledging the rule.

Page Break 306

Page 306

Or ought I to have said: the King's Bishop shews me how 8×9 *can* make 72; that is to say, it shews me a way?

Page 306

The procedure shews me a How of '*making*'.

Page 306

In so far as $8 \times 9 = 72$ is a rule, of course it means nothing to say that that shews me *how* $8 \times 9 = 72$; unless this were to mean: someone shews me a process through the contemplation of which one is led to this rule.

Page 306

Now isn't going through any proof such a process?

Page 306

Would it mean anything to say: "I want to shew you how 8×9 originally made 72"?

Page 306

5. What is really queer is that the picture, not the reality, should be able to prove a proposition! As if here the

picture itself took over the role of reality.--But that's not how it is: for what I derive from the picture is only a rule. And this rule does not stand to the picture as an empirical proposition stands to reality.--The picture of course does not shew that such-and-such happens. It only shews that what does happen can be taken in *this* way.

Page 306

The proof shews how one proceeds according to the rule without a hitch.

Page Break 307

Page 307

And so one may even say: the procedure, the proof, shews one how far $8 \times 9 = 72$.

Page 307

The picture shews one, not, of course, anything that happens, but that what ever does happen will allow of being looked at like this.

Page 307

We are brought to the point of using this technique in this case. I am brought to this--and *to that extent* I am convinced of something.

Page 307

See, in this way 3 and 2 make 5. Note this procedure. "In doing so you at once notice the rule."

Page 307

6. The Euclidean proof of the infinity of prime numbers might be so conducted that the investigation of the numbers between p and $p! + 1$ was carried out on one or more examples, and in this way we learned a technique of investigation. The force of the proof would of course in that case not reside in the fact that a prime number $> p$ was found in *this* example. And at first sight this is queer.

It will now be said that the algebraic proof is stricter than the one by way of examples, because it is, so to speak, the extract of the effective principle of these examples. But after all, even the algebraic proof is not quite naked. Understanding--I might say--is needed for both!

Page 307

The proof teaches us a technique of finding a prime number between p and $p! + 1$. And we become convinced that this technique must

Page Break 308

always lead to a prime number $> p$. Or that we have miscalculated if it doesn't.

Page 308

Would one be inclined to say here that the proof shews us *how* there is an infinite series of prime numbers? Well, one might say so. And at any rate: "What there being an infinity of primes amounts to." For it could also be imagined that we had a proof that did indeed determine us to say that there were infinitely many primes, but did not teach us to find a prime number $> p$.

Now perhaps it would be said: "Nevertheless, these two proofs prove the same proposition, the same mathematical fact." There might be reason at hand for saying this, or again there might not.

Page 308

7. The spectator sees the whole impressive procedure. And he becomes convinced of something; that is the special impression that he gets. He goes away from the performance convinced of something. Convinced that (for example) he will end up the same way with other numbers. He will be ready to express what he is convinced of in such-and-such a way. Convinced of what? Of a psychological fact?--

Page 308

He will say that he has drawn a conclusion from what he has seen.--*Not*, however as one does from an experiment. (Think of periodic division.)

Page 308

Could he say: "What I have seen was very impressive. I have drawn a conclusion from it. In future I shall..."?

Page Break 309

Page 309

(E.g.: In future I shall always calculate like *this*.)

Page 309

He tells us: "I saw that it must be like that."

Page 309

"I realised that it must be like that"--that is his report.

Page 309

He will now perhaps run through the proof procedure in his mind.

Page 309

But he does not say: I realised that *this* happens. Rather: that it must be like that. This "must" shews what kind of lesson he has drawn from the scene.

The "must" shews that he has gone in a circle.

Page 309

I decide to see things like *this*. And so, to act in such-and-such a way.

Page 309

I imagine that whoever sees the process also draws a moral from it.

Page 309

'It must be so' means that this outcome has been defined to be essential to this process.

Page 309

8. This *must* shews that he has adopted a concept.

Page Break 310

Page 310

This *must* signifies that he has gone in a circle.

Page 310

He has read off from the process, not a proposition of natural science but, instead of that, the determination of a concept.

Let concept here mean method. In contrast to the application of the method.

Page 310

9. See, 50 and 50 make 100 like *this*. One has, say, added 10 to 50 five times in succession. And one goes on with the increase of the number until it grows to 100. Here of course the observed process would be a process of calculating in some fashion (on the abacus, perhaps); a proof.

Page 310

The meaning of that "like *this*" is of course not that the proposition " $50 + 50 = 100$ " says: this takes place somewhere. So it is not as when I say: "See, a horse canters like this"--and shew him a picture.

Page 310

One could however say: "See, *this* is *why* I say $50 + 50 = 100$ ".

Page 310

Or: See, *this* is how one gets $50 + 50 = 100$.

But if I now say: See, *this* is how 3 + 2 make 5, laying 3 apples on the table and then 2 more, here I mean to say: 3 apples and 2 apples

Page Break 311

make 5 apples, if none are added or taken away.--Or one might even tell someone: If you put 3 apples and then 2 more on the table (as I am doing), then what you see now almost always happens--and there are now 5 apples lying there.

I want perhaps to shew him that 3 apples and 2 apples don't make 5 apples in *such* a way as they might make 6 (because e.g. one makes a sudden appearance). This is really an explanation, a definition of the operation of adding. This is indeed how one might actually explain adding with the abacus.

Page 311

"If we put 3 things by 2 things, that may yield various counts of things. But we see as a *norm* the procedure that 3 things and 2 things make 5 things. See, *this* is how it looks when they make 5."

Page 311

Couldn't one say to a child: "Shew me how 3 and 2 make 5." And the child would then have to calculate 3 + 2 on the abacus.

Page 311

When, in teaching the child to calculate, one asks, "How do 3 + 2 make 5?"--what is he supposed to shew? Well, obviously he is supposed to move three beads up to 2 beads and then to count the beads (or something like that).

Page 311

Might one not say "Shew me how this theme makes a canon." And someone asked this would have to prove that it does make a canon.--One would ask someone "*how*" if one wanted to to get him to shew that he does grasp what is in question here.

And if the child now shews how 3 and 2 make 5, then he shews a procedure that can be regarded as a ground for the rule "2 + 3 = 5."

10. But suppose one asks the pupil: "Shew me how there are infinitely many prime numbers."--Here the grammar is doubtful! But it would be appropriate to say: "Shew me in how far one may say that there are infinitely many prime numbers."

When one says "Shew me that it is...", then the question *whether it is* is already put and it remains only to answer "yes" or "no". But if one says "Shew me *how* it is that...", then here the language-game itself needs to be explained. At any rate, one has so far no *clear* concept of what one is supposed to be at with this assertion. (One is asking, so to speak; "How can such an assertion be justified at all?")

Now am I meant to give different answers to the question: "Shew me *how*..." and "Shew me *that*..."?

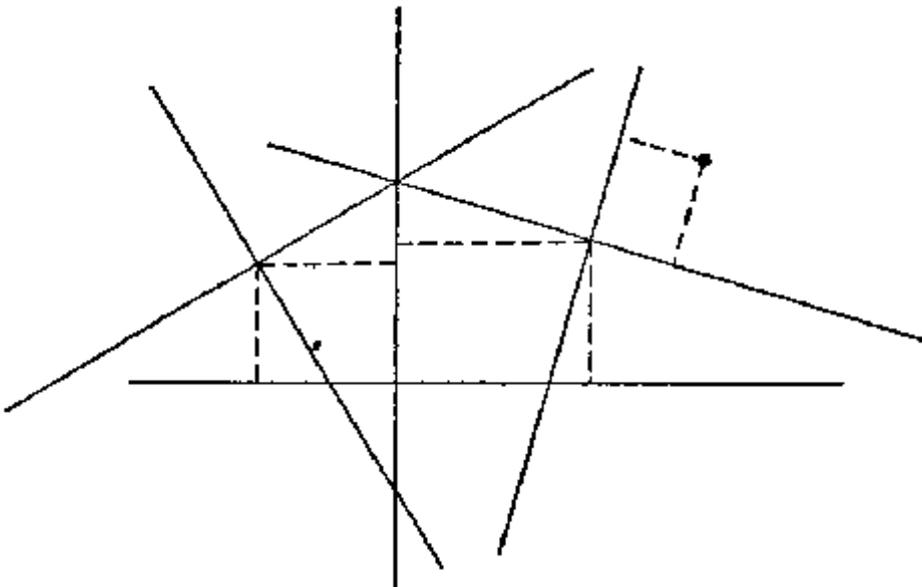

From the proof you derive a theory. If you derive a theory from the proof, then the sense of the theory must be independent of the proof; for otherwise the theory could never have been separated from the proof.

In the same way as I can remove auxiliary construction lines in a drawing and leave the rest.

Thus it is as if the proof did not determine the sense of the proposition proved; and yet as if it did determine it.

But isn't it like that with any verification of any proposition?

11. I believe this: Only in a large context can it be said at all that there are infinitely many prime numbers. That is to say: For this to be possible there must already exist an extended technique of calculating with cardinal numbers. That proposition only makes sense within this technique. A proof of the proposition locates it in the whole system of calculations. And its position therein can now be described in more than one way, as of course the whole complicated system in its background is presupposed.

If for example 3 co-ordinate systems are given a definite mutual arrangement, I can determine the position of a point for all of them by giving it for any one.

The proof of a proposition certainly does not mention, certainly does not describe, the whole system of calculation that stands behind the proposition and gives it its sense.

Assume that an adult with intelligence and experience has learnt only the first elements of calculation, say the four fundamental operations with numbers up to 20. In doing so he has also learnt the word "prime number". And suppose someone said to him "I am going to prove to you that there are infinitely many prime numbers." Now, how can he prove it to him? He has got to *teach him to calculate*. That is here part of the proof. It takes that, so to speak, to give the question "Are there infinitely many prime numbers?" any sense.

Page 314

12. Philosophy has to work things out in face of the temptations to misunderstand on *this* level of knowledge. (On another level there are again new temptations.) But that doesn't make philosophising any easier!

Page 314

13. Now isn't it absurd to say that one doesn't understand the sense of Fermat's last theorem?--Well, one might reply: the mathematicians are not *completely* blank and helpless when they are confronted by this proposition. After all, they try certain methods of proving it; and, so far as they try methods, *so far* do they understand the proposition.--But is that correct? Don't they *understand* it just as completely as one can possibly understand it?

Page 314

Now let us assume that, quite contrary to mathematicians' expectations, its contrary were proved. So now it is shewn that it *cannot* be so at all.

Page 314

But, if I am to know what a proposition like Fermat's last theorem says, must I not know what the criterion is, for the proposition to be true? And I am of course acquainted with criteria for the truth of

Page Break 315

similar propositions, but not with any criterion for the truth of this proposition.

Page 315

'Understanding' is a vague concept.

Page 315

In the first place, there is such a thing as *belief* that one understands a proposition.

And if understanding is a psychical process--why should it interest us so much? Unless experience connects it with the capacity to make use of the proposition.

Page 315

"Shew me how..." means: shew me the connexions in which you are using this proposition (this machine-part).

Page 315

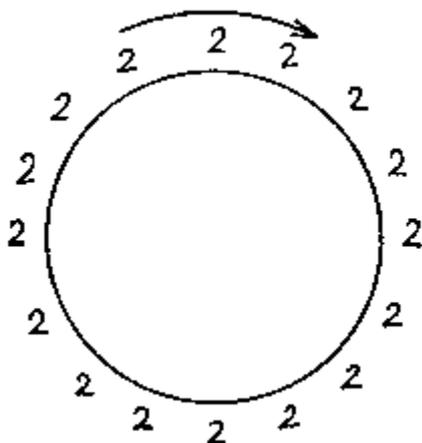

14. "I am going to shew you how there are infinitely many prime numbers" presupposes a condition in which the proposition that there are infinitely many prime numbers had no, or only the vaguest, meaning. It might have been merely a joke to him, or a paradox.

Page 315

If this procedure convinces you of that, then it must be very impressive.--But is it?--Not particularly. Why is it not *more* so? I believe it would only be impressive if one were to explain it quite radically. If for example one did not merely write $p! + 1$, but first explained it and illustrated it with examples. If one did not presuppose the techniques as something obvious, but gave an account of them.

Page Break 316

Page 316

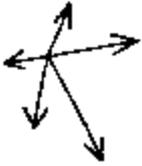

15.

We keep on copying the last figure "2" going round to the right. If we copy correctly, the last figure is in turn a copy

of the first one.

Page 316

A language-game:

Page 316

One person (A) predicts the result to another (B). The other follows the arrows with excitement, as it were curious how they will conduct him, and is pleased at the way they end by leading him to the predicted result. He reacts to it perhaps as one reacts to a joke.

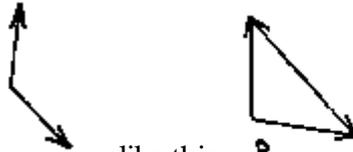

A may have constructed the result before, or merely have guessed it. B knows nothing about it and it does not interest him.

Page 316

Even if he was acquainted with the rule, still he had never followed it *thus*. He is *now* doing something new. But there is also such a thing as curiosity and surprise when one has already travelled this road. In this way one can read a story again and again, even know it by heart, and yet keep on being surprised at a particular turn that it takes.

Page Break 317

Page 317

Before I have followed the two arrows like this  , I don't know how the route or the result will look. I do not know what face I shall see. Is it strange that I did not know it? How should I have known it? I had never seen it! I knew the rule and had mastered it and I saw the sheaf of arrows.

Page 317

But why wasn't this a genuine prediction: "If you follow the rule, you will produce this"? Whereas the following is certainly a genuine prediction: "If you follow the rule as best you can, you will..." The answer is: the first is not a prediction because I might also have said: "If you follow the rule, you *must* produce this." It is not a prediction if the concept of *following* the rule is so determined, that the result is the criterion for whether the rule was followed.

Page 317

A says: "If you follow the rule you will get *this*" or he says simply: "You will get this." At the same time he draws the resulting arrow there.

Page 317

Now was what A said in this game a prediction? Well damn it, Yes--in a certain sense. Does that not become particularly clear if we make the suggestion that the prediction was *wrong*? It was only not a prediction in the case where the *condition* turned the proposition into a pleonasm.

Page Break 318

Page 318

A might have said: "If you are in agreement with each of your steps, then you will arrive *at this*."

Page 318

Suppose that while B is deriving the polygon, the arrows of the sheaf were to alter their direction a little. B always draws an arrow parallel, as it is just at this moment. He is now just as surprised and excited as in the foregoing game, although here the result is not that of a calculation. So he had taken the first game in the same way as the second.

Page 318

The reason why "If you follow the rule, this is where you'll get to" is not a prediction is that this proposition simply says: "The result of this calculation is..." and that is a true or false mathematical proposition: The allusion to the future and to yourself is mere clothing.

Page 318

Now must A have a clear idea at all, of whether his prediction is meant mathematically or otherwise? He

simply says "If you follow the rule... will result" and enjoys the game. If for example the predicted result does not come out, he does not investigate any further.

Page 318

16. ... And this series is defined by a rule. Or again by the training in proceeding according to the rule. And the inexorable proposition is that according to this rule this number is the successor of this one.†1

Page Break 319

Page 319

And this proposition is not an empirical one. But why not an empirical one? A rule is surely something that we go by, and we produce one numeral out of another. Is it not matter of experience, that this rule takes someone from here to there?

Page 319

And if the rule + 1 carries him one time from 4 to 5, perhaps another time it carries him from 4 to 7. Why is that impossible?

Page 319

The question arises, what we take as criterion of going according to the rule. Is it for example a feeling of satisfaction that accompanies the act of going according to the rule? Or an intuition (intimation) that tells me I have gone right? Or is it certain practical consequences of proceeding that determine whether I have really followed the rule?--In that case it would be possible that $4 + 1$ sometimes made 5 and sometimes something else. It would be thinkable, that is to say, that an experimental investigation would shew whether $4 + 1$ always makes 5.

Page 319

If it is not supposed to be an empirical proposition that the rule leads from 4 to 5, then *this*, the result, must be taken as the criterion for one's having gone by the rule.

Page 319

Thus the truth of the proposition that $4 + 1$ makes 5 is, so to speak, *overdetermined*. Overdetermined by this, that the result of the operation is defined to be the criterion that this operation has been carried out.

Page Break 320

Page 320

The proposition rests on one too many feet to be an empirical proposition. It will be used as a determination of the concept 'applying the operation + 1 to 4'. For we now have a new way of judging whether someone has followed the rule.

Page 320

Hence $4 + 1 = 5$ is now itself a rule, by which we judge proceedings.

This rule is the result of a proceeding that we assume as *decisive* for the judgment of other proceedings. The rule-grounding proceeding is the proof of the rule.

Page 320

17. How does one describe the process of learning a rule?--If A claps his hands, B is always supposed to do it too.

Page 320

Remember that the description of a language-game is already a description.

Page 320

I can train someone in a *uniform* activity. E.g. in drawing a line like this with a pencil on paper:

Now I ask myself, what is it that I want him to do, then? The answer is: He is always to go on as I have shewn him. And what do I really mean by: he is always to go on in that way? The best answer to this that I can give myself, is an example like the one I have just given.

Page Break 321

Page 321

I would use this example in order to shew him, and *also* to shew myself, what I mean by uniform.

Page 321

We talk and act. That is already presupposed in everything that I am saying.

Page 321

I say to him "That's right," and this expression is the bearer of a tone of voice, a gesture. I leave him to it. Or I say "No!" and hold him back.

18. Does this mean that 'following a rule' is indefinable? No. I can surely define it in countless ways. Only definitions are no use to me in these considerations.

19. I might also teach him to understand an order of the form:

$$(- \cdot \cdot) \rightarrow \quad \text{or} \quad (- \cdot \cdot \cdot -) \rightarrow$$

(Let the reader guess what I mean.)

Now what do I mean him to do? The best answer that I can give myself to this is to carry these orders on a bit further. Or do you believe that an algebraic expression of this rule presupposes less?

And now I train him to follow the rule

- - - - - etc.

And again I don't myself know any more about what I want from him, than what the example itself shews. I can of course paraphrase the rule in all sorts of different forms, but that makes it more intelligible only for someone who can already follow these paraphrases.

20. This, then, is how I have taught someone to count and to multiply in the decimal system, for example. "365 × 428" is an order and he complies with it by carrying out the multiplication.

Here we insist on this, that the same sum that is set always has the same multiplication-pattern in its train, and so the same result. Different patterns of multiplication for the same set sum we reject.

The situation will now arise, of a calculator making mistakes in calculation; and also of his correcting mistakes.

A further language-game is this: He gets asked "How much is '365 × 428'?" And he may act on this question in two different ways. Either he does the multiplication, or if he has already done it before, he reads off the previous result.

21. The application of the concept 'following a rule' presupposes a custom. Hence it would be nonsense to say: just once in the history of

the world someone followed a rule (or a signpost; played a game, uttered a sentence, or understood one; and so on).

Here there is nothing more difficult than to avoid pleonasms and only to say what really describes something.

For here there is an overwhelming temptation to say something more, when everything has already been described.

It is of the greatest importance that a dispute hardly ever arises between people about whether the colour of this object is the same as the colour of that, the length of this rod the same as the length of that, etc. This peaceful agreement is the characteristic surrounding of the use of the word "same".

And one must say something analogous about proceeding according to a rule.

No dispute breaks out over the question whether a proceeding was according to the rule or not. It doesn't come to blows, for example.

This belongs to the framework, out of which our language works (for example, gives a description).

22. Now someone says that in the series of cardinal numbers that obeys the rule $+ 1$, the technique of which was taught to us in such-and-such a way, 450 succeeds 449. That is not the empirical proposition that we come from 449 to 450 when it strikes us that we have applied the operation $+ 1$ to 449. Rather is it a stipulation that only when the result is 450 have we applied this operation.

It is as if we had hardened the empirical proposition into a rule. And now we have, not an hypothesis that gets tested by experience, but a paradigm with which experience is compared and judged. And so a new kind of judgment.

For one judgment is: "He worked out 25×25 , was attentive and conscientious in doing so and made it 615"; and another: "He worked out 25×25 and got 615 out instead of 625."

But don't the two judgments come to the same thing in the end?

The arithmetical proposition is not the empirical proposition: "When I do *this*, I get *this*"--where the criterion for my doing *this* is not supposed to be what results from it.

23. Might we not imagine that the main point in multiplying was the concentration of the mind in a definite way, and that indeed one didn't always work out the same sums the same way, but for the particular practical problems that we want to solve, just these differences of result were advantageous?

Is the main thing not this: that in *calculating* the main weight would be placed on whether one has calculated right or wrong, quite prescindng from the psychical condition etc. of the person who is doing the calculation?

The justification of the proposition $25 \times 25 = 625$ is, naturally, that if anyone has been trained in such-and-such a way, then under normal circumstances he gets 625 as the result of multiplying 25 by 25. But the arithmetical proposition does not *assert that*. It is so to speak an empirical proposition hardened into a rule. It stipulates that the rule has been followed only when that is the result of the multiplication. It is thus withdrawn from being checked by experience, but now serves as a paradigm for judging experience.

If we want to make practical use of a calculation, we convince ourselves that it has been "worked out right", that the *correct* result has been obtained. And there can be only *one* correct result of (e.g.) the multiplication; it doesn't depend on what you get when you *apply* the calculation. Thus we judge the facts by the aid of the calculation and quite differently from the way in which we should do so, if we did not regard the result of the calculation as something determined once for all.

Not empiricism and yet realism in philosophy, that is the hardest thing. (Against Ramsey.)

You do not yourself understand any more of the rule than you can explain.

24. "I have a particular concept of the rule. If in this sense one follows it, then from that number one can only arrive at this one". That is a spontaneous decision.

But why do I say "I *must*", if it is my decision? Well, may it not be that I must decide?

Doesn't its being a spontaneous decision merely mean: that's how I act; ask for no reason!

You say you must; but cannot say what compels you.

I have a definite concept of the rule. I know what I have to do in any particular case. I know, that is I am in no doubt: it is obvious to me. I say "Of course". I can give no reason.

When I say "I decide spontaneously", naturally that does not mean: I consider which number would really be the best one here and then plump for...

Page 326

We say: "First the calculations must be done right, and then it will be possible to pass some judgment on the facts of nature."

Page Break 327

Page 327

25. Someone has learned the rule of counting in the decimal system. Now he takes pleasure in writing down number after number in the "natural" number series.

Or he follows the rule in the language-game "Write down the successor of the number in the series"--How can I explain this language-game to anyone? Well, I can describe an example (or examples).--In order to see whether he has understood the language-game, I may make him work out examples.

Page 327

Suppose someone were to verify the multiplication tables, the logarithm tables etc., because he did not trust them. If he reaches a different result, he trusts it, and says that his mind had been so concentrated on the rule that the result it gets must count as the right one. If someone points out a mistake to him he says that he would rather doubt the trustworthiness of his own understanding and his own meaning *now* than then when he first made the calculation.

Page 327

We can take agreement for granted in all questions of calculation. But now, does it make any difference whether we utter the proposition used in calculating as an empirical proposition or as a rule?

Page 327

26. Should we acknowledge the rule $25^2 = 625$, if we did not all arrive at this result? Well, why then should we not be able to make use of the empirical proposition instead of the rule?--Is the answer to that: Because the contrary of the empirical proposition does not correspond to the contrary of the rule?

Page 327

When I write down a bit of a series for you, that you then see *this*

Page Break 328

regularity in it may be called an empirical fact, a psychological fact. But, *if* you have seen this law in it, that you then continue the series in *this* way--that is no longer an empirical fact.

But how is it not an empirical fact?--for "seeing *this* in it" was presumably not the *same* as: continuing it like this.

One can only say that it is not an empirical proposition, by *defining* the step on this level as the one that corresponds to the expression of the rule.

Page 328

Thus you say: "By the rule that *I* see in this sequence, it goes on in *this* way." Not: according to experience! Rather: that just is the meaning of this rule.

Page 328

I understand: You say "that is not according to experience"--but still *isn't* it according to experience?

Page 328

"By this rule it goes like *this*": i.e., you *give* this rule an extension.

Page 328

But why can't I give it this extension today, that one tomorrow?

Page 328

Well, so I can. I might for example alternately give one of two interpretations.

Page 328

27. If I have once grasped a rule I am bound in what I do further. But of course that only means that I am bound in my *judgment* about

Page Break 329

what is in accord with the rule and what not.

Page 329

If I now see a rule in the sequence that is given me--can that simply consist in, for example, my seeing an algebraic expression before me? Must it not belong to a language?

Page 329

Someone writes up a sequence of numbers. At length I say: "Now I understand it; I must always..." And this *is* the expression of a rule. *But*, only within a language!

Page 329

For when do I say that I see the rule--or a rule--in this sequence? When, for example, I can talk to myself about this sequence in a particular way. But surely also when I simply can continue it? No, I give myself or someone else a general explanation of how it is to be continued. But might I not give this explanation purely in the mind, and so without any real language?

Page 329

28. Someone asks me: What is the colour of this flower? I answer: "red".--Are you absolutely sure? Yes, absolutely sure! But may I not have been deceived and called the wrong colour "red"? No. The certainty with which I call the colour "red" is the rigidity of my measuring-rod, it is the rigidity from which I start. When I give descriptions, *that* is not to be brought into doubt. This simply characterizes what we call describing.

(I may of course even here assume a slip of the tongue, but nothing else.)

Page Break 330

Page 330

Following according to the rule is FUNDAMENTAL to our language-game. It characterizes what we call description.

Page 330

This is the similarity of my treatment with relativity-theory, that it is so to speak a consideration about the clocks with which we compare events.

Page 330

Is $25^2 = 625$ a fact of experience? You'd like to say: "No".--Why isn't it?--"Because, by the rules, it can't be otherwise."--And why so?--Because *that* is the meaning of the rules. Because that is the procedure on which we build all judging.

Page 330

29. When we carry out a multiplication, we give a law. But what is the difference between the law and the empirical proposition that we give this law?

Page 330

When I have been taught the rule of repeating the ornament

and now I have been told "Go on like that": how do I know what I have to do the next time?--Well, I do it with certainty, I shall also know how to defend what I do--that is, up to a certain point. If that does not count as a defence then there is none.

Page 330

"As I understand the rule, *this* comes next."

Page Break 331

Page 331

Following a rule is a human activity.

Page 331

I give the rule an extension.

Page 331

Might I say: See here, if I follow the order I draw this line? Well in certain cases I shall say that. When for example I have constructed a curve according to an equation.

Page 331

"See here! if I follow the order I do *this*!" That is naturally not supposed to mean: if I follow the order I follow the order. So I must have a different identification for the "this".

Page 331

"So *that's* what following this order looks like!"

Page 331

Can I say: "Experience teaches me: if I take the rule like *this* then *this* is how I must go on?"

Page 331

Not if I make 'taking it so' one and the same with 'continuing so'.

Page 331

Following a rule of transformation is not more problematic than following the rule: "keep on writing the same". For the transformation is a kind of identity.

Page Break 332

Page 332

30. It might however be asked: if all humans that are educated like this also calculate like *this*, or at least agree to *this* calculation as the right one; then what does one need the *law* for?

Page 332

" $25^2 = 625$ " cannot be the empirical proposition that people calculate like that, because $25^2 \neq 626$ would in that case not be the proposition that people get not this but another result; and also it could be true if people did not calculate at all.

Page 332

The agreement of people in calculation is not an agreement in opinions or convictions.

Page 332

Could it be said: "In calculating, the rules strike you as inexorable; you feel that you can only do that and nothing else if you want to follow the rule"?

Page 332

"As I see the rule, *this* is what it requires." It does not depend on whether I am disposed this way or that.

Page 332

I feel that I have given the rule an interpretation before I have followed it; and that this interpretation is enough to *determine* what I have to do in order to follow it in the particular case.

If I take the rule as I have taken it, then only doing *this* will correspond to it.

Page Break 333

Page 333

"Have you understood the rule?"--Yes, I have understood--"Then apply it now to the numbers....." If I want to follow the rule, have I now any choice left?

Page 333

Assuming that he orders me to follow the rule and that I am frightened not to obey him: am I now not compelled?

But that is surely so too if he orders me: "Bring me this stone." Am I compelled less by *these* words?

Page 333

31. To what extent can the function of language be described? If someone is not master of a language, I may bring him to a mastery of it by training. Someone who is master of it, I may remind of the kind of training, or I may describe it; for a particular purpose; thus already using a technique of the language.

To what extent can the function of a rule be described? Someone who is master of none, I can only train. But how can I explain the nature of a rule to myself?

The difficult thing here is not, to dig down to the ground; no, it is to recognize the ground that lies before us as the ground.

Page 333

For the ground keeps on giving us the illusory image of a greater depth, and when we seek to reach this, we keep on finding ourselves on the old level.

Page 333

Our disease is one of wanting to explain.

Page 333

"Once you have got hold of the rule, you have the route traced for you."

Page Break 334

Page 334

32. What sort of public must there be if a game is to exist, if a game can be invented?

Page 334

What surrounding is needed for someone to be able to invent, say, chess?

Of course I might invent a board-game today, which would never actually be played. I should simply describe it. But that is possible only because there already exist similar games, that is because such games *are played*.

Page 334

One might also ask: is regularity possible *without* repetition?

I may give a new rule today, which has never been applied, and yet is understood. But would that be possible, if no rule had *ever* actually been applied?

And if it is now said: "Isn't it enough for there to be an imaginary application?" the answer is: No. (Possibility of a private language.)

A game, a language, a rule is an institution.

"But how often must a rule have actually been applied, in order for one to have the right to speak of a rule?" How often must a human being have added, multiplied, divided, before we can say that he has

mastered the technique of these kinds of calculation? And by that I don't mean: how often must he have calculated right in order to convince *others* that he can calculate? No, I mean: in order to prove it to himself.

33. But couldn't we imagine that someone without any training should see a sum that was set to do, and straightway find himself in the mental state that in the normal course of things is only produced by training and practice? So that he knew he could calculate although he had never calculated. (One might, then, it seems, say; The training would merely be history, and merely as a matter of empirical fact would it be necessary for the production of knowledge.)--But suppose now he is in that state of certainty and he calculates wrong? What is he supposed to say himself? And suppose he then multiplied sometimes right, sometimes again quite wrong.--The training may of course be overlooked as mere history, if he now *always* calculates right. But that he *can* calculate he shews, to himself as well as to others only by this, that he *calculates* correctly.

What, in a complicated surrounding, we call "following a rule" we should certainly not call that if it stood in isolation.

34. Language, I should like to say, relates to a *way* of living.

In order to describe the phenomenon of language, one must describe a practice, not something that happens once, *no matter of what kind*.

It is very hard to realize this.

Let us imagine a god creating a country instantaneously in the middle of the wilderness, which exists for two minutes and is an exact reproduction of a part of England, with everything that is going on there in two minutes. Just like those in England, the people are pursuing a variety of occupations. Children are in school. Some people are doing mathematics. Now let us contemplate the activity of some human being during these two minutes. One of these people is doing exactly what a mathematician in England is doing, who is just doing a calculation.--Ought we to say that this two-minute-man is calculating? Could we for example not imagine a past and a continuation of these two minutes, which would make us call the processes something quite different?

Suppose that these beings did not speak English but apparently communicated with one another in a language that we are not acquainted with. What reason should we have to say that they were speaking a language? And yet *could* one not conceive what they were doing as that?

And suppose that they were doing something that we were inclined to call "calculating"; perhaps because its outward appearance was similar.--But *is* it calculating; and do (say) the people who are doing it know, though we do not?

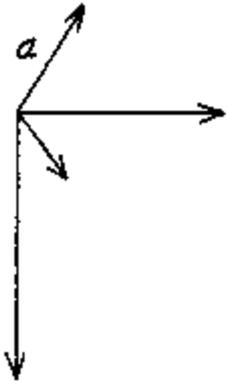

35. How do I know that the colour that I am now seeing is called "green"? Well, to confirm it I might ask other people; but if they did not agree with me, I should become totally confused and should perhaps

take them or myself for crazy. That is to say: I should either no longer trust myself to judge, or no longer react to what they say as to a judgement.

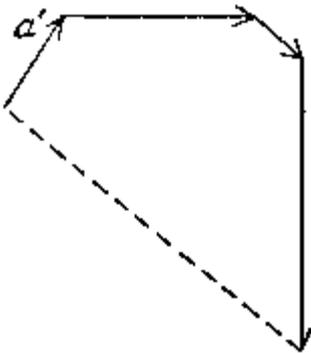

If I am drowning and I shout "Help!", how do I know what the word "Help" means? Well, that's how I react in this situation.--Now *that* is how I know what "green" means as well and also know how I have to follow the rule in the particular case.

Page 337

Is it *imaginable* that the polygon of forces of

looks, not like this:

but otherwise? Well, is it imaginable that the parallel to *a* should not look to have the direction of *a'* but a different direction? That is to say: is it imaginable that I should regard not *a'* but a differently directed arrow as parallel to *a*?

Well, I might for example imagine that I was somehow seeing the parallel lines in perspective and so I call parallel arrows, and that it never occurs to me that I have been using a different way of looking at them. Thus, then, it *is* imaginable that I should draw a different polygon of forces corresponding to the arrows.

Page Break 338

Page 338

36. What sort of proposition is this: "There are four sounds in the word *OBEN*"?

Is it an empirical proposition?

Page 338

Before we have counted the letters, we don't know it.

Page 338

Someone who counts the letters in the word 'OBEN' in order to find out how many sounds there are in a sequence that sounds like that, does just the same thing as someone who counts in order to find out how many letters there are in the word that is written in such-and-such a place. So the former is doing something that might also be an experiment. And that might be reason to call the proposition that 'OBEN' has four letters synthetic *a priori*.

Page 338

The word "Plato" has as many sounds in it as the pentacle has corners. Is that a proposition of logic?--Is it an empirical proposition?

Page 338

Is counting an experiment? It *may* be one.

Page 338

Imagine a language-game in which someone has to count the sounds in a word. Now it might be that a word

apparently always had the same sound, but that when we count its sounds we come to different numbers on different occasions. It might be, for example, that a word did seem to us to sound the same in different contexts (as it were by an acoustical illusion) but the difference emerged when we counted the sounds. In such a case we shall perhaps keep on counting the

Page Break 339

sounds of a word on different occasions, and this will perhaps be a kind of experiment.

On the other hand it may be that we count the sounds in words once for all, make a calculation, and make use of the result of this counting.

The resulting proposition will in the first case be a temporal one, in the second it will be non-temporal.

Page 339

When I count the sounds in the word "Daedalus" I can regard the result in two different ways: (1) The word that is written there (or looks like this or was just now pronounced or etc.) has 7 sounds. (2) The sound-pattern "Dædalus" has 7 sounds.

The second proposition is timeless.

The employment of the two propositions must be different.

The *counting* is the same in the two cases. Only, what we reach by means of it is different.

Page 339

The timelessness of the second proposition is not e.g. a result of the counting, but of the decision to employ the result of counting in a particular way.

Page 339

In English the word Dædalus has 7 sounds. That is surely an empirical proposition.

Page 339

Imagine that someone counted the sounds in words in order to find or test a linguistic law, say a law of development of language. He says: "Dædalus' has 7 sounds". That's an empirical proposition. Consider

Page Break 340

here the *identity* of the word. The same word may here have now this, now that number of sounds.

Page 340

Now I tell someone: "Count the sounds in these words and write down the number by each word."

Page 340

I should like to say: "Through counting the sounds one may get an empirical proposition--but also one may get a rule."

Page 340

To say: "The word.... has.... sounds--in the timeless sense" is a determination about the identity of the concept 'The word....'. Hence the timelessness.

Page 340

Instead of "The word.... has.... sounds--in the timeless sense," one might also say: "The word.... has *essentially*.... sounds."

Page 340

$$\begin{aligned} p|p \cdot | \cdot q|q &= p \cdot q \\ p|q \cdot | \cdot p|q &= pq \\ 37. \quad x|y \cdot | \cdot z|u &\stackrel{\text{Def}}{=} || (x, y, z, u) \end{aligned}$$

Page 340

Definitions would not at all need to be abbreviations; they might make new connexions in another way. Say by means of brackets or the use of different colours for the signs.

Page Break 341

Page 341

I may for example prove a proposition by using colours to indicate that it has the form of one of my axioms, lengthened by a certain substitution.

Page 341

38. "I know how I have to go" means: I am in no doubt how I have to go.

Page 341

"How can one follow a rule?" That is what I should like to ask.

Page 341

But how does it come about that I want to ask that, when after all I find no kind of difficulty in following a rule?

Page 341

Here we obviously misunderstand the facts that lie before our eyes.

Page 341

How can the word "Slab" indicate what I have to do, when after all I can bring any action into accord with any interpretation?

Page 341

How can I follow a rule, when after all whatever I do can be interpreted as following it?

Page 341

What must I know, in order to be able to obey the order? Is there some *knowledge*, which makes the rule followable only in *this* way?

Page Break 342

Sometimes I must *know* something, *sometimes* I must *interpret* the rule before I apply it.

Now, *how* was it possible for the rule to have been given an interpretation during instruction, an interpretation which reaches as far as to any arbitrary step?

And if this step was not named in the explanation, how then *can* we agree about what has to happen at this step, since after all whatever happens can be brought into accord with the rule and the examples?

Thus, you say, nothing definite has been said about these steps.

Page 342

Interpretation comes to an end.

Page 342

39. It is true that *anything* can be somehow justified. But the phenomenon of language is based on regularity, on agreement in action.

Page 342

Here it is of the greatest importance that all or the enormous majority of us agree in certain things. I can, e.g., be quite sure that the colour of this object will be called 'green' by far the most of the human beings who see it.

Page 342

It would be imaginable that humans of different stocks possessed languages that all had the same vocabulary, but the meanings of the words were different. The word that meant green among one tribe, meant same among another, table for a third and so on. We could even

Page Break 343

imagine that the same sentences were used by the tribes, only with entirely different senses.

Page 343

Now in this case I should not say that they spoke the same language.

Page 343

We say that, in order to communicate, people must agree with one another about the meanings of words. But the criterion for this agreement is not just agreement with reference to definitions, e.g., ostensive definitions--but *also* an agreement in judgments. It is essential for communication that we agree in a large number of judgments.

Page 343

40. Language-game (2), †1 how can I explain it to someone, or to myself? Whenever A shouts "Slab" B brings *this* kind of object.--I might also ask: how can *I* understand it? Well, *only* as far as I can explain it.

Page 343

But there is here a queer temptation which expresses itself in my inclination to say: I cannot understand it, because the interpretation of the explanation is still vague.

Page Break 344

Page 344

That is to say, both to you and to myself I can only give examples of the application.

Page 344

41. The word "agreement" and the word "rule" are *related*, they are cousins. The phenomena of agreement and of acting according to a rule hang together.

Page 344

the order: "draw something regular", "tap regularly". And here again one must imagine a particular technique.

Page Break 347

Page 347

You must ask yourself: under what special circumstances do we say that someone has "made a mere slip of the pen" or "he could perfectly well have gone on, but on purpose did not do so" or "he had meant to repeat the figure that he drew, but he happened not to do it".

Page 347

The concept "regular tapping", "regular figure", is taught us in the same way as 'light-coloured' or 'dirty' or 'gaudy'.

Page 347

44. But aren't we guided by the rule? And how can it guide us, when its expression can after all be interpreted by us both thus and otherwise? I.e. when after all various regularities correspond to it. Well, we are inclined to say that an expression of the rule guides us, i.e., we are inclined to use this metaphor.

Page 347

Now what is the difference between the proceeding according to a rule (say an algebraic expression) in which one derives number after number according to the series, and the following proceeding: When we shew someone a

certain sign, e.g. , a numeral occurs to him; if he looks at the numeral and the sign, another numeral occurs to him and so on. And each time we engage in this experiment the same series of numerals occurs to him. Is the difference between this proceeding and that of going on according to the rule the psychological one that in the second case we have something occurring to him? Might I not say: When he was following the rule "|- -|", then "| - -|" kept on occurring to him?

Page 347

Well in our own case we surely have intuition, and people say that intuition underlies acting according to a rule.

Page Break 348

Page 348

So let us assume that that, so to speak, magical sign produces the series 123123123 etc.: is the sign *then* not the expression of a rule? No.

Acting according to a rule presupposes the recognition of a *uniformity* and the sign "123123123 etc." was the natural expression of a uniformity.

Page 348

Now perhaps it will be said that | 22 || 22 || 22 | is indeed a uniform sequence of marks but surely

| 2 || 22 || 222 || 2222 |

is not.

Page 348

Well, I might call this another kind of uniformity.

Page 348

45. Suppose however there were a tribe whose people apparently had an understanding of a kind of regularity which I do not grasp. That is they would also have learning and instruction, quite analogous to that in § 42. If one watches them one would say that they follow rules, learn to follow rules. The instruction effects, e.g., agreement in actions on the part of pupil and teacher. But if we look at one of their series of figures we can see no regularity of any kind.

What should we say now? We *might* say: "They appear to be following a rule which escapes us," but also "Here we have a phenomenon of behaviour on the part of human beings, which we don't understand".

Page 348

Instruction in acting according to the rule can be described without employing "and so on".

What can be described in this description is a gesture, a tone of voice, a sign which the teacher uses in a particular way in giving instruction, and which the pupils imitate. The effect of these expressions can also

Page Break 349

be described, again without calling 'and so on' to our aid, i.e. finitely. The effect of "and so on" will be to produce agreement going beyond what is done in the lessons, with the result that we all or nearly all count the same and calculate the same.

It would be possible, though, to imagine the very instruction without any "and so on" in it. But on leaving school the people would still all calculate the same beyond the examples in the instruction they had had.

Suppose one day instruction no longer produced agreement?

Could there be arithmetic without agreement on the part of calculators?

Could there be only one human being that calculated? Could there be only one that followed a rule?

Are these questions like, say, this one: "Can one man alone engage in commerce?"

It only makes sense to say "and so on" when "and so on" is *understood*. I.e., when the other is as capable of going on as I am, i.e., does go on just as I do.

Could two people engage in trade with one another?

46. When I say: "If you follow the rule, this *must* come out," that doesn't mean: it must, because it always has. Rather, that it comes out is one of my *foundations*.

What *must* come out is a foundation of judgment, which I do not touch.

On what occasion will it be said: "If you follow the rule this *must* come out"?

This may be a mathematical definition given in the train of a proof that a particular route branches. It may also be that one says it to someone in order to impress the nature of a rule upon him, in order to tell him something like: "You are *not* making an experiment here".

47. "But at every step I know absolutely what I have to do; what the rule demands of me." The rule, as I conceive it. I don't reason. The picture of the rule makes it clear how the picture of the series is to be continued.

"But I know at every step what I have to do. I see it quite clear before me. It may be boring, but there is no doubt what I have to do."

Whence this certainty? But why do I ask that question? Is it not enough that this certainty exists? What for should I look for a source of it? (And I can indeed give *causes* of it.)

When someone, whom we fear to disobey, orders us to follow the rule... which we understand, we shall write down number after number without any hesitation. And that is a typical kind of reaction to a rule.

"You already know how it is"; "You already know how it goes on."

I can now determine to follow the rule $(- \cdot -) \rightarrow$.

Like this: $-- \cdot - - \cdot - - \cdot - - \cdot -$

But it is remarkable that I don't lose the meaning of the rule as I do it. For how do I hold it fast?

But--how do I know that I do hold it fast, that I do not lose it?! It makes no sense at all to say I have held it fast unless there is such a thing as an outward mark of this. (If I were falling through space I might hold something, but not hold it still.)

Language just is a phenomenon of human life.

48. One person makes a bidding gesture, as if he meant to say "Go!" The other slinks off with a frightened expression. Might I not call this procedure "order and obedience", even if it happened only once?

What is this supposed to mean: "Might I not call the proceeding----"? Against any such naming the objection could naturally be made, that among human beings other than ourselves a quite different

Page Break 352

gesture corresponds to "Go away!" and that perhaps our gesture for this order has among them the significance of our extending the hand in token of friendship. And whatever interpretation one has to give to a gesture depends on other actions, which precede and follow the gesture.

Page 352

As we employ the word "order" and "obey", gestures no less than words are intertwined in a net of multifarious relationships. If I am now construing a simplified case, it is not clear whether I ought still to call the phenomenon "ordering" and "obeying".

Page 352

We come to an alien tribe whose language we do not understand. Under what circumstances shall we say that they have a chief? What will occasion us to say that this man is the chief even if he is more poorly clad than others? The one whom the others obey--is he without question the chief?

What is the difference between inferring wrong and not inferring? between adding wrong and not adding? Consider this.

Page 352

49. What you say seems to amount to this, that logic belongs to the natural history of man. And that is not combinable with the hardness of the logical "must".

Page Break 353

Page 353

But the logical "must" is a component part of the propositions of logic, and these are not propositions of human natural history. If what a proposition of logic said was: Human beings agree with one another in such and such ways (and that would be the form of the natural-historical proposition), then its contradictory would say that there is here a *lack* of agreement. Not, that there is an agreement of another kind.

Page 353

The agreement of humans that is a presupposition of logic is not an agreement in *opinions*, much less in opinions on questions of logic.

Page Break 354

Page Break 355

PART VII

1941 and 1944

Page 355

1. The role of propositions which deal with measures and are not 'empirical propositions'.--Someone tells me: "this stretch is two hundred and forty inches long". I say: "that's twenty foot, so it's roughly seven paces" and now I have got an idea of the length.--The transformation is founded on arithmetical propositions and on the proposition that 12 inches = 1 foot.

Page 355

No one will ordinarily see this last proposition as an empirical proposition. It is said to express a convention. But measuring would entirely lose *its ordinary character* if, for example, putting 12 bits each one inch long end to end didn't ordinarily yield a length which can in its turn be preserved in a special way.

Page 355

Does this mean that I have to say that the proposition '12 inches = 1 foot' asserts all those things which give measuring its present point?

No. The proposition *is grounded in* a technique. And, if you like, also in the physical and psychological facts that make the technique *possible*. But it doesn't follow that its sense is to express these conditions. The opposite of that proposition, 'twelve inches = one foot' does not say that rulers are not rigid enough or that we don't all count and calculate in the same way.

Page 355

2. The proposition has the typical (but that doesn't mean *simple*) role of a rule.

Page Break 356

Page 356

I can use the proposition '12 inches = 1 foot' to make a prediction; namely that twelve inch-long pieces of wood laid end to end will turn out to be of the same length as one piece measured in a different way. Thus the point of that rule is, e.g., that it can be used to make certain predictions. Does it lose the character of a *rule* on that

account?

Page 356

Why can one make those predictions? Well,--all rulers are made alike; they don't alter much in length; nor do pieces of wood cut up into inch lengths; our memory is good enough for us not to take numbers twice in counting up to '12', and not to leave any out; and so on.

Page 356

But then can the rule *not* be replaced by an empirical proposition saying that rulers are made in such and such ways, that people do *this* with them? One might give an ethnological account of this human institution.

Page 356

Now it is evident that this account could take over the function of a rule.

Page 356

If you know a mathematical proposition, that's not to say you yet know anything. If there is confusion in our operations, if everyone calculates differently, and each one differently at different times, then there isn't any calculating yet; if we agree, then we have only set our watches, but not yet measured any time.

If you know a mathematical proposition, that's not to say you yet know *anything*.

I.e., the mathematical proposition is only supposed to supply a framework for a description.

Page Break 357

Page 357

3. How can the mere transformation of an expression be of practical consequence?

Page 357

The fact that I have 25×25 nuts can be verified by my counting 625 nuts, but it can also be discovered in another way which is closer to the form of expression ' 25×25 '. And of course it is in the linking of these two ways *of determining* a number that one point of multiplying lies.

Page 357

A rule *qua* rule is detached, it stands as it were alone in its glory; although what gives it importance is the facts of daily experience.

Page 357

What I have to do is something like describing the office of a king;--in doing which I must never fall into the error of explaining the kingly dignity by the king's usefulness, but I must leave neither his usefulness nor his dignity out of account.

Page 357

I am guided in practical work by the result of transforming an expression.

Page 357

But in that case how can I still say that it means the same thing whether I say "here are 625 nuts", or "here are 25×25 nuts"?

Page Break 358

Page 358

If you verify the proposition "here are 625 ..." then in doing that you are also verifying "here are 25×25 ..."; etc. But the one form is closer to one kind of verification, the other closer to another.

Page 358

How can you say that "... 625 ..." and "... 25×25 ..." say the same thing?--Only through our arithmetic do they *become one*.

Page 358

I can at one time arrive at the one, and at another time at the other kind of description, e.g. by counting. That is to say, I can arrive at either of these forms in either way; but by different routes.

Page 358

It might now be asked: if the proposition "... 625..." was verified at one time in this way and at another time in a different way, then did it mean the same thing both times?

Or: what happens if one method of verification gives '625', but the other not ' 25×25 '?--Is "... 625..." true and "... 25 times 25..." false? No.--To doubt the one means to doubt the other: that is the grammar given to these signs by our arithmetic.

Page 358

If both ways of counting are supposed to justify *giving a number* then giving *one* number, even though in different forms, is all that is *provided for*. On the other hand there is no contradiction in saying: "By one method of counting I get 25×25 (and so 625), by the other not 625 (and so not 25×25)". Arithmetic has no objection to this.

For arithmetic to equate the two expressions is, one might say, a grammatical trick.

In this way arithmetic bars a particular kind of description and conducts description into other channels. (And it goes without saying that this is connected with the facts of experience.)

4. Suppose I have taught somebody to multiply; not, however, by using an explicit general rule, but only by his seeing how I work out examples for him. I can then set him a *new* question and say: "Do the same with *these* two numbers as I did with the previous ones". But I can also say: "If you do with these two what I did with the others, then you will arrive at the number...". What kind of proposition is that?

"You will write such-and-such" is a prediction. 'If you write such-and-such, then you will have done it as I shewed you' determines what he calls "following his example".

'The solution to this problem is...!--If I read this before I have worked out the sum,--what sort of proposition is it?

"If you do with these numbers what I did with the others, you will get..."--that surely means: "The result of this calculation is..."--and that is not a prediction but a mathematical proposition. But it is none the less a prediction too--A prediction of a special kind. Just as someone who at the end finds that he really does get such-and-such when he adds up the column may be really surprised; for example may exclaim: Good Lord, it does come out!

Just think of this procedure of prediction and confirmation as a

special language-game--I mean: isolated from the rest of arithmetic and its application.

What is so singular about this game of prediction? What strikes me as singular would disappear if the prediction ran: "If you believe that you have gone by my example, then you will have produced *this*" or: "If everything seems correct to you, *this* will be the result". This game could be imagined in connexion with the administration of a particular poison and the prediction would be that the injection affects our faculties, our memory for example, in such-and-such a way.--But if we can imagine the game with the administration of a poison, then why not with the administration of a medicine? But even then the weight of the prediction may still always rest on the fact that the *healthy* man sees *this* as the result. Or perhaps: that *this* satisfies the healthy man.

"Do as I do, and this is what you will get" doesn't of course mean: "If you do as I do then you will do as I do"--nor: "Calculate like *this*, and you will calculate like *this*".--But what does "Do as I do" mean? In the language game--it can simply be an order: "Now do as I do!"

What is the difference between these predictions: "If you calculate correctly you will get *this* result"--and: "If you believe you are calculating correctly you will get *this* result"?

Now who says that the prediction in my language-game above does not mean the latter? It seems not to--but what *shews* this? Ask yourself *in what circumstances* the prediction would seem to predict the one thing and in what circumstances the other. For it is clear that it all depends on the rest of the circumstances.

If you predict that I shall get *this*, are you not simply predicting that I shall take this result as correct?--"But"--perhaps you say--"only because it really *is* correct!"--But what does it mean to say: "I take the calculation as correct because it is correct"?

And yet we can say: the person who is calculating in my language-game does not think of it as a peculiarity of *his* nature that he gets *this*; the fact does not appear to him as a psychological one.

I am imagining him as under the impression that he has only followed a thread that is already there, and accepting the How of the following as something that is a matter of course; and only knowing *one* explanation of his action, namely: how the thread runs.

He does just let himself go on when he follows the rule or the examples; however, he does not regard what

he does as a peculiarity of *his* course; he says, not: "so *that's* how I went", but: "so *that's* how it goes".

Page 361

But now, suppose someone did say at the end of the calculation in our language-game: "so *that's* how I went"--or: "so *this* course satisfies me"--can I say he has misunderstood the whole language-game? Certainly not! So long as he does not make some further unwelcome application of it.

Page 361

5. Isn't it the *application* that elicits that conception: that it is not we, but the calculation, that takes a certain course?

Page Break 362

Page 362

The different 'conceptions' must correspond to different applications.

Page 362

For there is indeed a distinction between these two things: being surprised that the figures on the paper seem to behave like *this*; and being surprised that *this* is what comes out as the result. In each case, however, I see the calculation in a different context.

Page 362

I think of the feeling of its 'coming out' when for instance we add up a rather long column of numbers of various patterns, and a round number of 1,000,000 comes out, as we had been told it would before, "Yes, by Jove, another nought--" we say.

Page 362

"One wouldn't guess it from looking at the numbers", I might say.

Page 362

How would it be if we said--instead of ' 6×6 gives 36':--'The number 36's being given by 6×6 '?--Replacing the *proposition* by a substantival expression. (The proof shews *the being given*.)

Page 362

Why do you always want to look at mathematics under the aspect of finding and not of doing?

Page 362

It must have a great influence, that we use the words "right" and "true" and "wrong" and the form of statement, in calculating. (Head-shaking and nodding.)

Page Break 363

Page 363

Why should I say that the knowledge that *this* is the way in which all human beings who have learned to calculate do calculate isn't *mathematical* knowledge? Because it seems to point in the direction of a different context.

Page 363

Then is working out what someone will get out by a calculation already applied mathematics?--and hence also: working out what I myself get out?

Page 363

6. There is no doubt at all that *in certain language-games* mathematical propositions play the part of rules of description, as opposed to descriptive propositions.

Page 363

But that is not to say that this contrast does not shade off in all directions. And *that* in turn is not to say that the contrast is not of the greatest importance.

Page 363

We feel that mathematics stands on a pedestal--this pedestal it has because of a particular role that its propositions play in our language games.

Page 363

What is proved by a mathematical proof is set up as an internal relation and withdrawn from doubt.

Page Break 364

Page 364

7. What is common to a mathematical proposition and a mathematical proof, that they are both called "mathematical"?

Not, that the mathematical proposition has to be proved mathematically; not, that the mathematical proof has to prove a mathematical proposition.

What is mathematical about an unproved proposition (an axiom)? what has it in common with a mathematical *proof*?

Page 364

Should I answer: "The inference rules of mathematical proof are always mathematical propositions"? Or: "Mathematical propositions and proofs are used in inference"? That would be getting closer to the truth.

Page 364

8. Proof must shew an internal relation, not an external one. For we might also imagine a process of transforming a sentence by *experiment*, and a transformation which would be used to predict what would be asserted by the transformed sentence. One might imagine, e.g., signs getting shifted through adding other signs to them, in such fashion that they form a true prediction on the basis of the conditions expressed in their initial position. And if you like, you may regard the calculating human being as an apparatus for such an experiment.

For, that a human being *works out* the result, in the sense that he doesn't write down the result at once, but only after he has written down various other things--doesn't make him any the less a physical-chemical means of producing one sequence of signs from another.

Page Break 365

Page 365

Thus I should have to say: The proved proposition is not: that sequence of signs which the man who has received such-and-such schooling produces under such-and-such conditions.

Page 365

When we think of proving in that way, what we see in it changes entirely. The intermediate steps become an uninteresting by-product. (Like a rattle in the insides of the automatic machine before it discharges its wares for us.)

Page 365

9. We say that a proof is a picture. But this picture stands in need of ratification, and that we give it when we work over it.--

Page 365

True enough; but if it got ratification from one person, but not from another, and they could not *come to any understanding*--would what we had here be calculation?

So it is not the ratification by itself that makes it calculation but the agreement of ratifications.

Page 365

For another game could quite well be imagined, in which people were prompted by expressions (similar perhaps to general rules) to let sequences of signs come to them for particular practical purposes, i.e. *ad hoc*; and that this even proved to pay. And here the 'calculations' if we choose to call them that, do not have to agree with one another. (Here we might speak of 'intuition'.)

Page 365

The agreement of ratifications is the pre-condition of our language-game, it is not affirmed in it.

Page Break 366

Page 366

If a calculation is an experiment and the *conditions are fulfilled*, then we must accept whatever comes, as the result; and if a calculation is an experiment then the proposition that it yields such and such a result is after all the proposition that under such conditions this kind of sign makes its appearance. And if under these conditions one result appears at one time and another at another, we have no right to say "there's something wrong here" or "both calculations cannot be all right", but we should have to say: this calculation does not always yield the same result (*why* need not be known). But although the procedure is now just as interesting, perhaps even more interesting, what we have here now is no longer calculation. And this is of course a grammatical remark about the use of the word "calculation". And this grammar has of course a point.

Page 366

What does it mean to reach an *understanding* about a difference in the result of a calculation? It surely means to arrive at a calculation that is free of discrepancy. And if we can't reach an understanding, then the one cannot say that the other is calculating too, only with different results.

Page 366

10. Now how about this--ought I to say that the same sense can only have *one* proof? Or that when a proof is found the sense alters?

Of course some people would oppose this and say: "Then the proof of a proposition cannot ever be found, for, if it has been found, it is no longer the proof of *this* proposition". But to say this is so far to say nothing at all.--

Page 366

It all depends *what* settles the sense of a proposition, what we choose

Page Break 367

to say settles its sense. The use of the signs must settle it; but what do we count as the use?--

Page 367

That these proofs prove the same proposition means, e.g.: both demonstrate it as a suitable instrument for the same purpose.

Page 367

And the purpose is an allusion to something outside mathematics.

Page 367

I once said: 'If you want to know what a mathematical proposition says, look at what its proof proves'.†1 Now is there not both truth and falsehood in this? For is the sense, the point, of a mathematical proposition really clear as soon as we can follow the proof?

Page 367

What Russell's ' $\sim f(f)$ ' lacks above all is application, and hence meaning.

If we do apply this form, however, that is not to say that ' $f(f)$ ' need be a proposition in any ordinary sense or ' $f(\xi)$ ' a propositional function. For the concept of a proposition, apart from that of a proposition of logic, is only explained in Russell in its general conventional features.

Here one is looking at language without looking at the language-game.

Page 367

When we say of different sequences of configuration that they shew e.g. that $25 \times 25 = 625$, it is easy enough to recognize what fixes the

Page Break 368

place of this proposition, which is reached by the two routes.

Page 368

A new proof gives the proposition a place in a new system; here there is often a translation of one kind of operation into a quite different kind. As when we translate equations into curves. And then we realize something about curves and, by means of that, about equations. But what right have we to be convinced by lines of thought which are apparently quite remote from the object of our thought?

Well, our operations are not more remote from that object than is, say, dividing in the decimal system from sharing out nuts. Especially if one imagines (what is quite easy to imagine) that operation as originally invented for a different purpose from that of making divisions and the like.

Page 368

If you ask: "What right have we?" the answer is: perhaps none.--What right have you to say that the development of this system will always run parallel with that one? (It is as if you were to fix *both* inch and foot as units, and assert that $12n$ inches will always be the same length as n feet.)

Page 368

When two proofs prove the same proposition it is possible to imagine circumstances in which the whole surrounding connecting these proofs fell away, so that they stood naked and alone, and there were no cause to say that they had a common point, proved the same proposition.

One has only to imagine the proofs without the organism of applications which envelopes and connects the two of them: as it were stark naked. (Like two bones separated from the surrounding manifold

Page Break 369

context of the organism; in which alone we are accustomed to think of them.)

Page 369

11. Suppose that people calculated with numbers, and sometimes did divisions by expressions of the form ($n - n$), and in this way occasionally got results different from the normal results of multiplying etc. But that nobody minded this.--Compare with this: lists, rolls, of people are prepared, but not alphabetically as we do it; and in this way it happens that in some lists the same name appears more than once.--But now it can be supposed that this does not strike anyone; or that people see it, but accept it without worrying. As we could imagine people of a tribe who, when they dropped coins on the ground, did not think it worth while to pick them up. (They have, say, an idiom for these occasions: "It belongs to the others" or the like.)

Page 369

But now times have changed and people (at first only a few) begin to demand exactness. Rightly,

wrongly?--Were the earlier lists *not* really lists?--

Page 369

Say we quite often arrived at the results of our calculations through a hidden contradiction. Does that make them illegitimate?--But suppose that we now absolutely refuse to accept such results, but still are afraid that some might slip through.--Well then, in that case we have an idea which might serve as a model for a new calculus. As one can have the idea of a new game.

Page Break 370

Page 370

The Russellian contradiction is disquieting, not because it is a contradiction, but because the whole growth culminating in it is a cancerous growth, seeming to have grown out of the normal body aimlessly and senselessly.

Page 370

Now can we say: "We want a calculus which more certainly tells us the truth"?

Page 370

But you can't allow a contradiction to stand!--Why not? We do sometimes use this form in our talk, of course not often--but one could imagine a technique of language in which it was a regular instrument.

It might for example be said of an object in motion that it existed and did not exist in this place; change might be expressed by means of contradiction.

Page 370

Take a theme like that of Haydn's (St. Antony Chorale), take the part of one of Brahms's variations corresponding to the first part of the theme, and set the task of constructing the second part of the variation in the style of its first part. That is a problem of the same kind as mathematical problems are. If the solution is found, say as Brahms gives it, then one has no doubt;--that is the solution.

Page 370

We are agreed on this route. And yet, it is obvious here that there may easily be different routes, on each of which we can be in agreement, each of which we might call consistent.

Page Break 371

Page 371

'We take a number of steps, all legitimate--i.e. allowed by the rules--and suddenly a contradiction results. So the list of rules, as it is, is of no use, for the contradiction wrecks the whole game!' Why do you have it wreck the game?

But what I want is that one should be able to go on inferring *mechanically* according to the rule without reaching any contradictory results. Now, what kind of provision do you want? One that your present calculus does not allow? Well, that does not make that calculus a bad piece of mathematics,--or not mathematics in the fullest sense. The meaning of the word "mechanical" misleads you.

Page 371

12. When, for some practical purpose, you want to avoid a contradiction mechanically, as your calculus so far cannot do, this is e.g. like looking for a construction of the ...-gon, which you have up to now only been able to draw by trial and error; or for a solution of a third degree equation, to which you have so far only approximated.

Page 371

What is done here is not to improve bad mathematics, but to create a new bit of mathematics.

Suppose I wanted to determine that the pattern '777' did not occur in the expansion of an irrational number. I might take π and settle that if that pattern occurs, we replace it by '000'. Now I am told: that is not enough, for whoever is calculating the places is prevented from looking back to the earlier ones. Now I need another calculus; one in which I can be assured in advance that it cannot yield '777'. A mathematical problem.

Page Break 372

Page 372

'So long as freedom from contradiction has not been proved I can never be quite certain that someone who calculates without thinking, but according to the rules, won't work out something wrong.' Thus so long as this provision has not been obtained the calculus is untrustworthy.--But suppose that I were to ask: "*How* untrustworthy?"--If we spoke of degrees of untrustworthiness mightn't this help us to take the metaphysical sting out of it?

Were the first rules of the calculus not good? Well, we gave them only *because* they were good.--If a contradiction results later,--have they *failed* in their office? No, they were not given for this application.

Page 372

I may want to supply my calculus with a particular kind of provision. This does not make it into a *proper* piece of mathematics, but e.g. into one that is more useful for a certain purpose.

Page 372

The idea of the mechanization of mathematics. The fashion of the axiomatic system.

Page 372

13. But suppose the 'axioms' and 'methods of inference' are not just some kind of construction, but are absolutely convincing. Well, this means that there are cases in which a construction out of these elements is *not* convincing.

And the logical axioms are in fact not at all convincing if for the propositional variables we substitute structures which no one originally foresaw as possible values, when, that is, we began by acknowledging the truth of the axioms absolutely.

Page Break 373

Page 373

But what about saying: the axioms and methods of inference surely ought to be so chosen that they cannot prove any false proposition?

Page 373

'We want, not just a fairly trustworthy, but an *absolutely* trustworthy calculus. Mathematics must be *absolute*.'

Page 373

Suppose I had erected rules for a game of 'hare and hounds'--fancying it to be a nice amusing game.--Later, however, I find that the hounds can always win once one knows how.

Now, let's say, I am dissatisfied with my game. The rules which I gave brought forth a result which I did not foresee and which spoils the game for me.

Page 373

14. "N. came upon the fact that in their calculations people had often reduced by expressions of the form ' $n - n$ '. He pointed out the consequent discrepancy of results and shewed how this way of calculating had led to the loss of human life."

Page 373

But let us suppose that other people too had noticed these contradictions, only they had not been able to give any account of their source. They calculated as it were with a bad conscience. They had chosen *one* among contradictory results but with uncertainty, whereas N's discovery would have made them quite certain.--But did they tell themselves: "There's something wrong with our calculus"? Was their uncertainty of the same kind as ours when we do a physical calculation

Page Break 374

but are not certain whether these formulae really give the correct result here? Or was it a doubt whether their calculating was really calculating? In this case: what did they do to get over the difficulty?

Page 374

So far these people have only rarely made use of reduction by expressions of values. But some time somebody discovers that they can actually arrive at any arbitrary result in this way.--What do they do now? Well, we could imagine very different things. They may now, e.g., state that this kind of calculation has lost its point, and that in future people are not to calculate in *this* way any more.

Page 374

'He believes that he is calculating'--one would like to say--'but as a matter of fact he is not calculating.'

Page 374

15. If the calculation lost its point for me as soon as I knew I could work out any arbitrary result--did it have none so long as I did *not* know that?

Page 374

I may of course now declare all these calculations to be null--for I have given up doing them now--but does that mean that they weren't calculations?

Page 374

I at one time inferred *via* a contradiction without realizing it. Is my result then wrong, or at any rate wrongly got?

Page Break 375

Page 375

If the contradiction is so well hidden that no one notices it, why shouldn't we call what we do now proper calculation?

Page 375

We say that the contradiction would *destroy* the calculus. But suppose it only occurred in tiny doses in lightning flashes as it were, not as a constant instrument of calculation, would it nullify the calculus?

Page 375

Imagine people had fancied that $(a + b)^2$ must be equal to $a^2 + b^2$. (Is this a fancy of the same kind as that there must be a trisection of the angle by ruler and compass?) Is it possible, then, to fancy that two ways of calculating had to yield the same result, if it is not the same?

Page 375

I add up a column, doing it in a variety of ways (e.g. I take the numbers in a different order), and I keep on getting random different results.--I shall perhaps say: "I am in a complete muddle, either I am making random mistakes in calculating, or I am making certain mistakes in particular connexions: e.g. always saying '7 + 7 = 15' after '6 + 3 = 9'."

Or I might imagine that suddenly, once in the sum, I subtract instead of adding, but don't think I am doing anything different.

Page 375

Now it might be that I didn't find the mistake and thought I had lost my wits. But this would not have to be my reaction.

Page Break 376

Page 376

'Contradiction destroys the calculus'--what gives it this special position? With a little imagination, I believe, it can certainly be shaken.

Page 376

To resolve these philosophical problems one has to compare things which it has never seriously occurred to anyone to compare.

Page 376

In this field one can ask all sorts of things which, while they belong to the topic, still do not lead through its centre.

A particular series of questions leads through the centre and out into the open. The rest get answered incidentally.

It is enormously difficult to find the path through the centre.

Page 376

It goes *via new* examples and comparisons. The hackneyed ones don't shew us it.

Page 376

Let us suppose that the Russellian contradiction had never been found. Now--is it quite clear that in that case we should have possessed a false calculus? For aren't there various possibilities here?

Page 376

And suppose the contradiction had been discovered but we were not excited about it, and had settled e.g. that no conclusions were to be drawn from it. (As no one does draw conclusions from the 'Liar'.) Would this have been an obvious mistake?

Page Break 377

Page 377

"But in that case it isn't a proper calculus! It loses all *strictness*!" Well, not *all*. And it is only lacking in full strictness, if one has a particular ideal of rigour, wants a particular style in mathematics.

'But a contradiction in mathematics is incompatible with its application.

Page 377

'If it is consistently applied, i.e. applied to produce arbitrary results, it makes the application of mathematics into a farce, or some kind of superfluous ceremony. Its effect is e.g. that of non-rigid rulers which permit various results of measuring by being expanded and contracted.' But was measuring by pacing not measuring at all? And if people worked with rulers made of dough, would that of itself have to be called wrong?

Page 377

Couldn't reasons be easily imagined, on account of which a certain elasticity in rulers might be desirable?

Page 377

"But isn't it right to manufacture rulers out of ever harder, more unalterable material?" Certainly it is right; if

that is what one wants!

Page 377

'Then are you in favour of contradiction?' Not at all; any more than of soft rulers.

Page 377

There is *one* mistake to avoid: one thinks that a contradiction *must* be senseless: that is to say, if e.g. we use the signs ' p ', ' \sim ', ' $'$ ' consistently,

Page Break 378

then ' $p.\sim p$ ' cannot say anything.--But think: what does it mean to continue such and such a use 'consistently'? ('A consistent continuation of this bit of a curve.')

Page 378

16. What does mathematics need a foundation for? It no more needs one, I believe, than propositions about physical objects--or about sense impressions, need an *analysis*. What mathematical propositions do stand in need of is a clarification of their grammar, just as do those other propositions.

Page 378

The *mathematical* problems of what is called foundations are no more the foundation of mathematics for us than the painted rock is the support of a painted tower.

Page 378

'But didn't the contradiction make Frege's logic useless for giving a foundation to arithmetic?' Yes, it did. But then, who said that it had to be useful for this purpose?

Page 378

One could even imagine a savage's having been given Frege's logic as an instrument with which to derive arithmetical propositions. He derived the contradiction unawares, and now he derives arbitrary true and false propositions from it.

Page 378

'Up to now a good angel has preserved us from going *this* way.' Well, what more do you want? One might say, I believe: a good angel will always be necessary, whatever you do.

Page Break 379

Page 379

17. One says that calculation is an experiment, in order to shew how it is that it can be so practical. For we do know that an experiment really does have practical value. Only one forgets that it possesses this value in virtue of a technique which is a fact of natural history, but whose rules do not play the part of propositions of natural history.

Page 379

"The limits of empiricism." †1--(Do we live because it is practical to live? Do we think because thinking is practical?)

Page 379

He knows that an experiment is practical; and so calculation is an experiment.

Page 379

Our experimental activities have indeed a characteristic physiognomy. If I see somebody in a laboratory pouring a liquid into a test tube and heating it over a Bunsen burner, I am inclined to say he is making an experiment.

Page 379

Let us suppose that people, who know how to count, want--just as we do--to know numbers for practical purposes of various kinds. And to this end they ask certain people who, having had the practical problem explained to them, shut their eyes, and let the appropriate number occur to them--here there wouldn't be any calculation, however trustworthy the numbers given might be. This way of determining numbers might be even more trustworthy in practice than any calculation.

Page Break 380

Page 380

A calculation--it might be said--is perhaps a part of the technique of an experiment, but is by itself not an experiment.

Page 380

Do we forget that a particular *application* is part of a procedure's being an experiment? And the calculation is an instrument of the application.

For would anyone *think* of calling the translation of a cipher by means of a key an experiment?

When I doubt whether n and m multiplied yield l , my doubt isn't about whether our calculating is going to fall into confusion, and e.g. half of mankind say one thing is right and the other half another.

An action is an 'experiment' only as seen from a certain point of view. And it is *obvious* that the action of calculating can also be an experiment.

I may for example want to test what this man calculates, in such-and-such circumstances, when set this question.--But isn't that exactly what you are asking when you want to know what 52×63 is? I may very well ask that--my question may even be expressed in these words. (Compare: is the sentence "Listen, she's groaning!" a proposition about her behaviour or about her suffering?)

But suppose I *work over* his calculation?--'Well, then I am making a further experiment so as to find out with complete certainty that all normal human beings react like that.'--And if they do *not* react uniformly--which one is the mathematical result?

18. "If calculation is to be practical, then it must uncover facts. And only experiment can do that."

But what things are 'facts'? Do you believe that you can shew what fact is meant by, e.g., pointing to it with your finger? Does that of itself clarify the part played by 'establishing' a fact?--Suppose it takes mathematics to define the *character* of what you are calling a 'fact'!

It is interesting to know *how many* vibrations this note has! But it took arithmetic to teach you this question. It taught you to see this kind of fact.

Mathematics--I want to say--teaches you, not just the answer to a question, but a whole language-game with questions and answers.

Are we to say that *mathematics* teaches us to count?

Can mathematics be said to teach us experimental *methods of investigation*? Or to help us to discover such methods of investigation?

'To be practical, mathematics must tell us facts.'--But do these facts have to be the *mathematical* facts?--But why should not mathematics, instead of 'teaching us facts', create the forms of what we call facts?

"Yes but surely it remains an empirical fact that men calculate like this!"--Yes, but that does not make the propositions used in calculating into empirical propositions.

"Yes, but surely our calculating must be founded on empirical facts!" Certainly. But what empirical facts are you now thinking of? The psychological and physiological ones that make it possible, or those that make it a useful activity? The connexion with *the latter* consists in the fact that the calculation is the picture of an experiment as it practically always turns out. From the former it gets its point, its physiognomy; but that is certainly not to say that the propositions of mathematics have the functions of empirical propositions. (That would almost be as if someone were to believe that because only the actors appear in the play, no other people could usefully be employed upon the stage of the theatre.)

There are no causal connexions in a calculation, only the connexions of the pattern. And it makes no difference to this that we work over the proof in order to accept it. That we are therefore tempted to say that it arose as the result of a psychological experiment. For the psychical course of events is not psychologically investigated when we calculate.

'There are 60 seconds to a minute.' This proposition is very *like* a mathematical one. Does its truth depend on experience?--Well, could we talk about minutes and hours, if we had no sense of time; if there were no clocks, or could be none for physical reasons; if there did not exist all the connexions that give our measures of time meaning and importance? In that case--we should say--the measure of time would have lost its meaning (like the action of

delivering check-mate if the game of chess were to disappear)--or it would have some quite different meaning. But suppose our experience were like that--then would experience make the proposition false; and the contrary experience make it true? No; *that* would not describe its function. It functions quite differently.

Page Break 383

Page 383

'Calculating, if it is to be practical, must be grounded in empirical facts.'--Why should it not rather determine what empirical facts *are*?

Page 383

Consider: 'Our mathematics turns experiments into definitions'.

Page 383

19. But can't we imagine a human society in which calculating quite in our sense does not exist, any more than measuring quite in our sense?--Yes.--But then why do I want to take the trouble to work out what mathematics is?

Because we have a mathematics, and a special conception of it, as it were an ideal of its position and function,--and this needs to be clearly worked out.

Page 383

Don't demand too much, and don't be afraid that your just demand will dwindle into nothing.

Page 383

It is my task, not to attack Russell's logic from within, but from without.

Page 383

That is to say: not to attack it mathematically--otherwise I should be doing mathematics--but its position, its office.

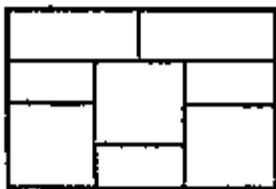

Page 383

My task is, not to talk about (e.g.) Gödel's proof, but to by-pass it.

Page Break 384

Page 384

20. The problem: find the number of ways in which we can trace the joins in this wall:

continuously and without repetition, will be recognized by everyone as a *mathematical* problem.--If the drawing were much bigger and more complicated, and could not be taken in at a glance, it could be supposed to change without our noticing; and then the problem of finding that number (which perhaps changes according to some law) would no longer be a mathematical one. But even if it does not change, the problem is, in this case, still not mathematical.--But even when the wall can be taken in at a glance, that cannot be said to make the question mathematical, as when we say: *this* question is now a question in embryology. Rather: *here* we need a mathematical solution. (Like: here what we need is a *model*.)

Page 384

Did we 'recognize' the problem as a mathematical one because mathematics treats of making tracings from drawings?

Page 384

Why, then, are we inclined to call this problem straight away a 'mathematical' one? Because we see at once that here the answer to a *mathematical* question is *practically* all we need. Although the problem could easily be seen as, for example, a psychological one.

Similarly with the task of folding a piece of paper in such-and-such a way.

Page Break 385

Page 385

It may look as if mathematics were here a science that makes experiments with *units*; experiments, that is, in which it does not matter what kind of units they are, whether for instance they are peas, glass marbles, strokes and so on.--Mathematics discovers only what holds for *all* these things. And so it does not discover anything about e.g. their melting point, but that 2 and 2 of them are 4. And the first problem of the wall is a mathematical one, i.e. can be

solved by means of *this* kind of experiment.--And what does the mathematical experiment consist in? Well, in setting things out and moving them about, in drawing lines, writing down expressions, propositions, etc. And we must not be disturbed by the fact that the outward appearance of these experiments is not that of physical or chemical experiments, etc.; they just are of a different kind. Only there is a difficulty here: the procedure is easy enough to see, to describe,--but *how* is it to be looked at as an experiment? What is the head and what the tail of the experiment here? What are the conditions of the experiment, what its result? Is the result what is yielded by the calculation; or the pattern of calculation; or the assent (whatever that consists in) of the person doing the calculation?

Page 385

But does it make the principles of dynamics, say, into propositions of pure mathematics if we leave their interpretation open, and then use them to produce a system of measurement?

Page 385

'A mathematical proof must be perspicuous'--this is connected with the perspicuousness of that figure.

Page 385

21. Do not forget that the proposition asserting of itself that it is unprovable is to be conceived as a *mathematical* assertion--for that is not *a matter of course*.

It is not a matter of course that the proposition that such-and-such

Page Break 386

a structure cannot be constructed is to be conceived as a mathematical proposition.

Page 386

That is to say: when we said: "it asserts of itself"--this has to be understood in a special way. For here it is easy for confusion to occur through the variegated use of the expression "this proposition asserts something of...".

Page 386

In this sense the proposition ' $625 = 25 \times 25$ ' also asserts something about itself: namely that the left-hand number is got by the multiplication of the numbers on the right.

Page 386

Gödel's proposition, which asserts something about itself, does not *mention* itself.

Page 386

'The proposition says that this number cannot be got from these numbers in this way.'--But are you also certain that you have translated it correctly into English? Certainly it looks as if you had.--But isn't it possible to go wrong here?

Page 386

Could it be said: Gödel says that one must also be able to trust a mathematical proof when one wants to conceive it practically, as the proof that the propositional pattern can be constructed according to the rules of proof?

Or: a mathematical proposition must be capable of being conceived as a proposition of a geometry which is actually applicable to itself. And if one does this it comes out that in certain cases it is not possible to rely on a proof.

Page Break 387

Page 387

The limits of empiricism†1 are not assumptions unguaranteed, or intuitively known to be correct: they are ways in which we make comparisons and in which we act.

Page 387

22. 'Let us assume that we have an arithmetical proposition saying that a particular number... cannot be obtained from the numbers ..., ..., ..., by means of such and such operations. And let us assume that a rule of translation can be given according to which this arithmetical proposition is translatable into the figures of the first number--the axioms from which we are trying to prove it, into the figures of the other numbers--and our rules of inference into the operations mentioned in the proposition.--If we had then derived *the arithmetical proposition* from the axioms according to our rules of inference, then *by this means* we should have demonstrated its derivability, but we should also have proved a proposition which, by that translation rule, can be expressed: this arithmetical proposition (namely ours) is not derivable.'

What would have to be done here? I am supposing that we trust our *construction* of the *propositional sign*; i.e. we trust the *geometrical* proof. So we say that this 'propositional pattern' can be obtained from those in such and such ways. And, merely translated into another notation, this means: this number can be got from those by means of these operations. So far the proposition and its proof have nothing to do with any special *logic*. Here the constructed proposition was simply another way of writing the constructed number; it had the *form* of a proposition but we don't compare it with other propositions as a sign *saying* this or that, making *sense*.

Page 387

But it must of course be said that that sign need not be regarded either as a propositional sign or as a number sign.--Ask yourself: what makes it into the one, and what into the other?

Page Break 388

Page 388

If we now read the constructed proposition (or the figures) as a proposition of mathematical language (in English, say) then it says the opposite of what we regard as proved. Thus we have demonstrated the falsity of the real sense of the proposition and at the same time *proved* it--if, that is, we look on its construction from the admitted axioms by means of the admitted rules of inference as a proof.

Page 388

If someone objects to us that we couldn't make such *assumptions*, for they would be *logical* or *mathematical* assumptions, then we reply that we need only assume that someone has made a mistake in calculating and so has reached the result we 'assume', and that for the time being he cannot find the mistake.

Page 388

Here once more we come back to the expression "the proof convinces us". And what interests us about conviction here is neither its expression by voice or gesture, nor yet the feeling of satisfaction or anything of that kind; but its ratification in the use of what is proved.

Page 388

It might justly be asked what importance Gödel's proof has for our work. For a piece of mathematics cannot solve problems of the sort that trouble *us*.--The answer is that the *situation*, into which such a proof brings us, is of interest to us. 'What are we to say now?'--That is our theme.

Page 388

However queer it sounds, my task as far as concerns Gödel's proof seems merely to consist in making clear what such a proposition as:

Page Break 389

Page 389

"Suppose this could be proved" means in mathematics.

Page 389

23. We take it much too much for granted that we ask "How many?" and thereupon count and calculate.

Page 389

Do we count because it is practical to count? We count!--And in the same way we calculate.

Page 389

An experiment--or whatever one likes to call it--can be what we go on, sometimes in determining the measurement of the thing measured, and sometimes even in determining the appropriate measure.

Page 389

Then is the unit of measurement in this way the result of measurements? Yes and no. Not the result reached in measuring but perhaps the *consequence* of measurements.

Page 389

"Has experience taught us to calculate in *this* way?" would be one question and: "Is calculation an experiment?" another.

Page 389

24. But isn't it possible to derive anything from anything according to some rule or other--nay, according to *any* rule with a suitable interpretation? What does it mean for me to say, for example: this number can be got from that pair of numbers by multiplying? Ask yourself: When does one use this proposition? Well, it isn't, e.g., a psychological proposition saying what humans will do under certain conditions;

Page Break 390

what will satisfy them; nor is it a physical proposition concerning the behaviour of marks on paper. That is, it will be applied in a surrounding other than a psychological or physical one.

Page 390

Assume that human beings learn to calculate, roughly as they in fact do; but now imagine different 'surroundings' which turn the calculating, now into a psychological experiment, now into a physical experiment with the marks used in calculating, now into something else!

We assume that children learn counting and the simple kinds of sum by means of imitation, encouragement and correction. But now, from a certain point of view, the nonagreement of the one who is doing the sums (i.e., the

mistakes) get treated, not as something bad, but as something psychologically interesting. "So you took that for correct then, did you? The rest of us did it like *this*."

Page 390

I want to say that what we call mathematics, the *mathematical* conception of the proposition $13 \times 14 = 182$, hangs together with the special position that we assign to the activity of calculating. Or, the special position that the calculation... has in our life, in the rest of our activities. The language-game in which it is found.

Page 390

One may learn a piece of music by heart in order to be able to play it correctly; but also as part of a psychological experiment, in order to investigate the working of musical memory. But one might also impress it on one's memory in order thereby to judge some alterations in the score.

Page Break 391

Page 391

25. A language-game: I am doing multiplication and I say to the other: if you calculate right you will get such-and-such a result; whereupon he carries out the calculation and is pleased at the correctness, and sometimes the incorrectness, of my prediction. What does this language-game presuppose? That 'mistakes in calculating' are easy to discover, and that agreement about the rightness or wrongness of the calculation is always quickly achieved.

Page 391

"If you agree with each step, you will arrive at this result."

Page 391

What is the criterion for a step in the calculation's being right; isn't it that the step seems right to me, and other things of the same sort?

What is the criterion for my working out the same figure twice? Isn't it things like the figures' *appearing* to me to be the same?

Page 391

What is the criterion for my having followed the paradigm here?

Page 391

"If you say that each step is correct, this is what will come out."

Page 391

The prediction really is: where you hold what you do to be right, *this* is what you will do.

Where you hold each step to be right, you will go this way.--And so you will reach this end.

Page Break 392

Page 392

A *logical* conclusion is being drawn, when no experience can contradict the conclusion without contradicting the premises. I.e., when the inference is only a movement within the means of representation.

Page 392

26. In some language-game sentences are used; reports, orders and so on. And now the people also employ calculating propositions. They say them to themselves perhaps, in between the orders and the reports.

Page 392

A language-game, in which someone calculates according to a rule and places the blocks of a building according to the results of the calculation. He has learnt to operate with written signs according to rules.--Once you have described the procedure of this teaching and learning, you have said everything that can be said about acting correctly according to a rule. We can go no further. It is no use, for example, to go back to the concept of agreement, because it is no more certain that one proceeding is in agreement with another, than that it has happened in accordance with a rule. Admittedly going according to a rule is also founded on an agreement.

Page 392

To repeat, what the correct following of a rule consists in cannot be described *more closely* than by describing the *learning* of 'proceeding according to the rule.' And this description is an everyday one, like that of cooking and sewing, for example. It presupposes as much as these. It distinguishes one thing from another, and so it informs a human being who is ignorant of something particular. (Cf. the remark: Philosophy doesn't use a preparatory language, etc.)

Page Break 393

Page 393

For if you give me a description of how people are trained in following a rule and how they react correctly to the training, you will yourself employ the expression of a rule in the description and will presuppose that I

understand it.

Page 393

We have, then, taught someone the technique of multiplying. So we employ expressions of acquiescence and rejection. We shall also sometimes write down the goal of the multiplication: "You must get this, if it is to be right," we may say to him.

Page 393

But now, can the pupil contradict and say: "How do you know that? And what do you want?--Do you want me to follow the rule, or to get this result? For there's no need for the two to coincide." Well, we do not assume that the pupil can say that; we assume that he accepts the rule as valid when approached from either side. That he conceives both the individual step *and* the multiplication-pattern--and therefore the result of the multiplication--as criteria of correctness, and if these are not in accord with one another, he believes there is some confusion of his senses.

Page 393

27. Now is it imaginable for someone to follow the rule right and nevertheless to work out different results at different times in multiplying 15×13 ? It all depends on what criteria one allows to count for correct following of the rule. In mathematics the result itself is also a criterion for correct calculation. Here then it is unthinkable that one should follow the rule right and should produce different patterns of multiplication.

Page Break 394

Page 394

Not letting a contradiction stand is something that characterises the technique of our employment of our truth-functions. If we do let the contradiction stand in our language-games, we alter that technique--as, if we departed from regarding a double negative as an affirmative. And this alteration would be significant, because the technique of our logic is connected in its character with the conception of the truth-functions.

Page 394

"The rules compel me to..."--this can be said if only for the reason that it is not all a matter of my own will what seems to me to agree with the rule. And that is why it can even happen that I memorize the rules of a board-game and subsequently find out that in this game whoever starts *must* win. And it is something like this, when I discover that the rules lead to a contradiction.

Page 394

I am now compelled to acknowledge that this is not a proper game.

Page 394

'The rules of multiplication, once adopted, compel me to acknowledge that $\dots \times \dots = \dots$.' Suppose it were disagreeable for me to acknowledge this proposition. Am I to say: "Well, this arises from that type of training. Human beings who are so trained, so conditioned, then get into this kind of difficulty"?

Page 394

'How does one count in the decimal system?'--"We write 2 after 1, 3 after 2, ... 14 after 13 ... 124 after 123 *and so on*."--That is an explanation for someone who, while there is indeed something he doesn't know, does understand 'and so on'. And understanding it

Page Break 395

means not understanding it as an abbreviation: it does *not* mean that he now sees a much longer series in his mind than that of my examples. That he understands it comes out in his now making certain applications, in his saying *this* and acting *so* in particular cases.

Page 395

"How do we count in the decimal system?"-- --Now is that not an answer?--But it isn't one for someone who did not understand the 'and so on'.--But may our explanation not have made it intelligible to him? May he not, through it, have got hold of the idea of the rule?--Ask yourself what are the criteria for his having got hold of the idea now.

Page 395

What is it that compels me?--the expression of the rule?--Yes, once I have been educated in this way. But can I say it compels me to follow it? Yes: if here one thinks of the rule, not as a line that I trace, but rather as a spell that holds us in thrall.

((("plain nonsense, and bumps...")))

Page 395

28. Why shouldn't it be said that such a contradiction as: 'heterological' \in heterological $\equiv \sim$ ('heterological' \in

heterological), shews a logical property of the concept 'heterological'?

Page 395

"'Two-syllabled' is heterological", or "'Four-syllabled' is not heterological" are empirical propositions. It might be important in some contexts to find out whether adjectives possess the properties they stand for or not. The word "heterological" would in that case

Page Break 396

be used in a language-game. But now, is the proposition "' $h \in h$ " supposed to be an empirical proposition? It obviously is not one, nor should we admit it as a proposition in our language-game even if we had not discovered the contradiction.

Page 396

' $h \in h \equiv \sim (h \in h)$ ' might be called 'a true contradiction'.--But this contradiction is not a significant proposition! Agreed, but the tautologies of logic aren't either.

Page 396

"The contradiction is true" means: it is proved; derived from the rules for the word " h ". Its employment is, to shew that " h " is one of those words which do not yield a proposition when inserted into ' $\xi \in h$ '.

Page 396

"The contradiction is true" means: this really is a contradiction, and so you cannot use the word " h " as an argument in ' $\xi \in h$ '.

Page 396

29. I am defining a game and I say: "If you move like this, then I move like *this*, and if you do that, then I do *this*.--Now play." And now he makes a move, or something that I have to accept as a move and when I want to reply according to my rules, whatever I do proves to conflict with the rules. How can this have come about? When I set the rules up, I *said* something: I was following a certain use. I did not foresee what we should go on to do, or I saw only a particular possibility. It was just as if I had said to somebody: "Give up the game; you can't mate with these pieces" and had overlooked an existing possibility of mating.

Page Break 397

The various half joking guises of logical paradox are only of interest in so far as they remind anyone of the fact that a serious form of the paradox is indispensable if we are to understand its function properly. The question is: what part can such a logical mistake play in a language-game?

Page 397

You may instruct someone what to do in such-and-such a case; and these instructions later prove *nonsensical*.

Page 397

30. Logical inference is part of a language-game. And someone who carries out logical inferences in the language-game follows certain instructions which were given him in the actual learning of the language-game. If, say, a builder's mate is building a house in accordance with certain orders, he has to interrupt his cartage of materials etc. from time to time and carry out certain operations with signs on paper; and then he takes up his work again in conformity with the result.

Page 397

Imagine a procedure in which someone who is pushing a wheelbarrow comes to realize that he must clean the axle of the wheel when the wheelbarrow gets too difficult to push. I don't mean that he says to himself. "Whenever the wheelbarrow can't be pushed...", but he simply *acts* in this way. And he happens to shout to someone else: "The wheelbarrow won't push; clean the axle", or again: "The wheelbarrow won't push. So the axle needs cleaning." Now this is an inference. Not a logical one, of course.

Page Break 398

Page 398

Can I now say: "Non-logical inference can prove wrong; but logical inference not"?

Page 398

Is logical inference correct when it has been made according to rules; or when it is made according to *correct* rules? Would it be wrong, for example, if it were said that p should always be inferred from $\sim p$? But why should one not rather say: such a rule would not give the signs ' $\sim p$ ' and ' p ' their usual meaning?

Page 398

We can conceive the rules of inference--I want to say--as giving the signs their meaning, because they are

rules for the use of these signs. So that the rules of inference are involved in the determination of the meaning of the signs. In this sense rules of inference cannot be right or wrong.

Page 398

In the course of building A has measured the length and breadth of an area and gives B the order: "bring 15×18 slabs". B is trained to multiply and to count out a number of slabs in conformity with the result.†1

Page 398

The sentence ' $15 \times 18 = 270$ ' need of course never be uttered.

Page 398

It might be said: experiment--calculation are poles between which human activities move.

Page 398

31. We condition a man in such-and-such ways; then bring a question to bear on him; and get a number-sign. We go on to use

Page Break 399

this for our purposes and it proves practical. That is calculating.--No, it isn't enough! It might be an eminently *sensible* procedure--but need not be what we call 'calculating'. As one could imagine sounds being emitted for purposes now served by language, which sounds yet did not form a language.

It is essential to calculating that everyone who calculates right produces the same pattern of calculation. And 'calculating right' does not mean calculating with a clear understanding or smoothly; it means calculating *like this*.

Page 399

Every mathematical proof gives the mathematical edifice a new leg to stand on. (I was thinking of the legs of a table.)

Page 399

32. I have asked myself: if mathematics has a purely fanciful application, isn't it still mathematics?--But the question arises: don't we call it 'mathematics' only because e.g. there are transitions, bridges from the fanciful to non-fanciful applications? That is to say: should we say that people possessed a mathematics if they used calculating, operating with signs, *merely* for occult purposes?

Page 399

33. But in that case isn't it incorrect to say: the *essential* thing about mathematics is that it forms concepts?--For mathematics is after all an anthropological phenomenon. Thus we can recognize it as the essential thing about a great part of mathematics (of what is called 'mathematics') and yet say that it plays no part in other regions. This insight by itself will of course have some influence on people once they learn to see mathematics in this way. Mathematics is, then, a family; but that is not to say that we shall not mind what is incorporated into it.

Page Break 400

Page 400

We might say: if you did not understand *any* mathematical proposition better than you understand the Multiplicative Axiom,†1 then you would *not* understand mathematics.

Page 400

34. --There is a contradiction here. But we don't see it and we draw conclusions from it. E.g. we infer mathematical propositions; and wrong ones. But we accept these inferences.--And now if a bridge collapses, which we built on the basis of these calculations, we find some other cause for it, or we call it an Act of God. Now was our calculation wrong; or was it not a calculation?

Certainly, if we are explorers observing the people who do this we shall perhaps say: these people don't calculate at all. Or: there is an element of arbitrariness in their calculations, which distinguishes the nature of their mathematics from ours. And yet we should not be able to deny that these people have a mathematics.

Page 400

What kind of rules must the king†2 give so as to escape henceforward from the awkward position, which his prisoner has put him in?--What sort of problem is this?--It is surely like the following one: how must I change the rules of this game, so that such-and-such a situation cannot occur? And that is a mathematical problem.

Page 400

But can it be a mathematical problem to make mathematics into mathematics?

Page 400

Can one say: "After this mathematical problem was solved, human beings began really to calculate"?

35. What sort of certainty is it that is based on the fact that in general there *won't* actually be a run on the banks by all their customers; though they would break if it did happen?! Well, it is a *different* kind of certainty from the more primitive one, but it is a kind of certainty all the same.

I mean: if a contradiction were now actually found in arithmetic--that would only prove that an arithmetic with *such* a contradiction in it could render very good service; and it will be better for us to modify our concept of the certainty required, than to say that it would really not yet have been a proper arithmetic.

"But surely this isn't ideal certainty!"--Ideal for what purpose?

The rules of logical inference are rules of the *language-game*.

36. What *sort* of proposition is: "The class of lions is not a lion, but the class of classes is a class"? How is it verified? How could it be *used*?--So far as I can see, only as a grammatical proposition. To draw someone's attention to the fact that the word "lion" is used in a fundamentally different way from the name of a lion; whereas the class word "class" is used like the designation of one of the classes, say the class *lion*.

One may say that the word "class" is used reflexively, even if for instance one accepts Russell's theory of types. For it is used reflexively there too.

Of course to say in this sense that the class of lions is not a lion etc. is like saying one has taken an "e" for an "a" when one has taken a ball for a bell.

The sudden change of aspect in the picture of a cube and the impossibility of seeing 'lion' and 'class' as comparable concepts.

The contradiction says: "Look out....".

But suppose that one gives a particular lion (the king of lions) the name "Lion"? Now you will say: But it is clear that in the sentence "Lion is a lion" the word "lion" is being used in two different ways. (*Tractatus Logico-philosophicus*.†1) But can't I count them as *one* kind of use?

But if the sentence "Lion is a lion" is used in this way: shouldn't I be drawing your attention to anything, if I drew your attention to the difference of employment of the two "lion"s?

One can examine an animal to see if it is a cat. But at any rate the concept cat cannot be examined in this way.

Even though "the class of lions is not a lion" seems like nonsense,

to which one can only ascribe a sense out of politeness; still I do not want to take it like that, but as a proper sentence, if only it is taken right. (And so not as in the *Tractatus*.) Thus my conception is a different one here. Now this means that I am saying: there is a language-game with this sentence too.

"The class of cats is not a cat."--How do you know?

The fable says: "The lion went for a walk with the fox", not a lion with a fox; nor yet the lion so-and-so with the fox so-and-so. And here it actually is as if the species lion came to be seen as a lion. (It isn't as Lessing†1 says, as if a particular lion were put in the place of some lion or other. "Reynard the Fox" does not mean: a fox of the name "Reynard".)

Imagine a language in which the class of lions is called "the lion of all lions", the class of trees "the tree of all

trees", etc.--Because people imagine all lions as forming *one* big lion. (We say: "God created man".)

Then it would be possible to set up the paradox that there isn't a definite number of all lions. And so on.

Page Break 404

Page 404

But would it be impossible to count and calculate in such a language?

Page 404

37. We might ask: What role can a sentence like "I always lie" have in human life? And here we can imagine a variety of things.

Page 404

38. Is turning inches into centimetres logical inference? "The cylinder is 2 inches long.--So it is about 5 cm. long." Is that a *logical* inference?†1

Page 404

But isn't a rule something arbitrary? Something that I *lay down*? And could I lay it down that the multiplication 18×15 shall *not* yield 270?--Why not?--But then it just hasn't taken place according to the rule which I first laid down, and whose use I have practised.

Is something that follows from a rule itself in turn a rule? And if not,--what kind of proposition am I to call it?

Page 404

"It is... impossible for human beings to recognize an object as different from itself." Well, if only I had an inkling how it is done,--I should try at once!--But, if it is impossible for us to recognize an object as different from itself, is it quite possible to recognize two objects as different from one another? I have e.g. two chairs before me and I recognize that they are *two*. But here I may sometimes believe that they are only *one*; and in *that* sense I can also take one for two.--

Page Break 405

But that doesn't mean that I recognize the chair as different from itself! Very well; but then neither have I recognized the two as different from one another. If you think you can do this and you are playing a kind of psychological game, then translate it into a game with gestures. When you have two objects before you, point with each hand at one of them; as if, as it were, you wanted to indicate that they were independent. If you only have one object before you then you point to it with both hands in order to indicate that no difference between it and itself can be made.--But now, why should one not play the game the opposite way?

Page 405

39. The words "right" and "wrong" are used when giving instruction in proceeding according to a rule. The word "right" makes the pupil go on, the word "wrong" holds him back. Now could one explain these words to a pupil by saying instead: "this agrees with the rule--that not"? Well yes, if he has a concept of agreement. But what if this has yet to be formed? (The point is how he reacts to the word "agree".)

Page 405

One does not learn to obey a rule by first learning the use of the word "agreement".

Page 405

Rather, one learns the meaning of "agreement" by learning to follow a rule.

Page 405

If you want to understand what it means "to follow a rule", you have already to be able to follow a rule.

Page Break 406

Page 406

"If you accept this rule you *must* do this."--This may mean: the rule doesn't leave two paths open to you here. (A mathematical proposition.) But I mean: the rule conducts you like a gangway with rigid walls. But against this one can surely object that the rule could be interpreted in all sorts of ways.--Here is the rule, like an order! And like an order too in its *effect*.

Page 406

40. A language-game: to bring something *else*; to bring the *same*. Now, we can imagine how it is played.--But how can I explain it to anyone? I can give him this training.--But then how does he know what he is to bring the next time as 'the same'--with what justice can I say that he has brought the right thing or the wrong?--Of course I know very well that in certain cases people would turn on me with signs of opposition.

And does this mean e.g. that the definition of "same" would be this: same is what all or most human beings with one voice take for the same?--Of course not.

Page 406

For of course I don't make use of the agreement of human beings to affirm identity. What criterion do you use, then? None at all.

Page 406

To use the word without a justification does not mean to use it wrongfully.

Page 406

The problem of the preceding language-game exists also here: Bring me something red. For what shews me that something is red? The

Page Break 407

agreement of the colour with a sample?--What right have I to say: "Yes, that's red"? Well, I say it; and it cannot be justified. And it is characteristic of this language-game as of the other that all men consent in it without question.

Page 407

An undecided proposition of mathematics is something that is accepted neither as a rule nor as the opposite of a rule, and which has the form of a *mathematical* statement.--But is this form a sharply circumscribed concept?

Page 407

Imagine $\lim_{n \rightarrow \infty} \phi_n = e$ as a property of a piece of music (say). But of course not as if the piece went on endlessly, but as a property that can be recognized by the ear (as it were an *algebraic* property) of the piece.

Page 407

Imagine equations used as ornaments (wallpaper patterns), and now a test of these ornaments with a view to discovering what kind of curves they correspond to. The test would be analogous to that of the contrapuntal properties of a piece of music.

Page 407

41. A proof that shews that the pattern '777' occurs in the expansion of π , but does not shew *where*.†1 Well, proved in this way this 'existential proposition' would, for certain purposes, not be a *rule*. But might it not serve e.g. as a means of classifying expansion rules? It would perhaps be proved in an analogous way that '777' does not occur in π^2 but it does occur in $\pi \times e$ etc. The question would simply be: is it reasonable to say of the proof concerned: it proves the existence

Page Break 408

of '777' in this expansion? This can be simply misleading. It is in fact the curse of prose, and particularly of Russell's prose, in mathematics.

Page 408

What harm is done e.g. by saying that God knows *all* irrational numbers? Or: that they are already all there, even though we only know certain of them? Why are these pictures not harmless?

Page 408

For one thing, they hide certain problems.--

Page 408

Suppose that people go on and on calculating the expansion of π . So God, who knows everything, knows whether they will have reached '777' by the end of the world. But can his *omniscience* decide whether they *would* have reached it after the end of the world? It cannot. I want to say: Even God can determine something mathematical only by mathematics. Even for him the mere rule of expansion cannot decide anything that it does not decide for us.

Page 408

We might put it like this: if the rule for the expansion has been given us, a *calculation* can tell us that there is a '2' at the fifth place. Could God have known this, without the calculation, purely from the rule of expansion? I want to say: No.

Page 408

42. When I said that the propositions of mathematics determine concepts, that is *vague*; for '2 + 2 = 4' forms a concept in a different sense from ' $p \supset p$ ', ' $(x).fx \supset fa$ ', or Dedekind's Theorem. The point is, there is a family of cases.

Page Break 409

The concept of the rule for the formation of an infinite decimal is--of course--not a specifically mathematical one. It is a concept connected with a rigidly determined *activity* in human life. The concept of this rule is not more mathematical than that of: following the rule. Or again: this latter is not less sharply defined than the concept of such a rule itself.--For the expression of the rule and its sense is only a part of the language-game: following the rule.

One has the *same* right to speak of such rules in general, as of the activities of following them.

Of course, we say: "all this is involved in the concept itself", of the rule for example--but what that means is that we incline to *these* determinations of the concept. For what have we in our heads, which of itself contains all these determinations?

A number is, as Frege says, a property of a concept--but in mathematics it is a mark of a mathematical concept. \hat{A}_0 is a *mark* of the concept of a cardinal number; and the *property* of a technique. $2\hat{A}_0$ is a mark of the concept of an infinite decimal, but what is this number a property of? That is to say: of what kind of concept can one assert it empirically?

43. The proof of a proposition shews me what I am prepared to stake on its truth. And different proofs can perfectly well cause me to stake the same thing.

Something surprising, a paradox, is a paradox only in a particular, as it were defective, surrounding. One needs to complete this surrounding in such a way that what looked like a paradox no longer seems one.

If I have proved that $18 \times 15 = 270$, I have thereby also proved the geometrical proposition that we get the sign '270' by applying certain transformation rules to the sign '18 \times 15'.--Now suppose that people, having their vision or memory impaired (as we now put it) by some harmful drug, did not get '270' when they did this calculation.--If we cannot use it to make a correct prediction of the result anyone is going to get under normal circumstances, isn't the calculation useless? Well, even if it is, that does not shew that the proposition '18 \times 15 = 270' is the empirical proposition: people in general calculate like *this*.

On the other hand it is not clear that the general agreement of people doing calculations is a characteristic mark of all that is called "calculating". I could imagine that people who had learned to calculate might in particular circumstances, say under the influence of opium, begin to calculate differently from one another, and might make use of these calculations; and that they were not said not to be calculating at all and to be deranged--but that their calculations were accepted as a reasonable procedure.

But must they not at least be trained to do the same calculations? Doesn't *this* belong essentially to the concept of calculating? I believe that we could imagine deviations here too.

44. Can we say that mathematics teaches an experimental method of investigation, teaches us to formulate empirical questions (cf. p. 381).†1

Can't it be said to teach me e.g. to ask whether a particular body moves according to the equation of a parabola?--What does mathematics do in this case? Without it, or without the mathematicians, we should of course not have arrived at the definition of this curve. But was defining this curve itself a piece of mathematics? Would it for instance imply mathematics for people to investigate the movement of a body so as to see whether its path can be represented by the construction of an ellipse with two pegs and a string? Was whoever invented this inquiry doing mathematics?

He did create a new *concept*. But was it in the same way as mathematics does? Was it like the way the multiplication $18 \times 15 = 270$ gives us a new concept?

45. Then *can't* one say that mathematics teaches us to count? But if it teaches us to count, then why doesn't it also teach us to compare colours?

It is clear that if someone teaches us the equation of an ellipse he is teaching us a new concept. But if someone proves to us that *this* ellipse and *this* straight line intersect at these points--he too is giving us a new concept.

Page 411

Teaching us the equation of an ellipse is like teaching us to count. But it is also like teaching us to ask the question: "Are there a hundred times as many marbles here as there?"

Page 411

Now if I had taught someone this question in a language-game, and a method of answering it, should I have taught him mathematics? Or

Page Break 412

would it have been that only if he operated with signs?

Page 412

(Would that be like asking: "Would it be geometry, even if it *only* consisted of the Euclidian axioms?")

Page 412

If arithmetic teaches us the question "how many?", then why doesn't it also teach the question "how dark?"?

Page 412

Is a new conceptual connexion a new concept? And does mathematics create conceptual connexions?

Page 412

But the question "are there a hundred times as many marbles here as there?" is surely not a mathematical question. And the answer to it is not a mathematical proposition. A mathematical question would be: "are 170 marbles a hundred times as many as 3 marbles?" (And this is a question of pure, not of applied mathematics.)

Page 412

Now ought I to say that whoever teaches us to count etc. gives us new concepts; and *also* whoever uses such concepts to teach us pure mathematics?

Page 412

The word "concept" is too vague by far.

Page Break 413

Page 413

Mathematics teaches us to operate with concepts in a new way. And hence it can be said to change the way we work with concepts.

Page 413

But only a mathematical proposition that has been proved or that is assumed as a postulate does this, not a problematic proposition.

Page 413

46. But can we not experiment mathematically? for instance, try whether a square bit of paper can be folded into a cat's head, where the *physical* properties of the paper, such as stiffness or elasticity, don't come into the question? Now certainly we speak of trying here. And why not of experimenting too? This case is like one in which we substitute pairs of numbers in the equation $x^2 + y^2 = 25$ in order to find by trial and error one that satisfies the equation. And if one finally arrives at $3^2 + 4^2 = 25$, is this proposition now the result of an experiment? For why did we call our procedure "trying"? Should we also have called it that if someone always solved such problems first time off with complete certainty (giving the signs of certainty) but without calculating? What did the experiment consist in here? Suppose that before he gives the solution, he has a vision of it.--

Page 413

47. If a rule does not compel you, then you aren't *following* a rule.

Page 413

But how am I supposed to be following it; if I can after all follow it as I like?

Page Break 414

Page 414

How am I supposed to follow a sign-post, if whatever I do is a way of following it?

Page 414

But, that everything can (also) be *interpreted* as following, doesn't mean that everything is following.

Page 414

But how then does the teacher interpret the rule for the pupil? (For he is certainly supposed to give it a particular interpretation.)--Well, how but by means of words and training?

And if the pupil reacts to it thus and thus; he possesses the rule inwardly.

But *this* is important, namely that this reaction, which is our guarantee of understanding, presupposes as a surrounding particular circumstances, particular forms of life and speech. (As there is no such thing as a facial expression without a face.)

(This is an important movement of thought.)

Page 414

48. Does a line compel me to trace it?--No; but if I have decided to use it as a model in *this* way, then it compels me.--No; then *I* compel myself to use it in this way. I as it were cleave to it.--But here it is surely important that I can form the decision with the (general) interpretation so to speak once for all, and can hold by it, and do not *interpret* afresh at every step.

Page 414

The line, it might be said, intimates to me how I am to go. But that is of course only a picture. And if I judge that it intimates this or that to me as it were irresponsibly, then I would not say that I was following it *as a rule*.

Page Break 415

Page 415

"The line intimates to me how I am to go": that is merely a paraphrase for:--it is my *last* court of appeal for how I am to go.

Page 415

49. Imagine someone was following a line as a rule in this way: he holds a pair of compasses, one point of which he carries along the rule, while the other point draws the line that follows the rule. And as he goes along the rule-line in this fashion, he opens and doses the compasses, to all appearances with great exactness; as he does this, he keeps on looking at the rule, as if *it* determined what he was doing. Now we, who are watching him, can see no regularity of any kind in this opening and shutting. Hence we cannot learn his way of following the rule from him either. But we believe him when he tells us that the line intimated to him to do what he did.

Page 415

Here we should perhaps really say: "The model seems to *intimate* to him how he has to go. But it isn't a rule."

Page 415

50. Suppose someone follows the series "1, 3, 5, 7, ..." in writing the series $2x + 1$; and he asked himself "But am I always doing the same thing, or something different every time?"

If from one day to the next someone promises: "Tomorrow I will give up smoking," does he say the same thing every day, or every day something different?

Page 415

How is it to be decided whether he always does the same, when the line intimates to him how he is to go?

Page Break 416

Page 416

51. Didn't I want to say: Only the total picture of the use of the word "same" as it is interwoven with the uses of the other words, can determine whether he does use the word as we do?

Page 416

Doesn't he always do the same, namely, let the line intimate to him how he is to go? But suppose he says that the line intimates now this to him and now that? Couldn't he now say: in *one* sense he is always doing the same thing, but still he isn't following a rule? And cannot the one who is following a rule nevertheless also say that in a certain sense he does something different every time? Thus whether he does the same thing or keeps on doing something different does not determine whether he is following a rule.

Page 416

The procedure of following a rule can be described only like this: by describing in a different way what we do in the course of it.

Would it make sense to say: "If he did something *different* every time, we should not say he was following a rule"? That does *not* make sense.

Page 416

52. Following a rule is a particular language-game. How can it be described? When do we say he has understood the description?--We do this and that; if he now reacts in such-and-such a way, he understood the game. And this "this and that," "in such-and-such a way" doesn't contain an "and so on."--Or: if I used an "and so on" in the description, and were to be asked what that meant, I should have to explain that in turn by the narration of examples; or perhaps by means of a gesture. And I should then regard it as a sign of understanding, if

he, say, repeated the gesture with an intelligent expression; and in special cases acted in such-and-such a way.

"But then doesn't the understanding reach beyond all the examples?" A very remarkable expression, and one that is entirely natural.

When one recounts examples and then says "and so on", this latter expression does not get explained in the same way as the examples.

For the "and so on" might on the one hand be replaced by an arrow, which indicates that the end of the series of examples is not supposed to signify an end of their application. On the other hand "and so on" also means: that's enough, you've understood; we don't need any more examples.

If we replace the expression by a gesture, it might easily be that people only took our series of examples as they were supposed to (only followed it correctly) when we made this gesture at the end. Thus it would be quite analogous to pointing to an object or a place.

53. Let us imagine a line intimating to me how I am to follow it; that is, as my eye travels along the line a voice within me says: "*This* way!"--What is the difference between this process of obeying a kind of inspiration and that of obeying a rule? For they are surely not

the same. In the case of inspiration I *await* direction. I shall not be able to teach anyone else my 'technique' of following the line. Unless, indeed, I teach him some way of hearkening, some kind of receptivity. But then, of course, I cannot require him to follow the line in the same way as I do.

It would also be possible to imagine such instruction in a sort of calculating. The children can calculate, each in his own way--as long as they listen to their inner voice and obey it. Calculating in this way would be something like composing.

For doesn't the technique (the *possibility*) of training someone else in following it belong to the following of a rule? To be sure, by means of examples. And the criterion of his understanding must be the agreement of their individual actions. Hence it is not as it is with instruction in receptivity.

54. How do you follow the rule?--"I do it like *this*;..." and now there follow general explanations and examples.--How do you follow the voice of the line?--"I look at it, exclude all thoughts, etc., etc."

"I wouldn't say that it kept on intimating something else to me--if I were following it as a rule". Can one say that? "Doing the same" is tied up with "following the rule."

55. Can you imagine having absolute pitch, if you don't have it? Can you imagine it, *if* you do?--Can a blind man imagine the seeing of red? Can *I* imagine it? Can I imagine spontaneously reacting in such-and-such a way if I don't do so? Can I imagine it better, if I do do so?

But can I play the language-game, if I don't react in this way?

56. One does not feel that one must always be awaiting the tip-off of the rule. On the contrary. We are not excited about what it will tell us to do next, rather it always tells us the same thing, and we do what it says.

It might be said: we look at what we do in following according to the rule from the point of view: *always the same*.

You might say to someone you were beginning to train: "See, I always do the same:..."

57. When do we say: "the line intimates this to me *as a rule*--always the same." And on the other hand: "It keeps on intimating to me what I have to do--it is not a rule."

In the first case the story is: I have no further court of appeal for what I have to do. The rule does it all by itself; I need only follow it (and following just is *one thing*). I don't feel for example that it's queer that the line always tells me something.--

Page Break 420

Page 420

The other proposition says: I don't know what I shall do; the line will tell me.

Page 420

Calculating prodigies, who reach the right result, but cannot tell how. Are we to say: they don't calculate? (A family of cases.)

Page 420

These things are finer spun than crude hands have any inkling of.

Page 420

58. May I not *believe* I am following a rule? Doesn't this case exist?

Page 420

And if so, then may I not also believe I am *not* following a rule and yet be following a rule? Isn't there something that we should call *that*, too?

Page 420

59. How can I explain the word "same"?--Well, by means of examples.--But is that *all*? Isn't there a still deeper explanation; or must not the *understanding* of the explanation be deeper?--Well, have I myself a deeper understanding? *Have* I more than I give in the explanation?

But whence arises the feeling, as if I had more than I can say?

Page 420

Is it that I interpret the not-limited as length which reaches further than any given length? (The permission that is not limited, as a permission for something limitless.)

Page 420

The image that goes with the limitless, is of something so big that we can't see its end.

Page Break 421

Page 421

The employment of the word "rule" is interwoven with the employment of the word "same".

Page 421

Consider: Under what circumstances will the explorer say: The word "..." of this tribe means the same as our "and so on"? Imagine the details of their life and their language, which would justify him in this.

Page 421

"But I know what 'same' means!"--I have no doubt of that; I know it too.

Page 421

60. "The line intimates to me..." Here the emphasis is on the *impalpability* of the intimating. On this: that *nothing* stands between the rule and my action.

Page 421

One could however imagine that someone multiplied, multiplied correctly, with such feelings; kept on saying: "I don't know--now suddenly the rules intimates *this* to me!" and that we reply: "Of course; for you are going ahead perfectly in accordance with the rule."

Page 421

Following a rule: this can be contrasted with various things. Among other things the explorer will also describe the circumstances under which someone of these people doesn't want to say he is following a rule. Even when in this or that respect it looks as if he were.

Page Break 422

Page 422

But might we not also calculate as we do calculate (all agreeing), etc., and yet at every step have the feeling of being guided by the rule as if by a spell; astonished maybe at agreeing with one another? (Thanking the deity perhaps for this agreement.)

Page 422

From this you can just see how much there is to the physiognomy of what we call "following a rule" in

everyday life!

Page 422

One follows the rule *mechanically*. Hence one compares it with a mechanism.

Page 422

"Mechanical"--that means: without thinking. But *entirely* without thinking? Without *reflecting*.

Page 422

The explorer might say: "they follow rules, but it looks different from the way it looks among us."

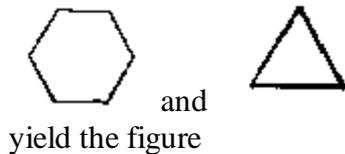

Page 422

"It--for no reason--intimates this or that to me" means: I can't teach you *how* I follow the line. I make no presumption that you will follow it as I do, even if you do follow it.

Page 422

61. An addition of shapes together, so that some of the edges fuse, plays a very small part in our life.--As when

Page Break 423

But if this were an *important* operation, our ordinary concept of arithmetical addition would perhaps be different.

Page 423

It is natural for us to regard it as a geometrical fact, not as a fact of physics, that a square piece of paper can be folded into a boat or hat. But is not geometry, so understood, part of physics? No; we split geometry off from physics. The geometrical possibility from the physical one. But what if we left them together? If we simply said: "If you do this and this and this with the piece of paper then *this* will be the result"? What has to be done might be told in a rhyme. For might it not be that someone did not distinguish at all between the two possibilities? As e.g. a child who learns this technique does not. It does not know and does not consider whether these results of folding are possible only because the paper stretches, is pulled out of shape, when it is folded in such-and-such a way, or because it is *not* pulled out of shape.

Page 423

And now isn't it like this in arithmetic too? Why shouldn't it be possible for people to learn to calculate without having the concepts of a mathematical and a physical fact? They merely know that this

Page Break 424

is always the result when they take care and do what they have learnt.

Let us imagine that while we were calculating the figures on paper altered erratically. A 1 would suddenly become a 6 and then a 5 and then again a 1 and so on. And I want to assume that this does not make any difference to the calculation because, as soon as I read a figure in order to calculate with it or to apply it, it once more becomes the one that we have in *our* calculating. At the same time, one would see how the figures change during the calculation; but we are trained not to worry about this.

Of course, even if we do not make the above assumption, this calculation could lead to useful results.

Here we calculate strictly according to rules, yet this result does not *have* to come out.--I am assuming that we see no sort of regularity in the alteration of the figures.

Page 424

I want to say: this calculating could really be conceived as an experiment, and we might for example say: "Let's try what will come out now if I apply this rule".

Page 424

Or again: "Let us make the following experiment: we'll write the figures with ink of such-and-such a composition... and calculate according to the rule...."

Now you might of course say: "In this case the manipulation of figures according to rules is not calculation."

"We are calculating only when there is a *must* behind the result."--But suppose we don't know this *must*,--is it contained in the calculation

all the same? Or are we not calculating, if we do it quite naïvely?

How about the following: You aren't calculating if, when you get now this, now that result, and cannot find a mistake, you accept this and say: this simply shews that certain circumstances which are still unknown have an influence on the result.

This might be expressed: if calculation reveals a causal connexion to you, then you are not calculating.

Our children are not only given practice in calculation but are also trained to adopt a particular attitude towards a mistake in calculating.†1

What I am saying comes to this, that mathematics is *normative*. But "norm" does not mean the same thing as "ideal".

62. The introduction of a new rule of inference can be conceived as a transition to a new language-game. I can imagine one in which for example one person pronounces: ' $p \supset q$ ', another ' p ' and a third draws the conclusion.

63. Is it possible to observe that a surface is coloured red and blue;

and not to observe that it is red? Imagine that a kind of colour adjective were used for things that are half red and half blue: they are said to be 'bu'. Now might not someone be trained to observe whether something is bu; and not to observe whether it is also red? Such a man would then only know how to report: "bu", or "not bu". And from the first report we could draw the conclusion that the thing was partly red.

I am imagining that the observation happens by means of a psychological sieve, which for example only lets through the fact that the surface is blue-white-red (the French tricolour) or that it is not.

Now if it is a special observation that the surface is partly red, how can this follow logically from the preceding? Surely logic cannot tell us what to observe.

Someone is counting apples in a box; he counts up to 100. Someone else says: "so there are at any rate 50 apples in the box" (that is all that interests him). This is surely a logical conclusion; but isn't it also a special piece of experience?

64. A surface which is divided into a number of strips is observed by several people. The colours of the strips change every minute, all at the same time.

Now the colours are: red, green, blue, white, black, blue.

It is observed:

red. blue \supset black. \supset . white.

It is also observed:

\sim green \supset \sim white

and someone draws the conclusion:

$\sim \text{green} \supset: \text{red. blue. } \sim \text{black.}$

And these implications are 'material implications' in Russell's sense.

Page 427

But then is it possible to *observe* that

$\text{red. blue} \supset \text{black.} \supset. \text{white?}$

Isn't one observing *arrangements* of colours, and so for example that red.blue.black.white; and then deducing that proposition?

But may not someone who is observing a surface be quite preoccupied with the question whether it is going to turn green or not green; and if he now sees: $\sim \text{green}$, need he be attentive to the particular colour that the surface is?

And might not someone be preoccupied with the aspect $\text{red. blue} \supset \text{black.} \supset. \text{white?}$ If, for example, he has been taught to forget everything else, and only to look at the surface from this point of view. (In particular circumstances it might be all one to people whether objects were red or green but important whether they had one of these colours or some third one. And in this case there might be a colour word for "red or green".)

Page 427

But if one can observe that

$\text{red. blue} \supset \text{black.} \supset. \text{white}$

and

$\sim \text{green} \supset \sim \text{white}$

Page Break 428

then one can also observe, and not merely infer, that

$\sim \text{green} \supset: \text{red. blue. } \sim \text{black.}$

Page 428

If these are three observations then it must also be possible for the third observation not to agree with the logical conclusion from the first two.

Page 428

Then is it imaginable that someone observing a surface should see the combination red-black (say as a flag), but if he now sets himself to see *one* of the two halves, he sees blue instead of red? Well, you have just described it.--It would perhaps be as if someone were to look at a group of apples and always see it as two groups of two apples each, but as soon as he tried to take the whole lot in at a glance, they seemed to him to be five. This would be a very remarkable phenomenon. And it is not one of whose possibility we take any notice.

Page 428

Remember that a rhombus, seen as a diamond, does not look like a parallelogram. Not that the opposite sides seem *not* to be parallel, only the parallelism does not strike us.

Page 428

65. I could imagine someone saying that he saw a red and yellow star but did not see anything yellow--because he sees the star as, so to speak, a *conjunction* of coloured parts, which he cannot separate.

Page 428

For example he had figures like these before him:

Page Break 429

Asked whether he sees a red pentagon he would say "yes"; asked whether he sees a yellow one, "no". In the same

way he says that he sees a blue triangle but not a red one.--When his attention was drawn to it perhaps he said: "Yes, now I see it; I had not taken the star like that."

Page 429

And it might seem to him that you can't separate the colours in the star, because you can't separate the shapes.

Page 429

You cannot learn to view the geography of a landscape as a whole, if you move on in it so slowly that you have already forgotten one bit when you come to another.

Page 429

66. Why do I always speak of being compelled by a rule; why not of the fact that I can *choose* to follow it? For that is equally important.

But I don't want to say, either, that the rule compels me to act like this; but that it makes it possible for me to hold by it and let it compel me.

Page 429

And if e.g. you play a game, you keep to its rules. And it is an interesting fact that people set up rules for the fun of it, and then keep to them.

Page Break 430

Page 430

My question really was: "How can one keep to a rule†1?" And the picture that might occur to someone here is that of a short bit of handrail, by means of which I am to let myself be guided further than the rail reaches. [But there *is* nothing there; but there isn't *nothing* there!] For when I ask "How can one...", that means that something here looks *paradoxical* to me; and so a picture is confusing me.

Page 430

"I never thought of its being red too; I only saw it as part of a multi-coloured ornament."

Page 430

Logical inference is a transition that is justified if it follows a particular paradigm and its rightness is not dependent on anything else.

Page 430

67. We say: "If you really follow the rule in multiplying, you *must* all get the same result." Now if this is only the somewhat hysterical way of putting things that you get in university talk, it need not interest us overmuch.

It is however the expression of an attitude towards the technique of calculation, which comes out everywhere in our life. The emphasis of the *must* corresponds only to the inexorableness of this attitude both to the technique of calculating and to a host of related techniques.

Page 430

The mathematical Must is only another expression of the fact that mathematics forms concepts.

Page Break 431

Page 431

And concepts help us to comprehend things. They correspond to a particular way of dealing with situations.

Page 431

Mathematics forms a network of norms.

Page 431

68. It is possible to see the complex formed of A and B, without seeing A or B. It is even possible to call the complex a "complex of A and B" and to think that this name points to some kind of kinship of this whole with A and with B. Thus it is possible to say that one is seeing a complex formed from A and B but neither A nor B. As for example one might say that there is a reddish yellow here but neither red nor yellow.

Page 431

Now can I have A and B before me and also see them both, but only observe $A \vee B$? Well, in a certain sense this is surely possible. I was thinking of it like this: the observer is preoccupied with a particular aspect; for example, he has a special kind of paradigm before him; he is engaged in a particular routine of application.--And just as he can be adjusted to $A \vee B$, so he can also be adjusted to A.B. Thus only A.B strikes him, and not, for example, A. To be adjusted to $A \vee B$ might be said to mean: to react to such-and-such a situation with the concept 'A \vee B'. And one can of course do exactly the same thing with A.B too.

Page 431

Say someone is interested only in A.B, and so whatever happens he judges merely either "A.B", or " $\sim(A.B)$ ";

then I can imagine his judging "A.B" and saying "No, I see A.B" when he is asked "Do you see B?" As for example some people who see A.B will not concede that they see $A \vee B$.

Page Break 432

Page 432

69. But 'seeing' the surface 'blue all over' and 'seeing' it 'red all over' are surely 'genuine' experiences, and yet we say that a man could not have them at the same time.

Page 432

Now suppose he assured us that he saw this surface really red all over and blue all over at the same time? We should have to say: "You aren't making yourself intelligible to us."

Page 432

With us the proposition "1 foot = ... cm." is timeless. But we could imagine the case in which the foot and the metre gradually altered somewhat, and kept on having to be compared anew in order for us to calculate their translations into one another.

Page 432

But have we not determined the relative length of foot and metre experimentally? Yes; but the result was given the character of a rule.

Page 432

70. In what sense can a proposition of arithmetic be said to give us a concept? Well let us interpret it, not as a proposition, as something that decides a question, but as a--somehow accepted--connexion of concepts.

Page 432

The equating of 25^2 and 625 could be said to give me a new concept. And the proof shews what the position is regarding this equality.--"To give a new concept" can only mean to introduce a new employment of a concept, a new practice.

Page Break 433

Page 433

"How can the proposition be separated from its proof?" This question betrays a false conception.

Page 433

The proof is part of the *surroundings* of the proposition.

Page 433

'Concept' is a vague concept.

Page 433

71. It is not in every language-game that there occurs something that one would call a concept.

Page 433

Concept is something like a picture with which one compares objects.

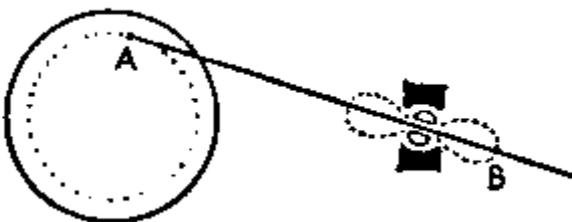

Page 433

Are there concepts in language-game (2)†1? Still, it would be easy to add to it in such a way that "slab", "block" etc. became concepts. For example, by means of a technique of describing or portraying those objects. There is of course no sharp dividing line between language-games which work with concepts and others. What is important is that the word "concept" refers to one kind of expedient in the mechanism of language-games.

Page Break 434

Page 434

72. Consider a mechanism. For example this one:

While the point *A* describes a circle, *B* describes a figure eight. Now we write this down as a proposition of kinematics.

When I work the mechanism its movement proves the proposition to me; as would a construction on paper. The proposition corresponds e.g. to a picture of the mechanism with the paths of the points *A* and *B* drawn in. Thus

it is in a certain respect a picture of that movement. It holds fast what the *proof* shews me. Or--what it persuades me of.

Page 434

If the proof registers the procedure according to the rule, then by doing this it produces a new concept.

Page 434

In producing a new concept it convinces me of something. For it is essential to this conviction that the procedure according to these rules must always produce the same configuration. ('Same', that is, by our ordinary rules of comparison and copying.)

Page 434

With this is connected the fact that we can say that proof must shew the existence of an internal relation. For the internal relation is the operation producing one structure from another, seen as equivalent to the picture of the transition itself--so that now the transition

Page Break 435

according to this series of configurations is *eo ipso* a transition according to those rules for operating.

Page 435

In producing a concept, the proof convinces me of something: what it convinces me of is expressed in the proposition that it has proved.

Page 435

Problem: Does the adjective "mathematical" always mean the same: when we speak of "mathematical" concepts, of "mathematical" propositions and of mathematical proofs?

Page 435

Now what has the proved proposition got to do with the concept created by the proof? Again: what has the proved proposition got to do with the internal relations demonstrated by the proof?

Page 435

The picture (proof-picture) is an instrument producing conviction.

Page 435

It is clear that one can also apply an unproved mathematical proposition; even a false one.

Page 435

The mathematical proposition says to me: Proceed like this!

Page 435

73. "If the proof convinces us, then we must also be convinced of the axioms." Not as by empirical propositions, that is not their role. In the language-game of verification by experience they are excluded. Are, not empirical propositions, but principles of judgement.

Page Break 436

Page 436

A language-game: How have I to imagine one in which axioms, proofs and proved propositions occur?

Someone who hears a bit of logic for the first time at school is straightway convinced when he is told that a proposition implies itself, or when he hears the law of contradiction, or of excluded middle.--Why is he immediately convinced? Well, these laws fit entirely into the use of language that he is so familiar with. Then he learns perhaps to prove more complicated propositions of logic. The proofs are exhibited to him, and he is again convinced; or he invents proofs himself.

In this way he learns new techniques of inference. And also, what account to lay it to, if now errors appear.

Page 436

The proof convinces him that he must hold fast to the proposition, to the technique that it prescribed; but it also shews him how he can hold fast to the proposition without running any risk of getting into conflict with experience.

Page 436

74. Any proof in applied mathematics may be conceived as a proof in pure mathematics which proves that *this* proposition follows from *these* propositions, or can be got from them by means of such and such operations; etc.

Page 436

The proof is a particular *path*. When we describe it, we do not mention causes.

Page 436

I act on the proof.--But how?--I act according to the proposition that got proved.

The proof taught me e.g., a technique of approximation. But still it proved *something*, convinced me of something. *That* is expressed by the proposition: It says what I shall now do on the strength of the proof.

The proof belongs to the background of the proposition. To the system in which the proposition has an effect.

See, *this* is how 3 and 2 yield 5. Note this proceeding.

Every empirical proposition may serve as a rule if it is fixed, like a machine part, made immovable, so that now the whole representation turns around it and it becomes part of the coordinate system, independent of facts.

"This is how it is, if this proposition is derived from these ones. That you have to admit."--What I admit is, *this* is what I call such a procedure.

FOOTNOTES

†1 The numbering of Wittgenstein's manuscripts and typescripts follows that of the list given in the article "The Wittgenstein Papers" by G. H. von Wright in: *The Philosophical Review*, Vol. LXXVIII, 1969.

†1 *Principia Mathematica*: What is implied by a true premiss is true. Pp. (Eds.)

†1 Is 'this correlation' here the correlation of the patterns in the proof itself? A thing cannot be at the same time the measure and the thing measured. (Note in margin.)

†2 On the strength of the figure I shall e.g. try to effect one correlation, but not the other, and shall say that that one is not possible. (Note in margin.)

†1 See above, § 36. (Eds.)

Foreword to the Edition of 1977

Page ix

In the manuscript material left by Wittgenstein there are numerous notes which do not belong directly with his philosophical works although they are scattered among the philosophical texts. Some of these notes are autobiographical, some are about the nature of philosophical activity, and some concern subjects of a general sort,

such as questions about art or about religion. It is not always possible to separate them sharply from the philosophical text; in many cases, however, Wittgenstein himself hinted at such a separation--by the use of brackets or in other ways.

Page ix

Some of these notes are ephemeral; others on the other hand--the majority--are of great interest. Sometimes they are strikingly beautiful or profound. It was evident to the literary executors that a number of these notes would have to be published. G.H. von Wright was commissioned to make a selection and arrange it.

Page ix

It was a decidedly difficult task; at various times I had different ideas about how best to accomplish it. To begin with, for example, I imagined that the remarks could be arranged according to the topics of which they treated--such as "music", "architecture", "Shakespeare", "aphorisms of practical wisdom", "philosophy", and the like. Sometimes the remarks can be arranged into such groupings without strain, but by and large, splitting up the material in this way would probably give an impression of artificiality. At one time moreover I had thought of including already published material. For many of Wittgenstein's most impressive "aphorisms" are to be found in his philosophical works--in the *Notebooks* from the First World War, in the *Tractatus*, and in the *Investigations* too. I should like to say that it is when they are embedded in such contexts that Wittgenstein's remarks really have their most powerful effect. But for that very reason it did not seem to me right to tear them from their surroundings.

Page Break x

Page x

At one time too I played with the idea of not making a very extensive selection, but including only the "best" remarks. The impression made by the good remarks would, I thought, only be weakened by a great mass of material. *That*, presumably, is true--but it was not my job to be an arbiter of taste. Furthermore, I did not trust myself to choose between repeated formulations of the same, or nearly the same, thought. Often the repetitions themselves seemed to me to have a substantial point.

Page x

In the end I decided on the only principle of selection that seemed to me unconditionally right. I excluded from the collection notes of a purely "personal" sort--i.e. notes in which Wittgenstein is commenting on the external circumstances of his life, his state of mind and relations with other people--some of whom are still living. Generally speaking these notes were *easy* to separate from the rest and they are on a *different* level of interest from those which are printed here. Only in a few cases where these two conditions seemed not to be met did I include notes of an autobiographical nature as well.

Page x

The remarks are published here in chronological order with an indication of their year of origin. It is conspicuous that nearly half the remarks stem from the period after the completion (in 1945) of Part One of *Philosophical Investigations*.

Page x

In the absence of further explanation some of the remarks will be obscure or enigmatic to a reader who is not familiar with the circumstances of Wittgenstein's life or with what he was reading. In many cases it would have been possible to provide explanatory comments in footnotes. I have nevertheless, with very few exceptions, refrained from adding comments. I ought to add that all the footnotes are the editor's. †1

Page x

It is unavoidable that a book of this sort will reach the hands of readers to whom otherwise Wittgenstein's philosophical work is, and will remain, unknown. This need not necessarily be harmful or useless. I am all the same convinced that these notes can be properly understood and appreciated only against the background of Wittgenstein's philosophy and, furthermore, that they make a contribution to our understanding of that philosophy.

Page x

I began making my selection from the manuscripts in the years 1965-6. I then laid the work aside until 1974. Mr Heikki Nyman helped me with the final selection and arrangement of the collection. He also checked that the next agreed exactly with the manuscripts and removed many errors and

Page Break xi

gaps from my typescript. I am very grateful to him for his work, which he carried out with great care and good taste. Without his help I should probably not have been able to bring myself to complete the collection for the press. I am also deeply indebted to Mr Rush Rhees for making corrections in the text which I produced and for giving me valuable advice on matters of selection.

Page Break xii

Foreword to New Edition 1994

Page xii

The present new version of the text of *Vermischte Bemerkungen* is the work of Alois Pichler. Mr Pichler, who works at the *Wittgenstein Archive of the University of Bergen*†*, has newly transcribed from the manuscripts all the remarks. In the process a few mistakes in the earlier editions were corrected, mainly places which had been difficult to read correctly. Some of these corrections had already been noticed by the original editor in the course of the years.

Page xii

The new edition contains all the remarks of the earlier editions and only those. However they appear here edited more completely and more faithfully to the original. Wittgenstein usually wrote his remarks in short sections, separated from each other by one or more blank lines. Some of the remarks printed in the earlier editions consisted simply of "extracts" from these sections, i.e. often parts were left out which did not seem relevant to the editor. This is a judgement that might appear controversial to some; for this reason in the present edition all such passages have been completed so as to comprise the totality of the section. Another new feature is that variants are retained in footnotes--formerly the editor had made a choice. The musical notation and the drawings are this time reproduced in facsimile; thanks are due to Michael Biggs of the University of Hertfordshire for his advice and help. Many will be pleased that the sources of the remarks are cited.†** (See Alois Pichler's Editorial Note for more details about editing.)

Page Break xiii

At the end of the remarks there is a poem which was in the possession of Hofrat Ludwig Hänsel, to whom Wittgenstein had given it. We assume that it was written by Wittgenstein. Here the poem is reproduced as a facsimile of the surviving typescript. There is supposed to have been a handwritten version too, which has probably been lost. It is not known when the poem was composed. The Wittgenstein Trustees thank Prof. Dr Hermann Hänsel, Vienna, for making this unique document available.

Page xiii

Alois Pichler and I thank the *Wittgenstein Archive of the University of Bergen* for professional and technical support.

Helsinki, November 1993

Georg Henrik von Wright

Page Break xiv

Editorial Note

Page xiv

History of the Edition: The *Vermischte Bemerkungen* were first published in 1977. In 1978 a new edition appeared with supplementary remarks. The edition of 1978 was corrected and expanded in Volume 8 in the complete works, 1984; between "Es ist als hätte ich mich verirrt (...)" and "Sind *alle* Leute große Menschen? (...)" (1978: p. 93) was inserted the remark "Je weniger sich Einer selbst kennt (...)" (1984: p. 516). For this reason the latter remark is not included in the English edition of 1980. The present new edition contains all the remarks of the edition of 1984 and--apart from the completion of the context to include the full section and the noting of the variants--only those remarks.

Page xiv

Sources: The manuscript source is given after each remark: "MS #" refers to the manuscript number in Georg Henrik von Wright's catalogue of the *Nachlaß*†*. Following the manuscript number the page is cited on which the remark begins (Folio pagination is distinguished according to recto and verso by "r" and "v"; identical pagination is distinguished according to left and right by "a" and "b".) The date of writing is also given, where this can be ascertained.

Page xiv

Arrangement: The remarks are arranged chronologically; this has led to fairly extensive rearrangements in relation to the earlier editions. For remarks which follow immediately one after another in the original, the source has been given after the last of those remarks, so that the original grouping may be clear in this edition.

Page xiv

Context: All remarks, i.e. all passages separated from each other by blank

lines and not indented, correspond to whole sections in the original; whereas the former editions sometimes contained only parts of sections, the complete section is reproduced here. Completions of this sort are marked in the citation of sources with an asterisk * (see e.g. the first remark). Further sections were added to the remark "Architecture immortalizes (...)" (1978: p. 133; 1984: p. 548; here p. 74), as they constitute different versions of it and in the manuscript are on the same or the previous side. In the earlier editions this passage was marked with "Several variants in the manuscript". With remarks which belong together and which are here edited under the same indication of source, but which in the original are separated from each other by one or more sections not published here, the omission of the relevant section(s) is indicated with (...) (e.g. as on p. 75).

Code: Several of the published remarks are written in the original partly or wholly in Wittgenstein's code; this is registered in the indication of source with a "c" for "code", following the page number. The code, roughly, consists in the reversal of the alphabet, in detail in the following correlations (read "a is z", "b is y", etc.):

a	z	h	s	n	n	u	f	
b	y	hh	ss/ß	o	m	v	e	
c	x	i	r	p	l	w	d	
d	w	k	q	q	k	x	d	
e	v	l	p	r	i/j	y	b	
f	u	m	o	s	h	z	a	
&funk;	ü	&munk;	ö	t	g	&zunk;	ä	

g t
"Rsx", e.g., is when decoded "Ich".

Completeness: In the originals many of the remarks are marked with working signs and lines in the margin: these marks were not included, as their significance belongs to the context of a work process that is not present here. The same holds for (curved and pointed) brackets, bracketing a section as a whole: where the bracketed sections are edited here without preceding or following section(s) that are not bracketed, the brackets have been omitted. This is because such brackets have the function of delimiting the context and so are meaningful only where the context is also included. Also omitted are text deleted by Wittgenstein words and punctuation marks, which do not fit syntactically into the remark (this applies to crossings-out

in cases where Wittgenstein has neglected to cross out the whole text which belongs syntactically together with the deleted material, and to duplications of words and punctuation marks). Insertions and rearrangements were arranged or followed without this being indicated. When there was a date by a section this was included in the indication of source in standardized form. Text underlined once in the original is printed in *italics*; text underlined twice in the original is in SMALL CAPITALS. Passages underlined in the original with a wavy line (expressing doubts about the expression, cf. collected works, Vol. 3, p. 166) are here **underlined**; e.g. p. 5 "Das", p. 35 "₂".

Indentation: Wittgenstein has used indentations of various lengths for the separate paragraphs of his sections. The extent of the indentation is not rendered here; it would have been meaningful to do this in a context reaching beyond section and page. The first line of a section is printed here without indentation; all following paragraphs of a section are indented.

Orthography, Grammar and Punctuation: Wittgenstein's orthographic habits especially in the use of upper and lower case (e.g. "pointen"†i), in separations and runnings-together of words (e.g. "jeder so & sovielte"†ii) and historically or regionally restricted orthographies (like "c" for "z" and "k" in words of Latin origin, "stätig" for "stetig" and "alchemistisch" for "alchimistisch") have been respected. The ampersand "&" for "und" or "and" is retained. The use of "ss"/"ß" and of the apostrophe in genitives ("Goethe's") has been consistently corrected in accordance with modern usage. Extra punctuation marks have been supplied only where their absence would make reading difficult; and brackets were completed where in the original brackets are opened, but not closed. Quotation marks are printed in standardized form, ",", ' '. Otherwise the punctuation has been left *as in the original*. All expansions at the level of *words* (i.e. expansions which constitute a new word) and at the level of *punctuation* are shown with pointed brackets, e.g. p. 7 "<>"; (orthographic) expansions and omissions below the level of words are not indicated. Indication is also made where an abbreviation has been expanded into the full word, as in the case of "B" into

"B<unyan>".

Page xvi

Variants: The remarks are printed inclusive of (undeleted) variants. Except

Page Break xvii

in cases like "(...) während die eigentlich(e) philosophische Überlegung (...)" (alternatives of "eigentliche" and "eigentlich": both versions in the main text, p. 53), the version written first is given in the main text, the other(s) however in footnotes. The various ways of marking variants ("[(...)]", "//(...)//" etc.) are not printed. Variants within variants are separated by "|". When variants required repetition of what was written only once in the original, this is indicated by "<(...)>". Alternative punctuation is also counted as a variant.

Page xvii

Graphics: The musical notation on p. 19 and the figures on pages 44 and 60 are facsimiles (reduced). In the original they are on lined paper; here the lines are suppressed for the sake of greater clarity. The facsimiles were produced by Michael Biggs.

Page xvii

Notes: Comments, explanations and textual notes are in end notes. "Unklar" means that the passage's content is unclear; "Nicht klar leserlich" means that the passage is not clearly legible.†

Page xvii

Appendix: The Appendix contains three lists: the first lists the sources of the remarks in the order in which they are published here; the second lists the sources alphanumerically; the third lists the beginnings of the remarks (with page references). The remarks which, in contrast to earlier editions, have been edited as whole sections are marked in the lists with an asterisk *.

Alois Pichler

Page Break xviii

Note by Translator

Page xviii

The present translation is a quite extensive revision of my original translation published in 1980. This is of course partly to take account of the new material included in Alois Pichler's revised edition, but there are other changes too. Some of these changes relate to my dissatisfaction with my earlier renderings; but there are others which are consequent on the somewhat different character of Mr Pichler's edition as compared with earlier editions.

Page xviii

Professor von Wright's earlier editions were intended for a readership broader than that to be expected for Wittgenstein's more technically philosophical works. They did not, partly for that reason, attempt to include the kind of textual detail that Mr Pichler has aimed at. *One* important feature of the newly included material is the detailed noting of the many variant readings that Wittgenstein included in his manuscripts and typescripts. In order even to begin any attempt to translate these variants, it was necessary to stick much more closely to the original grammatical structure of Wittgenstein's texts than I had thought appropriate in my earlier version. I have done this while still trying as far as possible to produce a text that reads like English and not a word for word representation into a weird "translatese".

Page xviii

Sometimes Wittgenstein's variant readings can be captured more or less satisfactorily; but by no means always. This is because the relative values of words which are roughly synonymous in German are not mirrored in the English counterparts of these words. In these cases there is no reason to suppose that Wittgenstein would have wished to present anything like the same variant readings had he been writing in English. It is important for the reader to bear this in mind.

Page xviii

I have added some footnotes of my own. These are numbered in small Roman numerals thus: i, ii, etc.

Page Break xix

Page xix

I wish to reiterate my gratitude to the people who gave me generous help with the earlier translation: Marina Barabas, Steven Burns, S. Ellis, Stephan Körner, Norman Malcolm, Heiki Nyman, Rush Rhees, Helen Widdess, Erika Winch and G. H. von Wright. I now wish to add my thanks to two people who have helped me with my revised version: Helen Geyer and Lars Hertzberg. Lars Hertzberg in particular took enormous pains to go through

the first draft of my revision. He made valuable suggestions, some of which I followed; though in other cases I obstinately stuck to my original versions.

No one can think a thought for me in the way no one can don my hat for me. MS 107 100 c: 1929

Page 4

Anyone who listens to a child's crying with understanding will know that psychic forces, terrible forces, sleep within it, different from anything commonly assumed. Profound rage & pain & lust for destruction. MS 107 116 c: 1929

Page 4

Mendelssohn is like a man who is cheerful only when everything is cheerful anyway, or good only when everyone around him is good, & not self-sufficient like a tree that stands firmly in its place, whatever may be going on around it. I too am like that & tend to be so. MS 107 120 c: 1929

Page 4

My ideal is a certain coolness. A temple providing a setting for the passions without meddling with them. MS 107 130 c: 1929

Page 4

I often wonder whether my cultural ideal is a new one, i.e. contemporary, or whether it comes from the time of Schumann. At least it strikes me as a continuation of that ideal, though not the continuation that actually followed it then. That is to say, the second half of the 19th Century has been left out. This, I ought to say, has happened quite instinctively & and was not the result of reflection. MS 107 156 c: 10.10.1929

Page Break 5

If we think of the world's future, we always mean the place it will get to if it keeps going as we see it going now and it doesn't occur to us that it is not going in a straight line but in a curve & that its direction is constantly changing. MS 107 176 c: 24.10.1929

Page 5

I think good Austrian work (Grillparzer, Lenau, Bruckner, Labor) is particularly hard to understand. There is a sense in which it is *subtler* than anything else and its truth never leans towards plausibility. MS 107 184 c: 7.11.1929

Page 5

What is Good is Divine too. That, strangely enough, sums up my ethics.

Page 5

Only something supernatural can express the Supernatural. MS 107 192 c: 10.11.1929

Page 5

You cannot lead people to the good; you can only lead them to some place or other; the good lies outside the space of facts. MS 107 196: 15.11.1929

Page 5

I recently said to Arvid,†2 after I had been watching a very old film with him in the cinema: A modern film is to an old one as a present-day motor car is to one built 25 years ago. The impression it makes is just as ridiculous and clumsy & the way film-making has improved is comparable to the sort of technical improvement we see in cars. It is not to be compared with the improvement--if it's right to call it that--of an artistic style. It must be much the same with modern dance music too. A jazz dance, like a film, must be something that can be improved. What distinguishes all these developments from the formation of a *style* is that spirit plays no part in them.

Page 5

Today the difference between a good & a poor architect consists in the fact that the poor architect succumbs to every temptation while the good one resists it.

Page 5

I once said, & perhaps rightly: The earlier culture will become a heap of rubble & finally a heap of ashes; but spirits will hover over the ashes. MS 107 229: 10.-11.1.1930

Page 5

One uses straw to try to stuff the cracks which show in the work of art's

Page Break 6

organic unity, but to quiet one's conscience one uses the *best* straw. MS 107 242: 16.1.1930

Page 6

If anyone should think he has solved the problem of life & feels like telling himself everything is quite easy now, he need only tell himself, in order to see that he is wrong, that there was a time when this "solution" had not been discovered; but it must have been possible to live *then* too & the solution which has now been discovered appears in relation to how things were then like†a an accident. And it is the same for us in logic too. If there were a "solution to the problems of logic (philosophy)" we should only have to caution ourselves that there was a time when they had not been solved (and then too it must have been possible to live and think)-- MS 108 207: 29.6.1930

Page 6

Engelmann told me that when he rummages round at home in a drawer full of his own manuscripts, they strike him

as so glorious that he thinks they would be worth presenting to other people. (He said it's the same when he is reading through letters from his dead relations.) But when he imagines a selection of them published he said the whole business loses its charm & value & becomes impossible I said this case was like the following one: Nothing could be more remarkable than seeing someone who thinks himself unobserved engaged in some quite simple everyday activity. Let's imagine a theatre, the curtain goes up & and we see someone alone in his room walking up and down, lighting a cigarette, seating himself etc. so that suddenly we are observing a human being from outside in a way that ordinarily we can never observe ourselves; as if we were watching a chapter from a biography with our own eyes,--surely this would be at once uncanny and wonderful. More wonderful than anything that a playwright could cause to be acted or spoken on the stage. We should be seeing life itself.--But then we do see this every day & it makes not the slightest impression on us! True enough, but we do not see it from *that* point of view.--Similarly when E. looks at his writings and finds them splendid†b (even though he would not care to publish any of the pieces individually) he is seeing his life as God's work of art, & and as such it is certainly worth contemplating, as is every life & everything whatever. But only the artist can represent the individual thing so that it appears to us as a work of art; those manuscripts *rightly* lose their value if we contemplate them singly & in any case without *prejudice*, i.e. without being enthusiastic about them in

Page Break 7

advance. The work of art compels us--as one might say--to see it in the right perspective, but without art the object is a piece of nature like any other & the fact that *we* may exalt it through our enthusiasm does not give anyone the right to display it to us. (I am always reminded of one of those insipid photographs of a piece of scenery which is interesting to the person who took it because he was there himself, experienced something, but which a third party looks at with justifiable coldness; insofar as it is ever justifiable to look at something with coldness.<)>

But now it seems to me too that besides the work†a†b of the artist there is another through which the world may be captured sub specie æterni. It is--as I believe--the way of thought which as it were flies above the world and leaves it the way it is, contemplating it from above in its†c flight.†d†e

MS 109 28: 22.8.1930

Page 7

In Renan's *Peuple d'Israël* I read: "Birth, sickness, death, madness, catalepsy, sleep, dreams, all made an infinite impression and, even nowadays, it is given to only a small number to see clearly that these phenomena have causes within our constitution<.">†3 On the contrary there is absolutely no reason to marvel at such things; because they are such everyday occurrences. If primitive human beings *must* marvel at them, how much more so dogs & monkeys. Or is it being assumed that human beings suddenly awoke as it were & noticed these things which had always been there & were understandably amazed? Well, one might even assume something like this; not however that they became aware of these things for the first time, but rather that they suddenly began to marvel at them. But that too has nothing to do with their being primitive. Unless we call it primitive not to marvel at things, in which case it is precisely the people of today & Renan himself who are primitive, if he believes that scientific explanation could enhance wonderment.

As though today lightning were more commonplace or less astounding than 2000 years ago.

In order to marvel human beings--and perhaps peoples--have to wake up. Science is a way of sending them off to sleep again.

Page 7

I.e. it is simply false to say: of course, these primitive peoples *had* to marvel

Page Break 8

at everything. But perhaps right that these people *did* marvel at everything around them.--To think they had to marvel at them is a primitive superstition. (Like that of thinking that they *had* to fear all the forces of nature & that we of course do not have†a to fear. On the other hand experience may show that certain primitive tribes are very strongly inclined to fear natural phenomena.--But we cannot exclude the possibility that highly civilized peoples will become liable to this very same fear again & their civilization and the knowledge of science will†b not protect them from this. All the same it is true that the *spirit* in which science is carried on nowadays is not compatible with fear of this kind)

Page 8

What Renan calls the *bon sens précoce* of the semitic races (an idea that I †c already entertained a long time ago) is their *unpoetic* mentality, which heads straight for what is concrete. Which is characteristic of my philosophy. Things are right before our eyes†d, not covered by any veil.--This is where religion & art part company.

Page 8

Sketch for a Foreword†4

This book is written for those†e who are in sympathy with the spirit in which it is written.†f This spirit is, I believe, different from that of the†g prevailing European and American civilization. The spirit of this civilization the expression of which is the industry, architecture, music, of present day†h fascism & socialism, is a spirit that is alien & uncongenial†i to the author. This is not a value judgement. It is not as though I did not know that†j what today represents itself as architecture is not architecture & not†k as though he did not approach what is called modern music with the greatest mistrust (without understanding its language), but the disappearance of the arts does not justify a disparaging judgement on a whole segment of humanity. For in these times genuine & strong characters simply turn away from the field of the arts & towards other things & somehow the value of the individual finds expression. Not, to be sure, in the way it would at a time of Great Culture. Culture is like a great organization which assigns to each of its members his place, at which he

Page Break 9

can work in the spirit of the whole, and his strength can with a certain justice be measured by his success as understood within that whole. In a time without culture, however, forces are fragmented and the strength of the individual is wasted through the overcoming of opposing forces & frictional resistances; it is not manifest in the distance travelled but rather perhaps in the heat generated through the overcoming of frictional resistances. But energy is still energy & even if the spectacle afforded by this age is not the coming into being of a great work of culture in which the best contribute to the same great end, so much as the unimposing spectacle of a crowd whose best members pursue purely private ends, still we must not forget that the spectacle is not what matters.

Even if it is clear to me then that the disappearance of a culture does not signify the disappearance of human value but simply of certain means of expressing this value, still the fact remains that I contemplate the current of European civilization without sympathy, without understanding its aims if any. So I am really writing for friends who are scattered throughout the corners of the globe.

Page 9

It is all one to me whether the typical western scientist understands or appreciates my work since in any case he does not understand the spirit in which I write.

Page 9

Our civilization is characterized by the word progress. Progress is its form, it is not one of its properties that it makes progress. Typically it constructs. Its activity is to construct a more and more complicated structure. And even clarity is only a means to this end & not an end in itself.

For me on the contrary clarity, transparency, is an end in itself

I am not interested in erecting a building but in having the foundations of possible buildings transparently before me.

So I am aiming at something different than are the scientists & my thoughts move differently than do theirs.

Page 9

Each sentence that I write is trying to say the whole thing, that is, the same thing over and over again & it is as though they were†a views of one object seen from different angles.

Page Break 10

I might say: if the place I want to reach could only be climbed up to by a ladder, I would give up trying to get there. For the place to which I really have to go is one that I must actually be at already.

Anything that can be reached with a ladder does not interest me.

Page 10

One movement orders one thought to the others in a series, the other keeps aiming at the same place.

Page 10

One movement constructs & takes (in hand) one stone after another,†a the other keeps reaching for the same one.

Page 10

The danger in a long foreword is that the spirit of a book has to be evident in the book itself & cannot be described. For if a book has been written for only a few readers that will be clear just from the fact that only a few understand it. The book must automatically separate those who understand it & those who do not. The foreword too is written just for such as†b understand the book.

Telling someone something he does not understand is pointless, even if you add that he will not be able to

understand it. (That so often happens with someone you love.)

If you do not want certain people to get into a room, put a lock on it for which they do not have the key. But it is senseless to talk with them about it, unless you want them all the same to admire the room from outside!

The decent thing to do is: put a lock on the doors that attracts only those†c who are able to open it & is not noticed by the rest.

But it's alright to say that the book in my opinion has nothing to do with the progressive civilization of Europe & America.

That this civilization is perhaps an environment necessary for its spirit but that they have different aims.

Everything ritualistic (everything that, as it were, smacks of the high priest) is strictly to be avoided because it straightaway turns rotten†d.

Of course a kiss is a ritual too & it isn't rotten; but no more ritual is permissible than is as genuine as a kiss.

Page Break 11

Page 11

It is a great temptation to want to make the spirit explicit.

MS 109 204: 6-7.11.1930

Page 11

When you bump against the limits of your own decency it is as though a whirlpool of thoughts is generated, (&) an endless regress: you may *say* what you like, it gets you no further. MS 109 212: 8.11.1930

Page 11

I am reading Lessing (on the Bible): "Add to this the verbal clothing and the style.... absolutely full of tautologies, but of a kind to exercise one's wits by seeming sometimes to say something different while really saying the same thing, and at other times seeming to say the same thing while at bottom meaning, or being capable of meaning, something different..."†5 MS 110 5:12.12.1930

Page 11

If I do not quite know how to begin a book that is because something is still unclear. For I should like to begin with the original data of philosophy, written & spoken sentences, with books as it were
And here we encounter the difficulty of "Everything is in flux". And perhaps that is the very point at which to begin. MS 110 10: 13.12.1930

Page 11

If someone is merely ahead of his time, it will catch him up one day.

MS 110 11: 25.12.1930

Page 11

Music, with its few notes & rhythms, seems to some people a primitive art. But only its surface†a is simple, while the body which makes possible the interpretation of this manifest content has all the infinite complexity that is suggested in the external forms of other arts & which music conceals. In a certain sense it is the most sophisticated art of all.

Page 11

There are problems I never tackle, which do not lie in my path or belong to my world. Problems of the intellectual world of the West which Beethoven (& perhaps Goethe to a certain extent) tackled & wrestled with but which no philosopher has ever confronted (perhaps Nietzsche passed close to them)

And perhaps they are lost to western philosophy, that is there will be no one there who experiences and so can describe the development of this culture as an epic. Or more precisely it just is no longer an epic, or is one

Page Break 12

only for someone who observes it from outside & perhaps Beethoven did this with prevision (as Spengler hints in one place) It might be said that civilization can only have its epic poet in advance. Just as one can only foresee one's own death and describe it as something lying in the future, not report it as it happens. So it might be said: If you want to see the epic of a whole culture written†a you will have to seek it in the works of its greatest figures and hence seek it at a time when the end of this culture can only be *foreseen*, for later there is no one there any more to describe it. So it is not to be wondered at that it should be written in the dark language of prevision†b & intelligible only to the very few.

Page 12

But I do not get to these problems at all. When I "have done with the world" I have created an amorphous (transparent) mass & the world in all its variety is left on one side like an uninteresting lumber room.

Or perhaps more precisely: the whole outcome of the entire work is for the world to be set on one side. (A throwing-into-the-lumber-room of the whole world)

Page 12

In this world (mine) there is no tragedy & with that all the endlessness that gives rise to tragedy (as its result†c) is lacking

It is as though everything were soluble in the ether;†d there are no harnesses.

This means that hardness & conflict do not become something splendid†e but a *defect*.

Page 12

Conflict is dissipated in much the same way as is the tension of a spring in a mechanism that you melt (or dissolve in nitric acid). In this†f solution tensions no longer exist. MS 110 12: 12.-16.1.1931

Page 12

If I say that my book is meant for only a small circle of people (if that can be called a circle) I do not mean to say that this circle is in my view the élite of mankind but it is the circle to which†g I turn (not because they are better or worse than the others but) because they form my cultural circle, as it

Page Break 13

were my fellow countrymen in contrast to the others who are *foreign* to me.

MS 110 18: 18.1.1931

Page 13

The limit of language manifests itself in the impossibility of describing the fact that corresponds to (is the translation of) a sentence without simply repeating the sentence.

Page 13

(We are involved here with the Kantian solution of the problem of philosophy.)

MS 110 61: 10.2.1931

Page 13

Can I say that drama has its own time which is not a segment of historical time. I.e. I can speak of earlier and later within it but there is *no sense* to the question whether the events in it took place, say, before or after Caesar's death.

MS 110 67: 12.2.1931

Page 13

The charming difference in temperature between the parts of a human body. MS 153a 4v: 10.5.1931

Page 13

It is humiliating having to present oneself as an empty tube only inflated by the mind.

MS 153a 12v: 1931

Page 13

No one likes having offended another person; that is why it does everyone good when the other person doesn't show that he has been offended. Nobody likes being confronted by a wounded spaniel. Remember that. It is much easier patiently--& tolerantly†i--to avoid the person that offended you than to approach him as a friend. You need courage too for that.

MS 153a 18v 1931

Page 13

To treat well somebody who does not like you requires not just great good nature but great *tact* too.

MS 153a 35v: 1931

Page 14

A thinker is very similar to a draughtsman. Who wants†a to represent all the interconnections. MS 153a 90v: 1931

Page 14

Pieces of music composed at the keyboard, those by thinking with the pen & those composed just with imagined

sounds must be of quite a different kind†b and make quite different kinds of impression.

I am sure that Bruckner composed just in his head, imagining the orchestra playing, Brahms with his pen. Of course this is an oversimplification. But it does highlight *one* feature. MS 153a 127v: 1931

Page 14

A tragedy might really always start with the words: "Nothing at all would have happened, had it not been that..."

Page 14

(Had he not been caught in the machine by a corner of his clothing?)

Page 14

But isn't it a one-sided view of tragedy to think of it merely as showing, that an encounter can decide one's whole life.

Page 14

I think today there could be a form of theatre played in masks. The characters would be just stylized human beings.†c†6 In Kraus's writings this can be clearly seen. His pieces could be, or should be, performed in masks. Of course this goes with a certain abstractness in these works. And masked theatre, as I believe, is in any case the expression of an intellectual character. Perhaps (too) for this reason only Jews will be attracted to this theatre. MS 153a 128v: 1931

Frida Schanz:

Foggy day. Grey autumn haunts us.

Laughter seems tainted;

Page Break 15

the world is mute today,
as though last night it died.
In the red-gold hedge
are brewing fog dragons;
and sleeping lies the day.
The day will not awaken.

(...)

I took the poem on the previous page from a "Rösselsprung"†i in which of course the punctuation was not shown. So I do not know if the words "Foggy day" form the title, or belong to the first line, as I have written it. And it is remarkable how trivial the poem sounds if it does not begin with "Foggy day" but with "Grey". This changes the rhythm of the *whole* poem.†a MS 153a 136r: 1931

Page 15

What you have achieved cannot mean†b more to others than to you.

Page 15

As much (as) it has cost you, that is what they will pay.

MS 153a 141r: 1931

Page 15

The Jew is a desert region under whose thin layer of rock lies the molten lava of spirit. MS 153a 160v: 1931

Page 15

Grillparzer: "How easy it is to move about in broad distant regions, how hard to grasp what is individual & near at hand..." MS 153b 3r: 1931

How should we feel if we had never heard of Christ?

Should we feel left alone in the dark?

Do we not feel like that only in the way a child doesn't when he knows there is someone in the room with him?

Religious madness is madness springing from irreligiousness. MS 153b 29r: 1931

Page 15

I look at the photographs of Corsican brigands and reflect: these faces are too hard & mine too soft for Christianity to be able to write on them. The

Page Break 16

faces of the brigands are terrible to behold & yet they are certainly no more distant from a good life & are simply situated on a different side of it than am I. MS 153b 39v: 1931

Page 16

A confession has to be part of one's new life.

MS 154 1r: 1931

Page 16

I never more than half succeed in expressing what I want to express. Indeed not even so much,†7 but perhaps only one tenth. That must mean something. My writing is often nothing but "stammering".

MS 154 1v: 1931

Page 16

The saint is the only Jewish "genius". Even the greatest Jewish thinker is no more than talented. (Myself for instance.)

Page 16

I think there is some truth in my idea that I am really only reproductive in my thinking. I think I have never *invented* a line of thinking but that it was always provided for me by someone else & I have done no more than passionately take it up for my work of clarification. That is how Boltzmann Hertz Schopenhauer Frege, Russell, Kraus, Loos Weininger Spengler, Sraffa†8 have influenced me. Can one take Breuer & Freud as an example of Jewish reproductive thinking?--What I invent are new *comparisons*.

Page 16

At the time I modelled the head for Drobil too the stimulus was essentially a work of Drobil's & my work was again really one of clarification. I believe that what is essential is for the activity of clarification to be carried out with COURAGE; without this it becomes a mere clever game.

Page 16

The Jew must in a real sense "make nothing his business".†i But for him especially this is particularly hard because he, as it were, has nothing. It is much harder to be poor voluntarily if you *can't help* being poor, than when you might also be rich.

Page 16

It might be said (rightly or wrongly) that the Jewish mind is not in a

Page Break 17

position to produce even so much as a tiny blade of grass or flower but that its way is to make a drawing of the blade of grass or the flower that has grown in the mind of another & then use it to sketch a comprehensive picture. This is not to allege a vice & everything is all right as long as what is being done is quite clear. Danger arises only when someone confuses the nature of a Jewish work with that of a non-Jewish work & especially when the author of the former does so himself, as he so easily may. ("Doesn't he look as proud as though he were being milked himself."†9<>

It is typical of the Jewish mind to understand someone else's work better than he understands it himself.

Page 17

When I have had a picture suitably framed or have hung it in the right surroundings I have often caught myself being as proud as though I had painted the picture. Actually that's not right: not "as proud as though I had painted it" but as proud as though I had helped to paint it, as though I had so to speak painted a little bit of it. It is as if an exceptional arranger of grasses were at last to think that he too had produced at least a quite tiny blade of grass himself. Whereas it ought to be clear to him that his work lies in a different region altogether.

The process through which even the tiniest & meanest blade of grass comes into being is quite foreign & unknown to him.

Page 17

A picture of a complete apple tree, however accurate, in a certain sense resembles it infinitely less than does the smallest daisy. And in this sense a symphony by Bruckner is infinitely more closely related to a symphony from the heroic period than is one by Mahler. If the latter is a work of art it is one of a *totally* different sort. (But this observation itself is actually Spenglerian.)

Page 17

Anyway when I was in Norway during the year 1913-14 I had some thoughts of my own, or so at least it seems to me now. I mean that I have the impression of having given birth to new lines of thinking at that time (But perhaps I am mistaken). Whereas now I seem just to apply old ones.

MS 154 15v: 1931

Page 17

There is something Jewish in Rousseau's character.

MS 154 20v: 1931

Page 17

If it is said on occasion that (someone's) philosophy is a matter of temperament, there is some truth in this. A preference for certain comparisons is something we call a matter of temperament & far more disagreements

rest on this than appears at first sight.†a

"Look on this wart†b as a regular limb of your body!" Can one do that, to order?

Do I have the power to decide at will to have, or not to have, a certain ideal conception of my body?

Within the history of the peoples of Europe the history of the Jews is†10 not treated so circumstantially as their intervention in European affairs would actually merit, because within this history they are experienced as a sort of disease, anomaly, & nobody wants to put a disease on the same level as normal life†c [[sic . ?]]

We may say: this bump can be regarded as a limb of one's body only if our whole feeling for the body changes (if the whole national feeling for the body changes). Otherwise the best we can do is *put up with it*.

You may expect an individual to display this sort of tolerance or even to disregard such things; but you cannot expect this of a nation since it is only a nation by virtue of not disregarding such things. I.e. there is a contradiction in expecting someone to retain the original aesthetic feeling for his body & also to make the swelling welcome.

Power & possession are not the *same* thing. Even though possession also gives us power. If Jews are said not to have any sense for possession that is presumably compatible with their liking to be rich; for money is for them a particular sort of power not possession. (I should for instance not like my people to be poor, since I wish them to have a certain power. Naturally I wish them to use this power properly too.)

There is definitely a certain kinship between Brahms & Mendelssohn; but I do not mean that shown by the individual passages in Brahms's works that are reminiscent of passages in Mendelssohn but the kinship of which I am speaking could be expressed by saying that Brahms does with complete rigour what Mendelssohn did half-rigorously. Or: Brahms is often Mendelssohn without the flaws.

†11 That must be the end of a theme which I cannot place†i. It occurred to me today as I was thinking about my work in philosophy & said to myself: "I destroy, I destroy, I destroy--" MS 154 21v: 1931

It has sometimes been said that the Jews' secretive & cunning nature is a result of their long persecution. That is certainly untrue; on the other hand it is certain that, despite this persecution, they continue to exist only because they have the inclination towards this secretiveness. As we may say that such & such an animal has escaped extinction only because it has the possibility or capability of concealing itself. Of course I do not mean that one should commend this ability for such a reason, not by any means.

In Bruckner's music nothing is left of the long & slender (nordic?) face of Nestroy, Grillparzer, Haydn, etc. but it has in full measure a round full (alpine?) face even purer in type than was Schubert's.

The power of language to make everything look the same which appears in its crassest form in the *dictionary* & which makes it possible to personify *time*, something which is no less remarkable than would have been making

divinities of the logical constants.

MS 154 25v: 1931

Labor's seriousness is a very late seriousness. MS 110 231 c: 29.6.1931

Page 20

Talent is a spring from which fresh water is constantly flowing. But this spring loses its value if it is not used†c in the right way. MS 110 238: 30.6.1931

Page 20

"What a sensible man knows is hard to know." Does Goethe's contempt for laboratory experiment and his exhortation to go out into uncontrolled nature & learn from that, does this have some connection with the idea that a hypothesis (wrongly conceived) is already a falsification of the truth? And with the beginning I am now thinking of for my book which might consist of a description of nature?†d MS 110 257: 2.7.1931

Page 20

If people find a flower or an animal ugly they always have an impression as though they were artifacts. "It looks like a ..." they say. This sheds light on the meaning of the words "ugly" & "beautiful". MS 110 260 c: 2.7.1931

Page Break 21

Page 21

Labor, when he writes good music, is absolutely unromantic. That is a very remarkable & significant indication. MS 111 2c: 7.7.1931

Page 21

Reading the Socratic dialogues, one has the feeling: what a frightful waste of time! What's the point of these arguments that prove nothing & clarify nothing. MS 111 55: 30.7.1931

Page 21

The story of Peter Schlemihl†13 should, it seems to me, go†a like this: He makes over his soul to the Devil for money. Then he repents it & now the Devil demands his shadow as ransom. But Peter Schlemihl still has a choice between giving the Devil his soul or sacrificing along with his shadow life in community with human beings. MS 111 77:11.8.1931

Page 21

In Christianity it is as though God said to human beings: Don't act a tragedy, that is to say, don't enact heaven & hell on earth, heaven & hell are *my* affair. MS 111 115: 19.8.1931

Page 21

Spengler could be better understood if he said: I am *comparing* different periods of culture with the lives of families; within the family there is a family resemblance, while you will also find a resemblance between members of different families; family resemblance differs from the other sort of resemblance in such & such ways etc.. What I mean is: We have to be told the object of comparison, the object from which this approach is derived, so that prejudices do not constantly slip into the discussion. Because then we shall willy nilly ascribe what is true†b of the prototype of the approach†c to the object to which we are applying the approach as well; & we claim "*it must always be...*" This comes about because we want to give the prototype's characteristics a foothold in the approach. But since we confuse prototype & object we find ourselves dogmatically conferring on the object properties which only the prototype necessarily possesses. On the other hand we think the approach will lack the†d generality we want to give

if it really holds only of the one case. But the prototype must just be presented for what it is; as characterizing the whole approach and determining its form. In this way it stands at the head & is generally valid by virtue of determining the form of approach, not by virtue of a claim that everything which is true only of it

Page Break 22

holds for all the objects to which the approach is applied.

One should thus always ask when exaggerated dogmatic claims are made: What is actually true in this. Or again: In what case is that actually true MS 111 119: 19.8.1931

Page 22

From Simplicissimus: riddles of technology.

(Picture: two professors in front of a bridge under construction) Voice from above: "Fotch it dahn--coom on--fotch it dahn A tell tha--we'll turn it t'other rooad sooin!"†i --"It really is quite incomprehensible, my dear colleague, how such complicated & precise work can be carried out in this language." MS 111 132: 23.8.1931

Page 22

We keep hearing the remark that philosophy really does not progress, that we are still occupied with the same philosophical problems as were the Greeks. Those who say this however don't understand why it is so.†a It is because our language has remained the same & keeps seducing us into asking the same questions. As long as there is still a verb 'to be' that looks as though it functions in the same way as 'to eat' and 'to drink', as long as we still have the adjectives 'identical', 'true', 'false', 'possible', as long as we continue to talk of a river of time & an expanse of space, etc., etc., people will keep stumbling over the same cryptic difficulties & staring at something that no explanation seems capable of clearing up.

And this satisfies besides a longing for the supernatural†b for in so far as people think they can see the "limit of human understanding", they believe of course that they can see beyond it.

Page 22

I read: "philosophers are no nearer to the meaning of 'Reality' than Plato got;..." What a singular†c situation. How singular then that Plato has been able to get†d even as far as he did! Or that we could get no further afterwards! Was it because Plato was so clever? MS 111 133: 24.8.1931

Page Break 23

Kleist wrote somewhere†14 that what the poet would most of all like to be able to do, would be to convey thoughts in themselves†a without words. (What a strange avowal.) MS 111 173: 13.9.1931

Page 23

It is often said that a new religion brands the gods of the old one as devils. But in reality they have presumably by that time already become devils. MS 111 180:13.9.1931

Page 23

The works of the great masters are stars†b which rise and set around us. So the time will come again for every great work that is now in the descendent. MS 111 194: 13.9.1931

Page 23

(Mendelssohn's music, when it is flawless, consists of musical arabesques. That is why we feel embarrassed at every lack of rigour in his work.)

Page 23

In Western Civilization the Jew is always being measured according to calibrations which do not fit him. That the Greek thinkers were neither philosophers in the western sense, nor scientists in the western sense, that those who took part in the Olympic Games were not sportsmen & fit into <no> western occupation, is clear to many people. But it is the same with the Jews too†c

And insofar as the words of our <language> seem to us the only possible standards of measurement we are always doing him†d injustice. And he is†e first overestimated then underestimated. In this context Spengler is quite right not to classify Weininger with the western philosophers.†f†15

Page 23

Nothing we do can be defended definitively. But only by reference to something else that is established.

I.e. no reason can be given why you should act (or should have acted) *like this*, except that by doing so you bring about such and such a situation, which again you have to *accept* as an aim. MS 111 195: 13.9.1931

Page 23

The inexpressible (what I find enigmatic & cannot express) perhaps provides the background, against which whatever I was able to express acquires meaning. MS 112 1: 5.10.1931

Page Break 24

Work on philosophy--like work in architecture in many respects--is really more work†a on oneself. On one's own conception. On how one sees things. (And what one expects of them.) MS 112 46: 14.10.1931

Page 24

The philosopher easily gets into the position of an incompetent manager who, instead of doing his *own* work & simply seeing to it†b that his employees do theirs properly takes over their work & so finds himself one day overloaded with other people's work, while the employees look on and criticize him. MS 112 60: 15.10.1931

Page 24

The idea is worn out by now & no longer usable. (I once heard Labor make a similar remark about musical ideas.) In the way silver paper, once crumpled, can never quite be smoothed out again. Nearly all my ideas are a bit crumpled. MS 112 76: 24.10.1931

Page 24

I really do think with my pen, for my head often knows nothing of what my hand is writing.

Page 24

(Philosophers are often like little children who first scribble some marks on a piece of paper at random and now†c ask the grown-up "what's that?"--It happened like this: The grown-up had often drawn something for the child & said: "this is a man", "this is a house" etc. And now the child makes some marks too and asks: and what's *this* then?" MS 112 114: 27.10.1931

Page 24

Ramsey was a bourgeois thinker. I.e. he thought with the aim of clearing up the affairs of some particular community. He did not reflect on the essence of the state--or at least he did not like doing so--but on how *this* state might reasonable be organized. The idea that this state might not be the only possible one partly disquieted him and partly bored him. He wanted to get down as quickly as possible to reflecting on the foundations--of *this* state. This was what he was good at & what really interested him; whereas real philosophical reflection disquieted him until he put its result (if it had one) on one side as trivial. MS 112 139: 1.11.1931

Page Break 25

A curious analogy could be based on the fact that the eye-piece of even the hugest telescope cannot be bigger†a than our eye. MS 112 153: 11.11.1931

Page 25

Tolstoy: the meaning (importance) of something lies in its being something everyone can understand. That is both true & false. What makes the object hard to understand--if it's significant, important--is not that you have to be instructed in abstruse matters in order to understand it, but the antithesis between understanding the object & what most people *want* to see. Because of this precisely what is most obvious may be what is most difficult to understand. It is not a difficulty for the intellect but one for the will that has to be overcome. MS 112 221: 22.11.1931

Page 25

Someone who teaches philosophy nowadays gives his pupil foods, not†b because they are to his taste, but in order to change his taste. MS 112 223: 22.11.1931

Page 25

I must be nothing more than the mirror in which my reader sees his own thinking with all its deformities & with this assistance can set it in order. MS 112 225: 22.11.1931

Page 25

Language sets everyone the same traps; it is an immense network of well kept†c wrong turnings. And hence we see one person after another walking down the same paths & we know in advance the point at which they will branch off, at which they will walk straight on without noticing the turning, etc., etc. So what I should do is erect signposts at all the junctions where there are wrong turnings, to help people past the danger points.

Page 25

What Eddington says about the 'direction of time' & the principle of entropy amounts to saying that time would reverse its direction if people began one day to walk backwards. If you like you can by all means call it that; but then you must be clear in your mind that you have said no more than that people have changed the direction in which they walk. MS 112 231: 22.11.1931

Page Break 26

Someone divides human beings into buyers & sellers, & forgets that buyers are sellers as well. If I remind him of this, †a is his grammar changed? MS 112 232: 22.11.1931

Page 27

The various plants & their *human* character: rose, ivy, grass, oak, apple tree, corn palm. Compared with the diverse character of words MS 156b 23v: ca. 1932-1934

Page 27

If one wanted to characterize the essence of Mendelssohn's music one could do it by saying that there is perhaps no music by Mendelssohn that is hard to understand. MS 156b 24v: ca. 1932-1934

Page 27

Every artist has been influenced by others & shows (the) traces of that influence in his works; but what we get from him is all the same only his own personality †b. What is inherited from others can be nothing but egg shells. We should treat the fact of their presence with indulgence but they will not give us Spiritual nourishment.

Page 27

It seems to me (sometimes) as though I were already †c philosophizing with toothless gums & as though I took speaking without teeth for the right way, the more worthwhile way. I detect something similar in Kraus. Instead of my recognizing it as a deterioration. MS 156b 32r: ca. 1932-1934

Page 27

If someone says, let's suppose, "A's eyes have a more beautiful expression than B's", then I want to say that he certainly does not mean by the word beautiful what is common to everything that we call "beautiful". Rather he is playing a game with this word that has quite narrow bounds. But what shows this? Did I have in mind some particular restricted explanation of the word "beautiful"? Certainly not.--But perhaps I shall not even want to compare the beauty of expression in a pair of eyes with the beauty in the shape of a nose.

Page Break 28

Page 28

Indeed we might perhaps say: If a language had two words so that there was no indication of anything common to these cases I should have no trouble taking one of these two specialized words for my case & nothing would be lost from the sense of what I wanted to say.

One might say: how would I explain the word 'rule' or 'plant' in the particular case then? that will show 'what I mean by it'.

Suppose I had said: "the gardener raises very beautiful plants in this greenhouse". I want to communicate something to my hearer with this & the question arises: for this does he have to know what is common to everything that we call "plant"? No. I could quite well have given him the explanation for the case in hand by means of a few examples or a few pictures.

In the same way if I say: "I will just explain the rules of this game to you", do I presuppose that the other knows everything that is common to what we call "rule"? MS 145 14r: Autumn 1933*

Page 28

If I say A. has beautiful eyes I may be asked: What do you find beautiful about his eyes & perhaps I will answer: the almond shape, the long lashes, the delicate lids.

What do these eyes have in common with a Gothic church that I also find beautiful? Am I to say they make a similar impression on me? What if I said: what they have in common is that in both cases my hand is tempted to draw them? That at any rate would be a *narrow definition* of the†a beautiful.

It will often be possible to say: ask what your reasons are for calling something good or beautiful & the particular grammar of the word "good" in this case will be apparent. MS 145 17v: 1933

Page 28

I believe I summed up where I stand in relation to philosophy when I said: really one should write philosophy only as one *writes a poem*. That, it seems to me, must reveal how far my thinking belongs to the present, the future, or the past. For I was acknowledging myself, with these words, to be someone who cannot quite do what he would like to be able to do. MS 146 25v: 1933-1934

Page 28

If you use a trick in logic, whom can you be tricking but yourself? MS 146 35v: 1933-1934

Page Break 29

Composers' names. Sometimes it is the method of projection that we treat as given. When we, say, ask What name would hit off this person's character But sometimes we project the character into the name & treat that as given. Thus we get the impression that the great masters we know so well have just the names that suit their work. MS 146 44v: 1933-1934

Page 29

If someone prophesies that the generation to come will take up these problems & solve them that is usually a sort of wishful thinking, a way of excusing oneself for what one should have accomplished & hasn't. A father would like his son to achieve what he has not achieved so that the task he left unresolved should find a resolution nevertheless. But his son is faced with a new task. I mean: the wish that the task should not remain unfinished disguises itself as a prediction that it will be taken further by the next generation. MS 147 16r: 1934

Page 29

The overwhelming *skill* in Brahms. MS 147 22r: 1934

Page 29

If I say: "that is the only thing that is really seen" I point in front of me. If I were to point sideways or behind me however--at things that I did not see--this pointing would lose all its sense for me. That means, though that my pointing in front of me is not contrasted with anything.

(Someone who is in a hurry will when sitting in a car push involuntarily, even though he may tell himself that he is not pushing the car at all.) MS 157a 2r: 1934*

Page 29

By the way, in my artistic activities I have merely *good manners*. MS 157a 22v: 1934

Page 29

In the days of silent films all the classics were played with the films, except Brahms & Wagner. Not Brahms because he is too abstract. I can imagine an exciting scene in a film accompanied with music by Beethoven or Schubert & might gain some sort of understanding of the music from the film. But not an understanding of music by Brahms. Bruckner on the other hand does go with a film. MS 157a 44v: 1934 or 1937

Page 29

The queer resemblance between a philosophical investigation (perhaps especially in mathematics <)> and one in

aesthetics. (E.g. what is bad about this garment, how it should be, etc..) MS 116 56: 1937

Page Break 30

The *edifice of your pride* has to be dismantled. And that means frightful work. MS 157a 57r: 1937

Page 30

In one day you can experience the horrors of hell; that is plenty of time. MS 157a 57r: 1937

Page 30

There is a big difference between the effect of a script that you can read fluently & one that you can write but not decipher†a *easily*. The thoughts are enclosed,†16 as in a casket. MS 157a 58r: 1937

Page 30

The greater "purity" of objects that do not affect the senses, numbers for instance. MS 157a 62v: 1937

Page 30

If you offer a sacrifice & then are conceited about it, you will be cursed along with your†b sacrifice. MS 157a 66v c: 1937

Page 30

The light shed by work is a beautiful light, but it only shines with real beauty if it is illuminated by yet another light. MS 157a 67v c: 1937

Page 30

"Yes, that's how it is," you say, "because that's how it *must* be!"

Page 30

(Schopenhauer: the real life span of the human being is 100 years.)

"Of course, it must be like that!" It is as though you have understood a creator's *purpose*. You have understood the *system*.

You do not ask yourself 'How long do human beings actually live then?', that seems now a superficial matter; whereas you have understood something more profound. MS 157b 9v: 1937

Page 30

The†17 only way namely for us†c to avoid prejudice†18 --or vacuity in our claims, is to posit†d the ideal as what it is, namely as an object of comparison--a measuring rod as it were--within our way of looking at things, & not†e as a preconception to which everything must†f conform. This namely is†g the dogmatism into which philosophy†h can so easily degenerate.

Page Break 31

But then†19 what is the relation between an approach like Spengler's & mine?

Injustice in Spengler: The ideal loses none of its dignity if it is posited as the principle determining the form of one's approach. A good unit of measurement.-- --†20 MS 157b 15v: 1937

Page 31

Slept a bit better. Vivid dreams. A bit depressed; weather & state of health.

The solution of the problem you see in life is a way of living which makes what is problematic disappear.

The fact that life is problematic means that your life does not fit life's shape. So you must change your life, & once it fits the shape, what is problematic will disappear.

But don't we have the feeling that someone who doesn't see a problem there is blind to something important, indeed to what is most important of all?

Wouldn't I like to say he is living aimlessly--just blindly like a mole as it were; & if he could only see†a, he would see the problem?

Or shouldn't I say: someone who lives rightly does not experience the problem as *sorrow*, hence not after all as a problem, but rather as joy, that is so to speak as a bright halo round his life, not a murky background. MS 118 17r c: 27.8.1937*

Page 31

Almost in the same way as earlier physicists are said to have found suddenly that they had too little mathematical understanding to be able to master physics; we may say that young people today are suddenly in the position that ordinary common sense no longer suffices to meet the strange demands life makes. Everything has become so intricate that for its mastery†b an exceptional degree of understanding is required. For it is not enough any longer to be able to play the game well; but the question is again and again: what sort of game is to be played now anyway?†c MS 118 20r: 27.8.1937

Page 31

There is much that is excellent in Macaulay's essays; only his *value judgements* on people are tiresome, &

superfluous. One would like to say to him: stop gesticulating! & just say what you have to say. MS 118 21v:
27.8.1937

Page Break 32

Ideas too sometimes fall from the tree before they are ripe.

MS 118 35r c: 29.8.1937

Page 32

In philosophizing it is important for me to keep changing my position, not to stand too long on *one* leg, so as not to get stiff.

Like someone on a long up-hill climb who walks backwards for a while to revive himself, stretch some different muscles.

MS 118 45r c: 1.9.1937

Page 32

Caught a bit of a chill & unable to think. Ghastly weather.--

Christianity is not a doctrine, not, I mean, a theory about what has happened & will happen to the human soul, but a description of something that actually takes place in human life. For 'recognition of sin' is an actual occurrence & so is despair & so is redemption through faith. Those who speak of it (like Bunyan), are simply describing what has happened to them; whatever gloss someone may want to put on it!

MS 118 56r c: 4.9.1937*

Page 32

When I imagine a piece of music, something I do every day & often, I--always I think--rhythmically grind my upper & lower front teeth together. I have noticed it before but usually it takes place quite unconsciously. Moreover it's as though the notes in my imagination were produced by this movement.

I think this way of hearing music in the imagination may be very common. I can of course also imagine music without moving my teeth, but then the notes are much more blurred, much less clear, less pronounced.

MS 118 71v c: 9.9.1937

Page 32

If certain graphic propositions for instance are laid down for human beings as dogmas governing thinking, namely in such a way that opinions are not thereby determined, but the *expression* of opinions†a is completely controlled, this will have a very strange effect. People will live under an absolute, palpable tyranny, yet without being able to say they are not free.†i I think the Catholic Church does something like this. For dogma is expressed in the form of an assertion & is unshakable, & at the same time any practical

Page Break 33

opinion can be made to accord with it; admittedly this is easier in some cases, more difficult in others. It is not a *wall* setting limits to belief, but like a *brake* which in practice however serves the same purpose;†a†b almost as though someone attached a weight to your foot to limit your freedom of movement.†c This is how dogma becomes irrefutable & beyond the reach of attack.

MS 118 86v: 11.9.1937

Page 33

With thinking too there is a time for ploughing & a time for harvesting.

It gives me satisfaction to write *a lot* every day. This is childish but that's how it is. MS 118 87r c: 11.9.1937*

Page 33

If I am thinking just for myself without wanting to write a book, I jump about all round the topic; that is the only way of thinking that is natural to me. Forcing my thoughts into an ordered sequence is a torment for me. Should I even attempt it now??

I *squander* untold effort making an arrangement of my thoughts that may have no value whatever. MS 118 94v c: 15.9.1937

Page 33

People have sometimes said to me†d they cannot make any judgement about this or that because they have never learnt philosophy. This is irritating nonsense,†e it is†f being assumed that philosophy is some sort of science. And people speak of it as they might speak of medicine.--What one can say, however, is that people who have never carried out an investigation of a philosophical sort, like most mathematicians for instance, are not equipped with the right optical instruments for that sort of investigation or scrutiny. Almost,†g as someone who is not used to searching in the forest for berries†h will not find any because his eye has not been sharpened for such things & he does not know where you have to be particularly on the lookout for them. Similarly someone unpractised in philosophy passes by all the spots where difficulties lie hidden under the grass, while someone with practice pauses & senses that there is a difficulty here, even though†i he does not yet

see it.--And no wonder, if one knows how long even the practised investigator, who realizes there is a difficulty, has to search in order to find it.

If something is well hidden it is hard to find.

MS 118 113r: 24.9.1937

Religious similes can be said to move on the edge of the abyss. B<unyan>'s allegory for instance. For what if we simply add: "and all these traps, swamps, wrong turnings, were planted by the Lord of the Road, the monsters, thieves, robbers were created by him?"

Without doubt, that is not the sense of the simile! but this sequel is too obvious! For many & for me it robs the simile of its power.

But more especially if this is--as it were--suppressed. It would be different if it were said openly at every turn: 'I am using this as a simile, but look: it doesn't fit here'. Then you wouldn't feel you were being cheated, that someone were trying to convince you by trickery. You can say to someone for instance: "Thank God for the good you receive but don't complain about the evil,†a as you would of course do if a human being were to do you good and evil by turns." Rules of life are dressed up in pictures. And these pictures can only serve to *describe* what we are supposed to do, but not to *justify* it. Because to be a justification they would have to hold good in other respects too. I can say: "Thank these bees for their honey as though they†i were good people who have prepared it for you"; that is *intelligible* & describes how I wish you to behave. But not: <">. Thank them, for look how good they are!"--since the next moment they may sting you.

Religion says: *Do this!--Think like that!* but it cannot justify this and it only need try to do so to become repugnant; since for every reason it gives, there is a cogent counter-reason.

It is more convincing to say: "Think like this!--however strange it may seem.--" Or: "Won't you do this?--repugnant as it is.--"

Election by grace: It is only permissible to write like this out of the most frightful suffering--& then it means something quite different. But for this reason it is not permissible for anyone to cite it as truth, unless he himself says it in torment.--It simply isn't a theory.--Or as one might also say: if this is truth, it is not the truth it appears at first glance to express. It's less

a theory than a sigh, or a cry. MS 118 117v: 24.9.1937

In the course of our conversations Russell would often exclaim: "Logic's hell!"--And this *fully* expresses what we†a experienced while†b thinking about the problems of logic; namely their immense difficulty. Their hardness--their hard & *slippery* texture.

The primary ground of this experience, I think, was this fact: that each new†c phenomenon of language that we might retrospectively think of†d could show our earlier explanation to be unworkable.†e†f But that is the difficulty Socrates gets caught up in when he tries to give the definition of a concept. Again and again an application of the word emerges that seems not to be compatible with the concept to which other applications have led us. We say: but that *isn't* how it is!--it *is* like that though!--& all we can do is keep repeating these antitheses. MS 119 59:

1.10.1937

The spring that flows quietly & clearly†g in the Gospels seems to foam in Paul's Epistles. Or that is how it seems to *me*. Perhaps it is just my own impurity that reads muddiness into it; for why shouldn't this impurity be able to pollute what is clear? But for *me* it's as though I saw human passion, something like pride or anger, which does not square with the humility of the *Gospels*. It is as though he really is insisting here on his own person, & *doing so moreover as a religious act*, something which is foreign to the Gospel. I want to ask--& may this be no blasphemy--: "What would Christ perhaps have said to Paul?"

But a fair rejoinder to that would be: What business is that of yours? Look after making *yourself* more decent! In your present state, you are quite incapable of understanding what may be the truth here.

In the Gospels--as it seems to me--everything is *less pretentious*, humbler, simpler. There you find huts;--with Paul a church. There all human beings are equal & God himself is a human being; with Paul there is already something like a hierarchy; honours, and official positions.--That is, as it were, what my NOSE tells me. MS 119 71:

4.10.1937

Page Break 36

Let us be human.--

Page 36

I just took some apples out of a paper bag where they had been lying for a long time; I had to cut off & throw away half of many of them. Afterwards as I was copying out a sentence of mine the second half of which was bad, I at once saw it as a half-rotten apple. And that's how it always is with me. Everything that comes my way becomes for me †a picture of what I am thinking about. (Is there something feminine about this outlook?) MS 119 83: 7.10.1937

Page 36

Doing this work I am †b in the same state as that of many people when they struggle in vain †c to recall a name; we say in such a case: "think of something else, then it will come to you"--& similarly I had constantly to think of something else †i so that what I had long been *searching* for could occur †d to me. MS 119 108: 14.10.1937

Page 36

The origin & the primitive form of the language game is a reaction; only from this can the more complicated forms grow.

Language--I want to say--is a refinement, 'in the beginning was the deed' †ii. MS 119 146: 21.10.1937

Page 36

Kierkegaard writes: If Christianity were so easy and cosy, why would God have moved Heaven & Earth in his Scripture, threatened *eternal* punishments-- --Question: But why is this Scripture so unclear then? If we want to warn someone of a terrible danger, do we do it by giving him a riddle to solve, whose solution is perhaps the warning?--But who is to say that the Scripture really is unclear: isn't it possible that it was essential in this case to tell a riddle? That a more direct warning, on the other hand, would necessarily have had the *wrong* effect? God has *four* people recount the life of the incarnate God, each one differently, & contradicting each other--but can't we say: It is important that this narrative should not have more than quite middling historical plausibility, *just so* that this †21 should not be taken as the essential, decisive thing. So that the *letter* should not be believed more strongly than is proper & the *spirit* should receive its due. I.e.: What you are supposed to see cannot be communicated even by the

Page Break 37

best, most accurate, historian; *therefore* a mediocre account suffices, is even to be preferred. For that too can tell you what you are supposed to be told. (Roughly in the way a mediocre stage set can be better than a sophisticated one, painted trees better than real ones,--which distract attention from what matters.)

The Spirit puts what is essential, essential for your life, into these words. The point is precisely that you are SUPPOSED to see clearly only what even *this* representation clearly shows. (I am not sure how far all this is exactly in the spirit of Kierkegaard.) MS 119 151: 22.10.1937

Page 37

In religion it must be the case that corresponding to every level of devoutness there is a form of expression that has no sense at a lower level. For those still at the lower level this doctrine, which means something at the higher level, is null & void; it *can* only be understood *wrongly*, & so these words are *not* valid for such a person.

Paul's doctrine of election by grace for instance is at my level irreligiousness, ugly non-sense. So it is not meant for me since I can only apply wrongly the picture offered me. If it is a holy & good picture, then it is so for a quite different level, where it must be applied in life quite differently than I could apply it. MS 120 8: 20.11.1937

Page 37

Christianity is not based on a historical truth, but presents us with a (historical) narrative & says: now believe! But not believe this report with the belief that †22 is appropriate to a historical report,--but rather: believe, through thick & thin & you can do this only as the outcome of a life. *Here you have a message!--don't treat it as you would another historical message!* Make a *quite different* place for it in your life.--There is no *paradox* about that!

Page 37

If I realized how mean & petty I am, I should become more modest.

Nobody can say with truth of himself that he is filth. For if I do say it, though it can be true in a sense, still I cannot myself be penetrated by this truth: otherwise I should have to go mad, or change myself.

Had coffee with A.R. †23; it was not as it used to be, but it was not *bad* either.

Queer as it sounds: the historical accounts of the Gospels might, in the historical sense, be demonstrably false, & yet belief would lose nothing through this: but *not* because it has to do with 'universal truths of reason'!

rather, because historical proof (the historical proof-game) is irrelevant to belief. This message (the Gospels) is seized on by a human being believably (i.e. lovingly): *That* is the certainty of this "taking-for-true", nothing *else*.

The believer's relation to these messages is *neither* a relation to historical truth (probability) *nor yet* that to a doctrine consisting of 'truths of reason'. There is such a thing.--(We have quite different attitudes even to different species of what we call fiction!) MS 120 83 c: 8-9.12.1937*

You cannot write more truly about yourself than you *are*. That is the difference between writing about yourself and writing about external things. You write about yourself from your own height. Here you don't stand on stilts or on a ladder but on your bare feet. MS 120 103 c: 12.12.1937

A great blessing for me to be able to work *today*. But I so easily forget all my blessings!

I am reading: "& no man can say that Jesus is the Lord, but by the Holy Ghost."†i And it is true: I cannot call him *Lord*; because that says absolutely nothing to me. I could call him "the paragon", "God" even or rather: I can understand it when he is so called; but I cannot utter the word "Lord" meaningfully. *Because I do not believe* that he will come to judge me; because *that* says nothing to me. And it could only say something to me if I were to live *quite* differently.

What inclines even me to believe in Christ's resurrection? I play as it were with the thought.--If he did not rise from the dead, then he decomposed in the grave like every human being. *He is dead & decomposed*. In that case he is a teacher, like any other & can no longer *help*; & we are once more orphaned & alone. And have to make do with wisdom & speculation. It is as though we are in a hell, where we can only†a dream & are shut out from heaven, roofed in as it were. But if I am to be REALLY redeemed,--I need *certainty*--not wisdom, dreams, speculation--and this certainty is faith. And faith is faith in what my *heart*, my *soul*, needs, not my speculative intellect. For my soul, with its passions, as it were with its flesh & blood, must be redeemed, not my abstract mind. Perhaps one may

say: Only *love* can believe the Resurrection. Or: it is *love* that believes the Resurrection. One might say: redeeming love believes even in the Resurrection; holds fast even to the Resurrection. What fights doubt is *as it were redemption*. Holding fast to *it* must be holding fast to this belief. So this means: first be redeemed & hold on tightly to your redemption (keep hold of your redemption)--then you will see that what you are holding on to is this belief. So this can only come about if you no longer support yourself on this†a earth but suspend yourself from heaven. Then *everything* is different and it is 'no wonder' if you can then do what now you cannot do. (It is true that someone who is suspended looks like someone who is standing but the interplay of forces within him is nevertheless a quite different one & hence he is able to do quite different things than can one who stands.) MS 120 108 c: 12.12.1937*

Freud's idea: in madness the lock is not destroyed, only altered; the old key can no longer open it, but a differently configured key could do so. MS 120 113: 2.1.1938

A Bruckner symphony can be said to have *two* beginnings: the beginning of the first idea & the beginning of the second idea. These two ideas stand to each other not as blood relations, but†b as man & wife.

Bruckner's Ninth is a sort of *protest* against Beethoven's, & because of this†c becomes bearable, which as a sort of imitation it would not be. It stands to Beethoven's Ninth very much as Lenau's Faust to Goethe's, which means as the Catholic to the Enlightenment Faust. etc. etc. MS 120 142: 19.2.1938

Nothing is so difficult as not deceiving yourself. MS 120 283: 7.4.1938

Longfellow:

In the elder days of art,
Builders wrought with greatest care
Each minute & unseen part,
For the gods are†i everywhere.
(This might serve as my motto.)

MS 120 289: 20.4.1938

Page Break 40

Phenomena akin to language in music or architecture. Significant irregularity--in Gothic e.g. (I have in mind too the towers of St. Basil's Cathedral.) Bach's music is more like language than Mozart's & Haydn's. The double bass recitative in the 4th movement of Beethoven's 9th Symphony. (Compare too Schopenhauer's remark about *universal* music composed to a *particular* text.) †24 MS 121 26v: 25.5.1938

Page 40

In philosophy the winner of the race is the one who can run most slowly. Or: the one who gets to the winning post last. †a †b MS 121 35v: 11.6.1938

Page 40

Being psychoanalyzed is in a way like eating from the tree of knowledge. †c The knowledge we acquire sets us (new) ethical problems; but contributes nothing to their solution. MS 122 129: 30.12.1939

Page 40

What is lacking in Mendelssohn's music? A 'courageous' melody? MS 162a 18: 1939-1940

Page 40

The Old Testament seen as the body without its head; the New T.: the head; the Epistles of the Apostles: the crown on the head.

If I think of the Jewish Bible, the Old Testament on its own, I should like to say: the head is (still) missing from this body The solution to these problems is missing The fulfilment of these hopes is missing. But I do not necessarily think of a head as having a *crown*. MS 162b 16v: 1939-1940

Page 40

Envy is something superficial--i.e.: the typical colour of envy does not go down deep--farther down passion has a different colouring. (*That* does not, of course, make envy any less real.) MS 162 21v: 1939-1940

Page 40

The measure of genius is character,--even if character on its own does *not* amount to genius
Genius is not 'talent *and* character', but character manifesting itself in the form of a special talent. Where one man will show courage by jumping into the water, another will show courage by writing a symphony. (This is a weak example.) MS 162b 22r c: 1939-1940

Page Break 41

There is no more light in a genius than in any other honest human being--but the genius concentrates this light into a burning point by means of a particular kind of lens.

Page 41

Why is the soul moved by idle thoughts,--since they are after all idle? Well, it is moved by them.
(How can the wind move a tree, since it is after all just wind †a ? Well, it *does* move it; & don't forget it.) MS 162b 24r: 1939-1940

Page 41

One *cannot* speak the truth;--if one has not yet conquered oneself. One *cannot* speak it--but not, because one is still not clever enough.

Page 41

The truth can be spoken only by someone who is already *at home* in it; not by someone who still lives in untruthfulness, & does no more than reach out towards it from within untruthfulness. MS 162b 37r c: 1939-1940

Page 41

Resting on your laurels is as dangerous as resting when hiking through snow. You doze off & die in your sleep. MS 162b 42v c: 1939-1940

Page 41

The monstrous vanity of wishes is revealed for instance in †b my wish to fill a nice notebook with writing as soon as possible. I get *nothing* from this; it's not that I wish it because, say, it will be evidence of my productivity; it is simply a *longing* to rid myself of something familiar as soon as I can; although of course, as soon as I am rid of it, I must start a fresh one & the whole business will have to be repeated. MS 162b 53r: 1939-1940

Page 41

One could call Schopenhauer a quite *crude* mind. I.e., †c He does have refinement, but at a certain level this suddenly comes to an end & he is as crude as the crudest. Where real depth starts, his finishes.

Page 41

One might say of Schopenhauer: he never takes stock of himself.

Page Break 42

I sit astride life like a bad rider on his mount. I owe it solely to the horse's good nature that I am not thrown off right now. MS 162b 55v: 1939-1940

Page 42

'The impression (made by this melody) is completely indescribable.'- That means: a description is no use (for my purpose); you have to hear the melody.

If art serves 'to arouse feelings', is, perhaps, perceiving it with the senses included amongst these feelings? MS 162b 59r: 1939-1940*

Page 42

My originality (if that is the right word) is, I believe, an originality that belongs to the soil, not the seed. (Perhaps I have no seed of my own.) Sow a seed in my soil, & it will grow differently than it would in any other soil. Freud's originality too was like this, I think. I have always believed--without knowing why--that the original seed of psychoanalysis was due to Breuer, not Freud. Of course Breuer's seed-grain can only have been quite tiny. (*Courage* is always original.)

Page 42

People nowadays think, scientists are there to instruct them, poets, musicians etc. to entertain them. *That the latter have something to teach them*; that never occurs to them.

Page 42

Piano playing, a dance of human fingers. MS 162b 59v: 1939-1940

Page 42

Shakespeare, one might say, displays the dance of human passions. For this reason he has to be objective, otherwise he would not so much display the dance of human passions--as perhaps talk about it. But he shows us them in a dance, not naturalistically. (I got this idea from Paul Engelmann.) MS 162b 61r: 1939-1940

Page 42

The comparisons of the N.T.†i leave room for as much depth of interpretation†a as you like. They are bottomless.†b

Page Break 43

They have less style than the first speech of a child. Even a work of supreme art has something that can be called 'style', yes even something that can be called 'fashion'. MS 162b 63r: 1939-1940

Page 43

Within all great art there is a WILD animal: tamed.

Not, e.g., in Mendelssohn. All great art has primitive human drives as its ground bass. They are not the *melody* (as they are, perhaps, in Wagner), but they are what gives the melody *depth†a & power*.

In *this* sense one may call Mendelssohn a '*reproductive*' artist.--

In the same sense: my house for Gretl†25 is the product of a decidedly sensitive ear, *good* manners, the expression of great *understanding* (for a culture, etc.). But *primordial* life, *wild* life striving to erupt into the open--is lacking. And so you might say,†b *health* is lacking (Kierkegaard). (Hothouse plant.) MS 122 175 c: 10.1.1940

Page 43

A teacher who can show good, or indeed†c astounding results while he is teaching, is still not on that account a good teacher, for it may be that, while his pupils are under his immediate influence, he raises them to a level which is not natural to them, without developing their own capacities for work at this level, so that they immediately decline again once the teacher leaves the schoolroom. Perhaps this holds for me; I have thought about this. (When Mahler was himself conducting, his private performances†26 were excellent; the orchestra seemed to collapse at once if†d he was not conducting it himself.) MS 122 190 c: 13.1.1940

Page 43

'The aim of music: to communicate feelings.'

Connected with this: We may rightly say "he has†e now the same face as before"--although measurement gave different results in the two cases.

How are the words "the same facial expression" used?--How do we know that someone is using these words correctly? But how do I know that I am using them correctly? MS 122 235: 1.2.1940

Page 43

Not funk but funk conquered is what is worthy of admiration & makes life

Page Break 44

worth having been lived. Courage, not cleverness; not even inspiration, is the grain of mustard that grows up to be a great tree. To the extent there is courage, there is connection with life & death. (I was thinking of Labor's & Mendelssohn's organ music.) But it is not by recognizing the want of courage in someone else, that you acquire courage yourself. MS 117 151 c: 4.2.1940

Page 44
One might say: "Genius is *courage in one's talent*". MS 117 152 c: 4.2.1940

You can't be reluctant to give up your lie & still tell the truth. MS 117 168 c: 17.2.1940

Page 44
Writing the right style means, setting the carriage precisely†b on the rails. MS 117 225: 2.3.1940

Page 44
If this stone won't budge at present, if it is wedged in, first move other stones around it.--

Page 44
We are only going to set you straight on the track, if your carriage stands on the rails crookedly; driving†c is something we shall leave you to do by yourself.†d MS 117 237: 6.3.1940

Page 44
Scraping away mortar is much easier than moving a stone. Well, you have to do the one, before you can do the other. MS 117 253: 11.3.1940

Page Break 45

What is insidious about the causal approach is that it leads one to say: "Of course,†a that's how it has to†b happen". Whereas one ought to say: It may have happened *like that*, & in many other ways.†c

Page 45
If we use the ethnological approach does that mean we are saying philosophy is ethnology? No it only means we are taking up our position far outside, in order to see the things *more objectively*. MS 162b 67r: 2.7.1940

Page 45
One of my most important methods is to imagine a historical development of our ideas different from what has†d actually occurred. If we do that the problem shows us a quite new side. MS 162b 68v: 14.8.1940

Page 45
What I am resisting is the concept of an ideal exactness thought as it were to be given us a priori. At different times our ideals of exactness are different; & none of them is preeminent. MS 162b 69v: 19.8.1940

Page 45
It is often only very slightly more disagreeable to tell the truth than a lie; only about as much as is drinking bitter rather than sweet coffee; & yet even then I have a strong inclination to tell the lie. MS 162b 70r: 21.8.1940

Page 45
(My style is like bad musical composition.)

Page 45
Don't apologize for anything, don't obscure anything, look & tell how it really is--but you must see something that sheds a new light on the facts. MS 123 112: 1.6.1941

Page 45
Our greatest stupidities may be very wise. MS 124 3 c: 6.6.1941

Page 45
It is incredible how helpful a new drawer can be, suitably placed in our filing cabinet. MS 124 25: 11.6.1941

Page 45
You must say something new & yet nothing but what is old. (N.)

Page Break 46

You must indeed say only what is old--but *all the same* something new!

Page 46

Different 'interpretations' must correspond to different applications.

Page 46

The poet too must always be asking himself: 'is what I am writing really true then?' which does not necessarily mean: 'is this how it happens in reality?'

Page 46

(...)

Page 46

It's true you must assemble old material. But for a *building*.--(W.)†28 MS 124 28: 11.6.1941

Page 46

As we get old the problems slip through our fingers again, as in our youth. It is not just that we cannot crack them open,†a we can't even keep hold of them. MS 124 31: 12.6.1941

Page 46

What a curious attitude scientists have--: "We still don't know that;†b but it is knowable & it is only a question of time till we know it"! As if that went without saying.-- MS 124 49: 16.6.1941

Page 46

I could imagine someone thinking the names "Fortnum" & "Mason"†29 fitted together. MS 124 56: 18.6.1941

Page 46

Don't demand too much, & don't be afraid that your just demand will melt into nothing. MS 124 82: 27.6.1941

Page 46

People who are constantly asking 'why' are like tourists, who stand in front of a building, reading Baedeker, & through reading about the history of the building's construction etc etc are prevented from *seeing* it. MS 124 93: 3.7.1941

Page 46

Counterpoint might represent an extraordinarily difficult problem for a composer; the problem namely: given *my* propensities what should be *my* relation towards counterpoint. He may have found a conventional relation

Page Break 47

to it yet feel perhaps that it is not *his*. That it is not clear what the importance of counterpoint to him *ought* to be.

(I was thinking of Schubert in this connection; of his still wanting to take lessons in counterpoint at the end of his life. I think his aim may have been not simply learning more counterpoint, but rather determining where he stood in relation to it.) MS 163 25r: 4.7.1941

Page 47

Wagner's motifs might be called musical prose sentences. And just as there is such a thing as "rhyming prose", so too these motifs can certainly be put together into melodic form, but without their constituting *one* melody.

Page 47

Wagnerian drama too is not drama, but a stringing together of situations as if on a thread, which for its part is only cleverly spun but not, like the motifs & situations, inspired. MS 163 34r: 7.7.1941

Page 47

Don't let yourself be guided by the example of others, but by nature! MS 163 39r c: 8.7.1941

Page 47

The language used by philosophers is already deformed, as though by shoes that are too tight. MS 163 47v: 11.7.1941

Page 47

The characters in a drama arouse our sympathy, they are like people we know, often like people we love or hate: The characters in the second part of Faust don't arouse our sympathy at all! We don't feel as though we knew them. They file past us like thoughts not like human beings. MS 163 64v c: 6.9.1941

Page 47

The mathematician (Pascal) who admires the beauty of a theorem in number theory†a; it is as though he were admiring some natural beauty. It's wonderful, he says, what splendid properties numbers have. It's as though he were admiring the conformity to laws of a crystal†b.

Page 47

One might say: what splendid laws the Creator has built into numbers!

Page Break 48

Page 48

You can't *construct* clouds. And that is why the future you dream of never comes true.

Page 48

Before there was an aeroplane people dreamed about aeroplanes & what a world with them would look like. But, as the reality was nothing like this dream, so we have no reason to believe that reality will develop in the way we dream. For our dreams are full of tinsel, like paper hats & costumes. MS 125 2v: 4.1.1942 or later

Page 48

The popular scientific writings of our scientists are not the expression of hard work but of resting on their laurels. †a †b †30

Page 48

If you already *have* someone's love, no sacrifice is too high a price to pay for it but any sacrifice is too great †c to *buy* it. MS 125 21r: 1942

Page 48

Virtually as there is such a thing as a *deep* & a shallow sleep, there are thoughts which occur deep within one & thoughts which romp about on the surface. MS 125 42r: 1942

Page 48

You cannot draw the seed up out of the earth. You can only give it warmth †d, moisture & light & then it must grow. (You mustn't even *touch* †e it except with care.) MS 125 44r: 1942

Page 48

What is pretty cannot be beautiful.----- MS 125 58r: 1942

Page 48

Someone is *imprisoned* in a room if the door is unlocked, opens inwards; but it doesn't occur to him to *pull*, rather than push against it.

Page 48

Put someone in the wrong atmosphere & nothing will function as it should. He will seem unhealthy in every part. Bring him back into his right element, & everything will blossom and look healthy. But if he is not in his

Page Break 49

right element, what then? Well he just has to make the best of looking like a cripple.

Page 49

If white turns to black some say: "Essentially it is still the same". And others, if the colour becomes †a one degree darker, say "It has changed *completely*." MS 125 58v: 18.5.1942

Page 49

Architecture is a *gesture*. Not every purposive movement of the human body is a gesture. Just as little as every functional building is architecture. MS 126 15r: 28.10.1942

Page 49

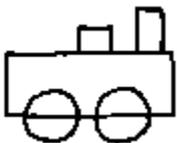

At present we are combatting a trend. But this trend will die out, superseded by others. And then people will no longer understand our arguments against it; will not see why all that needed saying. MS 126 64r: 15.12.1942

Page 49

Looking for the fallacy in a fishy argument & hunt-the-thimble. MS 126 65v: 17.12.1942

Page 49

Suppose that 2000 years ago someone had invented the *shape*

& said that one day it would be the shape of an instrument of locomotion.

Or perhaps: that someone had constructed the complete *mechanism* of the steam engine without having the least †b idea how it could be used as a motor. †c MS 127 14r: 20.1.1943

Page 49

What you are taking for a gift is a problem you have to solve.

Page 49

Genius is what makes us forget the master's talent.

Page 49

Genius is what makes us forget talent. †d

Where genius wears thin skill may show through.†e (Overture to the Mastersingers.

Genius is what makes us unable to see the master's talent.

Only where genius wears thin can you see the talent.

MS 127 35v: 4.4.1943

Why shouldn't I apply words in opposition to their original usage? Doesn't e.g. Freud†a do that when he calls even an anxiety dream a wish-fulfilment dream? Where is the difference? In the scientific approach the new use is justified through a *theory*. And if this theory is false then the new extended use has to be given up too. But in philosophy the extended use is not supported by true or false opinions about natural processes. No fact†b justifies it (&)†c non can overturn it.

We say:†d "You understand this expression, don't you? Well, the way you always understand it†e is the way I too am using it."†f [Not: "... in *that* meaning..."]

As though meaning were a halo which the word carries over†g†h into every sort of application MS 127 36v: 27.2.1944

Thoughts at peace. That is the goal someone who philosophizes longs for. MS 127 41v: 4.3.1944

The philosopher is someone who has to cure many diseases of the understanding in himself, before he can arrive at the notions of common sense. MS 127 76r: 1944

If in life we are surrounded by death, so too in the health of our understanding by madness.†i†j31 MS 127 77v: 1944

Wanting to think is one thing, having a talent for thinking another.

MS 127 78v: 1944

If there is anything in the Freudian theory of dream interpretation; then it shows how *complicated* is the way the human mind makes†a pictures of the facts.

So complicated, so irregular is the mode of representation that it can *barely* be called representation any more. MS 127 84r: 1944

It will be hard to follow my portrayal: for it says something new, but still has eggshells of the old material sticking to it. MS 129 181: 1944 or later

Is it some frustrated longing that makes someone mad? (I was thinking of Schumann, but of myself too.) MS 165 200 c: ca. 1941-1944

The revolutionary will be the one who can revolutionize himself.

MS 165 204: ca. 1944

People are religious to the extent that they believe themselves to be not so much *imperfect* as *sick*.

Anyone who is half-way decent will think himself utterly imperfect, but the religious person thinks himself *wretched*

What's ragged should be left ragged.

A miracle is, as it were, a *gesture* which God makes. As a man sits quietly & then makes an impressive gesture, God lets the world run on smoothly & then accompanies the words of a Saint by a symbolic occurrence, a gesture of nature. It would be an instance if, when a saint has spoken, the trees around him bowed, as if in reverence.--Now, do I believe that this happens? I don't.

The only way for me to believe in a miracle in this sense would be to be *impressed* by an occurrence in this particular way. So that I should say e.g.: "It was *impossible* to see these trees & not to feel that they were responding to the words." Just as I might say "It is impossible to see the face of this dog & not to see that he is alert & full of attention to what his master is

Page Break 52

doing <">. And I can imagine that the mere report of the *words* & life of a saint can make someone believe the reports that the trees bowed. But I am not so impressed.

Page 52

When I came home I expected a surprise & there was no surprise for me, so, of course, I was surprised. MS 128 46: ca. 1944

Page 52

Go on, believe! It does no harm.

Page 52

'Believing' means, submitting to an authority. Having once submitted to it, you cannot then, without rebelling against it, first call it in question & then once again find it convincing.

Page 52

A cry of distress cannot be greater than that of *one* human being.

Page 52

Or again *no* distress can be greater than what a single person can suffer.

Hence one human being can be in infinite distress & so need infinite help.

The Christian religion is only for the one who needs infinite help, that is only for the one who suffers infinite distress.

Page 52

The whole Earth cannot be in greater distress than *one* soul.

Page 52

Christian faith--so I believe--is refuge in this *ultimate* distress.

Someone to whom it is given in such distress to open his heart instead of contracting it, absorbs the remedy into his heart.

Someone who in this way opens his heart to God in remorseful confession opens it for others too. He thereby loses his dignity as someone special†a & so becomes like a child. That means without office, dignity & aloofness from others. You can open yourself to others only out of a particular kind of love. Which acknowledges as it were that we are all wicked children.

Page 52

It might also be said: hate between human beings comes from our cutting ourselves off from each other. Because we don't want anyone else to see inside us, since it's not a pretty sight in there.

Page Break 53

Page 53

Of course you must continue to feel ashamed of what's within you, but not ashamed of yourself before your fellow human beings.

Page 53

There is no greater distress to be felt than that of One human being. For if someone feels himself lost, that is the ultimate distress. MS 128 49: ca. 1944

Page 53

Words are deeds. †32 MS 179 20: ca. 1945

Page 53

Only someone very unhappy has the right to pity someone else. MS 179 26: ca. 1945

Page 53

It isn't reasonable to be furious even at Hitler; let alone at God. MS 179 27: ca. 1945

Page 53

When people have died we see their life in a conciliatory light. His life looks well-rounded through a haze. For *him* it was not well-rounded however, but jagged & incomplete. For him there was no conciliation; his life is naked & wretched. MS 180a 30: ca. 1945

Page 53

It is as though I had lost my way & asked someone the way home. He says he will show me and walks with me along a nice smooth path. This suddenly comes to an end. And now my friend says: "All you have to do now is to find the rest of the way home from here."†33

MS 180a 67: ca. 1945

Page 53

The less somebody knows & understands himself the less great he is, however great may be his talent. For this reason our scientists are not great. For this reason Freud, Spengler, Kraus, Einstein are not great. MS 130 239: 1.8.1946*

Page 53

Schubert is irreligious & melancholy.

MS 130 283: 5.8.1946

Page 53

Are *all* people great human beings? No.--Well then, what hope can you have of being a great human being! Why should something be given you that is not given your fellows? To what purpose?!--If it isn't your *wish* to be rich that makes you think you are rich, then it must be some observation some experience that shows you it! And what experience do you have (except that of vanity)? Simply that you have a *talent*. And my conceit of

Page Break 54

being an extraordinary human being is of course *much* older than my experience, of my particular talent. MS 130 291 c: 9.8.1946

Page 54

Schubert's melodies can be said to be full of *climaxes*, & this cannot be said of Mozart's; Schubert is baroque. You can point to particular places in a Schubert melody & say: look, that is the point of this melody, this is where the idea comes to a head.

Page 54

The melodies of different composers can be approached by applying the principle: every species of tree is a 'tree' in a different sense of the word. I.e. Don't let yourself be misled by our saying they are all melodies. They are steps along a path that leads from something you would not call a melody to something else that you again would not call one. If you simply look at the sequences of notes & the changes of key all these structures no doubt appear on the same level. But if you look at the field of force in which they stand (and hence at their significance), you will be inclined to say: Here melody is something quite different than there (here it has a different origin, plays a different role, inter alia.

MS 131 2: 10.8.1946

Page 54

The idea working its way towards the light.

MS 131 19: 11.8.1946

Page 54

The remark by Jucundus in "The Lost Laugh"†34, that his religion consisted in: his knowing, if things are going well for him now,†a that his fate could take a turn for the worse--this actually is an expression of the same religion as the saying "The Lord hath given, the Lord hath taken away".

MS 131 27: 12.8.1946

Page 54

It is hard to understand yourself properly since something that you *might* be doing out of generosity & goodness is the same as you may be doing out of cowardice or indifference. To be sure, one may act in such & such a way from true love, but also from deceitfulness & from a cold heart too. Similarly not all moderation is goodness. And only if I could be submerged in religion might these doubts be silenced. For only religion could destroy vanity & penetrate every nook & cranny.

MS 131 38: 14.8.1946

Page 54

What I want to say then is: Someone who--e.g.--cannot EXPERIENCE

Page Break 55

the word "pas" in "je ne sais pas" as "step", cannot be taught an expression of voice†a by being told "speak it with this meaning".

If you are reading aloud and want to read *well*, you accompany the words with more vivid images. At least it is *often* like that. Sometimes though ["To Corinth from Athens..."]†35 it is the punctuation, i.e., the precise intonation & the length of the pauses that is all that matters to us.

MS 131 43: 14.8.1946*

Page 55

It is remarkable how hard we find it to believe something the truth of which we do not see for ourselves. If e.g. I hear expressions of admiration for Shakespeare made by the distinguished men of several centuries, I can never rid myself of a suspicion that praising him has been a matter of convention, even though I have to tell myself that this is not the case. I need the authority of a *Milton* to be really convinced. In his case I take it for granted that he was

incorruptible.--But of course I don't mean to deny by this that an enormous amount of praise has been & still is lavished on Shakespeare without understanding & for specious reasons by a thousand professors of literature. MS 131 46: 15.8.1946

Page 55

Grasping the difficulty *in its depth* is what is hard.

For if you interpret it in a shallow way the difficulty just remains. It has to be pulled out by the root; & that means, you have to start thinking about these things in a new way. The change is as decisive e.g. as that from the alchemical to the chemical way of thinking.--The new way of thinking is what is so hard to establish.

Page 55

Once it†b is established the old problems disappear; indeed it becomes hard to recapture them. For they are embedded in the way we express ourselves; & if we clothe ourselves in a new form of expression, the old problems are discarded along with the old garment.†c MS 131 48: 15.8.1946

Page 55

The hysterical fear of the atom bomb the public now has, or at least expresses, is almost a sign that here for once a really salutary discovery has been made. At least the fear gives the impression of being fear in the face of a really effective bitter medicine. I cannot rid myself of the thought: if there

Page Break 56

were not something good here, the *philistines* would not be making an outcry. But perhaps this too is a childish idea. For all I can mean really is that the bomb creates the prospect of the end, the destruction of a ghastly evil, of disgusting soapy water science and certainly that is not an unpleasant thought; but who is to say what would come *after* such a destruction? The people now making speeches against the production of the bomb are undoubtedly the *dregs* of the intelligentsia, but even that does not prove beyond question that what they abominate is to be welcomed. MS 131 66c: 19.8.1946

Page 56

In former times people entered monasteries. Were they perhaps simple-minded, or obtuse people?--Well, if people like that took such measures so as to be able to go on living, the problem cannot be an easy one! MS 131 79 c: 20.8.1946

Page 56

The human being is the best picture of the human soul.†36 MS 131 80:20.8.1946

Page 56

Shakespeare's similes are, *in the ordinary sense*, bad. So if they are nevertheless good--& I don't know whether they are or not--they must be a law to themselves. Perhaps e.g. their ring makes them convincing & gives them truth. It might be the case that with S. the essential thing is his effortlessness, his arbitrariness, so that if you are to be able really to admire him, you just have to accept him as he is in the way you accept nature, a piece of scenery e.g.

If I am right about this, that would mean that the style of his whole work, I mean, of his complete works†a is in this case what is essential, & provides the justification.

Page 56

That I do *not* understand him could then be explained by the fact that I cannot read him *with ease*. Not, that is, as one views a splendid piece of scenery. MS 131 163:31.8.1946

Page 56

A man sees well enough what he has, but not what he is. What he is can be compared with his height above sea level, which you cannot for the most part judge straight off. And the greatness, or triviality, of a work depends on where its creator stands.

Page Break 57

Page 57

But you can equally say: someone who misjudges himself is never great: someone who throws dust in his own eyes. MS 131 176: 1.9.1946

Page 57

How small a thought it takes to fill a whole life!

Page 57

Just as someone may travel around the same little country throughout his whole life, & think there is nothing outside it!

You see everything in a queer perspective (or projection): the country that you ceaselessly keep covering, strikes you

as enormously big; the surrounding countries seem to you like narrow border regions.†a MS 131 180: 2.9.1946

Page 57

To go down into the depths you don't need to travel far; you can do it in your own backgarden.†b MS 131 182: 2.9.1946

Page 57

It is very *remarkable*, that we should be inclined to think of civilization--houses, streets, cars, etc--as separating man from his origin, from the lofty, eternal, etc. Our civilized environment, even its trees & plants, seems to us then cheap, wrapped†c in cellophane, & isolated from everything great & from God as it were. It is a remarkable picture that forces itself on us here. MS 131 186: 3.9.1946

Page 57

My 'achievement' is very much like a mathematician's,†d who invents a new calculus.†e MS 131 218: 8.9.1946

Page 57

If people did not sometimes commit stupidities, nothing intelligent at all would ever happen. MS 131 219: 8.9.1946

Page 57

The purely corporeal can be uncanny. Compare the way†f angels & devils are portrayed. A so-called "miracle" must be connected with this. It must be as it were a *sacred gesture*. MS 131 221: 8.9.1946

Page Break 58

The way you use the word "God" does not show *whom* you mean,†a but what you mean. MS 132 8: 11.9.1946

Page 58

In a bullfight the bull is the hero of a tragedy. First driven mad by suffering, he dies a slow & terrible death. MS 132 12: 12.9.1946

Page 58

A hero looks death in the face, real death, not just a picture of death. Behaving decently in a crisis does not mean being able to act the part of a hero well, as in the theatre, it means rather being able to look death *itself* in the eye. For an actor may play a multitude of roles, but in the end it is after all he himself, the human being, who has to die. MS 132 46 c: 22.9.1946

Page 58

What does it consist in: following a musical phrase with understanding? Observing a face with a feeling†b for its expression? Drinking in the expression on the face?

Page 58

Think of the demeanour of someone who draws the face with understanding for its expression. Think of the sketcher's face his movements;--what shows that every stroke he makes is†i dictated by the face, that nothing in his sketch is arbitrary, that he is a *delicate* instrument?

Is that really an *experience*? I mean: can we say that this expresses an experience?

Page 58

Once again: what does it consist in, following a musical phrase with understanding, or, playing it with understanding? Don't look inside yourself. Ask yourself rather, what makes you say that's what *someone else* is doing. And *what* prompts you to say *he* has a particular experience? Indeed, do we ever actually say that? Wouldn't I be more likely to say of someone else that he's having a whole host of experiences†ii?

I would perhaps say: "He is experiencing the theme intensely"; but ask yourself, what the expression of this†c is?†d†e

Page Break 59

Then again you might think intensive experiencing of the theme '*consists*' in the sensations of the movements etc. with which we accompany it. And that seems (again) like a soothing explanation. But have you any reason to think it true? I mean, e.g., a recollection of this experience? Is not this theory again merely a picture? No, this is not how things are: the theory is no more than an attempt to link up the expressive movements with an 'experience'.

Page 59

If you ask: how I experienced the theme, I shall perhaps say "As a question" or something of the sort, or I shall whistle it with expression etc. MS 132 51: 22.9.1946

Page 59

"He is experiencing the theme intensely. Something is happening in him when†a he hears it." Well, *what*?

Page 59

Does the theme point to nothing beyond itself? Oh yes! But that means:--The impression it makes on me is connected with things in its surroundings--e.g. with the existence of the German language & of its intonation, but that means with the whole field†i of our language games.†37

If I say e.g.: it's as if here a conclusion were being drawn, or, as if here something were being confirmed, or, as if *this* were a reply to what came earlier,--then the way I understand it clearly presupposes familiarity with conclusions, confirmations, replies, etc.

Page 59

A theme, no less than a face, wears an expression.

Page 59

"The repeat is *necessary*" In what respect is it necessary? Well, sing it, then you will see that it is only the repeat that gives it its tremendous power.--Don't we feel then as though a model for this theme must in this case exist in reality, & as though the theme only approached it, corresponded to it, once this part were repeated Or am I to utter the inanity: 'It just sounds more beautiful with the repeat'? (You see there by the way what an inane role the word "beautiful" plays in aesthetics) And yet there just *is* no paradigm there other than the theme. And yet again there *is* a paradigm other than the theme: namely the rhythm of our language, of our thinking & feeling. And furthermore the theme is a *new* part of our language, it becomes incorporated in it; we learn a new *gesture*.

Page Break 60

Page 60

The theme interacts with language.

Page 60

It is one thing to sow in thought, another to reap in thought.

Page 60

The last two bars of the "Death & the Maiden" theme, the ; you may think first that this figure is conventional, ordinary, until you understand its deeper expression. I.e. until you understand that here the ordinary is filled with significance. MS 132 59: 25.9.1946

Page 60

"Fare well!"

"A whole world of pain lies in these words" How can it live†a in them?--It is bound up with them. The words are like the acorn from which an *oak tree* can grow.

But where is the law laid down, according to which the tree grows out of the acorn? Well, the picture is incorporated into our thinking as a result of experience.†b MS 132 62: 25.9.1946*

Page 60

Esperanto. Our feeling of disgust, when we utter an *invented* word with invented derivative syllables. The word is cold, has no associations & yet plays at 'language'. A system of purely written signs would not disgust us like this. MS 132 69: 26.9.1946

Page 60

You could attach prices to ideas. Some cost a lot some little. [Broad's ideas all cost *very* little.] And how do you pay for ideas? I believe: with courage. MS 132 75: 28.9.1946*

Page 60

If life becomes hard to bear we think of improvements†c. But the most important & effective improvement,†d in our own attitude, hardly occurs to us, & we can decide on this only with the utmost difficulty.†e MS 132 136: 7.10.1946

Page 60

It's possible to write in a style that is unoriginal in form--like mine--but with well chosen words; or on the other hand in one that is original in *form*, *freshly* grown from within oneself. (And also of course in one which is botched together just anyhow out of old furnishings†f.) MS 32 145: 8.10.1946

Page Break 61

Amongst other things Christianity says, I believe, that sound doctrines are all useless. That you have to change your *life*. (Or the *direction* of your life.)

That all wisdom is cold; & that you can no more use it for setting your life to rights, than you can forge iron when it is *cold*.

For a sound doctrine need not *seize* you; you can follow it, like a doctor's prescription.--But here you have to

be seized & turned around by something.--(I.e. this is how I understand it.) Once turned round, you must *stay* turned round.

Wisdom is passionless. By contrast Kierkegaard calls faith a *passion*. MS 132 167: 11.10.1946

Page 61

Religion is as it were the calm sea bottom at its deepest, remaining calm, however high the waves rise on the surface.-- MS 132 190: 16.10.1946

Page 61

"I never before believed in God"--that I understand. But not: "I never before really believed in Him." MS 132 191: 18.10.1946

Page 61

I often fear madness. Have I any reason to assume that this fear does not spring from, so to speak, an optical illusion: of seeing something as an abyss that is close by, when it isn't? The only *experience* I know of that speaks for its not being an illusion, is the case of Lenau. For in his "Faust" there are thoughts of a kind I too am familiar with. Lenau puts them into Faust's mouth, but they are no doubt his own about himself. What is important is what Faust says about his *loneliness* or *isolation*.

Page 61

His talent too strikes me as similar to mine: A lot of froth--but a few *fine* thoughts. The stories in his Faust are all bad, but the observations often true & great. MS 132 197: 19.10.1946

Page 61

Lenau's Faust is remarkable in that here man has dealings only with the Devil. God does not stir himself. MS 132 202: 20.10.1946

Page 61

In my view Bacon was not a *precise thinker*. He had large, as it were broad, visions But someone who has nothing but these is bound to be generous with promises, inadequate in keeping them. You may *envision* a flying machine without being precise about its details. Outwardly you may†a imagine it as very similar to a proper aeroplane, & describe its functioning

Page Break 62

graphically. Nor is it obvious, that such an invention†a has to be worthless. Perhaps it spurs others to a different sort of work.--So while these others make preparations, a long time in advance as it were, for building an aeroplane that really flies, the former occupies himself with dreaming what this aeroplane has to look like & what it will be capable of. This so far says *nothing* about the value of these activities. The dreamer's *may* be worthless--& so may the others. MS 132 205: 22.10.1946

Page 62

Madness doesn't *have* to be regarded as an illness. Why not as a sudden--more or *less* sudden--change of character? Everybody is (or most are) mistrustful, & perhaps more so towards their relations, than towards others. Is there any reason for mistrust? Yes & no. Reasons can be given for it, but they are not compelling. Why shouldn't someone suddenly become *much* more mistrustful of people? Why not *much* more withdrawn? or devoid of love? Don't people get like this even in the ordinary course of events?--Where is the line to be drawn here between will & ability? Is it that I *will* not open my heart to anyone any longer, or that I *cannot*? If so much can lose its attraction, why not everything? If someone is wary even in ordinary life, why shouldn't he--& *perhaps* suddenly--become *much* more wary? And *much* more inaccessible. MS 133 2: 23.10.1946

Page 62

The lesson in a poem is *overstated*, if the intellectual points are nakedly exposed, not clothed by the heart. MS 133 6: 24.10.1946

Page 62

Oh a key can†38 lie for ever where the locksmith placed it, & never be used to open†b the lock for which the master forged it. MS 133 12: 24.10.1946

Page 62

"It is high time for us to compare this phenomenon†c with something *different*"--one may say.--I am thinking, e.g. of mental illnesses. MS 133 18: 29.10.1946

Page 62

Freud's fanciful pseudo-explanations (just because they are so brilliant) performed a disservice.

Page Break 63

Page 63

(Now every ass has them†a within reach for 'explaining' symptoms of illness with their help.) MS 133 21:

Page 63

Irony in music. E.g. Wagner in the Mastersingers. Incomparably deeper in the first movement of the IXth in the fugato. Here is something, that corresponds to the expression of bitter irony in speech.

Page 63

I could equally well have said: the distorted in music. In the sense in which we speak of features distorted by grief. When Grillparzer says Mozart countenanced only the "beautiful" in music, that means, I think, that he did not countenance the distorted, frightful, that there is nothing in his music corresponding to *this*. I am not saying that is quite true; but assuming it to be so, it is a prejudice on Grillparzer's part, to think that by rights it ought not to be otherwise. The fact that music since Mozart (of course especially through Beethoven) has extended the range of its language is to be neither commended nor deplored, rather: *that's* how it is.†b Grillparzer's *attitude* involves a certain ingratitude. Did he want *another* Mozart? Could he imagine something†39 that such a being might compose? Would he have been able to imagine Mozart if he had not known him?
The concept of "the beautiful" has done a lot of mischief here too.

Page 63

Concepts *may* alleviate mischief or make it worse; foster it or check it. MS 133 30: 1.-2.11.1946

Page 63

The fundamental insecurity of life. Misery, everywhere you look.

The grinning faces of idiots may, it is true, make us think *they* do not really suffer; but they do, only not in the same place as the more intelligent. They do not have, as one might say, *headache*, but as much other wretchedness as anyone else. Not all wretchedness need after all evoke the *same* facial expression. A nobler person who suffers will look different from me.

MS 133 68 c: 12.11.1946*

Page 63

I cannot kneel to pray, because it's as though my knees were stiff. I am afraid of dissolution (of my own dissolution) should I become soft.

MS 133 82: 24.11.1946

Page Break 64

I am showing my pupils sections of an immense landscape, which they cannot possibly find their way around. MS 133 82: 24.11.1946

Page 64

The truly apocalyptic view of the world is that things do *not* repeat themselves. It is not e.g. absurd to believe that the scientific & technological age is the beginning of the end for humanity, that the idea of Great Progress is a bedazzlement, along with the idea that the truth will ultimately be known; that there is nothing good or desirable about scientific knowledge & that humanity, in seeking it, is falling into a trap. It is by no means clear that this is not how things are.

MS 133 90: 7.1.1947

Page 64

A man's dreams are virtually never realized.

MS 133 118: 19.1.1947

Page 64

Socrates, who always reduces the Sophist to silence--does he reduce him to silence *rightfully*?--It's true, the Sophist does not know what he thinks he knows; but that is no triumph for Socrates. It can neither be a case of "You see! You don't know it!"--nor, triumphantly, "So none of us knows anything!"

Because I don't want to think *just* to convict myself, or even someone else, of unclarity I am not trying to understand something,†a *simply* in order to see that I still do not understand it. MS 133 188: 27.2.1947*

Page 64

Wisdom is something cold, & to that extent foolish. (Faith, on the other hand, a passion.) We might also say: wisdom merely *conceals* life from you. (Wisdom is like cold, grey ash covering the glowing embers.) MS 134 9:
3.3.1947

Page 64

Don't *for heaven's sake*, be afraid of talking nonsense! Only don't fail to pay attention to your nonsense. MS 134 20:
5.3.1947

Page 64

The miracles of nature,

We might say: art *discloses* the miracles of nature to us. It is based on the *concept* of the miracles of nature. (The blossom, just opening out. What is *marvellous* about it?) We say: "Look, how it's opening out!"

It could only be by accident that someone's dreams about the future of

philosophy, art, science would come true. What he sees is a continuation of his own world in his dream, that is to say PERHAPS his wish (and perhaps not) but not reality.

It might still happen that a person's photograph, e.g., changed with time, almost as if he were aging on it. But its changes then take place according to their own laws & why should they lead in a parallel direction to the development of the real person?

The mathematician too can of course marvel at the miracles (the crystal) of nature; but can he do it, once a problem has arisen about *what* he sees?†a Is it really possible as long as the object he finds awe-inspiring or gazes at with awe is shrouded in a philosophical fog?

I could imagine someone admiring trees, & also the shadows, or reflections of trees, which he mistakes for trees. But if he should once tell himself that these†b are not after all trees & if it becomes a problem for him what they are, or what relation they have to trees, then his admiration will have suffered a rupture, that will now need healing. MS 134 27: 10.-15.3.1947*

Sometimes a sentence can be understood only if it is read at the *right tempo*. My sentences are all to be read *slowly*. MS 134 76: 28.3.1947

The 'necessity' with which the second idea succeeds the first. (Overture to Figaro.) Nothing could be more idiotic than to say it's '*pleasing*' to hear the second after the first!--But the paradigm according to which everything there is *right* is certainly obscure. 'It is the natural development.' You gesture with your hand, would like to say: "of course!"--You could too compare the transition to a transition (the entry of a new character) in a story, e.g., or a poem. *That* is how this piece fits into the world of our thoughts & feelings. MS 134 78: 30.3.1947

The folds of my heart all the time tend to stick together & to open it I should need to keep tearing them apart. MS 134 80 30.3.1947

A foolish & naïve American film can in all its foolishness & *by means of* it be instructive. A fatuous, non-naïve†c English film can teach nothing. I have

often drawn a lesson from a foolish American film. MS 134 89: 2.4.1947

Is what I am doing in any way worth the effort? Well only, if it receives a light from above. And if that happens,--why should I take care, not to be robbed of the fruits of my labour? If what I write really has value, how were anyone to steal the value from me? If the light from above is *lacking*, then I can in any case be no more than clever. MS 134 95: 3.4.1947

I completely understand, how someone may *hate* it, if the priority of his invention or discovery is called in question, how†a he may be willing to defend†b this priority with tooth & claw. *And yet* it is only a chimera. To be sure it seems to me too cheap, all too easy for *Claudius* to scoff at the priority disputes between Newton & Leibniz; but I think it is true all the same that this quarrel springs only from vile weaknesses & is nourished by VILE people. *What* would Newton have lost if he had acknowledged Leibniz's originality? Absolutely nothing! He would have gained a lot. And yet, how hard is such an acknowledgement, seeming,†c to someone who attempts it, like a confession of his own incapacity. Only people who esteem one, & at the same time *love* one, can make such behaviour†d *easy* for one.†e

It's a question of *envy* of course. And anyone who feels it, ought to keep saying to himself: 'It's a mistake! It's a mistake!--'

MS 134 100: 4.4.1947

In the train of every idea that costs a lot come a host of cheap ones: amongst them even a few that are useful.

Sometimes one sees ideas, as an astronomer sees stars in the far distance. (Or at least it seems so.) MS 134

If I had written a *good* sentence, & they were by accident two rhyming lines, †f†g†h this would be a *blemish*.

There is *much* that could be learned from Tolstoy's false†a theorizing that the work of art conveys 'a feeling'.--And you really might call it, if not the expression of a feeling, an expression of feeling, or a felt expression. And you might say too that people who understand it to that extent 'resonate' with it, respond to it. You might say: The work of art does not seek to convey *something else*, just itself. As, if I pay someone a visit, I don't wish simply to produce such & such feelings in him, but above all to pay him a visit, & naturally I also want to be well received.

And it does start to be really absurd, to say, the artist wishes that, what he feels when writing, the other should feel when reading. Presumably I can think I understand a poem (e.g.), understand it in the way its author would wish,--but what *he* may have felt in writing it, that doesn't concern me *at all*. MS 134 106: 5.4.1947

Just as I cannot write verse, so too I can write prose only *up to a certain point*, & no further. There is a quite definite limit to my prose, & I can no more overstep *it*, than I would be able to write a poem. *This* is how my equipment is constituted; it is the only equipment available to me. It is like someone's saying: In this game I can attain only *this* level of perfection, & not *that*. MS 134 108: 5.4.1947

It is *possible*†b, that everyone who executes an important work, sees before his mind's eye, dreams of, a continuation of, a sequel to, his work; but it would be remarkable all the same if it really turned out as he dreamed. Nowadays not believing in your own dreams is of course easy. MS 134 120: 7.4.1947

Nietzsche writes somewhere, †40 that even the best poets & thinkers have written mediocre & bad stuff, but have just separated off the good. But it is not quite like that. It's true that along with the roses a gardener has manure & *sweepings* & *straw* in his garden, but they are distinguished not only†c by value, but above all too by†d function in the garden.

What looks like a bad sentence can be the *germ* of a good one. MS 134 124: 8.4.1947

The faculty of 'taste' cannot create a new organism, only rectify one that is already there. Taste loosens screws & tightens screws, it doesn't create a new original work.†41

Taste rectifies, it doesn't give birth.†a

Taste makes ACCEPTABLE.

(Hence, I think, a great creator needs no†b taste: the child is born into the world well formed.)

Polishing is *sometimes* the job of taste, sometimes not.

I have taste.

The†c *most refined* taste has *nothing* to do with creative power.

Taste is refinement of sensibility; but sensibility does not *act*, it merely assimilates.

I *cannot*†d judge whether I have only taste, or originality as well. The former I can see distinctly, but not the latter, or only quite indistinctly. And perhaps it has to be like that, & you see only what you *have*, not what you are. Someone who does not lie is original enough. For, after all, the originality that would be worth wishing for, cannot be a sort of trick, or an idiosyncrasy, however marked.

In fact it is already a seed of good originality not to want to be what you are not. And all that has been said before *much* better by others.

Taste can delight, but not seize.

MS 134 129: 9.4.1947

You can as it were restore an old style in a new†e language; perform it afresh so to speak in a manner†f that†g suits

our times. In doing so you really only reproduce. I have done this in my building work.

Page Break 69

Page 69

What I mean is *not* however giving an old style a new trim. You don't take the old forms & fix them up to suit today's taste. No, you are really †a speaking, maybe unconsciously, the old language, but speaking it in a manner that belongs to the newer world, though not on that account necessarily one that is to its taste. MS 134 133: 10.4.1947

Page 69

Someone reacts *like this*: he says "Not *that!*"--& resists it. Out of this situations perhaps develop which are equally intolerable; & perhaps by then strength for any further revolt is exhausted. We say "If *he* hadn't done *that*, the evil would not have come about." But with what justification? Who knows the laws according to which society unfolds? I am sure even the cleverest has no idea. If you fight, you fight. If you hope, you hope. Someone can fight, hope & even believe, without believing *scientifically*.

Page 69

Science: enrichment & impoverishment. The *one* method elbows all others aside. Compared with this they all seem paltry, preliminary stages at best. You must climb down to the sources to see them all side by side, the disregarded & the preferred. MS 134 141: 13.4.1947

Page 69

Is it just *I* who cannot found a school, or can a philosopher never do so? I cannot found a school, because I actually want not to be imitated. †i In any case not by those who publish articles in philosophical journals.

Page 69

The use of the word "fate". Our attitude to the future & the past. To what extent do we hold ourselves responsible for the future? How much do we speculate about the future? How do we think about past & future? If something unwelcome happens:--do we ask "Who's to blame?", do we say "Someone must be to blame for it"?,--or do we say "It was God's will", "It was fate"?

In the way in which asking a question, insisting on an answer, or not asking it, expresses a different attitude, a different way of living, *so* too, in this sense, an utterance like "It is God's will" or "We are not masters of our fate". What this sentence does, or at least something similar, a commandment

Page Break 70

too could do. Including one that you give to yourself. And conversely a commandment, e.g. "Do not grumble!" can be uttered like the affirmation of a truth.

Now why am I so anxious to keep apart these ways of using "declarative sentences"? Is it really necessary? Did people in former times really not properly understand what they wanted to do with a sentence? Is it pedantry?--It is simply an attempt to see that every usage gets its due. Perhaps then a reaction against the overestimation of science. The use of the word "science" †i for "everything that can be said without nonsense" already betrays this over-estimation. For this amounts in reality to dividing utterances into two classes: good & bad; & the danger is already there. It is similar to dividing all animals, plants & rocks into the useful & the harmful.

But of course the words "see that they get their due" & "overestimation" express my point of view. I could have said instead: "I want to help this & this to regain respect."; only I don't see it like that.

Page 70

Fate is the antithesis of natural law. A natural law is something you try to fathom, & make use of, fate is not.

Page 70

It is not by any means clear to me, that I wish for a continuation of my work by others, more than a change in the way we live, making all these questions superfluous. (For this reason I could never found a school.)

Page 70

The philosopher says "Look at things *like this!*"--but first, that is not to say that people will look at things like this, second, he may be altogether too late with his admonition, & it's possible too that such an admonition can achieve absolutely nothing & that the impulse towards such a change in the way things are perceived must come from another direction. For instance it is quite unclear whether Bacon started anything moving, except the surface of his readers' minds.

Page 70

Nothing seems to me more unlikely than that a scientist or mathematician, who reads me, should be seriously influenced thereby in the way he works. (In that respect my warnings †a are like the posters on the ticket offices at English railway stations †42 "Is your journey really necessary?" As if anyone

Page Break 71

Page 71

reading that would say to himself "On second thoughts, *no*"†i.) Quite different artillery is needed here from anything I am in a position to muster. Most likely I could still achieve an effect in that, above all, a *whole lot* of garbage is written in response to†a my stimulus & that *perhaps* this provides†b the stimulus for something good. I ought always to hope only for the most indirect of influences.

Page 71

E.g. nothing more stupid than the chatter about cause & effect in history books; nothing more wrong-headed, more half-baked.--But who could put a stop to it by *saying* that? (It is†c as though I wanted to change men's and women's fashions†d by talking.) MS 134 143: 13.-14.4.1947

Page 71

Think about how it was said of Labor's playing "*He is speaking*". How curious! What was it about this playing that was so reminiscent of speaking? And how remarkable that this†e similarity with speaking is not something we find incidental, but an important & big matter!--We should like to call music, & certainly *some* music, a language; but no doubt not *some* music.†f (Not that this need involve a judgement of value!) MS 134 156: 11.5.1947

Page 71

The book is full of life--not like a human being, but like an ant-heap. MS 134 157: 11.5.1947

Page 71

One keeps forgetting to go down to the foundations. One doesn't put the question marks *deep* enough down.

Page 71

The labour pains at the birth of new concepts. MS 134 180: 27.6.1947

Page 71

"Wisdom is grey." Life on the other hand & religion are full of colour. MS 134 181: 27.6.1947

Page Break 72

It may be that science & industry, & their progress, are the most enduring thing in the world today. That any guess at a coming collapse of science & industry were†a for now, & for a *long* time to come, simply a dream, & that science & industry after†43 & with infinite misery will unite the world, I mean integrate it into a single empire, in which†i to be sure peace is the last thing that will then find a home.

For science & industry do decide wars, or so it seems. MS 135 14: 14.7.1947

Page 72

Do not interest yourself in what, presumably, only you are doing! MS 135 23: 16.7.1947

Page 72

My thoughts probably move in a far narrower circle than I suspect! MS 135 85: 24.7.1947

Page 72

Thoughts rise to the surface slowly, like bubbles.

Page 72

Sometimes it's as though you could see a thought, an idea, as an indistinct point far away on the horizon; & then it often comes closer†b with surprising speed. MS 135 101: 26.7.1947

Page 72

Where there is bad management in the state, I believe, bad management is fostered in families too. A worker who is ready for a strike†44 at any time will not bring up his children to respect order either. MS 135 102: 27.7.1947

Page 72

God grant the philosopher insight into what lies in front of everyone's eyes. MS 135 103 c: 27.7.1947

Page 72

Life is like a path along a mountain ridge; right & left smooth†c slopes down which you slide in this or that†d direction without being able to stop yourself. I keep seeing people slip like this & I say: "How could anyone help himself in that situation!" And *that* is what "denying free will" comes to. That is the attitude that expresses itself in this 'belief'. But it is not a *scientific* belief, has nothing to do with scientific convictions.

Page Break 73

Page 73

Denying responsibility means, not *holding* anyone responsible. MS 135 110: 28.7.1947

Page 73

Some people have a taste that is related to an educated taste as is the visual impression of a purblind eye to that of a normal eye. Where a normal eye see clear articulation, the weak one sees blurred patches of colour. MS 135 133: 2.8.1947

Page 73

Someone who knows too much finds it hard not to lie. MS 135 191: 17.12.1947

Page 73

I am so afraid of someone's playing the piano in the house that, when it happens & the strumming has stopped, I still have a sort of hallucination, that it's continuing. I can hear it then quite clearly, although I know that it is all in my imagination. MS 135 192: 17.12.1947

Page 73

It appears to me as though a religious belief could only be (something like) passionately committing oneself to a system of coordinates†a. Hence although it's belief, it is really a way of living, or a way of judging life. Passionately taking up *this* interpretation. And so instructing in a religious belief would have to be portraying, describing that system of reference & at the same time appealing to the conscience. And these together would have to result finally in the one under instruction himself, of his own accord, passionately taking up that system of reference. It would be as though someone were on the one hand to let me see my hopeless situation, on the other depict the rescue-anchor†b, until of my own accord, or at any rate not†c†d led by the hand by the *instructor*, I were to rush up & seize it.†45 MS 136 16b: 21.12.1947

Page 73

Perhaps one day a culture will arise out of this civilization. Then there will be a real history of the discoveries of the 18th, 19th & 20th centuries, which will be of profound interest. MS 136 18b: 21.12.1947

Page 73

In the course of a scientific investigation we say all kinds of things; we make many utterances the role of which in our investigation we do not

Page Break 74

understand. For of course not everything we say has a conscious purpose, but our tongues just keep going. Our thoughts run in established routines, we make, automatically, transitions†a according to the techniques†b we have learned. And now comes the time for us to survey what we have said. We have made a whole lot of movements that do not further our purpose, even impede it, and now we have to clarify our thought processes philosophically. MS 136 31a: 24.12.1947

Page 74

It seems to me I am still a long way from understanding these things; from the point, that is, at which I know what I have to talk about, & what I don't need to talk about. I still keep getting entangled in details without knowing whether I ought to be talking about such things at all; & I have the impression that I may be inspecting a large area, simply to exclude it eventually from consideration. But even in this case these reflections would not be worthless; as long, that is, as they are not just going round in a circle. MS 136 37a: 25.12.1947

Page 74

Architecture glorifies something (because it endures).†c It glorifies its purpose.

Page 74

(...)

Page 74

Architecture immortalizes & glorifies something. Hence there can be no architecture where there is nothing (to immortalize &) glorify.

Page 74

(...)

Page 74

Architecture immortalizes & glorifies something. Hence there can be no architecture where there is nothing to glorify.

Page 74

Architecture glorifies something (because it endures). Hence there can be no architecture where there is nothing to glorify. MS 167 10v: ca. 1947-1948

Page 74

When philosophizing you have to descend into the old chaos†i & feel at home there. MS 136 51a: 3.1.1948

Page Break 75

Genius is talent in which character makes itself heard. For that reason, I would like to say, Kraus has talent, an extraordinary talent, but not genius.

To be sure, there are flashes of genius where, despite the *great* application of talent, you do not notice the talent. Example: "For the ox & the ass can do things too..."†46 It is curious that this e.g. is so much greater than anything Kraus ever wrote. Here you see not merely an intellectual skeleton, but a whole human being.

That is the reason too why the greatness of what someone writes depends on everything else he writes & does. MS 136 59a: 4.1.1948

Page 75

In a dream, & even *long* after we wake up, dream words can seem to us to have the greatest significance. Isn't the same illusion possible too in waking life? It seems to me as though *I* am sometimes subject to it these days. It often appears to be like this with the insane. MS 136 60b: 4.1.1948

Page 75

What I am writing here may be feeble stuff; well, in that case I am just not capable of getting out the big, important thing. But there are great prospects hidden in these feeble remarks. MS 136 62a: 4.1.1948

Page 75

Schiller writes in a letter (to Goethe, I think)†47 of a 'poetic mood'. I think I know what he means, I think I am familiar with it myself. It is the mood of receptivity to nature & one in which one's thoughts seem as vivid as nature itself. But it is strange that Schiller did not produce anything better (or so it seems to me) & so I am furthermore not entirely convinced that what *I* produce in such a mood is worth anything. It is quite possible that what gives my thoughts their lustre on such occasions is a light that they receive from *behind* them. That they do not *themselves* glow.

Page 75

Where others go on ahead, I remain standing. MS 136 80a: 8.1.1948

Page 75

[For the Foreword.]†48 It is not without†a reluctance that I offer the book to the public. The hands into which it will fall are for the most part not those in which I like to imagine it. May it soon--this is what I wish for it--be completely forgotten by the philosophical journalists & thus perhaps be kept for a more upright†b kind of reader. MS 136 81a: 8.1.1948

Page Break 76

Only every so often does one of the sentences I am writing here make a step forward; the rest are like the snipping of the barber's scissors, which he has to keep in motion so as to be able to make a cut with them at the right moment. MS 136 81b: 8.1.1948

Page 76

As I again & again come across questions in more remote regions that I cannot answer, it becomes clear†a why I still cannot find my way round regions that are less remote. For how do I know that what stands in the way of an answer here is not precisely what prevents me from clearing away the fog over there? MS 136 89a: 10.1.1948

Page 76

Raisins may be the best part of a cake; but a bag of raisins is not better than a cake; & someone who is in a position to give us a bag full of raisins still cannot bake a cake with them, let alone do something better.

I am thinking of Kraus & his aphorisms, but of myself too & my philosophical remarks.

A cake is not as it were: thinned out raisins. MS 136 91b: 11.1.1948

Page 76

Colours are a stimulus to philosophizing. Perhaps that explains Goethe's passion for the theory of colours. Colours seem to present us with a riddle, a riddle that stimulates us,--not one that exasperates†i us. MS 136 92b: 11.1.1948

Page 76

Human beings can regard all the evil within them as blindness. MS 136 107a: 14.1.1948

Page 76

If it is true, as I believe, that Mahler's music is worthless, the question is what I think he should have done with his talent. For quite obviously it took *a string of very rare talents* to produce this bad music. Should he, say, have written his symphonies & burnt them? Or should he have done himself violence & not have written them? Should he have written them & realized that they were worthless? But how could he have realized that? I see it because I can

compare his music with that of the great composers. But *he* could not do that; for someone to whom that has occurred may perhaps have *misgivings* about the value of his production, because he no doubt sees that he does not, so to speak, have the nature of the other great

Page Break 77

composers,--but that does not mean that he will grasp the worthlessness; because he can always tell himself that he is, it is true, *different* from the rest (whom however he admires) but excellent in another way. We could perhaps say: If nobody whom you admire is like you, then presumably you believe in your own value only because you are *you*.--Even someone who struggles against vanity, but not entirely successfully, will always deceive himself about the value of what he produces.

But what seems most dangerous is to put your work into the position of being compared, first by yourself & then by others, with the great works of former times. You should not entertain such a comparison at all. For if today's circumstances are really so different, from what they once were, that you cannot compare your work with earlier works in respect of its *genre*, then you equally cannot compare its *value* with that of the other work. I myself am constantly making the mistake under discussion.

Incorruptibility is everything!

Page 77

Conglomeration: national sentiment, e.g. MS 136 110b: 14.1.1948*

Really I want to slow down the speed of reading with continual†a punctuation marks. For I should like to be read slowly. (As I myself read.) MS 136 128b: 18.1.1948

Page 77

I think Bacon got bogged down in his philosophy & this danger threatens me too. He had a vivid image of a huge building, it disappeared however when he really wanted to get down to details. It was as though his contemporaries had begun to build a great building from the foundations; & as though *he* had seen something similar in his imagination, the vision of such a building; had seen it as even more imposing than, perhaps, those who were working on the construction. For this an *inkling* of the method was necessary, but by no means a talent for building work. But the bad

Page Break 78

thing was that he launched polemical attacks against the real builders & either did not recognize, or did not want to recognize, *his* limitations.

On the other hand it is tremendously hard to see these limitations, & that means, to delineate them clearly. That is, as it were, to find†a a way of painting to depict this fuzziness. For I want to keep saying to myself: "Paint nothing more than what you see!" MS 136 129b: 19.1.1948

Page 78

In Freudian analysis the dream is as it were dismantled. It loses its original sense *completely*. You might think of it as performed on the stage, with a plot that is sometimes fairly incomprehensible but also in part quite comprehensible, or at least apparently so, & as though this plot were then torn into little pieces & each part given a completely different meaning. You could also think of it like this: a picture is drawn on a big sheet of paper & the sheet is then folded in such a way that pieces which do not belong together at all in the original picture collide in appearance & a new picture, which may make sense or may not, is formed (this would be the manifest dream, the first picture the 'latent dream thought').

Now I could imagine that someone, who sees the unfolded picture, might exclaim "Yes, that is the solution, that is what I dreamed, but without gaps & distortions." It would then be this acknowledgement that made this solution the solution. Just as, if you are searching for a word while writing & then say: "*That's it, that* says what I wanted to say!"--Your acknowledgement stamps the word as having been found, i.e. the one you were looking for. (In this case it might really be said: only when you have found it, do you know what you were looking for--much as Russell said about wishing.)

Page 78

What is intriguing about a dream, is not its *causal* connection with events in my life, etc., but rather this, that it

affects us like part of a story, †b & indeed a very *vivid* part, the rest lying in darkness. (We would like to say †c: "Where on earth did this image come from, & what has become of it?") Yes, and if someone now shows me that this story was not the right story; that in reality quite a different one underlay it, so that I want to say †d, disenchanted, "Oh, *that's* how it was?", I have seemingly really been robbed of something. Certainly, the first story now disintegrates, as the paper is unfolded; the man I saw was taken from *here*, his words from

Page Break 79

there, the surroundings in the dream from somewhere else again; but the dream story all the same has its own charm, like a painting that attracts & inspires us.

It can certainly be said that we *contemplate* the dream picture with inspiration, that we just *are* inspired. For if we tell the dream to someone else, the picture usually does not inspire him. The dream is like an idea pregnant with possible implications †a

MS 136 137a: 22.1.1948

Page 79

Strike a coin from every mistake.

MS 137 17a: 10.2.1948

Page 79

Understanding & explaining a musical phrase.--The simplest explanation is sometimes a gesture; another might be a dance step, or words describing a dance.--But isn't our understanding of the phrase an experience we have while hearing it? & what function, in that case, has the explanation? Are we supposed to think of *it* while we hear the music? Are we supposed to imagine the dance, or whatever it may be, as we listen? And supposing we do,--why should *that* be called hearing the music with understanding?? If seeing the dance is what matters, it would be better *that*, rather than the music, were performed. But that is all a misunderstanding.

I give someone an explanation, say to him: "It's as though..."; then he says "Yes now I understand it" or "Yes now I know how it is to be played". Above all he did not have to *accept* the explanation; it is not after all as though I had given him compelling reasons for comparing this passage with this & that. I did not e.g. explain to him that remarks made by the composer show that this passage is supposed to represent this & that.

Page 79

If I now ask "What do I actually experience then, if I hear the theme & hear it with understanding?"--nothing but inanities †b occur to me by way of reply. Such as images, kinaesthetic sensations, thoughts †c and the like. Sure enough I say "I go along with it"--but what does that mean? It *might* mean roughly that I accompany the music with gestures. And if we point out that after all this happens for the most part only in very rudimentary measure, we shall perhaps receive the answer that the rudimentary movements are supplemented with images. But let us nevertheless assume that someone does accompany the music with movements in full

Page Break 80

measure,--in what sense does *that* amount to understanding it? And do I want to say, the movements are the understanding; or his kinaesthetic sensations? (What do I know about them?)--What is true is, that, in certain circumstances, I shall regard his movements as signs of his understanding.

Page 80

But am I to say (if I reject images, kinaesthetic sensations, etc. as an explanation) that understanding is just a specific experience that cannot be analysed further? Well, that would be passable, as long as it is not supposed to mean, †a it is a specific *experiential content*. For *these* words make one think of distinctions like those between seeing, hearing & smelling. †b

Page 80

How then do we explain to someone what it means "to understand music"? By naming the images, kinaesthetic sensations, etc. experienced by someone who understands? *More likely*, by pointing out the expressive movements of one who understands.--Anyway, there is also the question, what function does explanation have here? & what does it mean: to understand what it means to understand music? Some indeed would say: to understand that means: to understand music oneself. And so the question would be "Then can we teach someone to understand music", for only that kind of teaching could be called an explanation of music.

Appreciation †c of music is *expressed* in a certain way, both in the course of hearing & playing and at other times †d too. This expression sometimes includes movements, but sometimes only the way the one who understands plays, or hums, occasionally too parallels he draws & images which, as it were, illustrate the music. Someone who understands music will listen differently (with a different facial expression, e.g.), play differently, hum differently, talk differently about the piece than someone who does not understand. His appreciation of a theme will not however be shown only in phenomena that accompany the hearing or playing of the theme, but also in an

appreciation for music in general.

Page 80

Appreciating music is a manifestation of human life. How could it be described to someone? Well, above all I suppose we should have to describe *music*. Then we could describe the relation human beings have to it. But is that all that is necessary, or is it also part of the process to teach

Page Break 81

him to appreciate it for himself? Well, developing his appreciation will teach him what appreciation is in a *different* sense, than a teaching†a that does not do this. And again, teaching him to appreciate poetry or painting can be part of an explanation of what music is. MS 137 20b: 15.2.1948

Page 81

Our children learn in school already that water *consists* of the gases hydrogen & oxygen, or sugar of carbon, hydrogen & oxygen. Anyone who does not understand is stupid. The most important questions are concealed. MS 137 30b: 8.3.1948

Page 81

The beauty of a star-shaped figure--of a hexagonal star perhaps--is spoiled if we see it as symmetrical relative to a given axis. MS 137 34b: 10.3.1948

Page 81

Bach said that everything he achieved was the result of industry. But industry like that presupposes humility & an enormous capacity for suffering, strength then. And anyone who in addition can express himself perfectly, simply addresses us in the language of a great human being. MS 137 40b: 28.5.1948

Page 81

I think that present day education of human beings†49 aims at decreasing the capacity for suffering. Nowadays a school counts as good, if the children have a Good time. And formerly that was *not* the yardstick. And parents would like children to become the way they themselves are (only more so) & yet they give them an education which is *quite* different from their own.--Capacity for suffering is not rated highly, since there are not supposed to be any sufferings, really they are out of date.

Page 81

"The cussedness of things"†i--An unnecessary anthropomorphism. We might speak of a malice of the *world*; easily imagine the devil created the

Page Break 82

world, or part of it. And we need not imagine the demon intervening in particular situations; everything may happen 'in accordance with the laws of nature': it is just that the whole plan is directed at evil from the start. But a human being exists in this world in which things break, slide about, cause every possible mischief. And of course he†a is one of the things.--The 'malice' of the object is a stupid anthropomorphism. For the truth is much graver than this fiction. MS 137 42a: 30.5.1948

Page 82

A stylistic device may be useful & yet I may be barred from using it. Schopenhauer's "as which" e.g. It would sometimes make for much more comfortable, clearer expression, but cannot be used by someone who perceives it as archaic; & he must not disregard this perception†b. MS 137 43a: 30.5.1948

Page 82

Religious faith & superstition are quite different. The one springs from *fear* & is a sort of false science. The other is a trusting. MS 137 48b: 4.6.1948

Page 82

It would almost be strange if there did not exist animals with the mental life of plants. I.e. lacking mental life. MS 137 49a: 4.6.1948

Page 82

I think it might be regarded as a fundamental law of natural history that, whenever something in nature 'has a function', 'serves a purpose', the same thing also occurs in circumstances where it serves none, is even 'dysfunctional'.

If dreams sometimes protect sleep, you can count on their sometimes disturbing it; if dream hallucination sometimes serves a *plausible* end (imagined†c wish fulfilment), count on its doing the opposite as well. There is no 'dynamic theory of dreams'. MS 137 49b: 4.6.1948

Page 82

What is important about depicting anomalies precisely? If you cannot do it, that'd shows you do not know your way around the concepts. MS 137 51a: 15.6.1948

Page Break 83

I am too soft, too weak, & so too lazy, to achieve anything important. The industry of the great is, amongst other things, a sign of their *strength*, quite apart from their inner wealth. MS 137 54b: 25.6.1948

Page 83

If God really does *choose* those who are to be saved, there is no reason why he should not choose them according to their nationalities, races, or temperaments. Why the choice should not be expressed in the laws of nature. (He was of course also *able* so to choose, that the choice follows a law.)

I have been reading extracts from the writings of St. John of the Cross†50, in which it is written that people have gone to their ruin, because they did not have the good fortune to find a wise spiritual director at the right moment.

And how can you†a say then that God does not try people beyond their strengths?

I am inclined to say here, it is true, that crooked concepts have done a lot of mischief, but the truth is, that I do not know at all, what does good & what does mischief. MS 137 57a: 26.6.1948

Page 83

We must not forget: even our more refined, more philosophical, scruples have a foundation in instinct. E.g. the 'We can never know...' Remaining receptive to further arguments. People who couldn't be taught this would strike us as mentally inferior. *Still* incapable of forming a certain concept. MS 137 57b: 30.6.1948

Page 83

If the dreams of sleep have a similar function to daydreams, then they partly serve <to> prepare people for *any* eventuality (including the worst). MS 137 65b: 3.7.1948

Page 83

If someone can believe in God with complete certainty, why not in Other Minds? MS 137 67a: 3.7.1948

Page 83

This musical phrase is a gesture for me. It creeps into my life. I make it my own.

Page 83

Life's infinite variations are an essential part of our life. And so precisely of the habitual character of life. Expression consists for us <in> incalculability. If I knew exactly how he would grimace, move, there would be no facial expression, no gesture.--But is that true?--I can after all listen again

Page Break 84

& again to a piece of music that I know (completely) by heart; & it could even be played on†a a musical box. Its gestures would still remain gestures for me although I know all the time, what comes next. Indeed I may even be surprised afresh again & again. (In a certain sense.) MS 137 67a: 4.7.1948

Page 84

The honest religious thinker is like a tightrope walker. It almost looks as though he were walking on nothing but air. His support†b†i is the slenderest imaginable. And yet it really is possible to walk on it. MS 137 67b: 5.7.1948

Page 84

Unshakable faith. (E.g. in a promise.) Is it less certain than being convinced of a mathematical truth?--(But does that make the language games any more alike!) MS 137 70b: 7.7.1948

Page 84

It is important for our approach, that someone may feel concerning certain people, that he will never know what goes on inside them. He will never understand them. (Englishwomen for Europeans.) MS 137 71a: 9.7.1948

Page 84

I think it is an important & remarkable fact, that a musical theme, if it is played <at> (very) different tempi, changes its *character*. Transition from quantity to quality. MS 137 72b: 14.7.1948

Page 84

The problems of life are insoluble on the surface, & can only be solved in depth. In surface dimensions they are insoluble. MS 137: 73b: 25.7.1948

In a conversation: One person throws a ball; the other does not know: is he to throw it back, throw it to a third person, or leave it lying, or pick it up & put it in his pocket, etc.. MS 137 75b: 23.8.1948

Page 84

A great architect in a bad period (Van der Nüll) has a quite different task from that of a great architect in a good

period. You must again not let yourself be deceived†c by the generic term. Don't take comparability, but rather incomparability, as a matter of course. MS 137 76a: 19.10.1948

Page Break 85

Nothing is more important though than the construction of fictional concepts,†a which will teach us at last to understand our own. MS 137 78b: 24.10.1948

Page 85

"Thinking is difficult." (Ward) What does that really mean? Why is it difficult?--It is almost like saying "Looking is difficult". For looking intently is difficult. And you may look intently & yet see nothing, or keep thinking you see something & yet not be able to see clearly†b. You can tire from looking, even if you see nothing. MS 137 81b: 27.10.1948

Page 85

If you cannot unravel a tangle, the most sensible thing you can do†c is to recognize this; & the most decent, to admit it. [Antisemitism.]

What you should do to cure the evil is *not* clear. What is *not* permissible is clear from one case to another. MS 137 88a: 4.11.1948

Page 85

It is remarkable that Busch's drawings can often be called 'metaphysical'. There is then a way of drawing that is metaphysical.--"Seen, with the eternal as background"†51 one might say. However these strokes mean this only in a whole language. And it is a language without grammar, you couldn't say what its rules are. MS 137 88b: 4.11.1948

Page 85

When he was old Charlemagne tried unsuccessfully to learn to write: & someone may be similarly unsuccessful in trying to learn a new line of thinking. He never becomes fluent in it. MS 137 89b: 5.11.1948

Page 85

A language, which is spoken in strict tempo, so that you can also speak according to the *metronome*. It does not go without saying that music can be performed, like ours, at least occasionally, to the metronome. (Playing the theme from the 8th Symph.†52 exactly according to the metronome.) MS 137 97b: 14.11.1948

Page 85

It would already be enough, that all members of a community had the same facial features, for us not to be able to fathom them. MS 137 97b: 16.11.1948

Page Break 86

If a false thought is so much as expressed boldly & clearly, a great deal has already been gained. MS 137 100a: 19.11.1948

Page 86

Only by thinking much more crazily even than the philosophers, can you solve their problems. MS 137 102a: 20.11.1948

Page 86

Imagine someone watching a pendulum & thinking: God makes it move like that. Well, doesn't God have the right†a even to act in accordance with a calculation?

Page 86

A writer far more talented than I would still have little talent. MS 137 104a: 21.11.1948

Page 86

Human beings have a *physical* need to tell themselves when at work: "Let's have done with it now", & it's having constantly to go on thinking in the face of this need when philosophizing, that makes this work so strenuous. MS 137 104b: 22.11.1948

Page 86

You must *accept* the faults in your own style. Almost like the blemishes in your own face. MS 137 106b: 23.11.1948

Page 86

Always come down from the barren heights of cleverness into the green valleys of folly. MS 137 111b: 28.11.1948

Page 86

I have one of those talents that has constantly to make a virtue out of necessity.

Page 86

Tradition is not something that anyone can pick up, it's not a thread, that someone can pick up, if & when he pleases; any more than you can choose your own ancestors.

Someone who has no tradition & would like to have it, is like an unhappy lover.

Page 86

The happy lover & the unhappy lover both have their particular pathos.

But it is harder to bear yourself well as an unhappy lover than as a happy one. MS 137 112b: 29.11.1948

Page Break 87

Moore poked into a philosophical wasp nest with his paradox; & if the wasps did not duly fly out, that's only because they were too listless. MS 137 120a: 10.12.1948

Page 87

In the realm of the mind a project can usually not be begun again, nor should it be. These thoughts fertilize the soil for fresh thoughts. MS 137 122a: 11.12.1948

Page 87

Are you a bad philosopher then, if what you write is hard to understand. If you were better, then you would make it easy to understand what is difficult.--But who says that is possible?! [Tolstoy] MS 137 127a: 16.12.1948

Page 87

The greatest happiness for a human being is love. Suppose you say of the schizophrenic: he does not love, he cannot love, he refuses to love--where is the difference?

Page 87

"He refuses to..." means: it is in his power. And *who* wants to say that?!

Page 87

Well, of what do we say "it is in his power"?--We say it in cases where we want to draw a distinction. I can lift *this* weight, but I will not lift it; *that* weight I cannot lift.

Page 87

"God has commanded it, therefore we must be able to do it." That means nothing. There is no "*therefore*" about it. The two expressions might at most mean the *same*.

Page 87

"He has commanded it" means here roughly: He will punish anyone who does not do it. And nothing follows from that about being able. And *that* is the sense of 'election by grace'.

Page 87

But that does not mean that it is right to say: "He punishes, although we *cannot* act otherwise."--Perhaps, though, one might say: here there is punishment, where punishment by human beings would be impermissible. And the whole concept of 'punishment' changes here. For the old illustrations can no longer be applied, or now have to be applied quite differently. Just look at an allegory like "The Pilgrim's Progress" & see how nothing

Page Break 88

--in human terms--is right.--But isn't it right all the same? i.e. can it not be applied? Indeed, it has been applied. (At railway stations there are dials with two hands, they indicate when the next train leaves. They look like clocks & aren't; but they have a use.) (There should be a better comparison here.)

Page 88

To someone who is upset by this allegory it might be said: Apply it differently or don't bother with it! (But *some* will be far more confused than helped by it.) MS 137 130a: 22.12.1948

Page 88

Anything the reader can do for himself, leave it to the reader. MS 137 134b: 25.12.1948

Page 88

Almost the whole time I am writing conversations with myself. Things I say to myself tête-à-tête. MS 137 134b: 26.12.1948

Page 88

Ambition is the death of thought. MS 137 135a: 27.12.1948

Page 88

Humour is not a mood, but a way of looking at the world. So, if it's right to say that humour was eradicated in Nazi Germany, that does not mean that people were not in good spirits or anything of that sort, but something much deeper & more important. MS 137 135a: 28.12.1948

Page 88

Two people who are laughing together, at a joke perhaps. One of them has said †c certain somewhat unusual words & now they both break out into a sort of bleating. That might appear *very* bizarre to someone arriving among us from a quite different background. Whereas we find it quite *reasonable*.

(I witnessed this scene recently on a bus & was able to think myself into the skin of someone not accustomed to it. It struck me then as quite irrational & like the reactions of an outlandish *animal*.) MS 137 136b: 31.12.1948

Page 88

Recounting a dream, a medley of recollections. Often forming a significant & enigmatic whole. As it were a fragment, that makes a *powerful* impression on us (*sometimes* that is), so that we look for an explanation, for connections.

Page Break 89

Page 89

But why did *these* recollections come *now*? Who will say?--It may be connected with our present life, and so too with our wishes, fears, etc. "But do you mean to say that this phenomenon must exist in the particular causal interconnection?"--I mean to say that it does not necessarily make sense to speak of discovering its cause.

Page 89

Shakespeare & the dream. A dream is all wrong, absurd, composite, & yet completely right: in *this* strange concoction it makes an impression. Why? I don't know. And if Shakespeare is great, as he is said to be, then we must be able to say of him: Everything is wrong, things *aren't like that*--& is all the same completely right according to a law of its own.

It could be put like this too: If Shakespeare is great, then he can be so only in the whole *corpus* of his plays, which create their *own* language & world. So he is completely unrealistic. (Like the dream.) MS 168 1r: January 1949

Page 89

If Christianity is the truth, then all the philosophy about it is false. MS 169 58v: 1949

Page 89

Culture is an observance. Or at least presupposes an observance. MS 169 62v: 1949

Page 89

The concept of a 'festivity'. Connected for us with merrymaking; perhaps in another age only with fear & dread. What we call "wit" & what we call "humour" doubtless did not exist in other ages. And both these are perpetually †a changing. †b MS 137 137a: 1.1.1949

Page 89

"Le style c'est l'homme." "Le style c'est l'homme même." The first expression has a cheap epigrammatic brevity. The second, correct, one opens up a quite different perspective. It says that style is the *picture* of the man.

Page 89

There are remarks that sow, & remarks that reap. MS 137 140a: 4.1.1949

Page Break 90

To piece together †a the landscape of these conceptual relationships out of their individual fragments †b is *too difficult* for me. I can make only a very imperfect job of it. MS 137 141a: 6.1.1949

Page 90

If I prepare myself for some eventuality, you can be pretty sure that it won't happen. Perhaps. †i

Page 90

It is *difficult* to know something, & to act as though you didn't know it. MS 137 143a: 7.-8.1.1949

Page 90

There really are cases in which one †c has the sense of what one †d wants to say much more clearly in mind than he †e †54 can express in words. (This happens to me very often.) It is as though one remembered a dream very clearly, but could not give a good account of it. †f Indeed the image often stays there behind the words for the writer (me), so that they *seem* to describe it *to me*.

Page 90

A mediocre writer must beware of too quickly replacing a crude, incorrect expression with a correct one. By doing so he kills the original idea, which was still at least a living seedling. And now it is shrivelled & no longer worth *anything*. He may now just as well throw it on the rubbish heap. Whereas the pitiful seedling still had a certain usefulness. MS 138 2a: 17.1.1949

Page 90

That writers, who after all *were* something, go out of date is connected with the fact that their writings, when

complemented by the setting of their own age, speak strongly to people, but that they die without this complementation, as if bereft of the lighting that gave them colour.

And I believe that the beauty of mathematical demonstrations, as experienced by Pascal too, is connected with this. Within *this* way of

Page Break 91

looking at the world these demonstrations did have *beauty*--not what superficial people call beauty. A crystal too is not beautiful in every 'setting'--though perhaps everywhere *attractive*--

Page 91

The way whole periods are incapable of freeing themselves from the grip of certain concepts--e.g. the concept 'beautiful' & 'beauty'. MS 138 3a: 18.1.1949

Page 91

My own thinking about art & values is far more disillusioned, than would have been *possible* for people 100 years ago. However that does not mean that it is more correct on that account. It only means that there are examples of decline in the forefront of my mind, which were not in the *forefront* for those people then. MS 138 4a: 18.1.1949

Page 91

Troubles are like illnesses; you have to put up with them: the worst thing you can do is, rebel against them. They come in attacks too, triggered by inner, or outer causes. And then you must tell yourself: "Another attack". MS 138 4b: 19.1.1949

Page 91

Scientific questions may interest me, but they never really grip†a me. Only *conceptual & aesthetic* questions have that effect on me. At bottom it leaves me cold whether scientific problems are solved; but not those other questions. MS 138 5b: 21.1.1949

Page 91

Even if we are not thinking in circles, still, we sometimes walk straight through the thicket of questions out into the open country, sometimes†b along tortuous, or zigzagging paths, which don't take us into the open country. MS 138 8a: 22.1.1949

Page 91

The Sabbath is not simply a time to rest, to recuperate. We are supposed to look at our work from the outside, not just from within. MS 138 8b: 23.1.1949

Page 91

This is how philosophers should salute each other: "Take your time!" MS 138 9a: 24.1.1949

Page Break 92

Page 92

For a human being the eternal, the consequential is often hidden behind an impenetrable veil. He knows: there is something under there, but he cannot *see* it; the veil reflects the daylight. MS 138 9a: 24.1.1949

Page 92

Why shouldn't someone become desperately unhappy? It is one human possibility. As in 'Corinthian Bagatelle', this is one of the possible paths for the balls. And perhaps not even one of the rarest. MS 138 9b: 25.1.1949

Page 92

The valleys of foolishness have more grass growing in them for the philosopher than do the barren heights of cleverness. MS 138 11a: 28.1.1949

Page 92

Isochronism according to the clock & isochronism in music. They are by no means equivalent concepts. Playing in *strict* time, does not mean playing exactly according to the metronome. But it would be possible that a certain *kind* of music should be played according to the metronome. (Is the opening theme <of the second movement> of the 8th symphony of this kind?) MS 138 12a: 30.1.1949

Page 92

Could the concept of the punishments of hell be explained in some other way than by way of the concept of punishment? Or the concept of God's goodness in some other way than by way of the concept of goodness? If you want to achieve the right *effect* with your words, doubtless not.

Page 92

Suppose someone were taught: There is a being who, if you do this & that, live in such & such a way, will take you

after your death to a place of eternal torment; most people end up there, a few get to a place of eternal joy.--This being has picked out in advance those who are to get to the good place; &, since only those who have lived a certain sort of life get to the place of torment, he has also picked out in advance those who are to lead that sort of life. What might be the effect of such a doctrine?

Page 92

Well, there is no mention of punishment here, but rather a kind of natural law. And anyone to whom it is represented in such a light, could derive only despair or incredulity from it.†a

Page Break 93

Page 93

Teaching this could not be an ethical training. And if you wanted to train anyone ethically & yet teach him like this, you would have to teach the doctrine *after* the ethical training, and represent it as a sort of incomprehensible mystery. MS 138 13b: 2.2.1949

Page 93

"He has chosen them, in his goodness, & you he will punish" really makes no sense. The two halves belong to different kinds of perspective. The second half is ethical & the first not. And taken together with the first the second is absurd. MS 138 14a: 2.2.1949

Page 93

It is an accident that 'last' rhymes with 'fast'.†i But a lucky accident, & you can *discover*†a this lucky accident. MS 138 25a: 25a: 22.2.1949

Page 93

In Beethoven's music what one might call the expression of irony is to be found for the first time. E.G. in the first movement of the Ninth. With him, moreover, it is a terrible irony, that of fate perhaps.--In Wagner irony reappears, but turned into something bourgeois.

You could no doubt say that Wagner & Brahms, each in his own way, imitated Beethoven; but what with him was cosmic, is†b earthly with them.

The same expressions are to be found in him, but they follow different laws.

Page 93

In Mozart's or Haydn's music again fate plays no sort of role. That is not the *concern* of this music.

That ass Tovey says somewhere that this, or something similar, is connected with the fact that Mozart has no access to literature of a certain sort. As though it were established, that only books had made the music of the masters what it was. Naturally, books & music are connected. But if Mozart found no great *tragedy* in his reading, does that mean that he did not find it in his *life*? And do composers always see solely through the spectacles of poets? MS 138 28a: 27.2.1949

Page 93

Only in a quite particular musical context is there such a thing as three-part counterpoint. MS 138 28b: 27.2.1949

Page Break 94

Soulful expression in music. It is not to be described in terms of degrees of loudness & of tempo. Any more than is a soulful facial expression describable in terms of the distribution of matter in space. Indeed it is not even to be explained by means of a paradigm, since the same piece can be played with genuine expression in innumerable ways. MS 138 29a: 1.3.1949

Page 94

God's essence is said to guarantee his existence--what this really means is that here what is at issue is not the existence of something.

Page 94

For could one not equally say that the essence of colour guarantees its existence? As opposed, say, to the white elephant. For it really only means: I cannot explain what 'colour' is, what the word "colour" means, without the help of a colour sample. So in this case there is no such thing as explaining 'what it *would be like* if colours *were* to exist'.

Page 94

And now we might say: There can be a description of what it would be like if there were gods on Olympus--but not: 'what it would be like if there were God'. And this determines the concept 'God' more precisely,

Page 94

How are we taught the word "God" (its use, that is)? I cannot give an exhaustive systematic description. But I can as it were make contributions towards the description; I can say something about it & perhaps in time assemble a sort

of collection of examples.

Page 94

Reflect in this connection that in a dictionary one would perhaps like to give such descriptions of use, but in reality one gives only a few examples & explanations. But also that no more than this is necessary. What use could we make of an enormously long description?--Well, it would be no use to us if it dealt with the use of words in languages already familiar to us. But what if we came across such a description of the use of an Assyrian word? And in what language? Let's say in another language already known to us.--In this description the word "sometimes" will frequently occur, or "often", or "usually", or "nearly always" or "almost never".

Page 94

It is difficult to form a good picture of a description of this sort.

Page Break 95

And what I basically am after all is a painter, & often a very bad painter. MS 138 30b: 17.3.1949

Page 95

What is it like when people do not have the same sense of humour? They do not react properly to each other. It is as though there were a custom among certain people to throw someone a ball, which he is supposed to catch & throw back; but certain people might not throw it back, but put it in their pocket instead.

Page 95

Or what is it like for someone to have no idea how to fathom another's taste? MS 138 32b: 20.5.1949

Page 95

A picture that is firmly rooted in us may indeed be compared to superstition, but it may be said too that we *always* have to reach some sort of firm ground, be it a picture, or not, so that a picture at the root of all our thinking is to be respected & not treated as a superstition. MS 138 32b: 20.5.1949

Page 95

It is not unheard of†a that†b someone's character may be influenced by the external world (Weininger). For that only means that, as we know from experience, people change with circumstances. If someone asks: How *could* the environment *coerce* someone, the ethical in someone?--the answer is that he may indeed say "No human being has to give way to coercion", †i but all the same under such circumstances†c someone *will* do such & such.

'You don't HAVE to, I can show you a (different) way out,--but you won't take it.' MS 173 17r: 30.3.1950

Page 95

I do not think that Shakespeare can be set alongside any other poet.

Was he perhaps a *creator of language* rather than a poet?

Page 95

I could only stare in wonder at Shakespeare; never do anything with him.

Page 95

I am *deeply* suspicious of most of Shakespeare's admirers. I think the trouble is that, in western culture at least, he stands alone, & so, one can only place him by placing him wrongly.

Page Break 96

It is *not* as though S. portrayed human types well & were in that respect *true to life*. He is *not* true to life. But he has such a supple hand & such individual *brush strokes*. [[sic , ?]] that each one of his characters looks *significant*, worth looking at.

Page 96

"Beethoven's great heart"--no one could say "Shakespeare's great heart". The supple hand that created new natural forms of language' would seem to me nearer the mark.

Page 96

The poet cannot really say of himself "I sing as the bird sings"--but perhaps S. could have said it of himself. MS 173 35r: 12.4.1950 or later

Page 96

One & the same theme has a different character in the minor than in the major, but it is quite wrong to speak generally of a character belonging to the minor. (In Schubert the major often sounds sadder than the minor.†a) And similarly, I think, it is idle & futile for the understanding of painting to speak of the characters of the individual colours. In doing so one really thinks only of special applications. The fact that green has one effect as the colour of a table cloth, red another, licenses no conclusion about their effect in a picture. MS 173 69r: 1950

Page 96

I do not think Shakespeare could have reflected on the 'lot of the poet'.

Neither could he regard himself as a prophet or teacher of humanity.

People regard him with amazement almost as a spectacle of nature. They do not have the feeling that this brings them into contact with a great *human being*. Rather with a phenomenon.

I think that, in order to enjoy a poet, you have to *like* the culture to which he belongs as well. If you are indifferent to this or repelled by it, your admiration cools off. †bMS 173 75v: 1950

If the believer in God looks around & asks "Where does everything I see come from?" "Where does all that come from?", what he hankers after is

not a (causal) explanation; and the point of his question is that it is the expression of this hankering. †i He is expressing, then, a stance †a towards all explanations.--But how is this manifested in his life?

It is the attitude of taking a certain matter seriously, but then at a certain point not taking it seriously after all, & declaring that something else is still more serious.

Someone may for instance say that it is a very grave matter that such & such a person has died before he could complete a certain piece of work; & in another sense that is not what matters. At this point one uses the words "in a deeper sense".

Really what I should like to say is that here too what is important is not the *words* you use or what you think while saying them, so much as the difference that they make at different points in your life. How do I know that two people mean the same thing when each says he believes in God? And just the same thing goes for the Trinity. Theology that insists on *certain* †b words & phrases & prohibits others makes nothing clearer. (Karl Barth)

It gesticulates with words, as it were, because it wants to say something & does not know how to express it. †c *Practice* gives the words their sense. MS 173 92r: 1950

A proof of God ought really to be something by means of which you can convince yourself of God's existence. But I think that *believers* who offered such proofs wanted to analyse & make a case for their 'belief' with their intellect, although they themselves would never have arrived at belief by way of such proofs. "Convincing someone of God's existence" is something you might do by means of a certain upbringing, shaping his life in such & such a way. Life can educate you to "believing in God". And *experiences* too are what do this but not visions, or other sense experiences, which show us the "existence of this being", but e.g. sufferings of various sorts. And they do not show us God as a sense experience does an object, nor do they give rise to *conjectures* about him. Experiences, thoughts,--life can force this concept on us.

So perhaps it is similar to the concept 'object'.

MS 174 1v: 1950

The reason I cannot understand Shakespeare is that I want to find symmetry in all this asymmetry.

It seems to me as though his pieces are, as it were, enormous *sketches*, not paintings; as though they were *dashed off* by someone who could permit himself *anything*, so to speak. And I understand how someone may admire this & call it *supreme art*, but I don't like it.--So I can understand someone who stands before those pieces speechless; but someone who admires him as one admires Beethoven, say, seems to me to misunderstand Shakespeare. MS 174 5r: 24.4.1950 or later

One age misunderstands another; and a *petty* age misunderstands all the others in its own ugly way. MS 174 5v: 1950

How God judges people is something we cannot imagine at all. If he really takes the strength of temptation & the frailty of nature into account, whom can he condemn? But if not, then these two forces simply yield as a result the end for which this person was predestined. In that case he was created so as either to conquer or succumb as a result of the interplay of forces. And that is not a religious idea at all, so much as a scientific hypothesis.

So if you want to stay within the religious sphere, you must *struggle*. MS 174 7v: 1950

Look at human beings: One is poison for the other. A mother for her son, and vice versa, etc. etc. But the mother is blind & the son too. Perhaps they have a guilty conscience, but what good does that do them? The child is wicked, but nobody teaches it to be different, & the parents only spoil it with their foolish affection; & how are they supposed to understand this, & how is the child to understand it? They are, so to speak, *all* wicked & *all* innocent. MS 174 8r: 1950

Page 98

Philosophy hasn't made any progress?--If someone scratches where it itches, do we have to see progress? isn't it genuine scratching otherwise, or genuine itching? And can't this reaction to the irritation†a go on†b like this for a long time, before a cure for the itching is found? MS 174 10r: 1950

Page Break 99

Page 99

God may say to me: "I am judging you out of your own mouth. You have shuddered with disgust at your own actions when you have seen them in other people". MS 175 56r: 15.3.1951

Page 99

Is the sense of belief in the Devil this, that not everything that comes to us as an inspiration is good†a? MS 175 63v: 17.3.1951

Page 99

You cannot judge yourself, if you are not versed in the categories. (Frege's style of writing is sometimes *great*; Freud writes excellently, & it is a pleasure to read him, but his writing is never *great*)†55 MS 176 55v: 6.4.1951

Page Break 100

A Poem†a

Page 100

If you throw the fragrant veil of
true love on my head,
at the moving of the hands
the soft stirring of the limbs
bereft of sense becomes the soul.

Page 100

Can you grasp it as it's drifting
as it stirs with scarce a sound
and deep within the heart its imprint fixes.

Page 100

At the sounding of the morning's bell
The gardener through the garden's space is passing
Touching with light feet his ground //the ground//
the flowers rouse themselves and gaze
inquiring on his radiant,
peaceful face:
Who was it then who wove the veil around your foot
touching us gently like a breath of wind
Is even Zephyr too your servant?
Was it the spider, or was it the silkworm?

Page Break 101

Notes

Page 101

†1 The Lieutenant in question is most probably Vojeslav Molé.

Page 101

†2 Arvid Sjögren, a friend and relation of Ludwig Wittgenstein, married to his niece Clara Salzer.

Page 101

†3 Ernest Renan: *History of the people of Israel, Vol 1, Chapter III.*

Page 101

†4 An earlier draft of the printed foreword to *Philosophical Remarks*, edited by Rush Rhees and translated by Raymond Hargreaves and Roger White (Oxford, Blackwell 1975).

Page 101

†5 G.E. Lessing, *The Education of the Human Race*, §§48-49.

Page 101

†6 Not clearly legible, unclear whether: "types of human being." or "human beings. types." and "types." as a variant on "Human beings."

Page 101

†7 The editor has corrected an obvious slip in the punctuation of the original, which results in nonsense.

Page 101

†8 Wittgenstein first wrote "Frege, Russell, Spengler, Sraffa" and added the other names later without adding the necessary commas.

Page 101

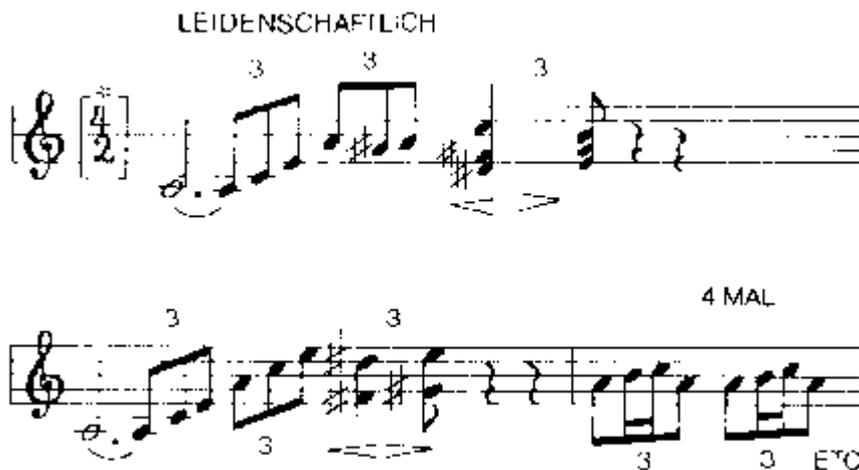

†9 The sentence is from Wilhelm Busch's prose poem "Edward's dream", The editor is indebted to MR. Robert Löffler for this information.

Page 101

†10 In the original "are": Wittgenstein first wrote "the Jews", and then replaced it with "the history of the Jews", without correcting the "are" to "is".

Page 101

†11 The time signature is not in the MS. The editor is very grateful to Mr Fabian Dahlström for professional help in interpreting the notes, which are very hard to read. Mr Dahlström has suggested the following interpretation:

Page Break 102

Page 102

†12 Not clearly legible. Unclear whether it reads: "if its wearer looks smugly at himself in it in the mirror" or "if its wearer smugly smartens himself up in it in the mirror".

Page 102

†13 Adelbert von Chamisso, *The Strange Tale of Peter Schlemihl.*

Page 102

†14 Heinrich von Kleist: "Letter from One poet to Another", 5th January 1811.

Page 102

†15 The words "no" in "<no> western occupation" and "language" in "the words of our <language>" were supplied from the corresponding text of the notebook in MS 153a: S. 122r.

Page 102

†16 Not clearly legible: comma after "enclose".

Page 102

†17 Cf. *Philosophical Investigations*, Part I, § 131.

Page 102

†18 It is unclear whether the text reads: "Nur so nämlich können wir unsere <n> Behauptungen der Ungerechtigkeit (..) entgehen" or whether "unsere Behauptungen" ("our claims") is a variant for "wir" ("we").

"unsere Behauptungen" was inserted between "wir" und "der Ungerechtigkeit" ("prejudice").

Page 102

†19 Not clearly legible: either "for" or "then".

Page 102

†20 Not clearly legible. "Maßeinheit--" Wittgenstein seems first to have written "Ein guter Maßstab" ("a good measuring rod"), then, changing the gender of the indefinite article appropriately, to have changed "Maßstab" to "Maßeinheit" ("unit of measurement"). The gender of "guter" (good) was not changed.

Page 102

†21 It is unclear whether the text reads "diese" ("this" in its feminine form which would make it refer to "plausibility") or "dieser" ("this" in its masculine form which would make it refer to "narrative").

Page 102

†22 In the text there is an intrusive comma which makes no grammatical sense and is clearly an error.

Page 102

†23 Anna Rebni, schoolteacher from Skjolden, Norway, where Wittgenstein had a hut.

Page 102

†24 Schopenhauer, "The Metaphysics of Music", *The World as Will and as Idea*, Chapter 39.

Page 102

†25 Wittgenstein's sister, Margarete Stonborough, for whom he built the house at 19 Kundmannngasse, Vienna.

Page 102

†26 It is unclear in the text whether this should read "private performances" ("Leeraufführungen"--literally empty performances) or "training performances" ("Lehraufführungen").

Page 102

†27 Wittgenstein expressly notes above "not-admired": "hyphen".

Page 102

†28 The sense of "(N.)" and "(W.)" is unclear.

Page 102

†29 A department store in London.

Page 102

†30 "scientists are not (...) on their laurels" is crossed out, which shows that Wittgenstein preferred the two subsequent alternatives.

Page 102

†31 Cf. Editor's note on p. 302 of *Remarks on the Foundations of Mathematics*, Second Edition.

Page 102

†32 Cf. *Philosophical Investigations*, Part I, § 546.

Page 102

†33 The German text is unclear as between "an" and "aus". [These involve a slight difference in emphasis: perhaps roughly, between "to find the rest of the way home from here" and "to find the rest of the way home from here onwards". But the difference, such as it is, can hardly be reproduced in English. (PW)]

Page 102

†34 Gottfried Keller, *The Lost Laugh*.

Page Break 103

Page 103

†35 Goethe, *The Bride of Corinth*.

Page 103

†36 *Philosophical Investigations*, Part II, Section IV.

Page 103

†37 Cf. *Zettel* § 175.

Page 103

†38 Text unclear: *either* Section mark "S", "Oh es kann ein Schlüssel (...)" ["Oh a key can (...)] *or* "Soh es kann ein Schlüssel (...)"--with the "h" in "Soh" crossed out ["So a key can (...)].

Page 103

†39 Not clearly legible: either "etwas" ("something") or "etwa" ("perhaps").

Page 103

†40 Friedrich Nietzsche, *Human, All-Too Human*, I, § 155.

Page 103

†41 "Urwerk". It is unclear whether this should read "Uhrwerk" [= "original work" or perhaps even "prototype"] or "Uhrwerk" ["clockwork" or simply "piece of machinery"].

Page 103

†42 During the Second World War and immediately after.

Page 103

†43 Not clearly legible: either "nach" (= "after") or noch (= "yet or "still").

Page 103

†44 In the original: "Strike": unclear whether English "strike" or German "Streike" (= "strikes").

Page 103

†45 In the original "anchor" in "rescue-anchor" is crossed out; "the rescue-anchor" was replaced by the variant "the <rescue>-instrument". However in what follows ("rush up to it & seize it") the masculine pronoun "ihn" (corresponding to "anchor" is not replaced by the neuter pronoun "es" (corresponding to "instrument").

Page 103

†46 Georg Christoph Lichtenberg, *Timorus*, Perface[[sic]]. The complete sentence reads: "For the ox & the ass can do things too, but up to now only a human being can give you an assurance."

Page 103

†47 Letter to Goethe, 17th December 1795

Page 103

†48 For *Philosophical Investigations*.

Page 103

†49 Not clearly legible: whether singular or plural.

Page 103

†50 St. John of the Cross, Juan de Yepes, 1542-91.

Page 103

†51 Cf. *Notebooks*, 7.10.1916.

Index of Beginnings of Remarks

(The remarks that in this edition have been completed to comprise a whole section are marked with an asterisk [*].)

Page 120

A beautiful garment that changes 19e

Page 120

A Bruckner symphony can be said 39e

Page 120

A confession has to be part 16e

Page 120

A cry of distress cannot be greater 52e

Page 120

Page 120	A curious analogy could be based	25e
Page 120	A foolish & naïve American film	65e
Page 120	A teacher who can show good, or	43e
Page 120	A good simile refreshes	3e
Page 120	A great architect in a bad period	84e
Page 120	A great blessing for me to be able	38e
Page 120	A hero looks death in the face,	58e
Page 120	At the time I modelled the head	16e
Page 120	A theme, no less than a face, wears	59e
Page 120	A thinker is very similar	14e
Page 120	A language, which is spoken in strict	85e
Page 120	A man sees well enough what he has,	56e
Page 120	A man's dreams are virtually never	64e
Page 120	A mediocre writer must beware of too	90e
Page 120	A miracle is, as it were, a	51e
Page 120	A new word is like a fresh seed	4e
Page 120	A picture of a complete apple tree,	17e
Page 120	A picture that is firmly rooted	95e
Page 120	At present we are combatting a trend	49e
Page 120	A proof of God ought really to be	97e
Page 120	A stylistic device may be useful	82e
Page 120	A tragedy might really always start	14e
Page 120	A writer far more talented than I	86e
Page 120	Almost in the same way as earlier	31e
Page 120	Almost the whole time I am writing	88e
Page 120	Always come down from the barren	86e
Page 120	Ambition is the death of thought	88e
Page 120	Amongst other things Christianity	61e
Page 120	And now we might say: There can be	94e

Page 120	And what I basically am after all	95e
Page 120	Animals come when their names	77e
Page 120	Anyone who is half-way decent will	51e
Page 120	Anyone who listens to a child's	4e
Page 120	Anything the reader can do	88e
Page Break 121		
Page 121	Anyway when I was in Norway	17e
Page 121	Appreciating music is a manifestation	80e
Page 121	Architecture glorifies something	74e
Page 121	Architecture immortalizes & glorifies	74e
Page 121	Architecture is a gesture	49e
Page 121	Are all people great human beings?	53e
Page 121	Are you a bad philosopher then,	87e
Page 121	As I again & again come across questions	76e
Page 121	As much (as) it has cost you, that	15e
Page 121	As we get old the problems slip	46e
Page 121	Bach said that everything he achieved	81e
Page 121	"Beethoven's great heart"--	96e
Page 121	Before there was an aeroplane	48e
Page 121	Being psychoanalyzed is in a way	40e
Page 121	'Believing' means, submitting to	52e
Page 121	Bruckner's Ninth is a sort of protest	39e
Page 121	But am I to say (if I reject images,	80e
Page 121	But I do not get to these problems	12e
Page 121	But isn't it a one-sided view of tragedy	14e
Page 121	But that does not mean that it is right	87e
Page 121	But then what is the relation between	31e
Page 121	By the way, in my artistic activities	29e

Page 121	By the way in the old conception	20e
Page 121	Can I say that drama has its own time	13e
Page 121	Caught a bit of a chill & unable to	32e
Page 121	Christian faith--so I believe--is	52e
Page 121	Christianity is not based on a historical	37e
Page 121	Colours are a stimulus to philosophizing	76e
Page 121	Compare the solution of philosophical	13e
Page 121	Composers' names. Sometimes it is the method	29e
Page 121	Concepts may alleviate mischief or	63e
Page 121	Conflict is dissipated in much	12e
Page 121	Conglomeration: national sentiment,	77e
Page 121	Could the concept of the punishments of hell	92e
Page 121	Counterpoint might represent an	46e
Page 121	Culture is an observance	89e
Page 121	Different 'interpretations' must correspond	46e
Page 121	Does the theme point to nothing beyond	59e
Page 121	Doing this work I am in the same state	36e
Page 121	Do not interest yourself in what	72e
Page 121	Don't apologize for anything, don't obscure	45e
Page 121	Don't demand too much, & don't be	46e
Page Break	122	
Page 122	Don't for heaven's sake, be afraid	64e
Page 122	Don't let yourself be guided by the example	47e
Page 122	Don't play with what lies deep	26e
Page 122	Each morning you have to break	4e
Page 122	Each sentence that I write	9e
Page 122	E.g. nothing more stupid than the chatter	71e
Page 122		

Election by grace: it is only permissible 34e
Page 122
Engelmann told me that when he rummages 6e
Page 122
Envy is something superficial-- 40e
Page 122
Esperanto. Our feeling of disgust, 60e
Page 122
Even if we are not thinking in circles, 91e
Page 122
Every artist has been influenced 27e
Page 122
"Fare well!" 60e
Page 122
Fate is the antithesis of natural law 70e
Page 122
For a human being the eternal, 92e
Page 122
For could one not equally say 94e
Page 122
[For the Foreword.] It is not 75e
Page 122
Freud's fanciful pseudo-explanations 62e
Page 122
Freud's idea: in madness the lock 39e
Page 122
Frida Schanz: 14e
Page 122
From Simplicissimus: riddles of 22e
Page 122
Genius is talent in which character 75e
Page 122
Genius is what makes us forget talent 49e
Page 122
Genius is what makes us forget the 49e
Page 122
Genius is what makes us unable to see 50e
Page 122
God grant the philosopher insight into 72e
Page 122
"God has commanded it, therefore we must 87e
Page 122
God may say to me: "I am judging you 99e
Page 122
God's essence is said to guarantee his 94e
Page 122
Go on, believe! It does no harm 52e
Page 122
Grasping the difficulty in its depth 55e
Page 122
Grillparzer: "How easy it is to move 15e
Page 122
(Had he not been caught in the machine 14e
Page 122

He has chosen them, in his goodness, 93e
Page 122

"He has commanded it" means here roughly:87e
Page 122

"He is experiencing the theme intensely 59e
Page 122

(Hence, I think, a great creator needs 68e
Page 122

"He refuses to..." means: it is in his 87e
Page 122

His talent too strikes me as 61e
Page 122

How are we taught the word "God" 94e
Page 122

How God judges people is something 98e

Page Break 123

Page 123

How hard it is for me to see what 44e
Page 123

How should we feel if we had never 15e
Page 123

How small a thought it takes 57e
Page 123

How then do we explain to someone 80e
Page 123

Human beings can regard all the evil 76e
Page 123

Human beings have a physical need 86e
Page 123

Humour is not a mood, but a way of 88e

Page 123

I am deeply suspicious of most of Shakespeare's 95e
Page 123

I am too soft, too weak, & so too lazy, 83e
Page 123

I am reading Lessing (on the Bible) 11e
Page 123

I am showing my pupils sections of 64e
Page 123

I am so afraid of someone's playing the piano 73e
Page 123

I ask countless irrelevant questions 77e
Page 123

I believe that what Goethe was really seeking26e
Page 123

I believe I summed up where I stand 28e
Page 123

I cannot judge whether I have only taste, 68e
Page 123

I cannot kneel to pray, because 63e
Page 123

I completely understand, how someone may hate 66e
Page 123

I could equally well have said: the distorted 63e
Page 123

I could imagine someone thinking the names 46e

Page 123

I could only stare in wonder at Shakespeare; 95e

Page 123

Ideas too sometimes fall from the tree 32e

Page 123

I do not think that Shakespeare 95e

Page 123

I do not think Shakespeare could have 96e

Page 123

I.e. it is simply false to say 7e

Page 123

If a false thought is so much as 86e

Page 123

If anyone should think he has solved 6e

Page 123

If certain graphic propositions 32e

Page 123

If Christianity is the truth, 89e

Page 123

If God really does choose those 83e

Page 123

If the believer in God looks around 96e

Page 123

If the dreams of sleep have a similar 83e

Page 123

If there is anything in the Freudian 50e

Page 123

If this stone won't budge at present, 44e

Page 123

If I am thinking just for myself 33e

Page 123

If I do not quite know how to begin 11e

Page 123

If I had written a good sentence, 66e

Page 123

If in life we are surrounded by death, 50e

Page 123

If I now ask "What do I actually experience 79e

Page 123

If I prepare myself for some eventuality, 90e

Page 123

If I realized how mean & petty I am 37e

Page 123

If I say A. has beautiful eyes 28e

Page 123

If I say: "that is the only thing that 29e

Page 123

If I say that my book is meant 12e

Page Break 124

Page 124

If it is said on occasion that 17e

Page 124

If it is true, as I believe, that Mahler's 76e

Page 124

If life becomes hard to bear we think 60e

Page 124	If one wanted to characterize the essence	27e
Page 124	If people did not sometimes commit stupidities,	57e
Page 124	If people find a flower or an animal	20e
Page 124	If someone can believe in God with complete	83e
Page 124	If someone is merely ahead of his time	11e
Page 124	If someone prophesies that the generation	29e
Page 124	If someone says, let's suppose, "A's eyes	27e
Page 124	If we think of the world's future	5e
Page 124	If we use the ethnological approach	45e
Page 124	If white turns to black some say:	49e
Page 124	If you already have someone's love,	48e
Page 124	If you ask: how I experienced the theme,	59e
Page 124	If you cannot unravel a tangle,	85e
Page 124	If you offer a sacrifice & then	30e
Page 124	If you use a trick in logic,	28e
Page 124	I have one of those talents that has	86e
Page 124	I just took some apples out of a paper bag	36e
Page 124	I look at the photographs of Corsican	15e
Page 124	Imagine someone watching a pendulum	86e
Page 124	I might say: if the place I want to reach	10e
Page 124	I must be nothing more than the mirror	25e
Page 124	I myself still find my way of philosophizing	3e
Page 124	In a bullfight the bull is the hero	58e
Page 124	In a conversation: One person throws	84e
Page 124	In a dream, & even long after we wake up,	75e
Page 124	In art it is hard to say anything,	26e
Page 124	In Beethoven's music what one might call	93e
Page 124	In Bruckner's music nothing is left	19e
Page 124		

	In Christianity it is as though God said"	21e
Page 124		
	I never before believed in God"	61e
Page 124		
	I never more than half succeed in expressing	16e
Page 124		
	In former times people entered monasteries	56e
Page 124		
	In Freudian analysis the dream is	78e
Page 124		
	In Mozart's or Haydn's music again fate	93e
Page 124		
	In my view Bacon was not a precise	61e
Page 124		
	In one day you can experience the horrors	30e
Page 124		
	In philosophizing it is important	31e
Page 124		
	In philosophy the winner of the race	40e
Page 124		
	In religion it must be the case	37e
Page 124		
	In Renan's Peuple d'Israël	7e
Page 124		
	In the course of a scientific investigation	73e
Page 124		
	In the course of our conversation Russell	35e
Page Break 125		
Page 125		
	In the days of silent films	29e
Page 125		
	In the Gospels--as it seems to me	35e
Page 125		
	In the train of every idea that costs	66e
Page 125		
	In the realm of the mind a project	87e
Page 125		
	In this world (mine) there is not tragedy	12e
Page 125		
	In Western Civilization the Jew	23e
Page 125		
	I often fear madness. Have I any reason	61e
Page 125		
	I often wonder whether my cultural	4e
Page 125		
	I once said, & perhaps rightly	5e
Page 125		
	I read: "philosophers are no nearer	22e
Page 125		
	I really do think with my pen,	24e
Page 125		
	I recently said to Arvid	5e
Page 125		
	Irony in music. E.g. Wagner	63e
Page 125		
	I sit astride life like a bad rider	42e

Page 125
Is it just I who cannot found a school, 69e

Page 125
Is it some frustrated longing that 51e

Page 125
Isochronism according to the clock 92e

Page 125
Is the sense of belief in the Devil 99e

Page 125
Is what I am doing in any way worth 66e

Page 125
It appears to me as though a religious 73e

Page 125
It could only be by accident that someone's 64e

Page 125
It has sometimes been said that the Jews' 19e

Page 125
I think Bacon got bogged down in 77e

Page 125
I think good Austrian work 5e

Page 125
I think it is an important & remarkable 84e

Page 125
I think it might be regarded as a fundamental 82e

Page 125
I think that, in order to enjoy a poet, 96e

Page 125
I think that present day education 81e

Page 125
I think there is some truth in my idea 16e

Page 125
I think today there could be a form of theatre 14e

Page 125
It is a great temptation to want 11e

Page 125
It is all one to me whether the typical 9e

Page 125
It is an accident that 'last' rhymes with 93e

Page 125
It is as though I had lost my way 53e

Page 125
It is difficult to form a good picture 94e

Page 125
It is difficult to know something, & to act 90e

Page 125
It is hard to tell someone who is shortsighted 3e

Page 125
It is hard to understand yourself properly 54e

Page 125
"It is high time for us to compare 62e

Page 125
It is humiliating having to present oneself 13e

Page 125
It is important for our approach, that someone 84e

Page 125
It is incredible how helpful a new 45e

Page 125

It is not as though S. portrayed human 96e
Page 125

It is not by any means clear to me, that I wish 70e
Page 125

It is not unheard of that someone's character 95e

Page Break 126

Page 126

It isn't reasonable to be furious even 53e
Page 126

It is often only very slightly more 45e
Page 126

It is often said that a new religion 23e
Page 126

It is one thing to sow in thought, 60e
Page 126

It is possible, that everyone who executes 67e
Page 126

It is remarkable how hard we find it 55e
Page 126

It is remarkable that Busch's drawings 85e
Page 126

It is very remarkable, that we should 57e
Page 126

It may be that science & industry, 72e
Page 126

It might also be said: hate between human 52e
Page 126

It might be said (rightly or wrongly) 16e
Page 126

I took the poem on the previous page 15e
Page 126

It's a good thing I don't let myself 3e
Page 126

It seems to me as though his pieces are 98e
Page 126

It seems to me I am still a long way 74e
Page 126

It seems to me (sometimes) as though 27e
Page 126

It's possible to write in a style 60e
Page 126

It's true you must assemble old material 46e
Page 126

It will be hard to follow my portrayal: 51e
Page 126

It would almost be strange if there 82e
Page 126

It would already be enough, that all members 85e

Page 126

Just as I cannot write verse 67e
Page 126

Just as someone may travel around 57e
Page 126

Just let nature speak 3e

Page 126
Kierkegaard writes: If Christianity 36e

Page 126
Kleist wrote somewhere that 23e

Page 126
Labor's seriousness is a very late 20e

Page 126
Labor, when he writes good music, 21e

Page 126
Language sets everyone the same traps; 25e

Page 126
"Le style c'est l'homme." 89e

Page 126
Lenau's Faust is remarkable in that 61e

Page 126
Let us be human.-- 36e

Page 126
Life is like a path along a mountain 72e

Page 126
Life's infinite variations are an 83e

Page 126
Longfellow: In the elder days 39e

Page 126
Look at human beings: One is poison 98e

Page 126
Looking for the fallacy in a fishy 49e

Page 126
"Look on this wart as a regular limb 18e

Page 126
Madness doesn't have to be regarded 62e

Page 126
Mendelssohn is like a man who is cheerful 4e

Page 126
Mendelssohn is not a peak 4e

Page Break 127

Page 127
(Mendelssohn's music, when it is flawless 23e

Page 127
Moore poked into a philosophical wasp nest 87e

Page 127
Music, with its few notes & rhythms 11e

Page 127
My 'achievement' is very much like 57e

Page 127
My ideal is a certain coolness 4e

Page 127
My originality (if that is the right word) 42e

Page 127
My own thinking about art & values 91e

Page 127
(My style is like bad musical composition.) 45e

Page 127
My thinking, like everyone's, has sticking 27e

Page 127

- Page 127
Neither could he regard himself as a prophet 96e
- Page 127
Nietzsche writes somewhere, that even the 67e
- Page 127
No one can think a thought for me 4e
- Page 127
No one likes having offended 13e
- Page 127
Not funk but funk conquered is what 43e
- Page 127
Nothing is more important though than the 84e
- Page 127
Nothing is so difficult as not deceiving 39e
- Page 127
Nothing seems to me more unlikely 70e
- Page 127
Nothing we do can be defended definitively 23e
- Page 127
Oh a key can lie for ever where 62e
- Page 127
Once again: what does it consist in, 58e
- Page 127
Once it is established the old problems 55e
- Page 127
One age misunderstands another; 98e
- Page 127
One & the same theme has a different 96e
- Page 127
One cannot speak the truth;--if 41e
- Page 127
One cannot view one's own character 26e
- Page 127
One could call Schopenhauer a quite crude 41e
- Page 127
One keeps forgetting to go down to the 71e
- Page 127
One might say: "Genius is courage 44e
- Page 127
One might say of Schopenhauer: he never 41e
- Page 127
One might say: what splendid laws 47e
- Page 127
One movement constructs 10e
- Page 127
One movement orders one thought to the 10e
- Page 127
One of my most important methods 45e
- Page 127
One uses straw to try to stuff 5e
- Page 127
Only by thinking much more crazily 86e
- Page 127
Only every so often does one of the sentences 76e

Page 127	Only in a quite particular musical context	93e
Page 127	Only someone very unhappy	53e
Page 127	Only something supernatural	5e
Page 127	Only where genius wears thin can	50e
Page 127	Or again no distress can be greater	52e
Page 127	Or what is it like for someone to have no	95e
Page Break 128		
Page 128	Our children learn in school	81e
Page 128	Our civilization is characterized	9e
Page 128	Our greatest stupidities may be	45e
Page 128	People are religious to the extent	51e
Page 128	People have sometimes said to me	33e
Page 128	People nowadays think, scientists	42e
Page 128	People who are constantly asking 'why'	46e
Page 128	Perhaps one day a culture will arise	73e
Page 128	Phenomena akin to language in music	40e

	The Lieutenant & I have already	3e
Page 130		
	The light shed by work is a beautiful	30e
Page 130		
	The limit of language manifests itself	13e
Page 130		
	The mathematician (Pascal) who admires	47e

Page 130
The mathematician too can of course marvel 65e

Page 130
The measure of genius is character 40e

Page 130
The melodies of different composers 54e

Page 130
The miracles of nature, 64e

Page 130
The monstrous vanity of wishes is 41e

Page 130
The most refined taste 68e

Page 130
Then again you might think intensive 59e

Page 130
The 'necessity' with which the second idea 65e

Page 130
The Old Testament seen as the body 40e

Page 130
The only way for me to believe in a miracle 51e

Page 130
The only way namely for us to avoid prejudice 30e

Page 130
The origin & the primitive form 36e

Page 130
The overwhelming skill in Brahms 29e

Page 130
The philosopher easily gets into the position 24e

Page 130
The philosopher is someone who has to cure 50e

Page 130
The philosopher says "Look at things 70e

Page 130
The pleasure I take in my thoughts 20e

Page 130
The poet cannot really say of himself 96e

Page 130
The poet too must always be asking himself: 46e

Page 130
The popular scientific writings 48e

Page 130
The power of language to make everything 19e

Page 130
The problems of life are insoluble 84e

Page 130
The purely corporeal can be uncanny 57e

Page 130
The queer resemblance between a philosophical 29e

Page 130
The real achievement of a Copernicus 26e

Page 130
There are problems I never tackle 11e

Page 130
There are remarks that sow, 89e

Page 130
The reason I cannot understand Shakespeare 98e

There is a big difference between the effect 30e

There is definitely a certain kinship 18e

There is much that could be learned from 67e

There is much that is excellent in Macaulay's 31e

There is no greater distress to be felt 53e

There is no more light in a genius 41e

There is no religious denomination 3e

There is something Jewish in Rousseau's 17e

The remark by Jucundus in "The Lost Laugh" 54e

"The repeat is necessary" In what respect 59e

There really are cases in which one has the sense 90e

The revolutionary will be the one who 51e

The Sabbath is not simply a time to rest, 91e

The saint is the only Jewish "genius" 16e

The story of Peter Schlemihl 21e

The spring that flows quietly & clearly 35e

The strength of the musical thinking 27e

The theme interacts with language 60e

The truly apocalyptic view of the world 64e

The truth can be spoken only by someone 41e

The use of the word "fate". Our 69e

The valleys of foolishness have more grass 92e

The various plants & their human 27e

The way whole periods are incapable of freeing 91e

The way you use the word "God" 58e

The whole Earth cannot be in greater distress 52e

The works of the great masters 23e

They have less style than the first speech 43e

Page 131	Think about how it was said of Labor's playing	71e
Page 131	"Thinking is difficult." (Ward)	85e
Page 131	Think of the demeanour of someone who draws	58e
Page 131	This is how philosophers should salute	91e
Page 131	This musical phrase is a gesture	83e
Page 131	Thoughts at peace	50e
Page 131	Thoughts rise to the surface slowly,	72e
Page 131	Today the difference between a good & a poor	5e
Page 131	To go down into the depths you don't need	57e
Page 131	Tolstoy: the meaning (importance) of	25e
Page 131	To piece together the landscape	90e
Page 131	To someone who is upset by this allegory	88e
Page 131	To treat well somebody who does not like you	13e
Page 131	Tradition is not something that	86e
Page 131	Troubles are like illnesses;	91e
Page 131	Try to be loved & not-admired	44e
Page 131	Two people who are laughing together,	88e
Page Break	132	
Page 132	Understanding & explaining a musical	79e
Page 132	Unshakable faith. (E.g. in a promise.)	84e
Page 132	Virtually as there is such a thing as a deep	48e
Page 132	Wagner's motifs might be called	47e
Page 132	Wanting to think is one thing,	50e
Page 132	We are engaged in a struggle with	13e
Page 132	(We are involved here with the Kantian	13e
Page 132	We are only going to set you straight	44e
Page 132	We are struggling with language	13e
Page 132		

	We keep hearing the remark that philosophy	22e
Page 132	Well, of what do we say "it is in his power"?	87e
Page 132	Well, there is no mention of punishment here,	92e
Page 132	We must not forget: even our more refined,	83e
Page 132	We say: "You understand this expression	50e
Page 132	What a curious attitude scientists	46e
Page 132	"What a sensible man knows is hard	20e
Page 132	What does it consist in: following a musical	58e
Page 132	What Eddington says about the 'direction	25e
Page 132	What I am resisting is the concept	45e
Page 132	What I am writing here may be feeble	75e
Page 132	What is Good is Divine too	5e
Page 132	What is it like when people do not have	95e
Page 132	What is important about depicting anomalies	82e
Page 132	What is intriguing about a dream,	78e
Page 132	What is insidious about the causal	45e
Page 132	What is lacking in Mendelssohn's music?	40e
Page 132	What is pretty cannot be beautiful	48e
Page 132	What I want to say then is:	54e
Page 132	What Renan calls the bon sens précoce	8e
Page 132	What's ragged should be left	51e
Page 132	What you are taking for a gift is a problem	49e
Page 132	What you have achieved cannot mean	15e
Page 132	When he was old Charlemagne tried	85e
Page 132	When I came home I expected a surprise	52e
Page 132	When I have had a picture suitably framed	17e
Page 132	When I imagine a piece of music,	32e
Page 132	When people have died we see their life	53e
Page 132	When philosophizing you have to descend	74e

Page 132

When you bump against the limits 11e

Page 132

Where genius wears thin skill may 49e

Page 132

Where others go on ahead, I remain 75e

Page 132

Where there is bad management in the state, 72e

Page 132

Why is the soul moved by idle thoughts 41e

Page Break 133

Page 133

Why shouldn't I apply words in opposition 50e

Page 133

Why shouldn't someone become desperately 92e

Page 133

"Wisdom is grey." Life on the other hand 71e

Page 133

Wisdom is something cold, & to that extent 64e

Page 133

Within all great art there is a WILD 43e

Page 133

With my full philosophical rucksack 4e

Page 133

With thinking too there is a time for 33e

Page 133

Words are deeds. Only someone very unhappy 53e

Page 133

Work on philosophy--like work in 24e

Page 133

Writing the right style means, 44e

Page 133

"Yes, that's how it is," you say, 30e

Page 133

You can as it were restore an old style 68e

Page 133

You cannot draw the seed up out 48e

Page 133

You cannot judge yourself, if you are not 99e

Page 133

You cannot lead people to the good 5e

Page 133

You cannot write more truly about yourself 38e

Page 133

You can't be reluctant to give up your lie 44e

Page 133

You can't construct clouds 48e

Page 133

You could attach prices to ideas 60e

Page 133

You get tragedy where the tree 3e

Page 133

You must accept the faults in your own 86e

Page 133

You must indeed say only what is 46e

You must say something new & yet 45e

FOOTNOTES

†1 But see Note by Translator.

†* The *Wittgenstein Archive of the University of Bergen* is producing a machine-readable version of the complete philosophical remains of Wittgenstein.

†** Mr Pichler published a list of the sources of *Vermischte Bemerkungen* in Spring 1991: Alois Pichler, "Ludwig Wittgenstein, Vermischte Bemerkungen: Liste der Manuskriptquellen. Ludwig Wittgenstein, Culture and Value: A List of Source Manuscripts", *Skriptserie fra Wittgensteinarkivet ved Universitetet i Bergen* 1 (1991)

†c strange
Page 22

†d could <get>
Page 23

†a themselves
Page 23

†b suns
Page 23

†c But with the Jews it is just the same.
Page 23

†d them
Page 23

†e they are
Page 23

†f thinkers
Page 24

†a a <work>
Page 24

†b while seeing <to it>
Page 24

†c then
Page 25

†a is no bigger
Page 25

†b --teacher of philosophy is like a person, someone, who gives his pupil foods, not |
Page 25

†c accessible
Page 26

†a draw his attention to this
Page 26

†b know
Page 27

†a remains
Page 27

†b but what he means to us is all the same only *his* personality
Page 27

†c already now
Page 28

†a one of the narrow def<initions [[sic > ?]] o<f> t<the>
Page 30

†a read
Page 30

†b the
Page 30

†c our claims
Page 30

†d regard
Page 30

†e rather than
Page 30

†f would have to
Page 30

†g In this <namely> lies

Page 30

†h our philosophy

Page 31

†a look up

Page 31

†b , to master it,

Page 31

†c but the question constantly arises: should this game be played at all now & what is the right game?

Page 32

†a of all <opinions>

Page 33

†a a hindrance which nullifies the movement by friction

Page 33

†b has the same effect

Page 33

†c but a weight attached to one's foot, which will not allow us to walk *far*.

Page 33

†d say from time to time

Page 33

†e ;|:

Page 33

†f as it is

Page 33

†g Similarly,

Page 33

†h flowers, berries or herbs

Page 33

†i although

Page 34

†a :

Page 35

†a both he and I

Page 35

†b in

Page 35

†c additional

Page 35

†d that might retrospectively be thought of,

Page 35

†e Our experience was that language could continually make new, & impossible, demands; & in this way every explanation was frustrated.

Page 35

†f could <show our earlier explanation to be unworkable>--frustrating every attempt at explanation.--

Page 35

†g transparently

Page 36

†a in me

Page 36

†b was

Page 36

†c as that of someone <when> he <struggle>s <in vain>

Page 36

†d occurred

Page 38

†a are permitted <only> to

Page 39

†a the

Page 39 †b are not blood relations but stand to each other

Page 39 †c written *against* Beethoven's & because of this

Page 40 †a he who gets there last.

Page 40 †b arrives last.

Page 40 †c may be similar to eating from the tree of knowledge.

Page 41 †a air

Page 41 †b by

Page 41 †c :

Page 42 †a of understanding

Page 42 †b have no bottom.

Page 43 †a its *depth*

Page 43 †b :

Page 43 †c even

Page 43 †d on the occasions when

Page 43 †e is making

Page 44 †a withdraw <an expression from the language>

Page 44 †b *straight*

Page 44 †c Driving

Page 44 †d , that is if your carriage stands | stood on the rails crookedly. You can drive then by yourself.

Page 45 †a -

Page 45 †b had to

Page 45 †c manners

Page 45 †d had

Page 46 †a break them open

Page 46 †b ,

Page 47 †a about numbers

Page 47 †b the regularities of a sort of *crystal*

Page 48 †a ... scientists do not express (hard) work, but resting on laurels.

Page 48

†b ... do not express hard work, but are the expression of resting on laurels.

Page 48

†c much

Page 48

†d You give it warmth...

Page 48

†e *take hold of*

Page 49

†a became

Page 49

†b any

Page 49

†c without any idea that, & how, it could be used as a motor

Page 49

†d skill

Page 49

†e look <through>

Page 50

†a the scientist

Page 50

†b experience

Page 50

†c ,

Page 50

†c [[sic, d?]] Someone says to us:

Page 50

†d [[sic, e?]] with the meaning known to you

Page 50

†f Well then, I too am using it with the meaning that you know."

Page 50

†g , which the word takes with it & carries over into whatever | every kind of application.

Page 50

†h takes with it

Page 50

†i so too in our everyday understanding by madness.

Page 51

†a paints

Page 52

†a outstanding

Page 54

†a --<if things are going well for him now>--

Page 55

†a a nuance of stress

Page 55

†b the new way of thinking

Page 55

†c , the old problems are put on one side along with the old garment

Page 56

†a of his total output

Page 57

†a seem to you like narrow borders.

Page 57

†b indeed for this you need not even leave your most immediate & familiar surroundings I need not for this <leave> your most immediate...

Page 57

†c tucked away

Page 57

†d .

Page 57

†e a mathematician's.

Page 57

†f the forms in which

Page 58

†a ,--

Page 58

†b <with feeling>

Page 58

†c of that

Page 58

†d the outward manifestation is?.

Page 58

†e ask yourself, what the expression of that is.

Page 59

†a while

Page 60

†a lie

Page 60

†b Experience has incorporated the picture into our thinking.

Page 60

†c a change of situation

Page 60

†d change,

Page 60

†e <we can> hardly | <only> with difficulty decide <on this>.

Page 60

†f bits & pieces

Page 61

†a Someone might <*fantasize* a flying machine, without being precise about its details. Outwardly> he <may>

Page 62

†a <a> vision

Page 62

†b to unlock

Page 62

†c <these phenom>ena

Page 63

†a these pictures

Page 63

†b rather: *that's how it has changed.*

Page 64

†a :

Page 65

†a then he is looking at?

Page 65

†b they

Page 65

†c affected

Page 66

†a that

Page 66

†b would like to defend

Page 66

†c appearing

Page 66

†d attitude

Page 66

†e <esteem> you <& at the same time *love*> you <can make this behaviour easy> for you you

Page 66

†f , & if | they had by accident become a pair of lines that rhymed (with each other),...

Page 66

†g , & it by accident they had become two rhyming lines,...

Page 66

†h , & it turned out by accident to read as two rhyming lines,...

Page 67

†d [[sic a?]] bad

Page 67

†a [[sic b?]] not impossible

Page 67

†b [[sic c?]] simply

Page 67

†c [[sic d?]] <by> their

Page 68

†a Taste rectifies. Giving birth is not its affair.

Page 68

†b <does> not <need>

Page 68

†c Even the

Page 68

†d am *not* able to

Page 68

†e newer

Page 68

†f <an> interpretation

Page 68

†g in a tempo that

Page 69

†a in reality

Page 70

†a observations

Page 71

†a through

Page 71

†b becomes

Page 71

†c would be

Page 71

†d change women's & men's dress

Page 71

†e the

Page 71

†f We should like to call music a 'language'; & no doubt this does apply to *some* music--& to some no doubt not.

Page 72

†a is

Page 72

†b very close

Page 72

†c slippery

Page 72

†d one or the other

Page 73

†a a system of reference
Page 73

†b the <rescue>-instrument
Page 73

†c <but> certainly not
Page 73

†d certainly not however
Page 74

TRANSLATOR'S NOTES

Page xvi

†i A noun, which in conventional German orthography would begin with an upper case "P".

Page xvi

†ii More conventionally "jeder so und so viele".

Page xvii

†i Such messages have in the main been rendered somewhat differently in the translation. Footnotes (like this one) numbered with small Roman numerals have been added by the translator.

Page 13

†i In German the irony is intensified by a play on the words *geduldig* and *duldend*.

Page 15

†i This is something like a crossword puzzle. Each space is occupied by a separate syllable. These are joined together to form a meaningful passage by making transpositions according to the knight's move (= *Rösselsprung*) in chess.

Page 16

†i The phrase in quotation marks is adapted from the first line of Goethe's poem, "Vanitas! Vanitatis vanitas" which in its turn is the title of the first chapter of Max Stirner's *Der Einzige und sein Eigentum*. Wittgenstein is here probably alluding more directly to Stirner than to Goethe, the sense of whose poem hardly fits the present context. The translator is indebted to the late Rush Rhees for drawing his attention to these allusions.

Page 19

†i Literally: "which I do not know".

Page 20

†i "Wissenschaft" and "wissenschaftlich" in this sentence have been translated as "science" and "scientific". However, Wittgenstein probably did not mean this in the sense of natural science (which is the most common English usage) but, according to natural German usage, was thinking of intellectual questions in a much more general way.

Page 22

†i The translator is grateful for this rendering to Mr S. Ellis of the Institute of Dialect and Folk Life Studies at the University of Leeds.

Page 32

†i The variant Wittgenstein wrote at this point consists of putting the clause expressing indirect speech into the subjunctive--which is grammatically correct in German but not, at least in this context, in English. One might translate the variant by rewriting the sentence: "People would live under an absolute, palpable tyranny, yet without

being able to say they were not free."

Page 34

†i The alternative versions "es" and "sie" have, in this context, no grammatical equivalent in English.

Page 36

†i Wittgenstein's variant here consists in supplying a capital A for the noun form "Anderes". There is no English counterpart for this grammatical move.

Page 36

†ii Goethe, *Faust*, Part I (In the Study).

Page 38

†i 1 *Corinthians*, 3.

Page 39

†i Lars Hertzberg has pointed out to me that Wittgenstein misquotes here. The last line of the stanza reads: "For the Gods see everywhere."

Page 42

†i New Testament

Page 58

†i Wittgenstein's alternative reading "wird" for "ist" does not correspond to any meaningful distinction in English.

Page 58

†ii The grammatical variant in Wittgenstein's German text has no meaningful counterpart in English.

Page 59

†i I think "field" here should be understood in the sense of a "field of force", as in physics.

Page 69

†i This could also be translated by the weaker "I actually do not want to be imitated".

Page 70

†i See translator's note on p. 46.

Page 71

†i The variant Wittgenstein gives here is simply a German version of the English phrase he originally used.

Page 72

†i Wittgenstein's alternative versions, "in dem" or "in welchem", do not correspond to any distinction in English.

Page 74

†i This could also be rendered as "the former chaos".

Page 76

†i The German text plays on the two cognate verbs "anregt" (= "stimulates") "aufregt" (= exasperates).

Page 81

†i This is the idiomatic phrase corresponding to the German. However, the reader's attention is drawn to two points. [1] "Cussedness" here translates the German "Tücke", which in other contexts sounds rather stronger than would "cussedness" in English. In this passage, therefore, outside the context of the particular idiom it has been rendered as "malice". [2] The plural "things" corresponds to the German singular "des Objekts". This may be important insofar as Wittgenstein interprets the idiomatic phrase under discussion as implying a demonic intervention *in particular cases*; whereas, in English at least, the phrase is quite compatible with the conception Wittgenstein here develops in opposition to such an implication.

Page 84

†i The justification for translating the variants thus is the slenderest imaginable...

Page 90

†i I am reading "U.u." as an idiosyncratic version of "U.U." (= "Unter Umständen"). It has been suggested to me that it could stand for "Und umgekehrt". However, (a) "And vice versa" seems to make little sense applied to the preceding sentence; and (b) "U.u." is not a recognized abbreviation for "Und umgekehrt"--in Germany at least; I am not sure about Austria.

Page 93

†i In the German 'Rast' (= 'rest') and 'Hast' (= 'haste').

Page 95

†i Literally: "No human being must must"

Page 97

†i "Craving" is too strong for "Verlangen" in this context; "desire" is too weak. The vulgarity "hankering" strikes me as just right.

EDITORS' PREFACE

Page iii

WE publish here a collection of fragments made by Wittgenstein himself and left by him in a box-file. They were for the most part cut from extensive typescripts of his, other copies of which still exist. Some few were cut from typescripts which we have not been able to trace and which it is likely that he destroyed but for the bits that he put in the box. Others again were in manuscript, apparently written to add to the remarks on a particular matter preserved in the box.

Page iii

The earliest time of composition of any of these fragments was, so far as we can judge, 1929. The date at which the latest datable fragment was written was August 1948. By far the greatest number came from typescripts which were dictated from 1945-1948.

Page iii

Often fragments on the same topic were clipped together; but there were also a large number lying loose in the box. Some years ago Peter Geach made an arrangement of this material, keeping together what were in single bundles, and otherwise fitting the pieces as well as he could according to subject matter. This arrangement we have retained with a very few alterations. We hereby express our indebtedness to him for the work that he did, which was laborious and exacting. Though the arrangement is not the kind of arrangement that Wittgenstein made of his 'remarks', we found that it made a very instructive and readable compilation.

Page iii

We were naturally at first rather puzzled to account for this box. Were its contents an accidental collection of left-overs? Was it a receptacle for random deposits of casual scraps of writing? Should the large works which were some of its sources be published and it be left on one side? One of these works was one of two total rearrangements of *Investigations* and other material; another was an extremely long and repetitive early typescript presenting great editorial problems. Another--though there are only a few cuttings from this source--has already been published under the title *Philosophische Bemerkungen*.

Page Break iv

Page iv

After most of the typed fragments had been traced to their sources, comparison of them with their original forms, together with certain physical features, shewed clearly that Wittgenstein did not merely keep these fragments, but worked on them, altered and polished them in their cut-up condition. This suggested that the addition of separate MS pieces to the box was calculated; the whole collection had a quite different character from the various bundles of more or less 'stray' bits of writing which were also among his Nachlass.

Page iv

We therefore came to the conclusion that this box contained remarks which Wittgenstein regarded as particularly useful and intended to weave into finished work if places for them should appear. Now we know that his method of composition was in part to make an arrangement of such short, almost independent pieces as, in the enormous quantity that he wrote, he was fairly satisfied with.

Page iv

Not every one of these remarks is quite of this kind; very occasionally the cutting was grammatically incomplete, so that it looked as if it were preserved only for the sake of the idea or expression to be seen on it. Here we have supplied the missing words from the original typescript where we could; once we had to supply the last few words ourselves. Very rarely, there is a pronoun or the like demanding a previous reference to explain it; once we supplied the preceding remark from the original typescript; once or twice we have put in appropriate words. Square brackets are the editors'; e.g. when Wittgenstein wrote a mere note on his text in the margin we have printed it, prefaced by the words 'Marginal note', between square brackets. Elsewhere words between square brackets have been supplied by us.

TRANSLATOR'S NOTE

Page v

I am indebted for the avoidance of many errors in the translation and for various helpful suggestions to Dr. L. Labowsky, Professor G. H. von Wright, Mr. R. Rhees and Professor P. T. Geach. Only I am to blame for any errors that remain.

G. E. M. A.

PREFACE TO THE SECOND EDITION

A CLOSE comparison of the printed text with the original cuttings has shewn that the first edition was marked by many inaccuracies, and even some misunderstandings of the original text. (See, e.g., § 671.) They have been corrected. The editors are grateful to Mr. Heikki Nyman for his laborious and conscientious work towards the production of a printed text that is faithful to the sources.

G. E. M. ANSCOMBE
G. H. VON WRIGHT

[Zettel: Main Body]

1. William James: The thought is already complete at the beginning of the sentence. How can one know that?--But the *intention* of uttering the thought may already exist before the first word has been said. For if you ask someone: "Do you know what you mean to say?" he will often say yes.

2. I tell someone: "I'm going to whistle you the theme... ", it is my intention to whistle it, and I already know what I am going to whistle.

It is my intention to whistle this theme: have I then already, in some sense, whistled it in thought?

3. "I'm not just *saying* this, I mean something by it."--Should one thereupon ask "What?" then one gets another sentence in reply. Or perhaps one cannot ask that, as the sentence meant, e.g. "I'm not just *saying* this, it moves me too".

4. (The question "What do I mean by that?" is one of the most misleading of expressions. In most cases one might answer: "Nothing at all--I *say*...".)

5. Can I then not use words to mean what I like? Look at the door of your room, utter a sequence of random sounds and mean by them a description of that door.

6. "Say 'a b c d' and mean: the weather is fine."--Should I say, then, that the utterance of a sentence in a familiar language is a quite different experience from the utterance of sounds which are not familiar to us as a sentence? So if I learnt the language in which "*abcd*" meant that--should I come bit by bit to have the familiar experience when I pronounced the letters? Yes and no.--A major difference between the two cases is that in the first one I *can't move*. It is as if one of my joints were in splints, and I not yet familiar with the possible movements, so that I as it were keep on stumbling.

7. If I have two friends with the same name and am writing one of them a letter, what does the fact that I am not writing it to the other consist in? In the content? But that might fit either. (I haven't yet written the address.) Well, the connexion might be in the antecedents. But in that case it may also be in what *follows* the writing. If someone asks me "Which of the two are you

writing to?" and I answer him, do I infer the answer from the antecedents? Don't I give it almost as I say "I have toothache"?--Could I be in doubt which of the two I was writing to? And what is a case of such a doubt like?--Indeed, couldn't there also be an illusion of this kind: I believe I am writing to one of them when in fact I am writing to the other? And what would such a case of illusion look like?

8. (One sometimes says: "What was I going to look for in this drawer?--Oh yes, the photograph!" Once this has occurred to us, we recall the connexion between our actions and what was happening before. But the following is also possible: I open the drawer and rattle around in it; at last I come to and ask myself "Why am I rummaging in this drawer?" And then the answer comes, "I want to look at the photograph of...". "*I want to*", not "*I wanted to*". Opening the drawer, etc. happened so to speak automatically and got interpreted *subsequently*.)

9. "That remark of mine was aimed at *him*." If I hear this I can imagine a situation and a history that fit it. I could present it on the stage, project myself into the state of mind in which I 'aim at him'.--But how is this state of mind to be described, i.e. to be identified?--I think myself into the situation, assume a certain expression and tone, etc.. What

connects my words with him? The situation and my thoughts. And my thoughts in just the same way as things I say out loud.

Page 2

10. Suppose I wanted to replace all the words of my language at once by other ones; how could *I* tell the place where one of the new words belongs? Is it images that keep the places of the words?

Page 2

11. I am inclined to say: I 'point' *in different senses* to this body, to its shape, to its colour, etc.--What does that mean?

What does it mean to say I 'hear' *in a different sense* the piano, its sound, the piece, the player, his fluency? I 'marry', in one sense a woman, in another her money.

Page 2

12. Here meaning gets imagined as a kind of mental pointing, indicating.

Page Break 3

Page 3

13. In some spiritualistic procedures it is essential to *think* of a particular person. And here we have the impression that 'thinking of him' is as it were nailing him with my thought. Or it is as if I kept on thrusting at him in thought. For the thoughts keep on swerving slightly away from him.

Page 3

14. "Suddenly I had to think of him." Say a picture of him suddenly floated before me. Did I know that it was a picture of him, N.? I did not tell myself it was. What did its being of him consist in, then? Perhaps what I later said or did.

Page 3

15. When Max says "The prince has a fatherly concern for the troops", he means Wallenstein.--Suppose someone said: We don't know that he means Wallenstein: he might mean some other prince in this sentence.† 1

Page 3

16. "Your meaning the piano-playing consisted in your *thinking* of the piano-playing."

"That you meant that man by the word 'you' in that letter consisted in this, that you were writing to *him*."

The mistake is to say that there is anything that meaning something consists in.

Page 3

17. "When I said that, I only wanted to drop a hint."--How can I know that I said it only to drop a hint? Well, the words "When I said it, etc." describe a particular intelligible situation. What is that situation like? In order to describe it, I must describe a context.

Page 3

18. How does *he* enter into these proceedings:

I thrust at him,
I spoke to him,
I called him,
I spoke of him
I imagined him,
I esteem him?

Page 3

19. It is wrong to say: I meant him *by* looking at him. "Meaning" does not stand for an activity which wholly or partly consists in the 'utterances' [outward expressions] of meaning.

Page Break 4

Page 4

20. Hence it would be stupid to call meaning a 'mental activity', because that would encourage a false picture of the function of the word.

Page 4

21. I say "Come here" and point towards A. B, who is standing by him, takes a step towards me. I say "No; A is to come". Will that be taken as a communication about my mental state? Certainly not.--Yet couldn't inferences be made from it about processes going on in me when I pronounced the summons "Come here"?

But what kind of processes? Mightn't it be conjectured that I looked at A as I gave the order? That I directed my thoughts towards him? But perhaps I don't know B at all; I am in touch only with A. In that case the man who guessed at my mental processes might have been quite wrong, but all the same would have understood that I meant

A and not B.

Page 4

22. I point with my hand and say "Come here". A asks "Did you mean me?" I say: "No, B".--What went on when I meant B (since my pointing left it in doubt which I meant)?--I said those words, made that gesture. Must still more have taken place, in order for the language-game to take place? But didn't I already know, while I was pointing, whom I meant? Know? Of course--going by the usual criteria for knowledge.

Page 4

23. "What I wanted to get at in my account was....". This was the objective I had before me. In my mind I could see the passage in the book, that I was aiming at.

Describing an intention means describing what went on from a particular point of view, with a particular purpose. I paint a particular portrait of what went on.

Page 4

24. Instead of "I meant *him*" one may also say "I was speaking of *him*". And how does one do that, how does one speak of *him* in speaking those words? Why does it sound wrong to say "I spoke of him by pointing to him as I spoke those words"?

"To mean him" means, say, "to talk of him". Not: to point to him. And if I talk *of him*, of course there is a connexion between my talk and him, but this connexion resides in the application of the talk, not in an act of pointing. Pointing is itself only a sign,

Page Break 5

and in the language-game it may direct the application of the sentence, and so shew what is meant.

Page 5

25. If I say "I saw a chair in this room", I can mostly recall the particular visual impression only very roughly, nor does it have any importance in most cases. The use that is made of the sentence bypasses this particular feature. Now is it also like that when I say "I meant N"? Does this sentence bypass the particular features of the proceeding in the same way?

Page 5

26. When I make a remark with an allusion to N., I may let this appear--given particular circumstances--in my glance, my expression, etc.

Page 5

You can shew that you understand the expression "to allude to N." by describing examples of alluding. What will you describe? First of all, circumstances. Then what someone says. Perhaps his glance etc. as well. Then what someone making an allusion is trying to do.

Page 5

And if I go on to tell someone the feelings, images etc. which I had while I was making the remark, these may fill out the typical picture of an allusion (or *one* such picture). But it doesn't follow that the expression "alluding to N" means: behaving like this, feeling this, imagining this, etc. And here some will say: "Of course not! We knew that all along. A red thread must run through all these phenomena. It is, so to speak, entangled with them and so it is difficult to pick out."--And that is not true either.

Page 5

But it would also be wrong to say that "alluding" stands for a family of mental and other processes.--For one can well ask "Which was your allusion to N.?" "How did you give others to understand that you meant N.?"; but not: "How did you mean this utterance as an allusion to N.?"

Page 5

"I alluded to him in my talk."--"When you said what?"--"I was alluding to him when I spoke of a man who...."

Page 5

"I was alluding to him" means roughly: "I *wanted* someone to think of him at these words. But "I wanted" is not the description of a state of mind. Neither is "understanding that N was meant" such a description. [*Marginal note*: But one does ask: "In which remark did you allude to him?", "Which" was the remark where you meant him?"]

Page Break 6

Page 6

27. When the situation is ambiguous, is it doubtful whether I mean him? When I say that I did or did not mean him, I don't go by the situation. And if not by the situation, what do I go by? Apparently not by anything at all. For I do remember the situation, but I *interpret* it. I may, e.g., *now imitate* my sidelong glance at him; but *meaning* him appears as a quite impalpable fine atmosphere of the speaking and acting. (A fishy picture!)

28. In the course of a conversation I want to point at something; I have already begun a pointing movement, but I don't complete it. Later on I say "I was going to point to it then. I still remember quite clearly that I was already raising my finger." In the current of those events, thoughts, and experiences, that was the beginning of a pointing gesture.

And if I completed the gesture and said: "He is lying over there", this would not be a case of pointing unless these words belonged to a language.

29. "You moved your hand--did you mean anything by the movement?--I thought you meant me to come to you."

So he may have meant something or nothing. And if the former, then was it the movement that he meant--or something else? When he used an expression, did he mean something other than the expression or did he simply *mean* the expression?

30. Could one also reply: "I meant something by this movement, which I can only express by this movement"? (Music, musical thought.)

31. "Of course I was thinking of him: I saw him in my mind's eye!"--But I did not *recognize* him by his appearance.

32. Imagine someone you know.--Now say who it was.--Sometimes the picture comes first and the name afterwards. But do I guess the name by the picture's likeness to the man?--And if the name only comes after the picture--was the idea of that man there as soon as the picture was, or was it only complete when I had the name? I did not infer the name from the picture; and just for that reason I can say that the idea of him was already there once the picture was there.

33. It is as if one experienced a *tendency*, a readiness (James). And why shouldn't I call it that? (And some would explain what happens here by innervations of muscles, dispositions to move, or even images of movement.) Only there is no need to see the experience of a tendency as a not quite complete experience.

It often strikes us as if in grasping meaning the mind made small rudimentary movements, like someone irresolute who does not know which way to go--i.e. it tentatively reviews the field of possible applications.

34. Imagine humans who from childhood up scribble very fast as they talk: as it were illustrating what they say.

Must I assume that if someone draws or describes or imitates something from memory, he *reads off* his representation from something or other?!--What supports this?

35. Guessing thoughts. There are playing-cards on the table. I want the other man to touch one. I shut my eyes and think of one of the cards; the other is supposed to guess which I mean.--He makes himself think of a card, and at the same time wills to hit on the one I mean. He touches the card and I say "Yes, that was it"; or else it wasn't. A variant of this game would be for me to *look* at a particular card, but so that the other can't see the direction of my gaze; he has to guess the card I am looking at. It is important that this is a variant of the other game. Here it may be important *how* I think of the card, because it might turn out that the reliability of the guessing depended on that. But if I say in ordinary life: "I thought of so-and-so" I am not asked "*How* did you think of him?"

36. One would like to ask: "Would someone who could look into your mind have been able to see that you *meant* to say *that*?"

Suppose I had written my intention down on a slip of paper, then someone else could have read it there. And can I imagine that he might in some way have found it out *more surely* than that? Certainly not.

37. (At the beginning of a piece of music it says  = 88, written there by the composer. But in order to play it right nowadays it must be played  = 94: which is *the tempo intended by the composer*?)

38. Interrupt a man in quite unpremeditated and fluent talk. Then ask him what he was going to say; and in many

cases he will be able to continue the sentence he had begun.--"For that, what he was going to say must already have swum into view before his mind."--Is not that phenomenon perhaps the ground of our saying that the continuation had swum into his mental view?

Page 8

39. But is it not peculiar that there is such a thing as this reaction, this confession of intention? Is it not an extremely remarkable instrument of language? What is really remarkable about it? Well--it is difficult to imagine how a human being learns this use of words. It is so very subtle.

Page 8

40. But is it really subtler than that of the phrase "I imagined him", for example? Yes, every such use of language is remarkable, peculiar, if one is adjusted only to consider the description of physical objects.

Page 8

41. If I say "I was then going to do such-and-such", and if this statement is based on the thoughts, images etc. which I remember, then someone else to whom I tell only these thoughts, images etc. ought to be able to infer with as great certainty as mine that I was then going to do such-and-such.--But often he could not do so. Indeed, were I myself to infer my intention from the evidence, other people would be right to say that this conclusion was very uncertain.

Page 8

42. And how does [a child] learn to use the expression "I was just on the point of throwing then"? And how do we tell that he was then really in that state of mind then which I call "being on the point of"?

Page 8

43. Suppose a human being never learnt the expression "I was on the point of" or "I was just going to..." and could not learn their use? A man can after all think a good deal without thinking *that*. He can master a great field of language-games without mastering this one.

But isn't it odd that among all the diversity of mankind we do not encounter defective humans of this sort? Or are such people just to be found among the feeble-minded, only it is not closely enough observed which uses of language such people are capable of and which not?

Page Break 9

Page 9

44. "I had the intention of ..." does not express the memory of an experience. (Any more than "I was on the point of ...".)

Page 9

45. Intention is neither an emotion, a mood, nor yet a sensation or image. It is not a state of consciousness. It does not have genuine duration.

Page 9

46. "I have the intention of going away tomorrow."--When have you that intention? The whole time; or intermittently?

Page 9

47. Look in the drawer where you think you'll find it. The drawer is empty.--I believe you were looking for it among the sensations.

Page 9

Consider what it would really mean "to have an intention intermittently". It would mean: to have the intention, to abandon it, to resume it, and so on.

Page 9

48. In what circumstances does one say "This appliance is a brake, but it doesn't work"? That surely means: it does not fulfil its purpose. What is it for it to have this purpose? It might also be said: "It was the *intention* that this should work as a brake." Whose intention? Here intention as a state of mind entirely disappears from view.

Might it not even be imagined that several people had carried out an intention without any one of them having it? In this way a government may have an intention that no man has.

Page 9

49. There might be a verb which meant: to formulate an intention in words or other signs, out loud or in one's thoughts. This word would not mean the same as our "intend".

There might be a verb which meant: to act according to an intention; and neither would this word mean the same as our "intend".

Yet another might mean: to brood over an intention; or to turn it over and over in one's head.

Page 9

50. One may disturb someone in thinking-but in intending?--Certainly in planning. Also in keeping to an intention, that is in thinking or acting.

51. Application of the imperative. Compare these orders:

Raise your arm.
Imagine...
Work... out in your head
Consider...
Concentrate your attention on...
See this figure as a cube

with these:

Intend...
Mean... by these words
Suspect that this is the case
Believe that it is so
Be of the firm conviction...
Remember that this happened
Doubt whether it has happened
Hope for his return.

Is *this* the difference, that the first are voluntary, the second involuntary mental movements? I may rather say that the verbs of the second group do not stand for actions. (Compare with this the order: "Laugh heartily at this joke.")

52. Can one order someone to understand a sentence? Why can't one tell someone: "Understand that!" Couldn't I obey the order "Understand this Greek sentence" by learning Greek?--Similarly: one can say "Produce pain in yourself", but not "Have pain". One says "Bring yourself into this condition" but not "Be in this condition".

53. I expect an explosion any moment. I can't give my full attention to anything else; I look in a book, but without reading. Asked why I seem distracted or tense, I say I am expecting the explosion any moment.--Now how was it: did this sentence describe that behaviour? But then how is the process of expecting the explosion distinguished from the process of expecting some quite different event, e.g. a particular signal? And how is the expectation of *one* signal distinguished from the expectation of a slightly different one? Or was my behaviour only a side-effect of the real expectation, and was that a special mental process? And was this process homogeneous or articulated like a sentence (with an *internal* beginning and end)?--But how does

the person in whom it goes on know which event the process is the expectation of? For he does not seem to be in uncertainty about it. It is not as if he observed a mental or other condition and formed a conjecture about its cause. He may well say: "I don't know whether it is only this expectation that makes me so uneasy today"; but he will not say: "I don't know whether this state of mind, in which I now am, is the expectation of an explosion or of something else."

The statement "I am expecting a bang at any moment" is an *expression* of expectation. This verbal reaction is the movement of the pointer, which shows the object of expectation.

54. It seems as if the expectation and the fact satisfying the expectation fitted together somehow. Now one would like to describe an expectation and a fact which fit together, so as to see what this agreement consists in. Here one thinks at once of the fitting of a solid into a corresponding hollow. But when one wants to describe these two one sees that, to the extent that they fit, a *single* description holds for both. (On the other hand compare the meaning of: "These trousers don't go with this jacket".)

55. Like everything metaphysical the harmony between thought and reality is to be found in the grammar of the language.

56. Here my thought is: If someone could see the expectation itself--he would have to see *what* is being expected. (But in such a way that it doesn't further require a method of projection, a method of comparison, in order to pass from what he sees to the fact that is expected.)

But that's how it is: if you see the expression of expectation you see 'what is expected'.

57. The idea that it takes finding to show what we were looking for, and fulfilment of a wish to show what we wanted, means one is judging the process like the symptoms of expectation or search in someone else. I see him uneasily pacing up and down his room; then someone comes in at the door and he relaxes and gives signs of satisfaction. And I say "Obviously he was expecting this person".

Page Break 12

Page 12

58. We say that the expression of expectation describes the expected fact and think of this as of an object or complex which makes its appearance as fulfilment of the expectation.--But it is not the expected thing that is the fulfilment, but rather: its coming about.

The mistake is deeply rooted in our language: we say "I expect him" and "I expect his arrival", and "I expect he is coming".

Page 12

59. It is difficult for us to shake off this comparison: a man makes his appearance--an event makes its appearance. As if an event even now stood in readiness before the door of reality and were then to make its appearance in reality--like coming into a room.

Page 12

60. Reality is not a property still missing in what is expected and which accedes to it when one's expectation comes about.--Nor is reality like the daylight that things need to acquire colour, when they are already there, as it were colourless, in the dark.

Page 12

61. One may say of the bearer of a name that he does not exist; and of course that is not an activity, although one may compare it with one and say: he must be there all the same, if he does not exist. (And this has certainly already been written some time by a philosopher.)

Page 12

62. The shadowy anticipation of a fact consists in this: something is only *going* to happen, but we can think that *it* is going to happen. Or, as it misleadingly goes: we can now think *what* (or of what) is only *going* to happen.

Page 12

63. Some will perhaps want to say "An expectation is a thought". And we need to remember that the process of thinking may be *very various*.

Page 12

64. I whistle and someone asks me why I am so cheerful. I reply "I'm hoping N. will come today".--But while I whistled I wasn't thinking of him. All the same, it would be wrong to say: I stopped hoping when I began to whistle.

Page Break 13

Page 13

65. If I say "I am expecting...",--am I remarking that the situation, my actions, thoughts etc. are those of expectancy of this event; or are the words: "I am expecting..." part of the process of expecting?

In certain circumstances these words will mean (will be replaceable by) "I believe such-and-such will occur". Sometimes also: "Be prepared for this to happen...."

Page 13

66. Psychological--trivial--discussions about expectation, association etc. always pass over what is really noteworthy and it is noticeable that they talk around, without touching, the *punctum saliens*.†1

Page 13

67. An expectation is embedded in a situation from which it takes its rise. The expectation of an explosion for example, may arise from a situation in which an explosion is *to be expected*. The man who expects it had heard two people whispering: "Tomorrow at ten o'clock the fuse will be lit". Then he thinks: perhaps someone means to blow up a house here. Towards ten o'clock he becomes uneasy, jumps at every sound, and at last answers the question why he is so tense: "I'm expecting...". This answer will e.g. make his behaviour intelligible. It will enable us to fill out the picture of his thoughts and feelings.†2

Page 13

68. Fulfilment of expectation doesn't consist in this: a third thing happens which can be described otherwise than *as* "the fulfilment of this expectation", i.e. as a feeling of satisfaction or joy or whatever it may be. The expectation that something will be the case is the same as the expectation of the fulfilment of that expectation. [Marginal note: Expectation of what is not.]†3

Page 13

69. Socrates to Theaetetus: "If you have an idea, must it not be an idea of *something*?"--Theaetetus:

"Necessarily".--Socrates: "And if you have an idea of something mustn't it be of something real?"--Theaetetus: "It seems so".†4

If we put the word "kill", say, in place of "have an idea of" in this argument, then there is a rule for the use of this word: it makes no sense to say "I am killing something that does not exist". I can imagine a stag that is not there, in this meadow,

Page Break 14

but not kill one that is not there. And "to imagine a stag in this meadow" means to imagine *that* a stag is there. But to kill a stag does not mean to kill *that*.... But if someone says "In order for me to be able to imagine a stag it must after all exist in some sense",--the answer is: no, it does not have to exist in any sense. And if it should be replied: "But the colour brown at any rate must exist, for me to be able to have an idea of it"--then we can say: "The colour brown exists" means nothing at all; except that not it exists here or there as the colouring of an object, and that is necessary in order for me to be able to imagine a brown stag.

Page 14

70. Being able to do something seems like a shadow of the actual doing, just as the sense of a sentence seems like the shadow of a fact, or the understanding of an order the shadow of its execution. In the order the fact as it were "casts its shadow before". But this shadow, whatever it may be, is not the event.

Page 14

71. Compare the applications of:

"I have been in pain since yesterday"
"I have been expecting him since yesterday"
"I have known since yesterday"
"Since yesterday I've known how to integrate".

Page 14

72. The general differentiation of all states of consciousness from dispositions seems to me to be that one cannot ascertain by spotcheck whether they are still going on.

Page 14

73. Some sentences have to be read several times to be understood as sentences.

Page 14

74. A sentence is given me in code together with the key. Then of course in one way everything required for understanding the sentence has been given me. And yet I should answer the question "Do you understand this sentence?": No, not yet; I must first decode it. And only when e.g. I had translated it into English would I say "Now I understand it".

If now we raise the question "At what moment of translating do I *understand* the sentence?", we shall get a glimpse into the nature of what is called "understanding".

Page 14

75. I can attend to the course of my pains, but not in the same way to that of my belief, or my translation, or my knowledge.

Page Break 15

Page 15

76. One can observe the duration of a phenomenon by uninterrupted observation or by trials. The observation of duration may be continuous or intermittent.

Page 15

77. How do I observe my knowledge, my opinions? And on the other hand an after-image, a pain? Is there such a thing as uninterrupted observation of my capacity to carry out the multiplication...?

Page 15

78. Is "I hope..." a description of a state of mind? A state of mind has duration. So "I have been hoping for the whole day" is such a description; but suppose I say to someone: "I hope you come"--what if he asks me "For how long have you been hoping that?" Is the answer "For as long as I've been saying so"? Supposing I had some answer or other to that question, would it not be quite irrelevant to the purpose of the words "I hope you'll come"?

Page 15

79. We say "I hope you'll come", but not "I believe I hope you'll come", but we may well say: "I believe I still hope he'll come."

Page 15

80. What is the past tense of "You are coming, aren't you"?

Page 15

81. Where there is genuine duration one can tell someone: "Pay attention and give me a signal when the thing you are experiencing (the picture, the rattling etc.) alters."

Here there *is* such a thing as paying attention. Whereas one cannot follow with attention the forgetting of what one knew or the like. [Not right, for one also cannot follow one's own mental images with attention.]

Page 15

82. Think of this language-game: Determine how long an impression lasts by means of a stop-watch. The duration of knowledge, ability, understanding, could not be determined in this way.

Page 15

83. "But the difference between knowing and hearing surely doesn't reside simply in such a characteristic as the kind of duration they have. They are surely wholly and utterly distinct!" Of course. But one can't say: "*Know* and *hear*, and you will notice the difference".

Page Break 16

Page 16

84. "Pain is a state of consciousness, understanding is not."--"Well, the thing is, I don't *feel* my understanding."--But this explanation achieves nothing. Nor would it be any explanation to say: What one in some sense *feels* is a state of consciousness. For that would only mean: State of consciousness = feeling. (One word would merely have been replaced by another.)

Page 16

85. Really one hardly ever says that one has believed, understood, intended something "uninterruptedly" since yesterday. An interruption of belief would be a period of unbelief, not e.g. the withdrawal of attention from what one believes--e.g. sleep.

(Difference between 'knowing' and 'being aware of'.)

Page 16

86. The most important thing here is this: there is a difference; one notices the difference which is 'a category-difference'--without being able to say what it consists in. That is the case where it is usually said that we know the difference by introspection.

Page 16

87. This is likely to be the point at which it is said that only form, not content, can be communicated to *others*.--So one talks to oneself *about the content!*--(But how do my words 'relate' to the content I know? And to what purpose?)

Page 16

88. It is very noteworthy that *what goes on* in thinking practically never interests us. It is noteworthy, but not queer.

Page 16

89. ((Thoughts, as it were only hints.))†1

Isn't it the same here as with a calculating prodigy?--He has calculated right if he has got the right answer. Perhaps he himself cannot say what went on in him. And if we were to hear it, it would perhaps seem like a queer caricature of calculation.

Page 16

90. What do I know of what goes on within someone who is reading a sentence attentively? And can he describe it to me afterwards, and, if he does describe something, will it be *the* characteristic process of attention?

Page 16

91. Ask: What result am I aiming at when I tell someone: "Read attentively"? That, *e.g.*, this and that should strike him, and he be able to give an account of it.--Again, it could, I think, be said that if you read a sentence with attention you will often be able to

Page Break 17

give an account of what has gone on in your mind, e.g. the occurrence of images. But that does not mean that these things are what we call "attention".

Page 17

92. "Did you think as you read the sentence?"--"Yes, I did think as I read it; every word was important to me."

That is not the usual experience.†1 One is not usually half-astonished to hear oneself say something; one doesn't follow one's own talk with attention; for one ordinarily talks voluntarily, not involuntarily.

Page 17

93. If a normal human is holding a normal conversation under normal circumstances, and I were to be asked what

distinguishes thinking from not-thinking in such a case,--I should not know what answer to give. And I could *certainly not* say that the difference lay in something that goes on or fails to go on while he is speaking.

Page 17

94. The boundary-line that is drawn here between 'thinking' and 'not thinking' would run between two conditions which are not distinguished by anything in the least resembling a play of images. (For the play of images is admittedly the model according to which one would like to think of thinking.)

Page 17

95. Only under quite special circumstances does the question arise whether one spoke *thinkingly* or not.

Page 17

96. Sure, if we are to speak of an experience of thinking, the experience of speaking is as good as any. But the concept 'thinking' is not a concept of an experience. For we don't compare thoughts in the same way as we compare experiences.

Page 17

97. What one mimics is, say, a man's tone in speaking, his expression and similar things; and that suffices us. This proves that the important accompanying phenomena of talking are found *here*.

Page 17

98. Do we say that *anyone* who is speaking significantly is thinking? For example the builder in language-game no. 2?†2 Couldn't we imagine him building and calling out the words in surroundings in which we should not connect this even remotely with thinking?

Page Break 18

Page 18

99. (On language-game no. 2†1) "You are just tacitly assuming that these people *think*; that they are like people as we know them in *that* respect; that they do not carry on that language-game merely mechanically. For if you imagined them doing that, you yourself would not call it the use of a rudimentary language."

What am I to reply to this? Of course it is true that the life of those men must be like ours in many respects, and I said nothing about this similarity. But the important thing is that their language, and their thinking too, may be rudimentary, that there is such a thing as 'primitive thinking' which is to be described via primitive *behaviour*. The surroundings are not the 'thinking accompaniment' of speech.

Page 18

100. Let us imagine someone doing work that involves comparison, trial, choice. Say he is constructing an appliance out of various bits of stuff with a given set of tools. Every now and then there is the problem "Should I use *this* bit?"--The bit is rejected, another is tried. Bits are tentatively put together, then dismantled; he looks for one that fits etc., etc.. I now imagine that this whole procedure is filmed. The worker perhaps also produces sound-effects like "hm" or "ha!" As it were sounds of hesitation, sudden finding, decision, satisfaction, dissatisfaction. But he does not utter a single word. Those sound-effects may be included in the film. I have the film shewn me, and now I invent a soliloquy for the worker, things that fit his manner of work, its rhythm, his play of expression, his gestures and spontaneous noises; they correspond to all this. So I sometimes make him say "No, that bit is too long, perhaps another'll fit better." Or "What am I to do now?" "Got it!"-- Or "That's not bad" etc.

If the worker can talk--would it be a falsification of what actually goes on if he were to describe that precisely and were to say e.g. "Then I thought: no, that won't do, I must try it another way" and so on--although he had neither spoken during the work nor imagined these words?

I want to say: May he not later give his wordless thoughts in words? And in such a fashion that we, who might see the work in progress, could accept this account?--And all the more, if we had often watched the man working, not just once?

Page Break 19

Page 19

101. Of course we cannot separate his 'thinking' from his activity. For the thinking is not an accompaniment of the work, any more than of thoughtful speech.

Page 19

102. Were we to see creatures at work whose *rhythm* of work, play of expression etc. was like our own, but for their not *speaking*, perhaps in that case we should say that they thought, considered, made decisions. For there would be a great deal there corresponding to the action of ordinary humans. And there is no deciding how close the correspondence must be to give us the right to use the concept 'thinking' in their case too.

103. And anyhow what should we come to this decision for?

We shall be making an important distinction between creatures that can learn to do work, even complicated work, in a 'mechanical' way, and those that make trials and comparisons as they work.--But what should be called "making trials" and "comparisons" can in turn be explained only by giving examples, and these examples will be taken from our life or from a life that is like ours.

104. If he has made some combination in play or by accident and he now uses it as a method of doing this and that, we shall say he thinks.--In *considering* he would mentally review ways and means. But to do this he must already have some in stock. Thinking gives him the possibility of *perfecting* his methods. Or rather: He 'thinks' when, in a definite kind of way, he perfects a method he has. [*Marginal note*: What does the search look like?]

105. It could also be said that a man thinks when he *learns* in a particular way.

106. And this too could be said: Someone who *thinks* as he works will intersperse his work with *auxiliary activities*. The word "thinking" does not now mean these auxiliary activities, just as thinking is not talking either. Although the concept 'thinking' is formed on the model of a kind of imaginary auxiliary activity. (Just as we might say that the concept of the differential quotient is formed on the model of a kind of ideal quotient.)

107. These auxiliary activities are not the thinking; but one imagines thinking as the stream which must be flowing under the surface of these expedients, if they are not after all to be mere mechanical procedures.

108. Suppose it were a question of buying and selling creatures (anthropoid brutes) which we use as slaves. They cannot learn to talk, but the cleverer among them can be taught to do quite complicated work; and some of these creatures work 'thinkingly', others quite mechanically. For a thinking one we pay more than for one that is merely mechanically clever.

109. If there were only quite few people who could get the answer to a sum without speaking or writing, they could not be adduced as testimony to the fact that calculating can be done without signs. The reason is that it would not be clear that these people were 'calculating' at all. Equally Ballard's testimony (in James) cannot convince one that it is possible to think without a language.

Indeed, where no language is used, why should one speak of 'thinking'? If this is done, it shows something about the *concept* of thinking.

110. 'Thinking', a widely ramified concept. A concept that comprises many manifestations of life. The *phenomena* of thinking are widely scattered.

111. We are not at all *prepared* for the task of describing the use of e.g. the word "to think" (And why should we be? What is such a description useful for?)

And the naïve idea that one forms of it does not correspond to reality at all. We expect a smooth contour and what we get to see is ragged. Here it might really be said that we have constructed a false picture.

112. It is not to be expected of this word that it should have a unified employment; we should rather expect the opposite.

113. Where do we get the concept 'thinking' from which we want to consider here? From everyday language. What first fixes the direction of our attention is the word "thinking". But

the use of this word is confused. Nor can we expect anything else. And that can of course be said of all psychological verbs. Their employment is not so clear or so easy to get a synoptic view of, as that of terms in mechanics, for example.

114. One learns the word "think", i.e. its use, under certain circumstances, which, however, one does not learn to describe.

Page 21

115. But I *can teach* a person the use of the word! For a description of those circumstances is not needed for that.

Page 21

116. I just teach him the word *under particular circumstances*.

Page 21

117. We learn to say it perhaps only of human beings; we learn to assert or deny it of them. The question "Do fishes think?" need not exist among their applications of language, *it is not raised*. (What can be more natural than such a set-up, such a use of language?)

Page 21

118. "No one thought of *that case*"--we may say. Indeed, I cannot enumerate the conditions under which the word "to think" is to be used--but if a circumstance makes the use doubtful, I can say so, and also say *how* the situation is deviant from the usual ones.

Page 21

119. If I have learned to carry out a particular activity in a particular room (putting the room in order, say) and am master of this technique, it does not follow that I must be ready to describe the arrangement of the room; even if I should at once notice, and could also describe, any alteration in it.

Page 21

120. "This law was not given with such cases in view." Does that mean it is senseless?

Page 21

121. It could very well be imagined that someone knows his way around a city perfectly, i.e. would confidently find the shortest way from any place in it to any other,--and yet would be quite incompetent to draw a map of the city. That, as soon as he tries, he produces nothing that is not completely wrong. (Our concept of 'instinct'.)

Page Break 22

Page 22

122. Remember that our language might possess a variety of different words: one for 'thinking out loud'; one for thinking as one talks to oneself in the imagination; one for a pause during which something or other floats before the mind, after which, however, we are able to give a confident answer.

One word for a thought expressed in a sentence; one for the lightning thought which I may later 'clothe in words'; one for wordless thinking as one works.

Page 22

123. "Thinking is a mental activity"--Thinking is *not* a bodily activity. Is thinking an activity? Well, one may tell someone: "Think it over". But if someone in obeying this order talks to himself or even to someone else, does he then carry out *two* activities?

Page 22

124. Concern with what we say has its own specific signs. It also has its own specific consequences and preconditions. Concern is something experienced; we attribute it to ourselves, not on grounds of observation. It is not an accompaniment of what we say. What would make an accompaniment of a sentence into concern about the content of that sentence? (Logical condition.)

Page 22

125. Compare the phenomenon of thinking with the phenomenon of burning. May not burning, flame, seem mysterious to us? And why flame more than furniture?--And how do you clear up the mystery?

And how is the riddle of thinking to be solved?--Like that of flame?

Page 22

126. Isn't flame mysterious because it is impalpable? All right--but why does that make it mysterious? Why should something impalpable be more mysterious than something palpable? Unless it's because we *want* to catch hold of it.--

Page 22

127. The soul is said to *leave* the body. Then, in order to exclude any similarity to the body, any sort of idea that some gaseous thing is meant, the soul is said to be incorporeal, non-spatial; but with the word "leave" one has already said it all. Shew me *how* you use the word "spiritual" and I shall see whether the soul is non-corporeal and what you understand by "spirit".

Page Break 23

Page 23

128. I am inclined to speak of a lifeless thing as lacking something. I see life definitely as a plus, as something added to a lifeless thing. (Psychological atmosphere.)

129. We don't say of a table and a chair: "Now they are thinking," nor "Now they are not thinking," nor yet "They never think"; nor do we say it of plants either, nor of fishes; hardly of dogs; only of human beings. And not even of all human beings.

"A table doesn't think" is not assimilable to an expression like "a table doesn't grow". (I shouldn't know 'what it would be like if a table were to think.) And here there is obviously a gradual transition to the case of human beings.

130. We only speak of 'thinking' in quite particular circumstances.

131. How then can the sense and the truth (or the truth and the sense) of sentences collapse together? (Stand or fall together?)

132. And isn't it as if you wanted to say: "If such-and-such is not the case, then it makes no *sense* to say it is the case"?

133. Like this, e.g.: "If all moves were *always* false, it would make no sense to speak of a 'false move'." But that is only a paradoxical way of putting it. The nonparadoxical way would be: "The general description ... makes no sense".

134. Do not say "one cannot", but say instead: "it doesn't exist in this game". Not: "one can't castle in draughts" but--"there is no castling in draughts"; and instead of "I can't exhibit my sensation"--"in the use of the word 'sensation', there is no such thing as exhibiting what one has got"; instead of "one cannot enumerate all the cardinal numbers"--"there is no such thing here as enumerating all the members".

135. Conversation flows on, the application and interpretation of words, and only in its course do words have their meaning.

"He has gone away" "Why?"--What did you mean, when you uttered the word "why"? What did you *think* of?

136. Think of putting your hand up in school. Need you have rehearsed the answer silently to yourself, in order to have the right to put your hand up? And *what* must have gone on inside you?--Nothing need have. But it is important that you usually know an answer when you put your hand up; and that is the criterion for one's *understanding* of putting one's hand up.

Nothing need have gone on in you; and yet you would be remarkable if on such occasions you never had anything to report about what went on in you.

137. Sometimes when I say "Just then I had the thought...." I may report that I had said those very words to myself, out loud or silently; or if not those, then others of which the present ones reproduce the gist. Surely that often happens. But it does also happen that my present words are 'not a *reproduction*', for they are only a reproduction if they are so by rules of projection.

138. It looks as if a sentence with e.g. the word "ball" in it already contained the shadow of other uses of this word. That is to say, the *possibility* of forming those other sentences.--To whom does it look like that? And under what circumstances?

139. We don't get free of the idea that the sense of a sentence accompanies the sentence: is there alongside of it.

140. One wants to say e.g.: "The one negation *does* the same thing with the proposition as the other, it excludes what it describes." But that is only another way of expressing one's assimilation of the two negative propositions. (Which is valid only when the negated proposition is not itself a negative proposition.) Ever and again comes the thought that what we see of a sign is only the outside of something within, in which the real operations of sense and meaning go on.†1

141. Our problem could be (very clearly) formulated like this: suppose we had two systems for measuring length; in

both a length is expressed by a numeral which is followed by a word giving the unit. One system designates a length as "n ft", and a foot is a unit of length in the ordinary sense; in the other system a length is designated by "n W" and $1 \text{ ft} = 1 \text{ W}$. But $2 \text{ W} = 4 \text{ ft}$,

Page Break 25

$3 \text{ W} = 9 \text{ ft}$ and so on.--So the sentence "This stick is 1 W long" means the same as "This stick is 1 ft long". Question: have "W" and "ft" the same meaning in these two sentences?

Page 25

142. The question is wrongly framed. We can see this, if we express the identity of meaning by an equation. The question can only run: "Does $\text{W} = \text{ft}$ or not?"--The sentences in which these signs occur do not come in here.--No more, of course, can we ask in this terminology whether "is" in one place means the same as "is" in another; what we can ask is whether the copula means the same as the equals sign. Well, what we said was: $1 \text{ ft} = 1 \text{ W}$; but $\text{ft} \neq \text{W}$.

Page 25

143. We might say: in all cases what one means by "thought" is what is *alive* in the sentence. That without which it is dead, a mere sequence of sounds or written shapes.

If however I were to speak in the same way of a something that gives meaning to a configuration of chess pieces, that is to say distinguishes them from any old arrangement of little bits of wood--couldn't I mean all sorts of things? The rules that make the chess arrangement into a situation in a game; the special experiences that we associate with such positions in a game; the usefulness of the game.

Or suppose we were to speak of a something that distinguishes paper money from mere printed slips of paper and gives it its meaning, its life!

Page 25

144. How words are understood is not told by words alone. (Theology.)

Page 25

145. There could also be a language in whose use the impression made on us by the signs played no part; in which there was no such thing as understanding, in the sense of such an impression. The signs are e.g. written and transmitted to us, and we are able to *take notice of them*. (That is to say, the only impression that comes in here is the pattern of the sign.) If the sign is an order, we translate it into action by means of rules, tables. It does not get as far as an impression, like that of a picture; nor are stories written in this language.

Page 25

146. In this case one might say: "Only in the system has the sign any life."

Page Break 26

Page 26

147. We could of course also imagine that we had to use rules, and translate a verbal sentence into a drawing in order to get an *impression* from it. (That only the picture had a soul.)

Page 26

148. We could imagine a language in which the meanings of expressions changed according to definite rules, e.g.: in the morning the expression A means this, in the afternoon it means that.

Or a language in which the individual words altered every day; each day each letter of the previous day would be replaced by the next one in the alphabet (and z by a).

Page 26

149. Imagine the following language: its vocabulary and grammar are those of English, but the words occur in the sentences in reverse order. So a sentence of this language sounds like an English sentence read from the full stop back to the beginning. Thus the possibilities of expression have the same multiplicity as in English. But the familiar ring of our sentences is done away with.

Page 26

150. Someone who doesn't know English hears me say on certain occasions: "What marvellous light!" He guesses the sense and now uses the exclamation himself, as I use it, but without understanding the three individual words. Does he understand the exclamation?

Page 26

151. I intentionally chose an example in which a man gives expression to his sensation. For in this case sounds belonging to no language are said to be full of meaning.

Page 26

152. Would it be equally easy to imagine the analogous case for this sentence: "If the train does not arrive punctually at five o'clock, he'll miss the connexion"? What would guessing the sense mean in this case?

153. It somehow worries us that the thought in a sentence is not wholly present at any one moment. We regard it as an object which we are making and have never got all there, for no sooner does one part appear than another vanishes.

154. (On no. 150) A language may easily be imagined in which people use a single word for the exclamation. But what about one word for the sentence "If the train...."? In what kind of case should we say that the word actually stood for that sentence?

Say in this one: people begin by using a sentence like ours, but then circumstances arise in which the sentence has to be uttered so often that they contract it to a single word. So these people could still explain the word by means of the sentence.

But is the further case possible in which people possess *only* a single word with that sense, that is for that use? Why not? One needs to imagine how the use of this word is learnt, and in what circumstances we should say that the word really stands in place of that sentence.

But remember this: in our language someone says "He is arriving at five o'clock"; someone else replies "No, at ten past five". Is there also this sort of exchange in the other language?

That is why sense and reference are vague concepts.

155. A poet's words can pierce us. And that is of course *causally* connected with the use that they have in our life. And it is also connected with the way in which, conformably to this use, we let our thoughts roam up and down in the familiar surroundings of the words.

156. Is there *a* difference of meaning that can be explained and another that does not come out in an explanation?

157. Soulful expression in music--this cannot be recognized by rules. Why can't we imagine that it might be, by other beings?

158. If a theme, a phrase, suddenly means something to you, you don't have to be able to explain it. Just *this* gesture has been made accessible to you.

159. But you do speak of *understanding* music. You understand it, surely, *while* you hear it! Ought we to say this is an experience which accompanies the hearing?

160. The way music speaks. Do not forget that a poem, even though it is composed in the language of information, is not used in the language-game of giving information.

161. Mightn't we imagine a man who, never having had any acquaintance with music, comes to us and hears someone playing a reflective piece of Chopin and is convinced that this is a language and people merely want to keep the meaning secret from him?

There is a strongly musical element in verbal language. (A sigh, the intonation of voice in a question, in an announcement, in longing; all the innumerable *gestures* made with the voice.)

162. But if I hear a tune with understanding, doesn't something special go on in me--which does not go on if I hear it without understanding? And *what?*--No answer comes; or anything that occurs to me is insipid. I may indeed say: "Now I've understood it," and perhaps talk about it, play it, compare it with others etc. *Signs* of understanding may accompany hearing.

163. It is wrong to call understanding a process that accompanies hearing. (Of course its manifestation, expressive playing, cannot be called an accompaniment of hearing either.)

164. For how can it be explained what 'expressive playing' is? Certainly not by anything that accompanies the playing.--What is needed for the explanation? One might say: a culture.--If someone is brought up in a particular culture--and then reacts to music in such-and-such a way, you can teach him the use of the phrase "expressive

playing".

Page 28

165. The understanding of music is neither sensation nor a sum of sensations. Nevertheless it is correct to call it an experience inasmuch as *this* concept of understanding has some kinship with other concepts of experience. You say "I experienced that passage quite differently". But still this expression tells you '*what happened*' only if you are at home in the special conceptual world that belongs to these situations. (Analogy: "I won the match".)

Page 28

166. *This* floats before my mind as I read. So does something go on in reading...?--This question doesn't get us anywhere.

Page 28

167. But how can it float before me?--Not in the dimensions you are thinking of.

Page Break 29

Page 29

168. How do I know that someone is enchanted? How does one learn the linguistic expression of enchantment? What does it connect up with? With the expression of bodily sensations? Do we ask someone what he feels in his breast and facial muscles in order to find out whether he is feeling enjoyment?

Page 29

169. But does that mean that there are not sensations which often return when one is enjoying music? Certainly not.

Page 29

170. A poem makes an impression on us as we read it. "Do you feel the same while you read it as when you read something indifferent?"--How have I learnt to answer this question? Perhaps I shall say "Of course not!"--which is as much as to say: *this* takes hold of me, and the other not.

"I experience something different"--And what kind of thing?--I can give no satisfactory answer. For the answer I give is not in itself of any importance.--"But didn't you enjoy it *during* the reading?" Of course--for the opposite answer would mean: I enjoyed it earlier or later, and I don't want to say that.

But now, surely you remember sensations and images as you read, and they are such as to connect up with the enjoyment, with the impression.--But they got their significance only from the surroundings: through the reading of this poem, from my *familiarity* with its language, with its metre and with innumerable associations.

You must ask how we learnt the expression "Isn't that glorious!" at all.--No one explained it to us by referring to sensations, images or thoughts that accompany hearing! Nor should we doubt whether he had enjoyed it if he had no account to give of such experiences; though we should, if he shewed that he did not understand certain tie-ups.

Page 29

171. But isn't understanding shewn e.g. in the expression with which someone reads the poem, sings the tune? Certainly. But what is the experience during the reading? About that you would just have to say: you enjoy and understand it if you hear it well read, or feel it well read in your speech-organs.

Page 29

172. Understanding a musical phrase may also be called understanding a *language*.

Page Break 30

Page 30

173. I think of a quite short phrase, consisting of only two bars. You say "What a lot that's got in it!" But it is only, so to speak, an optical illusion if you think that what is there goes on as we hear it. ("It all depends *who* says it.") (Only in the stream of thought and life do words have meaning.)

Page 30

174. What contains the illusion is not *this*: "Now I've understood"--followed perhaps by a long explanation of what I have understood.

Page 30

175. Doesn't the theme point to anything outside itself? Yes, it does! But that means:--it makes an impression on me which is connected with things in its surroundings--e.g. with our language and its intonations; and hence with the whole field of our language-games.

If I say for example: Here it's as if a conclusion were being drawn, here as if something were being confirmed, *this* is like an answer to what was said before,-then my understanding presupposes a familiarity with inferences, with confirmation, with answers.

Page 30

176. The words "Gottlob! Noch etwas Weniges hat man geflüchtet--vor den Fingern der Kroaten,"†1 and the tone

and glance that go with them seem indeed to carry within themselves every last *nuance* of the meaning they have. But only because we know them as part of a particular scene. But it would be possible to construct an entirely different scene around these words so as to shew that the special spirit they have resides in the story in which they come.

Page 30

177. If I hear someone say: "Away!" with a gesture of repulsion, do I have an 'experience' of meaning *here* as I do in the game where I pronounce that to myself meaning it now in one sense, now in another?--For he could also have said "Get away from me!" and then perhaps I'd have experienced the whole phrase in such-and-such a way--but the single word? Perhaps it was the supplementary words that made the impression on me.

Page Break 31

Page 31

178. The peculiar experience of meaning is characterized by the fact that we come out with an explanation and use the past tense: just as if we were explaining the meaning of a word for practical purposes.

Page 31

179. *Forget*, forget that you have these experiences yourself!

Page 31

180. How could he hear the word with that meaning? How was it possible?! It just wasn't--not in *these* dimensions.--

Page 31

181. But isn't it true, then, that the word means that to me now? Why not? For this sense doesn't come into conflict with the rest of the use of the word.

Someone says: "Give him the news that..., and *mean* by it..."--What sense would this order make?

Page 31

182. "When I uttered the word just now, it meant... to me." Why should that not be mere lunacy? Because *I* experienced that? That is not a reason.

Page 31

183. The man I call meaning-blind will understand the instruction "Tell him he is to go to the bank--I mean the river bank," but not "Say the word bank and mean the bank of a river". What concerns this investigation is not the forms of mental defect that are found among men; but the possibility of such forms. We are interested, not in whether there are men incapable of a thought of the type: "I was then going to..."--but in how the concept of such a defect should be worked out.

If you assume that someone cannot do *this*, how about *that*? Are you supposing he can't do that either?--Where does this concept take us? For what we have here are of course paradigms.

Page 31

184. Different people are very different in their sensitiveness about changes in the orthography of a word. And the feeling is not just piety towards an old use.--If for you spelling is just a practical question, the feeling you are lacking in is not unlike the one that a 'meaning-blind' man would lack. (Goethe on people's names. Prisoners' numbers.)

Page 31

185. It's just like the way some people do not understand the question "What colour has the vowel *a* for you?"--If someone did not understand this, if he were to declare it was nonsense--

Page Break 32

could we say he did not understand English, or the meaning of the individual words "colour", "vowel" etc.?

On the contrary: Once he has learned to understand these words, then it is possible for him to react to such questions 'with understanding' or 'without understanding'.

Page 32

186. Misunderstanding-non-understanding. Understanding is effected by explanation; but also by training.

Page 32

187. Why can't a cat be taught to retrieve? Doesn't it understand what one wants? And what constitutes understanding or failure to understand here?

Page 32

188. "I read each word with the feeling appropriate to it. The word 'but' e.g. with the but-feeling--and so on."--And even if that is true--what does it really signify? What is the logic of the concept 'but-feeling'?--It certainly isn't a feeling just because I call it "a feeling".

Page 32

189. Is lying a particular experience? Well, can I tell someone "I am going to tell you a lie" and straightway do it?

190. To what extent am I aware of lying while I'm telling a lie? Just in so far as I don't 'only realise it later on', and all the same I do know later that I was lying. The awareness that one is lying is a knowing-how. It is no contradiction of this that there are characteristic feelings of lying. [*Marginal note: Intention.*]

191. Knowledge is not *translated* into words when it is expressed. The words are not a translation of something else that was there before they were.

192. "To purpose to do something is a special inner process."--But what sort of process--even if you could dream one up could satisfy our requirements about purpose?

193. Isn't it just like this with the verb "to understand"? Someone tells me the route I have to take to some place and from there on. He asks "Did you understand?" I reply "Yes I did". --Do I mean to tell him what was going on within me during his explanation?--And after all that could be told him too.

194. Imagine the following game: A list of words from various languages and of senseless sound-sequences is read out to me. I am to say after each whether I understand it or not; and also what went on within me as I understood or failed to understand.--At the word "tree" I shall answer "yes" without reflection (perhaps an image floats before my mind); at a collocation of sounds that I have never heard before, I answer "No" equally without reflection. At words which stand for particular shades of colour, the answer will often be preceded by an image, at a few words ("continuum," say) there will be consideration; at words like the article "the" perhaps a shrug of the shoulders; words of a foreign language I shall *sometimes* translate into English; when images rise in my mind they are sometimes images of the objects that are designated by the words (in turn a host of cases), sometimes different pictures.

This game might be supplemented by one in which someone calls out the names of *activities* and at each one asks: "Can you do that?"--The subject is to give his reasons for answering the question "yes" or "no".

195. Let us imagine a kind of puzzle picture: there is not *one* particular object to find; at first glance it appears to us as a jumble of meaningless lines, and only after some effort do we see it as, say, a picture of a landscape.--What makes the difference between the look of the picture before and after the solution? It is clear that we see it differently the two times. But what does it amount to to say that after the solution the picture means something to us, whereas it meant nothing before?

196. We can also put this question like this: What is the general mark of the solution's having been found?

197. I will assume that as soon as it is solved I make the solution obvious by strongly tracing certain lines in the picture and perhaps putting in some shadows. Why do you call the picture you have sketched in a solution?

- (a) Because it is the clear representation of a group of spatial objects.
- (b) Because it is the representation of a regular solid.
- (c) Because it is a symmetrical figure.

- (d) Because it is a shape that makes an ornamental impression on me.
- (e) Because it is the representation of a body I am familiar with.
- (f) Because there is a list of solutions and this shape (this body) is on the list.
- (g) Because it represents a kind of object that I am very familiar with; for it gives me an instantaneous impression of familiarity, I instantly have all sorts of associations in connexion with it; I know what it is called; I know I have often seen it; I know what it is used for etc.
- (h) Because I seem to be familiar with the object, a word occurs to me at once as its name (although the word does not belong to any existent language); I tell myself "Of course that's a..." and give myself a nonsensical explanation, which at that moment seems to me to make sense. (Like in a dream.)
- (i) Because it represents a face which strikes me as familiar.
- (j) Because it represents a face which I recognize; it is the face of my friend N; it is a face which I have often seen pictures of, etc.
- (k) Because it represents an object which I remember having seen at some time.

- (l) Because it is an ornament that I know well (though I don't remember where I have seen it).
 - (m) Because it is an ornament that I know well; I know its name, I know where I have seen it.
 - (n) Because it represents part of the furniture of my room.
 - (o) Because I instinctively traced out those lines and now feel easy.
 - (p) Because I remember that this object has been described to me. And so on.
- (Anyone who does not understand why we talk about these things must feel what we say to be mere trifling.)

Page 34

198. Can I think away the impression of familiarity where it exists; and think it into a situation where it does not? And what does that mean? I see e.g. the face of a friend and ask myself: What does this face look like if I see it as a strange face (as if I were seeing it now for the first time)? What remains, as it were,

Page Break 35

of the look of this face, if I think away, subtract, the impression of familiarity from it? Here I am inclined to say: "It is *very difficult* to separate the familiarity from the impression of the face". But I also feel that this is a bad way of putting things. For I have no notion how I should so much as *try* to separate these two things. The expression "to separate them" does not have any clear sense for me.

I know what *this means*: "Imagine this table black instead of brown". To this there corresponds: "Paint this table, but black instead of brown".

Page 35

199. Suppose someone were to say: "Imagine this butterfly exactly as it is, but ugly instead of beautiful"?!

Page 35

200. In this case *we* have not *determined* what thinking the familiarity away is to mean.

It might mean, say, to recall the impression which I had when I saw the face for the first time.

Page 35

201. For someone who has no knowledge of such things a diagram representing the inside of a radio receiver will be a jumble of meaningless lines. But if he is acquainted with the apparatus and its function, that drawing will be a significant picture for him.

Given some solid figure (say in a picture) that means nothing to me at present--can I at will imagine it as meaningful? That's as if I were asked: Can I imagine an object of any old shape as an appliance? But to be applied to what?

One class of corporeal shapes might readily be imagined as dwellings for beasts or men. Another class as weapons. Another as models of landscapes. Etc. etc. So here I know how I can ascribe meaning to a meaningless shape.

Page 35

202. Consider well how we use the word "recognize". I recognize the furniture in my room, my friend whom I see every day. But no 'act of recognition takes place'.

Page 35

203. Someone might say: I should have no impression of the room as a whole, if I could not let my glance roam rapidly to and fro in it and myself move about in it freely. (Stream of thought.) But now the question is: How is it manifested that I 'have an

Page Break 36

impression of the room as a whole'? For one thing, in its being a matter of course that I find my way around in it; in the absence of hunting about, hesitation, and surprise. In there being no end of activities that are encompassed by its walls and in all this being covered by the expression "my room" when I'm talking. In my finding it useful and necessary to keep on using the idea 'my room', as opposed to its walls, its corners etc.

Page 36

204. What is the description of an 'attitude' like?

One says e.g. "Disregard these spots and this little irregularity, and look at it as a picture of a...."

"Think *that* away. Would you dislike the thing even without this...." Of course it will be said that I alter my visual image--as by blinking or blocking out a detail. This "Disregarding..." does indeed play a part quite like, say, the production of a new picture.

Page 36

205. Very well--that is good reason to say that we altered our visual impression through our attitude. That is to say, there are good reasons to delimit the concept 'visual impression' in this way.

Page 36

206. "But in seeing I can obviously *take elements together* (lines for example)." But why does one call it "taking

together"? Why does one here--*essentially*--need a word that already has another meaning? (This is of course like the case of the phrase "*calculating* in one's head".)

Page 36

207. If I tell someone "Take these lines (or something else) together" what will he do? Well, various things, according to the circumstances. Perhaps he is supposed to count them two by two, or to put them in a drawer, or to look at them etc.

Page 36

208. Let us consider what is said about a phenomenon like this:

Seeing the figure &unk; now as an F, now as the mirror image of an F.

I want to ask: what constitutes seeing the figure now like this, now another way?--Do I really see something different every time? Or do I merely *interpret* what I see in a different way?--I am inclined to say the first. *But why?* Well, interpreting is a procedure. It may for example consist in somebody's saying

Page Break 37

"That is supposed to be an F"; or not saying it, but replacing the sign with an F in copying; or again considering: "What can that be? It'll be an F that the writer did not hit off."--Seeing is not an action but a state. (A grammatical remark.) And if I have never read the figure as anything but an F, or considered what it might be, we shall say that I *see* it as F; if, that is, we know that it can also be seen differently. I should call it "interpretation" if I were to say "That is certainly supposed to be an F; the writer does all his F's like that."

Page 37

For how do we arrive at the concept 'seeing this as that' at all? On what occasions does it get formed, when is there need of it? (Very frequently in art.) Where, for example, there is a question of phrasing by eye or ear. We say "You have to hear these bars as an introduction," "You must hear it as in this key." "Once you have seen this figure as... it is difficult to see it otherwise", "I hear the French 'ne ... pas' as a negation in two parts, not as 'not a step'" etc., etc. Now, is it a real case of seeing or hearing? Well, we call it that; we react with these words in particular situations. And we react *to* these words in turn by particular actions.

209. This shape that I see--I want to say--is not simply *a* shape; it is one of the shapes I know; it is a shape marked out in advance. It is one of those shapes of which I already had a pattern in me; and only because it corresponds to such a pattern is it this familiar shape. (I as it were carry a catalogue of such shapes around with me, and the objects portrayed in it *are* the familiar ones.)

Page 37

210. But my already carrying the pattern around with me would be only a causal explanation of the present impression. It is like saying: this movement is made as easily as if it had been practised.

Page 37

211. "When I am asked 'Do you see a ball over there' and another time 'Do you see half a ball over there?' what I see may be the same both times, and if I answer 'Yes', still I distinguish between the two hypotheses. As I distinguish between pawn and king in chess, even if the present move is one that either might make, and even if an actual king-piece were being

Page Break 38

used as a pawn."--In philosophy one is in constant danger of producing a myth of symbolism, or a myth of mental processes. Instead of simply saying what anyone knows and must admit.

Page 38

212. Does introspection tell me whether what I have here is a genuine case of seeing, or one of interpretation after all? First of all I must make dear to myself what I should call an interpretation; how to tell whether something is to be called a case of interpreting or of seeing. [*Marginal note*: Seeing according to an interpretation.]

Page 38

213. Don't I see the figure now like this, now another way, even when I do not react verbally or otherwise?

But "now like this" "now another way" are words, and what right have I to use them here? Can I shew my right to you or to myself? (Unless by a further reaction.)

But I surely know that they are two impressions, even if I don't say so. [*Marginal note*: But how do I know that what I say is what I knew? What consequences follow from my interpreting this as that, or from my seeing this as that?]

Page 38

214. Experience of the real size. We see a picture showing a chair-shape; we are told it represents a construction the size of a house. Now we see it differently.

Page 38

215. Imagine someone watching the sun and suddenly having the *feeling* that it is not the sun that moves--but we that move past it. Now he wants to say he has seen a new state of motion that we are in; imagine him showing by gestures which movement he means, and that it is not the sun's movement.--We should here be dealing with two different applications of the word "movement".

Page 38

216. We see, not change of aspect, but change of interpretation.

Page 38

217. You see it conformably, not to an interpretation, but to an act of interpreting.

Page 38

218. I interpret words; yes--but do I also interpret looks? Do I interpret a facial expression as threatening or kind?--That *may* happen.

Page Break 39

Page 39

Suppose I said: "It is not enough to perceive the threatening face, I have to interpret it."--Someone whips out a knife at me and I say "I conceive that as a threat."

Page 39

219. We don't understand Chinese gestures any more than Chinese sentences.

Page 39

220. Consciousness in another's face. Look into someone else's face, and see the consciousness in it, and a particular *shade* of consciousness. You see on it, in it, joy, indifference, interest, excitement, torpor and so on. The light in other people's faces.

Do you look into *yourself* in order to recognize the fury in *his* face? It is there as clearly as in your own breast.

(And what do we want to say now? That someone else's face stimulates me to imitate it, and that I therefore feel little movements and muscle-contractions in my own face and *mean* the sum of these? Nonsense. Nonsense,--because you are making assumptions instead of simply describing. If your head is haunted by explanations here, you are neglecting to remind yourself of the most important facts.)

Page 39

221. "Consciousness is as clear in his face and behaviour, as in myself."

Page 39

222. We do not see the human eye as a receiver, it appears not to let anything in, but to send something out. The ear receives; the eye looks. (It casts glances, it flashes, radiates, gleams.) One can terrify with one's eyes, not with one's ear or nose. When you see the eye you see something going out from it. You see the look in the eye.

Page 39

223. "If you only shake free from your physiological prejudices, you will find nothing queer about the fact that the glance of the eye can be seen too." For I also say that I see the look that you cast at someone else. And if someone wanted to correct me and say that I don't really *see* it, I should take that for pure stupidity.

On the other hand I have not *made any admissions* by using that manner of speaking, and I should contradict anyone who told me I saw the glance 'just the way' I see the shape and colour of the eye.

For 'naïve language', that is to say our naïve, normal way of expressing ourselves, does not contain any theory of seeing--does not show you a *theory* but only a *concept* of seeing.

Page Break 40

Page 40

224. Get a human being to give angry, proud, ironical looks; and now veil the face so that only the eyes remain uncovered--in which the whole expression seemed concentrated: their expression is now surprisingly *ambiguous*.

Page 40

225. "We *see* emotion."--As opposed to what?--We do not see facial contortions and make inferences from them (like a doctor framing a diagnosis) to joy, grief, boredom. We describe a face immediately as sad, radiant, bored, even when we are unable to give any other description of the features.--Grief, one would like to say, is personified in the face.

This belongs to the concept of emotion.

Page 40

226. (The ugliness of a human being can repel in a picture, in a painting, as in reality, but so it can too in a description, in words.)

Page 40

227. How curious: we should like to explain our understanding of a gesture by means of a translation into words, and the understanding of words by translating them into a gesture. (Thus we are tossed to and fro when we try to find out where understanding properly resides.)

And we really shall be explaining words by a gesture, and a gesture by words.

Page 40

228. Explain to someone that the position of the clock-hands that you have just noted down is supposed to mean: the hands of this clock are now in this position.--The awkwardness of the sign in getting its meaning across, like a dumb person who uses all sorts of suggestive gestures--this disappears when we know that it all depends on the *system* to which the sign belongs.

We wanted to say: only the *thought* can say it, not the sign.

Page 40

229. But an *interpretation* is something that is given in signs. It is this interpretation as opposed to a different one (running differently).--So when we wanted to say "Any sentence still stands in need of an interpretation", that meant: no sentence can be understood without a rider.

Page 40

230. It would almost be like settling how much a toss is to be worth by another toss.

Page Break 41

Page 41

231. By "intention" I mean here what uses a sign in a thought. The intention seems to interpret, to give the final interpretation; which is not a further sign or picture, but something else--the thing that cannot be further interpreted. But what we have reached is a psychological, not a logical terminus.

Think of a sign language, an 'abstract' one, I mean one that is strange to us, in which we do not feel at home, in which, as we should say, we do not *think*; and let us imagine this language interpreted by a translation into--as we should like to say--an unambiguous picture-language, a language consisting of pictures painted in perspective. It is quite clear that it is much easier to imagine different *interpretations* of the written language than of a picture painted in the usual way. Here we shall also be inclined to think that there is no further possibility of interpretation.

Page 41

232. Here we might also say we didn't enter into the sign-language, but did enter into the painted picture.

Page 41

233. "Only the intended picture reaches up to reality like a yardstick. Looked at from outside, there it is, lifeless and isolated."--It is as if at first we looked at a picture so as to enter into it and the objects in it surrounded us like real ones; and then we stepped back, and were now outside it; we saw the frame, and the picture was a painted surface. In this way, when we intend, we are surrounded by our intention's pictures, and we are inside them. But when we step outside intention, they are mere patches on a canvas, without life and of no interest to us. When we intend, we exist in the space of intention, among the pictures (shadows) of intention, as well as with real things. Let us imagine we are sitting in a darkened cinema and entering into the film. Now the lights are turned on, though the film continues on the screen. But suddenly we are outside it and see it as movements of light and dark patches on a screen.

(In dreams it sometimes happens that we first read a story and then are ourselves participants in it. And after waking up after a dream it is sometimes as if we had stepped back out of the dream and now see it before us as an alien picture.) And it also means something to speak of "living in the pages of a book."

Page Break 42

Page 42

234. What happens is not that this symbol cannot be further interpreted, but: I do not interpret. I do not interpret, because I feel at home in the present picture. When I interpret, I step from one level of thought to another.

Page 42

235. If I see the thought symbol 'from outside', I become conscious that it *could* be interpreted thus or thus; if it is a step in the course of my thoughts, then it is a stopping-place that is natural to me, and its further interpretability does not occupy (or trouble) me. As I have a time-table and use it without being concerned with the fact that a table is susceptible of various interpretations.

Page 42

236. If I try to describe the process of intention, I feel first and foremost that it can do what it is supposed to only by containing an extremely faithful picture of what it intends. But further, that that too does not go far enough, because a picture, whatever it may be, can be variously interpreted; hence this picture too in its turn stands isolated. When one has the picture in view by itself it is suddenly dead, and it is as if something had been taken away from it, which

had given it life before. It is not a thought, not an intention; whatever accompaniments we imagine for it, articulate or inarticulate processes, or any feeling whatsoever, it remains isolated, it does not point outside itself to a reality beyond.

Now one says: "Of course it is not the picture that intends, but we who use it to intend something." But if this intending, this meaning, is in turn something that is done with the picture, then I cannot see why that has to involve a human being. The process of digestion can also be studied as a chemical process, independently of whether it takes place in a living being. We want to say "Meaning is surely essentially a mental process, a process of conscious life, not of dead matter." But what will give such a thing the specific character of what goes on?--so long as we think of it as a process. And now it seems to us as if intending could not be any process at all, of any kind whatever.--For what we are dissatisfied with here is the grammar of *process*, not the specific kind of process.--It could be said: we should call any process "dead" in this sense.

Page Break 43

Page 43

237. It might almost be said: "Meaning *moves*, whereas a process stands still."

Page 43

238. One says: How can these gestures, this way of holding the hand, this picture, be the wish that such and such were the case? It is nothing more than a hand over a table and there it is, alone and without a *sense*. Like a single bit of scenery from the production of a play, which has been left by itself in a room. It had life only in the play.

Page 43

239. "At that moment the thought was before my mind."--And how?--"I had this picture."--So was the picture the thought? No; for if I had just told someone the picture, he would not have got the thought.

Page 43

240. The picture was the key. Or it *seemed* like a key.

Page 43

241. Let us imagine a picture story in schematic pictures, and thus more like the narrative in a language than a series of realistic pictures. Using such a picture-language we might in particular e.g. keep our hold on the course of battles. (Language-game.) And a sentence of our word-language approximates to a picture in this picture language much more closely than we think.

Page 43

242. Let us remember too that we don't have to translate such pictures into realistic ones in order to 'understand' them, any more than we ever translate photographs or film pictures into coloured pictures, although black-and-white men or plants in reality would strike us as unspeakably strange and frightful.

Suppose we were to say at this point: "Something is a picture only in a picture-language"?

Page 43

243. Certainly I read a story and don't give a hang about any system of language. I simply read, have impressions, see pictures in my mind's eye, etc.. I make the story pass before me like pictures, like a cartoon story. (Of course I do not mean by this that every sentence summons up one or more visual images, and that that is, say, the purpose of a sentence.)

Page 43

244. "Sentences serve to describe how things are", we think. The sentence as a *picture*.

Page Break 44

Page 44

245. I understand the picture exactly, I could model it in clay.--I understand this description exactly, I could make a drawing from it.

In many cases we might set it up as a criterion of understanding, that one had to be able to represent the sense of a sentence in a drawing (I am thinking of an officially instituted test of understanding). How is one examined in map-reading, for example?

Page 44

246. And the significant picture is what can not merely be drawn, but also represented plastically. And saying this would make sense. But the thinking of a sentence is not an activity which one does from the words (like, say, singing from the notes). The following example shews this. Does it make sense to say "I have as many friends as the number yielded by a solution of the equation... "? One can't immediately see whether this makes sense, from the equation. And so while one is reading the sentence one doesn't know whether or not it can be thought. Whether or not it can be understood.

Page 44

247. For what does it mean "to discover that a sentence does not make sense"?

And what does this mean: "if I mean something by it, surely it must make sense"?

The first presumably means: not to be misled by the appearance of a sentence and to investigate its application in the language-game.

And "if I mean something by it"--does that mean something *like*: "if I can imagine something in connexion with it"?--An image often leads on to a further application.

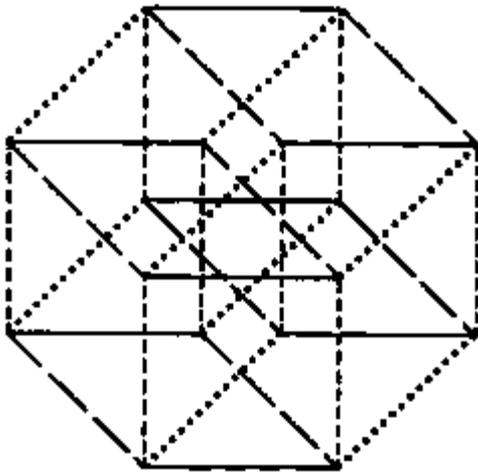

Page 44

248. (Something that at first sight looks like a sentence and is not one.) The following design for the construction of a steamroller. The motor is in the inside of the hollow roller. The crank-shaft runs through the middle of the roller and is connected at both ends by spokes with the wall of the roller. The cylinder of the motor is fixed onto the inside of the roller. At first glance this construction looks like a machine. But it is a rigid system and the piston cannot move to and fro in the cylinder. Unwittingly we have deprived it of all possibility [[sic]] of movement.

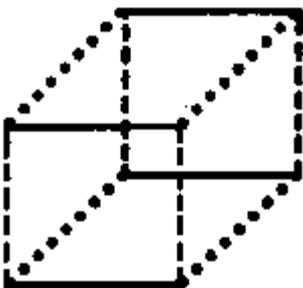

Page Break 45

Page 45

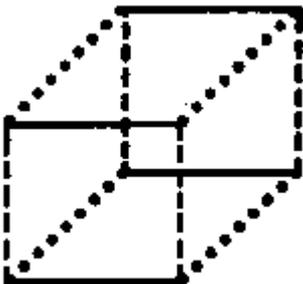

249. "Nothing easier than to imagine a four-dimensional cube! It looks like this:†1

--But I don't mean that, I mean something like

but with four dimensions!--"But isn't what I showed you like

Page Break 46

only with four dimensions?"--No; I don't *mean* that!--But what do I mean? What is my picture? Well, it is *not* the four-dimensional cube as you drew it. I have now for a picture only the *words* and my rejection of anything you can show me.

Page 46

250. Are roses red in the dark?--One can think of the rose in the dark as red.--

(That one can 'imagine' something does not mean that it makes sense to say it.)

251. "The supposition that this person--who behaves quite normally--is nevertheless blind, surely makes sense!"--That means: 'after all it is a supposition.' 'I surely can actually suppose something like that.' And that means: I picture the thing I am supposing. Very well: but does it go any further than that? If in other circumstances, I suppose that someone is blind, I never assure myself that this assumption really makes sense. And my actually imagining something, picturing something, as I make the assumption, plays no part at all in that case. This picture only becomes important here, where it is so to speak the only thing that gives a handle for thinking that I really have supposed something. That is all that is left of there being an assumption here.

252. "I can quite well imagine someone acting like that and nevertheless seeing nothing shameful in the action." There follows a description shewing how this is to be imagined.

"I can imagine a human society in which it counts as dishonest to calculate, except as a pastime." That means roughly the same as: I could easily fill this picture out with more detail.

253. "I haven't ever in fact seen a black patch gradually getting lighter until it was white and then the white turning more and more reddish, until it was red. But I know that it is possible, because I can imagine it."

254. (When you are talking with someone about some division of time, you often take out your watch, not to see what time it is, but to help form a picture of the division being considered.)

255. How can one learn the truth by thinking? As one learns to see a face better if one draws it.

256. Philosophers who think that one can as it were use thought to make an extension of experience, should think about the fact that one can transmit talk, but not measles, by telephone.

Nor can I experience time as limited, when I want to, or my visual field as homogeneous etc.†1

257. Would it be possible to discover a new colour? For a colour-blind man is in the same situation as we are, his colours form just as complete a system as ours do; he doesn't see any gaps where the remaining colours belong.

(Comparison with mathematics.)†2

258. Generality in logic cannot be extended any further than our logical foresight reaches. Or better: than our logical vision reaches.

259. "But how can human understanding outstrip reality and itself *think* the unverifiable?"--Why should we not *say* the unverifiable? For we ourselves made it unverifiable.

A false *appearance* is produced? And how can it so much as *look* like that? For don't you want to say that this *like that* is not a description at all? Well, then it isn't a *false* appearance either, but rather one that robs us of our orientation. So that we clutch our brows and ask: How can that be?

260. It is only apparently possible "to transcend any possible experience", even these words only seem to make sense, because they are arranged on the analogy of significant expressions.

261. The "philosophy of as if" itself rests wholly on this shifting between simile and reality.

262. "But I can't anticipate reality in my thoughts, using words to sneak in something I am *not acquainted* with."
(Nihil est in intellectu....)

As if I could as it were get round and approach from behind in thought, and so snatch a glimpse of what it is impossible to see from the front."

263. Hence there is something right about saying that unimaginability is a criterion for nonsensicality.

264. Suppose someone were to say "I can't imagine what it is like for someone to see a chair, except precisely when I

see it"? Would he be justified in saying this?

Page 48

265. *Am I justified* in saying: "I cannot see ||||| as a shape"?

Page 48

What justifies me? (What justifies the blind man in saying he cannot see?)

Page 48

266. Can you imagine absolute pitch, if you have not got it?--Can you imagine it *if* you have it?--Can a blind man imagine seeing? Can *I* imagine it?--Can I imagine spontaneously reacting thus and so, if I don't do it? Can I imagine it any better, if I do do it? ((Belongs to the question: can I imagine someone seeing ||||| as an articulated shape.))

Page 48

267. Is it supposed to be an empirical fact that someone who has had an experience can imagine it, and that someone else can *not*? (How do I know that a blind man can imagine colours?) But: he cannot play a certain language game (cannot learn it). But is this empirical, or is it the case *eo ipso*? The latter.

Page 48

268. What should we say to someone who asserted that he could imagine exactly what it is like to have absolute pitch without having it?

Page 48

269. If we think we can imagine four-dimensional space, why not also four-dimensional colours, that is colours which, besides degree of saturation, hue, and brightness, allowed of a fourth determination?†1

Page 48

270. "How can it make sense to speak of a kind of sense-perception which is quite new to me, which I shall perhaps have some time? If that is, you do not want to speak of a sense *organ*."

Page 48

271. What purpose is served by a sentence like: "We can't in the least imagine the sensations of a conjurer like Rastelli"?

Page Break 49

Page 49

272. "It makes sense to speak of an endless row of trees; I can surely imagine a row of trees going on without end." That means something like: If it makes sense to say the row of trees comes to an end here, then it makes sense to say [it doesn't come to an end here, and so also that it never comes to an end.]†1 Ramsey used to reply to such questions: "But it *just is* possible to think of such a thing." As, perhaps, one says: "Technology achieves things nowadays which you can't imagine at all."--Well here one has to find out *what* you are thinking. (Your asseveration that this phrase can be *thought*--what can I do with that? For that's not the point. Its purpose is not that of causing a fog to rise in your mind.) *What* you mean--how is that to be discovered? We must patiently examine how this sentence is supposed to be applied. What things look like *round about it*. Then its tense will come to light.

Page 49

273. Hardy: "That 'the finite cannot understand the infinite' should surely be a theological and not a mathematical war-cry." True, the expression is inept. But what people are using it to try and say is: "We mustn't have any juggling! How comes this leap from the finite to the infinite?" Nor is the expression all that nonsensical--only the 'finite' that can't conceive the infinite is not 'man' or 'our understanding', but the calculus. And HOW this conceives the infinite is well worth an investigation. This may be compared to the way a chartered accountant precisely investigates and clarifies the conduct of a business undertaking. The aim is a synoptic comparative account of all the applications, illustrations, conceptions of the calculus. The complete survey of everything that may produce unclarity. And this survey must extend over a wide domain, for the roots of our ideas reach a long way.--"The finite cannot understand the infinite" means here: It cannot work *in the way* you, with characteristic superficiality, are presenting it.

Thought can as it were *fly*, it doesn't have to walk. You do not understand your own transactions, that is to say you do not have a synoptic view of them, and you as it were project your lack of understanding into the idea of a medium in which the most astounding things are possible.

Page Break 50

Page 50

274. The 'actual infinite' is a 'mere word'. It would be better to say: for the moment this expression merely produces a picture -which still hangs in the air: you owe us an account of its application.

Page 50

275. An infinitely long row of marbles, an infinitely long rod. Imagine these coming in in some kind of fairy tale. What application--even though a fictitious one---might be made of this concept? Let us ask now, not "Can there be such a thing?" but "What do we imagine?" So give free rein to your imagination. You can have things now just as you choose. You only need to *say* how you want them. So (just) make a verbal picture, illustrate it as you choose--by drawing, comparisons, etc.! Thus you can--as it were--prepare a blueprint.--And now there remains the question how to work from it. [*Marginal note*: Belongs with 'It depends on the *service*'.]

Page 50

276. I believe I see a design drawn very fine in a bit of a series; which only stands in need of "and so on" to reach to infinity.

"I see a distinctive character in it."--Well, presumably something that corresponds to the algebraic expression.--"Yes, only nothing written, but positively something ethereal."--What a queer picture.--"Something that is not the algebraic expression, something for which this is only the *expression*!"†1

Page 50

277. I see something in it--like a shape in a puzzle picture. And if I see that, I say "That is all I need."--If you find the signpost, you don't now look for further instruction--you *walk*. (And if instead of "you walk" I were to say "you go by it" the difference between the two expressions might be only that the second one alludes to certain psychological accompaniments.)

Page 50

278. What does it mean to say: a straight line can be arbitrarily produced? Is there not an "and so on ad inf." here which is quite different from that of mathematical induction? According to the foregoing there would exist the expression for the possibility of producing the line, in the sense of the description of the produced part, or of its production. Here at first sight there does not seem to be any question of numbers. I can imagine the pencil that draws the line continuing its movement and keeping

Page Break 51

on going the same way. But is it also conceivable that there should be no possibility of accompanying this process with some countable process? I believe not.†1

Page 51

279. When do we say: "The line intimates this to me *like a rule*--always the same"? And on the other hand: "It keeps on intimating to me what I have to do--it is not a rule"?

In the first case the thought is: I have no further court of appeal for what I have to do. The rule does it all by itself: I only have to obey it--(and obeying is *one* thing!). I do not feel, for example: it is queer that the line always tells me something.--The other proposition says: I do not know what I am going to do: the line will tell me.

Page 51

280. One might imagine someone multiplying, correctly multiplying, with such feelings as these; he keeps on saying "I don't know--now the rule suddenly intimates *this* to me!"--and we answer "Of course; you are going on quite in accord with the rule."

Page 51

281. To say that the points yielded in this experiment lie roughly on this line, e.g. on a straight line, means something like: "Seen from this distance they seem to lie on a straight line."

I may say that a stretch gives the general impression of a straight line; but I cannot say this of the line ; although it would be possible to see it as a bit of a longer line in which the deviations from the straight were lost. I cannot say: "This bit of line looks straight, for it may be a bit of a line that as a whole gives me the impression of being straight." (Mountains on the earth and the moon. The earth a ball.)†2

Page 51

282. "It intimates this or that to me, irresponsibly" means: I cannot teach you *how* I follow the line. I do not presuppose that you will follow it as I do, even when you do follow it.

Page 51

283. What does it mean to understand that something is an order, although one does not yet understand the order itself? ("He means I am to do something--but I don't know *what* he wants.")

Page Break 52

Page 52

284. Of course the proposition "I must understand the order before I can act on it" makes good sense: but not a metalogical sense.

285. The idea that one has of understanding in this connexion is roughly that through it one gets a stage nearer from the words to the execution.--In what sense is this right?

286. "But I must understand an order to be able to act according to it." Here the "must" is fishy.
Think too of the question "How long before obeying it must you understand the order?"

287. "I cannot carry out the order because I don't understand what you mean.--Yes, I understand you now."--What went on when I suddenly understood him? Here there were various possibilities. The order may for example have been given with a wrong emphasis; and the right emphasis suddenly occurred to me. In that case I should say to a third party "Now I understand him, he means..." and should repeat the order with the right emphasis. And now, with the right emphasis, I should understand him; that is, I did not now have further to grasp a *sense* (something *outside* the sentence, hence something ethereal) but the familiar sound of English words perfectly suffices me.--Or the order was given me in comprehensible English, but seemed preposterous. Then an explanation occurs to me; and now I can carry it out.--Or several interpretations may have passed through my mind, and I eventually decide on one of them.

288. If the order is *not* executed--where in that case is that shadow of its execution which you think you see; because the form: "He ordered *such-and-such*" swam before your mind.

289. If the meaning-connexion can be set up *before* the order, then it can also be set up afterwards.

290. "He did *what* I told him."--Why should one not say here: There is an identity between action and WORD?! Why should I interpose a shadow between the two? Indeed we have a method of projection.--Only there is a different identity in: "I did what he did" and in: "I did what he ordered."

291. The lines of projection might be called the "connexion between the picture and what it depicts"; but so too might the technique of projection.

292. The ambiguity of our ways of expressing ourselves: If an order were given us in code with the key for translating it into English, we might call the procedure of constructing the English form of the order "derivation of what we have to do from the code" or "derivation of what executing the order is". If on the other hand we act according to the order, obey it, here too in certain cases one may speak of a derivation of the execution.

293. I give the rules of a game. The other party makes a move, perfectly in accord with the rules, whose possibility I had not foreseen, and which spoils the game, that is, as I had wanted it to be. I now have to say: "I gave bad rules; I must change or perhaps add to my rules."

So in this way have I a picture of the game in advance? In a sense: Yes.

It was surely possible, for example, for me not to have foreseen that a quadratic equation need have no real root.

Thus the rule leads me to something of which I say: "I did not expect this pattern: I imagined a solution always like *this*...."

294. In one case we make a move in an existent game, in the other we establish a rule of the game. Moving a piece could be conceived in these two ways: as a paradigm for future moves, or as a move in an actual game.

295. You must remember that there may be such a language-game as 'continuing a series of digits' in which no rule, no expression of a rule is ever given, but learning happens *only* through examples. So that the idea that every step should be justified by a something--a sort of pattern--in our mind, would be alien to these people.

296. How queer: It looks as if a physical (mechanical) form of guidance could misfire and let in something unforeseen, but not a rule! As if a rule were, so to speak, the only reliable form of

guidance. But what does guidance not allowing a movement, and a rule's not allowing it, consist in?--How does one

know the one and how the other?

Page 54

297. "How do I manage always to use a word correctly--i.e. significantly; do I keep on consulting a grammar? No; the fact that I mean something--the thing I mean, prevents me from talking nonsense."--"I mean something by the words" here means: I *know* that I can apply them.

I may however believe I can apply them, when it turns out that I was wrong.

Page 54

298. From this it does not follow that understanding is the activity by which we shew that we understand. It is misleading to ask whether it is this activity. The question ought not to be conceived as: "Is understanding *this* activity then, isn't it a different one instead?"--But rather as: "Is 'understanding' used to designate this activity--isn't its use *different*?"

Page 54

299. We say: "If you really follow the rule in multiplying, it **MUST** come out the same." Now, when this is merely the slightly hysterical style of university talk, we have no need to be particularly interested. It is however the expression of an attitude towards the technique of multiplying, which comes out everywhere in our lives. The emphasis of the 'must' corresponds only to the inexorability of this attitude, not merely towards the technique of calculating, but also towards innumerable related practices.†1

Page 54

300. With the words "*This* number is the right continuation of this series" I may bring it about that for the future someone calls such-and-such the "right continuation". What 'such-and-such' is I can only show in examples. That is, I teach him to continue a series (basic series), without using any expression of the 'law of the series'; rather, I am forming a substratum for the meaning of algebraic rules or what is like them.

Page 54

301. He must go on like this *without a reason*. Not, however, because he cannot yet grasp the reason but because--in *this* system--there is no reason. ("The chain of reasons comes to an end.")

Page Break 55

Page 55

And the *like this* (in "go on like this") is signified by a number, a value. For at *this* level the expression of the rule is explained by the value, not the value by the rule.

Page 55

302. For just where one says "But don't you *see*...?" the rule is no use, it is what is explained, not what does the explaining.

Page 55

303. "He grasps the rule intuitively."--But why the rule? Why not how he is to continue?

Page 55

304. "Once he has seen the right thing, seen the one of infinitely many references which I am trying to push him towards--once he has got hold of it, he will continue the series right without further ado. I grant that he can only guess (intuitively guess) the reference that I mean--but once he has managed that the game is won." But this 'right thing' that I mean does not exist. The comparison is wrong. There is no such thing here as, so to say, a wheel that he is to catch hold of, the right machine which, once chosen, will carry him on automatically. It could be that something of the sort happens in our brain but that is not our concern.

Page 55

305. "Do the same." But in saying this I must point to the rule. So its *application* must already have been learnt. For otherwise what meaning will its expression have for him?

Page 55

306. To guess the meaning of a rule, to grasp it intuitively, could surely mean nothing but: to guess its *application*. And that can't now mean: to guess the kind of application; the rule for it. Nor does guessing come in here.

Page 55

307. I might e.g. guess what continuation will give the other pleasure (by his expression, perhaps). The application of a rule can be guessed only when there is already a choice between different applications.

Page 55

308. We might in that case also imagine that, instead of 'guessing the application of the rule,' he *invents* it. Well, what would that look like? Ought he perhaps to say "Following the rule + 1 may mean writing 1, 1 + 1, 1 + 1 + 1, and so on"? But what does he mean by that? For the "and so on" presupposes that one has already mastered a technique.

Instead of "and so on" he might also have said: "Now you know what I mean." And his explanation would simply be a *definition* of the expression "following the rule + 1". *This* would have been his discovery.

309. We copy the numerals from 1 to 100, say, and this is the way we *infer, think*.

I might put it this way: If I copy the numerals from 1 to 100--how do I know that I shall get a series of numerals that is right when I count them? And here *what* is a check on *what*? Or how am I to describe the important empirical fact here? Am I to say experience teaches that I always count the same way? Or that none of the numerals gets lost in copying? Or that the numerals remain on the paper as they are, even when I don't watch them? Or *all* these facts? Or am I to say that we simply don't get into difficulties? Or that almost always everything seems all right to us?

This is how we think. *This* is how we act. *This* is how we talk about it.

310. Imagine you had to describe how humans learn to count (in the decimal system, for example). You describe what the teacher says and does and how the pupil reacts to it. What the teacher says and does will include e.g. words and gestures which are supposed to encourage the pupil to continue a sequence; and also expressions such as "Now he can count". Now should the description which I give of the process of teaching and learning include, in addition to the teacher's words, my own judgment: the pupil can count now, or: now the pupil has understood the numeral system? If I do not include such a judgment in the description--is it incomplete? And if I do include it, am I going beyond pure description?--Can I refrain from that judgment, giving as my ground: "*That is all that happens*"?

311. Must I not rather ask: "What does the description do anyway? What purpose does it serve?"--In another context, indeed, we know what is a complete and what an incomplete description. Ask yourself: How do we use the expressions "complete" and "incomplete description"?

Giving a complete (or incomplete) report of a speech. Is it part of this to report the tone of voice, the play of expression, the genuineness or falsity of feeling, the intentions of the speaker, the strain of speaking? Whether this or that belongs to a complete description will depend on the purpose of the description, on what the recipient does with the description.

312. The expression "that is all that *happens*" sets limits to what we call "happening".

313. Here the temptation is overwhelming to say something further, when everything has already been described.--Whence this pressure? What analogy, what wrong interpretation produces it?

314. Here we come up against a remarkable and characteristic phenomenon in philosophical investigation: the difficulty--I might say--is not that of finding the solution but rather that of recognizing as the solution something that looks as if it were only a preliminary to it. "We have already said everything.--Not anything that follows from this, no, *this* itself is the solution!"

This is connected, I believe, with our wrongly expecting an explanation, whereas the solution of the difficulty is a description, if we give it the right place in our considerations. If we dwell upon it, and do not try to get beyond it.

The difficulty here is: to stop.

315. "Why do you demand explanations? If they are given you, you will once more be facing a terminus. They cannot get you any further than you are at present."

316. A red object can be used as a sample for painting a *reddish* white or a reddish yellow (etc.)--but can it also be used as a sample for painting a shade of bluish green?--Suppose I saw someone, with all the outward signs of making an exact copy, 'reproducing' a red patch bluish green?--I should say: "I don't know how he's doing it" or even "I don't know *what* he's doing."--But supposing that he now 'copied' this shade of red bluish green on various occasions, and perhaps other shades of red systematically other shades of bluish green--ought I now to say he's copying, or he isn't copying?

But what does it mean to say that I don't know 'what he's doing'? For can't I see what he's doing?--But I can't see *into him*.--Avoid that comparison! Suppose I see him copying red as red--what do I know here? Do I know *how* I do it? Of course one says: "I'm just painting the *same* colour."--But suppose *he* says: "And I'm painting the *fifth* of this colour"? Can I see a special mediating process when *I* paint the 'same' colour?

Assume I know him for an honest man; he reproduces a red, as I described, by a bluish green--but now *not* the same shade by always the same shade, but sometimes one, sometimes another. Am I to say "I don't know what he's doing?"--He does what I can see--but *I* should never do it; I don't know, why he does it; his proceeding 'is unintelligible to me'.

317. We might imagine a negative portrait, that is one that is *supposed* to represent how Herr N does *not* look (and so is a bad portrait if it looks like N).

318. I cannot describe how (in general) to employ rules, except by *teaching* you, *training* you to employ rules.

319. I may now e.g. make a talkie of such instruction. The teacher will sometimes say "That's right." If the pupil should ask him "Why?"--he will answer nothing, or at any rate nothing relevant, not even: "Well, because we all do it like that"; that will not be the reason.

320. Why don't I call cookery rules arbitrary, and why am I tempted to call the rules of grammar arbitrary? Because 'cookery' is defined by its end, whereas 'speaking' is not. That is why the use of language is in a certain sense autonomous, as cooking and washing are not. You cook badly if you are guided in your cooking by rules other than the right ones; but if you follow other rules than those of chess you are *playing another game*; and if you follow grammatical rules other than such-and-such ones, that does not mean you say something wrong, no, you are speaking of something else.

321. When a rule concerning a word in it is appended to a sentence, the sense does not change.

322. Language is not defined for us as an arrangement fulfilling a definite purpose. Rather "language" is for us a name for a collection, and I understand it as including German, English and so on, and further various systems of signs which have more or less affinity with these languages.

323. Being acquainted with many languages prevents us from taking quite seriously a philosophy which is laid down in the forms of any one. But here we are blind to the fact that we ourselves have strong prejudices for, and against, certain forms of expression; that this very piling up of a lot of languages results in our having a particular picture.

324. Does a child learn only to talk, or also to think? Does it learn the sense of multiplication *before*--or *after* it learns multiplication?

325. How did I arrive at the concept 'sentence' or 'language'? Surely only through the languages that I have learnt.--But they seem to me in a certain sense to have led beyond themselves, for I am now able to construct new language, e.g. to invent words.--So such construction also belongs to the concept of language. But only because that is how I want to fix the concept.

326. The concept of a living being has the same indeterminacy as that of a language.

327. Compare: inventing a game--inventing language--inventing a machine.

328. In philosophy it is significant that such-and-such a sentence makes no sense; but also that it sounds funny.

329. I make a plan not merely so as to make myself understood but also in order to get clear about the matter myself. (I.e. language is not merely a means of communication.)

330. What does it mean to say: "But that's no longer the same game!" How do I use this sentence? As information?

Well, perhaps to introduce some information in which differences are enumerated and their consequences explained. But also to express that just for that reason I don't join in here, or at any rate take up a different attitude to the game.

Page Break 60

Page 60

331. One is tempted to justify rules of grammar by sentences like "But there really are four primary colours". And the saying that the rules of grammar are arbitrary is directed against the possibility of this justification, which is constructed on the model of justifying a sentence by pointing to what verifies it.

Yet can't it after all be said that in some sense or other the grammar of colour-words characterizes the world as it actually is? One would like to say: May I not really look in vain for a fifth primary colour? Doesn't one put the primary colours together because there is a similarity among them, or at least put *colours* together, contrasting them with e.g. shapes or notes, because there is a similarity among them? Or, when I set this up as the right way of dividing up the world, have I a preconceived idea in my head as a paradigm? Of which in that case I can only say: "Yes, that is the kind of way we look at things" or "We just do want to form this sort of picture." For if I say "there is a particular similarity among the primary colours"--whence do I derive the idea of this similarity? Just as the idea 'primary colour' is nothing else but 'blue or red or green or yellow'--is not the idea of that similarity too given simply by the four colours? Indeed, aren't they the same?--"Then might one also take red, green and circular together?"--Why not?!

Page 60

332. Do not believe that you have the concept of colour within you because you look at a coloured object--however you look.

(Any more than you possess the concept of a negative number by having debts.)

Page 60

333. "Red is something specific"--that would have to mean the same as: "*That* is something specific"--said while pointing to something red. But for that to be intelligible, one would have already to mean our *concept* 'red', to mean the use of that sample.

Page 60

334. I can indeed obviously express an expectation at one time by the words "I'm expecting a red circle," and at another by putting a coloured picture of a red circle in the place of the last few words. But in this expression there are not two things corresponding to the two separate words "red" and "circle". So the expression in the second language is of a *completely different kind*.

Page Break 61

Page 61

335. There might be another language, besides this last one, in which 'red circle' was expressed by the juxtaposition of a circle and a red patch.

Page 61

336. Now if I have two signs at hand, the expression "red circle" and the coloured picture, or image, of the red circle, then surely the question would be: How is the one word correlated with the shape, the other with the colour?

For it seems possible to say: one word turns the attention to the colour, the other to the shape. But what does that mean? How can these separate words be translated into this pattern?

Or again: If the word "red" summons up a colour in my memory, it must surely be in connexion with a shape; in that case how can I abstract from the shape?

The important question here is never: how does he know what to abstract from? but: how is this possible at all? or: what does it mean?

Page 61

337. Perhaps it becomes clearer if we compare *these* two languages: in one the phrase "red circle" is replaced by a red slip and a slip with a circle on it (say black on a white ground); and in the other by a red circle.

For how does translating proceed here? Say one looks at the red slip and chooses a red pencil, then at the circle, and now one makes a circle with this pencil.

It would first of all have been learnt that the first slip always determines the choice of the pencil, and the second what we should draw with it. Thus the two slips belong to two different parts of speech (say noun and activity-word). But in the other language there would be nothing that could be called two different words.

Page 61

338. If someone were to say: "Red is complex"--we could not guess what he was alluding to, what he was trying to do with this sentence. But if he says "This chair is complex," we may indeed not know straight off which kind of complexity he is talking about, but we can straight away think of more than one sense for his assertion.

Now what kind of fact am I drawing attention to here?

At any rate it is an *important* fact.--We are not familiar with any technique, to which that sentence might be alluding.

Page Break 62

Page 62

339. We are here describing a language-game that *we cannot learn*.

Page 62

340. "In that case something quite different must be going on in him, something that we are not acquainted with."--*This shews us* what we go by in determining whether something that takes place 'in another' is different from, or the same as in ourselves. This shews us *what we go by* in judging inner processes.

Page 62

341. Can you imagine what a red-green colour blind man sees? Can you paint a picture of the room as he sees it? Can *he* paint it as he sees it? Then can I paint it as I see it? In what sense can I?

Page 62

342. "If someone saw only grey, black and white, he would have to be *given* something if he were to know what red, green etc. are." And what would he have to be given? Well, the colours. And so, for example, *this* and *this* and *this*. (Imagine, e.g. that coloured patterns had to be introduced into his brain in addition to the merely grey and black ones.) But would this have to happen for the purpose of future action? Or does this action itself involve these patterns? Am I trying to say: "Something would have to be given him, for it is clear that otherwise he could not..."--or: His seeing behaviour *contains* new constituents?

Page 62

343. Again: what should we *call* an "explanation of seeing"? Is one to say: Well, you surely know what "explanation" means elsewhere; so employ this concept here too.

Page 62

344. Can I say: "Look at it! Then you'll see that it can't be explained!"--Or: "Drink in the colour red, then you'll see that it can never be presented by anything else."--And if the other man now agrees with me, does that shew that he has drunk in the same as I?--And what is the significance of our inclination to say this? Red seems to stand there, isolated. Why? What is the *value* of this appearance, this inclination of ours?
But one might ask: What peculiarity of the concept does this inclination point to?

Page 62

345. Think of the sentence: "Red is not a mixed colour" and of its function.

For the language-game with colours is characterized by what we can do and what we cannot do.

Page Break 63

Page 63

346. "There is no such thing as a reddish green" is akin to the sentences that we use as axioms in mathematics.

Page 63

347. The fact that we *calculate* with certain concepts and not with others only shews how various in kind conceptual tools are (how little reason we have here ever to assume uniformity). [*Marginal Note*: On propositions about colours that are like mathematical ones e.g. Blue is darker than white. On this Goethe's Theory of Colour.]

Page 63

348. "The possibility of agreement involves *some* sort of agreement already."--Suppose someone were to say: "Being able to play chess is a sort of playing chess"!

Page 63

349. It is very difficult to describe paths of thought where there are already many lines of thought laid down,--your own or other people's--and not to get into one of the grooves. It is difficult to deviate from an old line of thought *just a little*.

Page 63

350. "It is as if our concepts involved a scaffolding of facts."

That would presumably mean: If you imagine certain facts otherwise, describe them otherwise, than the way they are, then you can no longer imagine the application of certain concepts, because the rules for their application have no analogue in the new circumstances.--So what I am saying comes to *this*: A law is given for human beings, and a jurispudent may well be capable of drawing consequences for any case that ordinarily comes his way; thus the law evidently has its use, makes sense. Nevertheless its validity presupposes all sorts of things, and if the being that he is to judge is quite deviant from ordinary human beings, then e.g. the decision whether he has done a deed with evil intent will become not difficult but (simply) impossible.

Page 63

351. "If humans were not in general agreed about the colours of things, if undetermined cases were not exceptional, then our concept of colour could not exist." No:--our concept *would* not exist.

Page 63

352. Do I want to say, then, that certain facts are favourable to the formation of certain concepts; or again unfavourable? And does experience teach us this? It is a fact of experience that human beings alter their concepts, exchange them for others

Page Break 64

when they learn new facts; when in this way what was formerly important to them becomes unimportant, and *vice versa*. (It is discovered e.g. that what formerly counted as a difference in kind, is really *only* a difference in degree.)

Page 64

353. But may it not be said: "If there were only *one* substance, there would be no use for the word 'substance'"? That however presumably means: The concept 'substance' presupposes the concept 'difference of substance'. (As that of the king in chess presupposes that of a move in chess, or that of *colour* that of *colours*.)

Page 64

354. I want to say that there is a geometrical gap, not a physical one, between green and red.†1

Page 64

355. But doesn't anything physical correspond to it? I do not deny that. (And suppose it were merely our habituation to *these* concepts, to these language-games? But I am not saying that it is so.) If we teach a human being such-and-such a technique by means of examples,--that he then proceeds like *this* and not like *that* in a particular new case, or that in this case he gets stuck, and thus that this and not that is the 'natural' continuation for him: this of itself is an extremely important fact of nature.

Page 64

356. "But if by 'bluish yellow' I mean green, I am taking this expression in a different way from the original one. The original conception signifies a different road, a *no thoroughfare*."

But what is the right simile here? That of a road that is physically impassable, or of the non-existence of a road? i.e. is it one of physical or of mathematical impossibility?

Page 64

357. We have a colour system as we have a number system.

Do the systems reside in *our* nature or in the nature of things? How are we to put it?--*Not* in the nature of numbers or colours.

Page Break 65

Page 65

358. Then is there something arbitrary about this system? Yes and no. It is akin both to what is arbitrary and to what is non-arbitrary.

Page 65

359. It is obvious at a glance that we aren't willing to acknowledge anything as a colour intermediate between red and green. (Nor does it matter whether this is always obvious, or whether it takes experience and education to make it so.)

Page 65

360. 'a is between b and c, and nearer to b than to c': this is a characteristic relation between sensations of the same kind. That is, there is e.g. a language-game with the order "Produce a sensation between *this* and *this*, and nearer the first than the second." And also "Name two sensations which *this* is between."

Page 65

361. And here it is important that e.g. with *grey* one will get "black and white" for answer, with *purple* "blue and red", with *pink* "red and white", but with *olive green* one will *not* get "red and green."

Page 65

362. These people are acquainted with reddish green--"But there *is* no such thing!"--What an extraordinary sentence.--(How do you know?)

Page 65

363. Let's just put it like this: Must these people notice the discrepancy? Perhaps they are too stupid. And again: perhaps not that either.--

Page 65

364. Yes, but has nature nothing to say here? Indeed she has--but she makes herself audible in another way.

"You'll surely run up against existence and non-existence somewhere!" But that means against *facts*, not concepts.

Page 65

365. It is an extremely important fact that a colour which we are inclined to call (e.g.) "reddish yellow" can really be produced (in various ways) by a mixture of red and yellow. And that we are not able to recognize straight off a colour that has come about by mixing red and green as one that can be produced in that way. (But what does "straight off" signify here?)

Page Break 66

Page 66

366. Confusion of tastes: I say "This is sweet", someone else "This is sour" and so on. So someone comes along and says: "You have none of you any idea what you are talking about. You no longer know at all what you once called a taste." What would be the sign of our still knowing? ((Connects with a question about confusion in calculating.))

Page 66

367. But might we not play a language-game even in this 'confusion'?--But is it still the earlier one?--†1

Page 66

368. Let us imagine men who express a colour intermediate between red and yellow, say by means of a fraction in a kind of binary notation like this: R, LLRL and the like, where we have (say) yellow on the right, and red on the left.--These people learn how to describe shades of colour in this way in the kindergarten, how to use such descriptions in picking colours out, in mixing them, etc. They would be related to us roughly as people with absolute pitch are to those who lack it. *They can do* what we cannot.

Page 66

369. And here one would like to say: "But then, is it imaginable? Of course, the *behaviour* is! But is the inner process, the experience of colour?" And it is difficult to see what to say in answer to such a question. Could people without absolute pitch have guessed at the existence of people with absolute pitch?

Page 66

370. High-lights or reflections: when a child paints it will never paint these. Indeed it is quite hard to believe that they can be represented by ordinary oil or water colours.

Page 66

371. What would a society all of deaf men be like? Or a society of the 'feebleminded'? *An important question!* What then of a society that never played many of our customary language-games?

Page 66

372. One imagines the feeble-minded under the aspect of the degenerate, the essentially incomplete, as it were in tatters. And so under that of disorder instead of a more primitive order (which would be a far more fruitful way of looking at them).

We just don't see a *society* of such people.

Page Break 67

Page 67

373. Concepts other than though akin to ours might seem *very* queer to us; deviations from the usual *in an unusual direction*.

Page 67

374. Concepts with fixed limits would demand a uniformity of behaviour. But where I am *certain*, someone else is uncertain. And that is a fact of nature.

Page 67

375. These are the fixed rails along which all our thinking runs, and so our judgment and action goes according to them too.

Page 67

376. Where e.g. a certain type is only seldom to be found, no concept of that type will be formed. People do not feel *this* as a unity, as a particular physiognomy.

Page 67

377. They make no picture of it and always recognize it just in the particular cases.

Page 67

378. Must people be acquainted with the concept of modesty or of swaggering, wherever there are modest and swaggering men? Perhaps nothing hangs on this difference for them.

For us, too, many differences are unimportant, which we might find important.

379. And others have concepts that cut across ours.

380. A tribe has two concepts, akin to our 'pain'. One is applied where there is visible damage and is linked with tending, pity etc. The other is used for stomachache for example, and is tied up with mockery of anyone who complains. "But then do they really not notice the similarity?"--Do we have a single concept everywhere where there is a similarity? The question is: Is the similarity *important* to them? And need it be so? And why should their concept 'pain' not split ours up?

381. But in that case isn't this man overlooking something that is there?--He takes no notice of it, and why should he?--But in that case his concept just is fundamentally different from ours.--*Fundamentally* different? Different.--But in that case it surely is as if his word could not *designate* the *same* as ours. Or only part

of that.--But of course it must look like that, if his concept is different. For the indefiniteness of our concept may be projected for us into the *object* that the word designates. So that if the indefiniteness were missing we should also not have 'the same thing meant'. The picture that we employ symbolizes the indefiniteness.

382. In philosophizing we may not *terminate* a disease of thought. It must run its natural course, and *slow* cure is all important. (That is why mathematicians are such bad philosophers.)

383. Imagine that the people of a tribe were brought up from early youth to give no expression of feeling *of any kind*. They find it childish, something to be got rid of. Let the training be severe. 'Pain' is not spoken of; especially not in the form of a conjecture "Perhaps he has got...." If anyone complains, he is ridiculed or punished. There is no such thing as the suspicion of shamming. Complaining is so to speak already shamming.

384. "Shamming," these people might say, "What a ridiculous concept!" (As if one were to distinguish between a murder with one shot and one with three.)

385. Complaining is already so bad that there is no room at all for shamming as something worse.

386. One disgrace is invisible to them because of the other.

387. I want to say: an education quite different from ours might also be the foundation for quite different concepts.

388. For here life would run on differently.--What interests us would not interest *them*. Here different concepts would no longer be unimaginable. In fact, this is the only way in which *essentially* different concepts are imaginable.

389. [Someone] might surely be taught e.g. to mime pain (not with the intention of deceiving). But could this be taught to just anyone? I mean: someone might well learn to give certain crude tokens of pain, but without ever spontaneously giving a

finer imitation out of his own insight. (Talent for languages.) (A clever dog might perhaps be taught to give a kind of whine of pain but it would never get as far as conscious imitation.)

390. 'These men would have nothing human about them.' Why?--We could not possibly make ourselves understood to them. Not even as we can to a dog. We could not find our feet with them.

And yet there surely could be such beings, who in other respects were human.

391. I really want to say that scruples in thinking begin with (have their roots in) instinct. Or again: a language-game does not have its origin in *consideration*. Consideration is part of a language-game.

And that is why a concept is in its element within the language-game.

392. 'Heap of sand' is a concept without sharp boundaries--but why isn't one with sharp boundaries used instead of it?--Is the reason to be found in the nature of the heaps? What is the phenomenon whose nature is definitive for our concept?

393. It is easy to imagine and work out in full detail events which, if they actually came about, would throw us out in all our judgments.

If I were sometime to see quite new surroundings from my window instead of the long familiar ones, if things, humans and animals were to behave as they never did before, then I should say something like "I have gone mad"; but that would merely be an expression of giving up the attempt to know my way about. And the same thing might befall me in mathematics. It might e.g. *seem* as if I kept on making mistakes in calculating, so that no answer seemed reliable to me.

But the important thing about this for me is that there isn't any sharp line between such a condition and the normal one. [*Marginal note*: Hangs together with the concept of 'knowledge'.]

394. What would it mean for me to be wrong about his having a mind, having consciousness? And what would it mean for me to be wrong about *myself* and not have any? What would it mean

to say "I am not conscious"?--But don't I know that there is a consciousness in me?--Do I know it then, and yet the statement that it is so has no purpose?

And how remarkable that one can learn to make oneself understood to others in these matters!

395. A man can pretend to be unconscious; but *conscious*?

396. What would it be like for someone to tell me with complete seriousness that he (really) did not know whether he was dreaming or awake?--

Is the following situation possible: Someone says "I believe I am now dreaming"; he actually wakes up soon afterwards, remembers that utterance in his dream and says "So I was right!"--This narrative can surely only signify: Someone dreamt that he had said he was dreaming.

Imagine an unconscious man (anaesthetised, say) were to say "I am conscious"--should we say "He ought to know"?

And if someone talked in his sleep and said "I am asleep"--should we say "He's quite right"?

Is someone speaking untruth if he says to me "I am not conscious"? (And truth, if he says it while unconscious? And suppose a parrot says "I don't understand a word", or a gramophone: "I am only a machine"?)

397. Suppose it were part of my day-dream to say: "I am merely engaged in phantasy", would this be *true*? Suppose I write such a phantasy or narrative, an imaginary dialogue, and in it I say "I am engaged in phantasy"--but, when I write it down,--how does it come out that these words belong to the phantasy and that I have not emerged from the phantasy?

Might it not actually happen that a dreamer, as it were emerging from the dream, said in his sleep "I am dreaming"? It is quite imaginable there should be such a language-game.

This hangs together with the problem of 'meaning'. For I can write "I am healthy" in the dialogue of a play, and so not *mean* it, although it is true. The words belong to this and not that language-game.

398. 'True' and 'false' in a dream. I dream that it is raining, and that I say "It is raining"--on the other hand: I dream that I say "I am dreaming".

399. Has the verb "to dream" a present tense? How does a person learn to use this?

400. Suppose I were to have an experience like waking up, were then to find myself in quite different surroundings, with people who assure me that I have been asleep. Suppose further I insisted that I had not been dreaming, but living in some way outside my sleeping body. What function has this assertion?

401. "I have consciousness"--that is a statement about which no doubt is possible." Why should that not say the same as: "I have consciousness' is not a proposition"?

It might also be said: What's the harm if someone says that "I have consciousness" is a statement admitting of no doubt? How do I come into conflict with him? Suppose someone were to say this to me--why shouldn't I get used to making no answer to him instead of starting an argument? Why shouldn't I treat his words like his whistling

or humming?

Page 71

402. "Nothing is so certain as that I possess consciousness." In that case, why shouldn't I let the matter rest? This certainty is like a mighty force whose point of application does not move, and so no work is accomplished by it.

Page 71

403. Remember: most people say one feels nothing under anaesthetic. But some say: It *could* be that one feels, and simply forgets it completely.

If then there are here some who doubt and some whom no doubt assails, still the lack of doubt might after all be far more general.

Page 71

404. Or doubt might after all have a different and much less indefinite form than in our world of thought.

Page 71

405. No one but a philosopher would say "I know that I have two hands"; but one may well say: "I am unable to doubt that I have two hands."

Page 71

406. "Know," however, is not ordinarily used in this sense. "I know what 97×78 is." "I know that 97×78 is 432." In the first case I tell someone that I can do something, that I possess something; in the second I simply asseverate that 97×78 is 432.

Page Break 72

For doesn't " 97×78 is quite definitely 432" say: *I know* it is so? The first sentence is not an arithmetical one, nor can it be replaced by an arithmetical one; an arithmetical sentence could be used in place of the second one.

Page 72

407. Can someone *believe* that $25 \times 25 = 625$? What does it mean to believe that? How does it come out that he believes it?

Page 72

408. But isn't there a phenomenon of knowing, as it were quite apart from the sense of the phrase "I know"? Is it not remarkable that a man can *know* something, can as it were have the fact within him?--But that is a wrong picture.--For, it is said, it's only knowledge if things really are as he says. But that is not enough. It mustn't be just an accident that they are. For he has got to know that he knows: for knowing is a state of his own mind; he cannot be in doubt or error about it--apart from some special sort of blindness. If then knowledge *that* things are so is only knowledge if they *really* are so; and if knowledge is in him so that he cannot go wrong about whether it is knowledge; in that case, then, he is also infallible about things being so, just as he knows his knowledge; and so the fact which he knows must be within him just like the knowledge.

And this does indeed point to one kind of use for "I know". "I know that it is so" then means: It is so, or else I'm crazy.

So: when I say, without lying: "I know that it is so", then only through a special sort of blindness can I be wrong.

Page 72

409. How does it come about that doubt is not subject to arbitrary choice?--And that being so--might not a child doubt everything because it was so remarkably talented?

Page 72

410. A person can doubt only if he has learnt certain things; as he can miscalculate only if he has learnt to calculate. In that case it is indeed involuntary.

Page 72

411. Imagine that a child was quite specially clever, so clever that he could at once be taught the doubtfulness of the existence of all things. So he learns from the beginning: "That is probably a chair."

And now how does he learn the question: "Is it also really a chair?"--

Page Break 73

Page 73

412. Am I doing child psychology?--I am making a connexion between the concept of teaching and the concept of meaning.

Page 73

413. One man is a convinced realist, another a convinced idealist and teaches his children accordingly. In such an important matter as the existence or non-existence of the external world they don't want to teach their children anything wrong.

What will the children be taught? To include in what they say: "There are physical objects" or the opposite?

If someone does not believe in fairies, he does not need to teach his children "There are no fairies": he can omit to teach them the word "fairy". On what occasion are they to say: "There are..." or "There are no..."? Only when they meet people of the contrary belief.

Page 73

414. But the idealist will teach his children the word "chair" after all, for of course he wants to teach them to do this and that, e.g. to fetch a chair. Then where will be the difference between what the idealist-educated children say and the realist ones? Won't the difference only be one of battle cry?

Page 73

415. For doesn't the game "That is probably a..." begin with disillusion? And can the first attitude of all be directed towards a possible disillusion?

Page 73

416. "So does he have to begin by being taught a false certainty?"

There isn't any question of certainty or uncertainty yet in their language-game. Remember: they are learning to *do* something.

Page 73

417. The language-game "What is that?"--"A chair."--is not the same as: "What do you take that for?"--"It might be a chair."

Page 73

418. To begin by teaching someone "That looks red" makes no sense. For he must say that spontaneously once he has learnt what "red" means, i.e. has learnt the technique of using the word.

Page 73

419. Any explanation has its foundation in training. (Educators ought to remember this.)

Page 73

420. "It looks red to me."--"And what is red like?"--"Like *this*." Here the right paradigm must be pointed to.

Page Break 74

Page 74

421. When he first learns the names of colours--what is taught him? Well, he learns e.g. to call out "red" on seeing something red.--But is that the right description; or ought it to have gone: "He learns to call 'red' *what we too* call 'red'"?--Both descriptions are right.

What differentiates this from the language-game "How does it strike you?"?

But someone might be taught colour-vocabulary by being made to look at white objects through coloured spectacles. What I teach him however must be a *capacity*. So he *can* now bring something red at an order; or arrange objects according to colour. But then what is something red?

Page 74

422. Why doesn't one teach a child the language-game "It looks red to me" from the first? Because it is not yet able to understand the rather fine distinction between seeming and being?

Page 74

423. The red visual impression is a new *concept*.

Page 74

424. The language-game that we teach him then is: "It looks to me..., it looks to you..." In the first language-game a person does not occur as perceiving subject.

Page 74

425. You give the language game a new joint. Which does not mean, however, that now it is always used.

Page 74

426. The inward glance at the sensation--what connexion is this supposed to set up between words and sensation; and what purpose is served by this connexion? Was I taught *that* when I learned to use this sentence, to think this thought? (Thinking it really was something I had to learn.)

This is indeed something further that we learn, namely to turn our attention on to things and on to sensations. We learn to observe and to describe observations. But how am I taught this; how is my 'inner activity' checked in this case? How will it be judged whether I really have paid attention?

Page 74

427. "The chair is the same whether I am looking at it or not"--that *need* not have been true. People are often embarrassed when one looks at them. "The chair goes on existing, whether I look at it or not." This might be treated as an empirical proposition or it might be that we took it as a grammatical one. But it is also possible in this connexion simply to think of the conceptual difference between sense-impression and object [*Objekt*].

428. But isn't human agreement essential to the game? Must not anybody who learns it first know the meaning of "same", and do not the presuppositions of this include agreement? And so on.

429. You say "*That* is red," but how is it decided if you are right? Doesn't human agreement decide?--But do I appeal to this agreement in my judgments of colour? Then is what goes on like *this*: I get a number of people to look at an object; to each of them there occurs one of a certain group of words (what are called the "names of colours"); if the word "red" occurred to the majority of the spectators (I myself need not belong to this majority) the predicate "red" belongs to the object by rights. Such a technique might have its importance.

430. *Colour-words* are explained like *this*: "That's red" e.g.--Our language game only works, of course, when a certain agreement prevails, but the concept of agreement does not enter into the language-game. If agreement were universal, we should be quite unacquainted with the concept of it.

431. Does human agreement *decide* what is red? Is it decided by appeal to the majority? Were we taught to determine colour in *that* way?

432. For I describe the language-game "Bring something red" to someone who can himself already play it. Others I might at most teach it. (Relativity.)

433. "What I perceive is *THIS*--" and now follows a form of DESCRIPTION. The word "this" might also be explained as follows: Let us imagine a direct transfer of experience.--But now what is our criterion for the experience's really having been transferred? "Well, he just does have what I have."--But how does *he 'have'* it?

434. What does it mean "to use a word as a designation, a name, of a sensation"? Isn't there something to investigate here?

Imagine you were starting from a language-game with physical objects--and then it was said, from now on *sensations* are going to be named too. Wouldn't that be as if first there were talk of

transferring possessions and then suddenly of transferring joy in possession or pride in possession? Don't we have to learn something new here? Something new, which we call "transferring" too.

435. The description of what is subjectively seen is more or less akin to the description of an object, but just for that reason does not function as a description of an object. How are visual sensations compared? How do I compare my visual sensations with someone else's?

436. "Verifying by inspection" is a wholly misleading expression. For it says that first of all a procedure, the inspection, takes place (it might be compared with looking through a microscope, or with the procedure of turning one's head round *in order to see something*). And that then the seeing has to succeed. One might speak of "seeing by turning round," or "seeing by looking". But in that case the turning round (or looking) is a process external to the seeing, a process that is thus of only practical concern. What one would like to say is "seeing by seeing".

437. The causes of our belief in a proposition are indeed irrelevant to the question what we believe. Not so the grounds, which are grammatically related to the proposition, and tell us what proposition it is.

438. Nothing is commoner than for the meaning of an expression to oscillate, for a phenomenon to be regarded sometimes as a symptom, sometimes as a criterion, of a state of affairs. And mostly in such a case the shift of meaning is not noted. In science it is usual to make phenomena that allow of exact measurement into defining criteria for an expression; and then one is inclined to think that now the proper meaning has been *found*. Innumerable confusions have arisen in this way.

There are for example degrees of pleasure, but it is stupid to speak of a measurement of pleasure. It is true that in certain cases a measurable phenomenon occupies the place previously occupied by a non-measurable one. Then the word designating this place changes its meaning, and its old meaning has become more or less obsolete. We are soothed by the fact that the one

concept is the more exact, the other the more inexact one, and do not notice that here in each particular case a different relation between the 'exact' and the 'inexact' concept is in question: it is the old mistake of not testing particular cases.

439. Sufficient evidence passes over into insufficient without a definite borderline. Shall I say that a natural foundation for the way this concept is formed is the complex nature and the variety of human contingencies?

Then given much less variety, a sharply bounded conceptual structure would have to seem natural. And why does it seem so difficult to imagine the simplified case?

440. How should we have to imagine a complete list of rules for the employment of a word?--What do we mean by a complete list of rules for the employment of a piece in chess? Couldn't we always construct doubtful cases, in which the normal list of rules does not decide? Think e.g. of such a question as: how to determine who moved last, if a doubt is raised about the reliability of the players' memories?

The regulation of traffic in the streets permits and forbids certain actions on the part of drivers and pedestrians; but it does not attempt to guide the totality of their movements by prescription. And it would be senseless to talk of an 'ideal' ordering of traffic which should do that; in the first place we should have no idea what to imagine as this ideal. If someone wants to make traffic regulations stricter on some point or other, that does not mean that he wants to approximate to such an ideal.

441. Consider also the following proposition: "The rules of a game may well allow a certain freedom, but all the same they must be quite definite rules." That is as if one were to say: "You may indeed leave a person enclosed by four walls a certain liberty of movement, but the walls must be perfectly rigid"--and that is not true.--"Well, the walls may be elastic all right, but in that case they have a perfectly determinate degree of elasticity"--But what does this say? It seems to say that it must be possible to state the elasticity, but that again is not true. "The wall always has *some determinate* degree of elasticity--whether I know it or

not": that is really the avowal of adherence to a form of expression. The one that makes use of the *form* of an ideal of accuracy. As it were like the form of a parameter of representation.

442. The avowal of adherence to a form of expression, if it is formulated in the guise of a proposition dealing with *objects* (instead of signs) must be '*a priori*'. For its opposite will really be unthinkable, inasmuch as there corresponds to it a form of thought, a form of expression, that we have excluded.

443. Suppose people used always to point to objects in the following way: they describe a circle as it were round the object with their finger in the air; in that case a philosopher could be imagined who said: "All things are circular, for the table looks like *this*, the stove like *this*, the lamp like *this*", etc., drawing a circle round the thing each time.

444. We now have a *theory*, a 'dynamic theory'†* of the proposition; of language, but it does not present itself to us as a theory. For it is the characteristic thing about such a theory that it looks at a special clearly intuitive case and says: "*That* shews how things are in every case; this case is the exemplar of *all* cases."--"Of course! It has to be like that" we say, and are satisfied. We have arrived at a form of expression that *strikes us as obvious*. But it is as if we had now seen something lying *beneath* the surface.

The tendency to generalize the case seems to have a strict justification in logic: here one seems *completely* justified in inferring: "If *one* proposition is a picture, then any proposition must be a picture, for they must all be of the same nature." For we are under the illusion that what is sublime, what is essential, about our investigation consists in its grasping *one* comprehensive essence.

445. How can I understand a proposition *now*, if it is for analysis to shew *what* I really understand?--Here there sneaks in the idea of understanding as a special mental process.

446. But don't think of understanding as a 'mental process' at all.--For *that* is the way of speaking that is confusing

you. Rather ask yourself: in what kind of case, under what circumstances do we say "Now I can go on," if the formula has occurred to us?†1

That way of speaking is what prevents us from seeing the facts without prejudice. Consider the pronunciation of a word as its spelling presents it. How easy it is to persuade oneself that two words--e.g. "fore" and "four" sound different in everyday use--because one pronounces them differently when one has the difference in spelling directly in view. Comparable with this is the opinion that a violin player with a fine sense of pitch always strikes F somewhat higher than E sharp. Reflect on such cases.--*That* is how it can come about that the means of representation produces something *imaginary*. So let us not think we *must* find a specific mental process, because the verb "to understand" is there and because one says: Understanding is an activity of mind.

Page 79

447. Disquiet in philosophy might be said to arise from looking at philosophy wrongly, seeing it wrong, namely as if it were divided into (infinite) longitudinal strips instead of into (finite) cross strips. This inversion in our conception produces the *greatest* difficulty. So we try as it were to grasp the unlimited strips and complain that it cannot be done piecemeal. To be sure it cannot, if by a piece one means an infinite longitudinal strip. But it may well be done, if one means a cross-strip.--But in that case we never get to the end of our work!--Of course not, for it has no end.

(We want to replace wild conjectures and explanations by quiet weighing of linguistic facts.)

Page 79

448. And does one say that the sentence "It's raining" says: such-and-such is the case? What is the everyday use of this expression in ordinary language? For you learned it from this use. If you now use it contrary to its original use, and think you are still playing the old game with it, that is as if you were to play draughts with chess-pieces and imagine that your game had kept something of the spirit of chess.

Page Break 80

Page 80

449. Extension of a concept in a *theory* (e.g. 'wish-fulfilment dream').

Page 80

450. One who philosophizes often makes the wrong, inappropriate gesture for a verbal expression.

Page 80

451. (One says the ordinary thing--with the wrong gesture.)

Page 80

452. How does it come about that philosophy is so complicated a structure? It surely ought to be completely simple, if it is the ultimate thing, independent of all experience, that you make it out to be.--Philosophy unties knots in our thinking; hence its result must be simple, but philosophizing has to be as complicated as the knots it unties.†1

Page 80

453. (As one can sometimes reproduce music only in one's inward ear, and cannot whistle it, because the whistling drowns out the inner voice, so sometimes the voice of a philosophical thought is so soft that the noise of spoken words is enough to drown it and prevent it from being heard, if one is questioned and has to speak.)

Page 80

454. Plato: "--What? he said, *it* be of no use? If wisdom is the knowledge of knowledge and is prior to other knowledges, then it must also be prior to that knowledge which relates to the good and in that way must be of use to us.--Does *it* make us healthy, I said, and not medicine? And similarly with the rest of the arts; does *it* direct their business, and not rather each of them its own? Again, have we not long since allowed that it would only be the knowledge of knowledges and ignorances and not of any other matter?--We have indeed.--So it will not produce health in us?--Presumably not.--Because health belongs to a different art?--Yes--Then, friend, neither will it produce utility for us. For this is a business we have too assigned to another art.--Of course--So how can wisdom be useful, if it does not bring us any utility?"†2

Page 80

455. (The philosopher is not a citizen of any community of ideas. That is what makes him into a philosopher.)

Page Break 81

Page 81

456. Some philosophers (or whatever you like to call them) suffer from what may be called "loss of problems". Then everything seems quite simple to them, no deep problems seem to exist any more, the world becomes broad and flat and loses all depth, and what they write becomes immeasurably shallow and trivial. Russell and H. G. Wells suffer from this.

457. ...quia plus loquitur inquisitio quam inventio... (Augustine.)†1

458. Philosophical investigations: conceptual investigations. The essential thing about metaphysics: it obliterates the distinction between factual and conceptual investigations.

459. The fundamental thing expressed grammatically: What about the sentence: "One cannot step into the same river twice"?

460. In a certain sense one cannot take too much care in handling philosophical mistakes, they contain so much truth.†2

"Such irritations are wont to stimulate the powers of thought." How does thought remedy an irritation?

461. I should like you to say: "Yes, it's true, that can be imagined, that may even have happened!" But was I trying to draw your attention to the fact that you are able to imagine this? I wanted to put this picture before your eyes, and your *acceptance* of this picture consists in your being inclined to regard a given case differently; that is, to compare it with *this* series of pictures. I have changed your *way of seeing*. (I once read somewhere that a geometrical figure, with the words "Look at this", serves as a proof for certain Indian mathematicians. This looking too effects an alteration in one's way of seeing.)†3

462. (The classifications of philosophers and psychologists: they classify clouds by their shape.)

463. On mathematics: "Your concept is wrong.--However, I cannot illumine the matter by fighting against your words, but only by trying to turn your attention away from certain expressions, illustrations, images, and *towards* the *employment* of the words."

464. The pedigree of psychological concepts: I strive *not* after *exactness*, but after a synoptic view.

465. The treatment of all these phenomena of mental life is not of importance to me because I am keen on completeness. Rather because each one casts light on the correct treatment of *all*.

466. And here what is in question is not symptoms, but logical criteria. That these are not always sharply differentiated does not prevent them from being differentiated.

467. Our investigation does not try to *find* the real, exact meaning of words; though we do often *give* words exact meanings in the course of our investigation.

468. "Man thinks, is afraid etc. etc.": that is the reply one might give to someone who asked what chapters a book on psychology should contain.

469. Imagine someone saying: "Man hopes". How should this general phenomenon of natural history be described?--One might observe a child and wait until one day he manifests hope; and then one could say "Today he hoped for the first time". But surely that sounds queer! Although it would be quite natural to say "Today he said 'I hope' for the first time". And why queer?--One does not say that a suckling hopes that.... nor yet that he has no hope that.... and one does say it of a grown man--Well, bit by bit daily life becomes such that there is a place for hope in it.

But now it is said: We can't be certain when a child really begins to hope, for hope is an inner process. What nonsense! For then how do we know what we are talking about at all?

470. Or might he offer *this* example: "I, e.g., see, am not blind"? Even that sounds queer.

It would be correct to say: "You can observe the phenomena *of* thinking, hoping, seeing, etc., in *my* case as well".

471. The psychological verbs to see, to believe, to think, to wish, do not signify phenomena [appearances]. But

psychology observes the phenomena *of* seeing, believing, thinking, wishing.

Page Break 83

Page 83

472. Plan for the treatment of psychological concepts.

Psychological verbs characterized by the fact that the third person of the present is to be verified by observation, the first person not.

Sentences in the third person present: information. In the first person present: expression. ((Not quite right.))

The first person of the present akin to an expression.

Sensations: their inner connexions and analogies.

All have genuine duration. Possibility of giving the beginning and the end. Possibility of their being synchronized, of simultaneous occurrence.

All have degrees and qualitative mixtures. Degree: scarcely perceptible--unendurable.

In this sense there is not a sensation of position or movement. Place of feeling in the body: differentiates seeing and hearing from sense of pressure, temperature, taste and pain.

Page 83

473. We need to reflect that a state of language is possible (and presumably has existed) in which it does not possess the general concept of sensation, but does have words corresponding to our "see", "hear", "taste".

Page 83

474. We call seeing, hearing,... sense-perception. There are analogies and connexions between these concepts; these are our justification for so taking them together.

Page 83

475. It can, then, be asked: what kind of connexions and analogies exist between seeing and hearing? Between seeing and touching? Between seeing and smelling? Etc.

Page 83

476. And if we ask this, then the senses at once shift further apart from one another than they seemed to be at first sight.

Page 83

477. What is common to sense-experiences?--The answer that they give us knowledge of the external world is partly wrong and partly right. It is right in so far as it is supposed to point to a *logical* criterion.

Page 83

478. The duration of sensation. Compare the duration of a sense-experience of sound with the duration of the sensation of touch which informs you that you have a ball in your hand; and with the "feeling" that informs you that your knees are bent.

Page Break 84

Page 84

479. We feel our movements. Yes, we really *feel* them; the sensation is similar, not to a sensation of taste or heat, but to one of touch: to the sensation when skin and muscles are squeezed, pulled, displaced.

Page 84

480. I feel my arm and in a queer way I should now like to say: I feel it in a definite position in space; as if the feeling of my body in a space were disposed in the shape of an arm, so that in order to represent it I should have to model my arm, in plaster say, in the right position.

Page 84

481. It is queer. My lower arm is now resting horizontally, and I should like to say that I feel it; not, however, as if I had a feeling that always accompanies this position (as one would feel ischaemia or engorgement)--but as if the 'body-feeling' of the arm were arranged or disposed horizontally as e.g. a vapour or dust-particles on the surface of my arm are so disposed in space. So it is not really as if I felt the position of my arm, but as if I felt my *arm*, and the feeling had such-and-such a *position*. But that means only: I simply *know* how it is--without knowing it *because*.... Just as I also know where I feel pain--but do not know it *because*....

Page 84

482. It positively seems to us as if pain had a body, as if it were a thing, a body with shape and colour. Why? Has it the shape of the part of the body that hurts? One would like to say for example "I could *describe* the pain if I only had the necessary words and elementary meanings". One feels: all that is lacking is the requisite nomenclature. (James). As if one could even paint the sensation, if only other people would understand this language.--And one really can describe pain spatially and temporally.

Page 84

483. (If sensations are characteristic of the position and movements of the limbs, at any rate their place is not the joint.)

One *knows* the position of one's limbs and their movements. One can give them if asked, for example. Just as one also knows the place of a sensation (pain) in the body.

Reaction of touching the painful place.

Page Break 85

Page 85

No local sign about the sensation. Any more than a temporal sign about a memory-image. (Temporal signs in a photograph.)

Pain differentiated from other sensations by a characteristic expression. This makes it akin to joy (which is not a sense-experience).

Page 85

484. Is it hair-splitting to say:--joy, enjoyment, delight, are not sensations?--Let us at least ask ourselves: How much analogy is there between delight and what we call e.g. "sensation"?

Page 85

485. The connecting link between them would be pain. For this concept resembles that of e.g. tactile sensation (through the characteristics of localisation, genuine duration, intensity, quality) and at the same time that of the emotions through its expression (facial expressions, gestures, noises).

Page 85

486. "I feel great joy"--Where?--that sounds like nonsense. And yet one does say "I feel a joyful agitation in my breast".--But why is joy not localized? Is it because it is distributed over the whole body? Even where the feeling that arouses joy is localized, joy is not: if for example we rejoice in the smell of a flower.--Joy is manifested in facial expression, in behaviour. (But we do not say that we are joyful in our faces).

Page 85

487. "But I do have a real *feeling* of joy!" Yes, when you are glad you really are glad. And of course joy is not joyful behaviour, nor yet a feeling round the corners of the mouth and the eyes.

"But 'joy' surely designates an inward thing." No. "Joy" designates nothing at all. Neither any inward nor any outward thing.

Page 85

488. Continuation of the classification of psychological concepts.

Page 85

Emotions. Common to them: genuine duration, a course. (Rage flares up, abates, vanishes, and likewise joy, depression, fear.)

Distinction from sensations: they are not localized (nor yet diffuse!).

Common: they have characteristic expression-behaviour. (Facial expression.) And this itself implies characteristic sensations too. Thus sorrow often goes with weeping, and characteristic

Page Break 86

sensations with the latter. (The voice heavy with tears). But these sensations are not the emotions. (In the sense in which the numeral 2 is not the number 2).

Among emotions the directed might be distinguished from the undirected. Fear *at* something, joy *over* something.

This something is the object, not the cause of the emotion.

Page 86

489. The language game "I am afraid" already contains the object.

"Anxiety" is what undirected fear might be called, in so far as its manifestations resemble or are the same as those of fear.

The *content* of an emotion--here one imagines something like a *picture*, or something of which a picture can be made. (The darkness of depression which descends on a man, the flames of anger.)

Page 86

490. The human face too might be called such a picture and its alterations might represent the *course* of a passion.

Page 86

491. What goes to make them different from sensations: they do not give us any information about the external world. (A grammatical remark.)

Love and hate might be called emotional dispositions, and so might fear in one sense.

Page 86

492. It is one thing to feel acute fear, and another to have a 'chronic' fear of someone. But fear is not a sensation.

'Horrible fear': is it the *sensations* that are so horrible?

Typical causes of pain on the one hand, and of depression, sorrow, joy on the other. Cause of these also their object.

Pain-behaviour and the behaviour of sorrow.--These can only be described along with their external occasions. (If a child's mother leaves it alone it may cry because it is sad; if it falls down, from pain.) Behaviour and kind of occasion belong together.

Page 86

493. Thoughts may be fearful, hopeful, joyful, angry, etc.

Page Break 87

Page 87

494. Emotions are expressed in thoughts. A man talks angrily, timidly, sadly, joyfully etc., not lumbagoishly.

A thought rouses emotions in me (fear, sorrow etc.) not bodily pain.

Page 87

495. I should almost like to say: One no more feels sorrow in one's body than one feels seeing in one's eyes.

Page 87

496. ((The horribleness of fear is not in the sensations of fear.)) This matter also calls to mind hearing a sound *from a particular direction*. It is almost as if one felt the heaviness around the stomach, the constraint of breath, from the direction of the fear. That means really that "I am sick with fear" does not assign a *cause* of fear.

Page 87

497. "Where do you feel grief?"--In the mind.--What kind of consequences do we draw from this assignment of place? One is that we do *not* speak of a bodily place of grief. Yet we *do* point to our body, as if the grief were in it. Is that because we feel a bodily discomfort? I do not know the cause. But why should I assume it is a bodily discomfort?

Page 87

498. Consider the following question: Can a pain be thought of, say with the quality of rheumatic pain, but *unlocalized*? Can one *imagine* this?

If you begin to think this over, you see how much you would like to change the knowledge of the place of pain into a characteristic of *what is felt*, into a characteristic of a sense-datum, of the private object that I have before my mind.

Page 87

499. If fear is frightful and if while it goes on I am conscious of my breathing and of a tension in my facial muscles--is that to say that I find *these feelings* frightful? Might they not even be a mitigation? ((Dostoevsky)).

Page 87

500. Why does one use the word "suffering" for pain as well as for fear? Well, there are plenty of tie-ups.--

Page 87

501. To the utterance: "I can't think of it without fear" one replies: "There's no reason for fear, for..." That is at any rate *one* way of dismissing fear. Contrast with pain.

Page Break 88

Page 88

502. That there is a fear-syndrome of sensations, thoughts etc. (for example) does not mean that fear is a syndrome.

Page 88

503. If someone acts grief in the study, he will indeed readily become aware of the tensions in his face. But be really sad, or follow a sorrowful action in a film, and ask yourself if you were aware of your face.

Page 88

504. Love is not a feeling. Love is put to the test, pain not. One does not say: "That was not true pain, or it would not have gone off so quickly".

Page 88

505. One connexion between moods and sense-impressions is that we use mood-concepts to describe sense-impressions and images. We say of a theme, a landscape, that it is sad, glad etc. But much more important, of course, is our using all the mood-concepts to describe human faces, actions, behaviours.

Page 88

506. A friendly mouth, friendly eyes. How would one think of a friendly hand?--Probably open and not as a fist.--And could one think of the colour of a man's hair as an expression of friendliness or the opposite?--But put like that the question seems to be whether we can *manage* to. The question ought to run: Do we want to call anything a

friendly or unfriendly hair-colour? If we wanted to give such words a sense, we should perhaps imagine a man whose hair darkened when he got angry. The reading of an angry expression into dark hair, however, would work *via* a previously existent conception.

It may be said: The friendly eyes, the friendly mouth, the wagging of a dog's tail, are among the primary and mutually independent symbols of friendliness; I mean: they are parts of the phenomena that are called friendliness. If one wants to imagine further appearances as expressions of friendliness, one reads these symbols into them. We say: "He has a black look", perhaps because the eyes are more strongly shadowed by the eyebrows; and now we transfer the idea of darkness to the colour of the hair.

Page Break 89

Page 89

507. If anyone asks whether pleasure is a sensation, he probably does not distinguish between reason and cause, for otherwise it would occur to him that one takes pleasure *in something*, which does not mean that this something produces a sensation in us.

Page 89

508. But pleasure does at any rate go with a facial expression; and while we do not see that in ourselves, all the same we notice it.

Page 89

And just try to think over something very sad with an expression of radiant joy!

Page 89

509. It is quite possible that the glands of a sad person secrete differently from those of someone who is glad; and also that their secretion is the or a cause of sadness. But does it follow that the sadness is a *sensation* produced by this secretion?

Page 89

510. But here the thought is: "After all, you *feel* sadness--so you must feel it *somewhere*; otherwise it would be a chimera". But if you want to think that, remember the difference between seeing and pain. I feel pain in the wound--but colour in the eye? If we try to use a schema here, instead of merely noting what is really common, we see everything falsely simplified.

Page 89

511. But if one wanted to find an analogy to the place of pain, it would of course not be the mind (as, of course, the place of bodily pain is not the body) but the *object* of regret.

Page 89

512. Suppose it were said: Gladness is a feeling, and sadness consists in *not* being glad.--Is the absence of a feeling a feeling?

Page 89

513. One speaks of a feeling of conviction because there is a *tone* of conviction. For the characteristic mark of all 'feelings' is that there is expression of them, i.e. facial expression, gestures, of feeling.

Page 89

514. Now one might say this: A man's face has by no means a constant appearance. It alters from one moment to the next; sometimes only a little, sometimes up to the point of unrecognizability. Nevertheless it is possible to draw a picture of his physiognomy. Of course a picture in which the face smiles does

Page Break 90

not shew how it looks when weeping. But it does permit inferences.--And in this way it would also be possible to describe a kind of average physiognomy of belief (e.g.).

Page 90

515. I give signs of delight and comprehension.

Page 90

516. Can 'knowing one's way about' be called an experience? Surely not. But there are experiences characteristic of the condition of knowing one's way about and not knowing one's way about. (Not knowing one's way about and lying.)

Page 90

517. But it is surely important that all these paraphrases exist. That care can be described in such words as: "the descent of a permanent cloud". I have perhaps never stressed the importance of this paraphrasing enough.

Page 90

518. Why can a dog feel fear but not remorse? Would it be right to say "Because he can't talk"?

Page 90

519. Only someone who can reflect on the past can repent. But that does not mean that as a matter of empirical fact only such a one is capable of the feeling of remorse.

Page 90

520. There is nothing astonishing about certain concepts' only being applicable to a being that e.g. possesses a language.

Page 90

521. "The dog *means* something by wagging his tail."--What grounds would one give for saying this?--Does one also say: "By drooping its leaves, the plant means that it needs water"?--

Page 90

522. We should hardly ask if the crocodile means something when it comes at a man with open jaws. And we should declare that since the crocodile cannot think there is really no question of meaning here.

Page 90

523. Let us just forget entirely that we are interested in the state of mind of a frightened man. It is certain that under given circumstances we may also be interested in his behaviour as an indication of how he will behave in the future. So why should we not have a word for this?

Page Break 91

Page 91

It might now be asked whether this word would really relate simply to behaviour, simply to bodily changes. And this may be denied. There is no future in simplifying the use of this word in this way. It relates to the behaviour under certain external circumstances. If we observe these circumstances and that behaviour we say that a man is... or has....

Page 91

524. There might be a concept of fear that had application only to beasts, and hence only through observation.--But you don't want to say that such a concept would have no use. The verb that would roughly correspond to the word "to fear" would then have no first person and none of its forms would be an expression of fear.

Page 91

525. I now want to say that humans who employ such a concept would *not* have to be able to describe its use. And were they to try, it is possible that they would give a quite inadequate description. (Like most people, if they tried to describe the use of money correctly). (They are not prepared for such a task).

Page 91

526. If someone behaves in such-and-such a way under such-and-such circumstances, we say that he is sad. (We say it of a dog too). To this extent it cannot be said that the behaviour is the *cause* of the sadness: it is its symptom. Nor would it be beyond cavil to call it the effect of sadness.--If he says it of himself (that he is sad) he will not in general give his sad face as a reason. But what about this: "Experience has taught me that I get sad as soon as I start sitting about sadly, etc." This might have two different meanings. Firstly: "As soon as, following a slight inclination, I set out to carry and conduct myself in such-and-such a way, I get into a state in which I have to persist in this behaviour". For it might be that toothache got worse by groaning.--Secondly, however, that proposition might contain a speculation about the cause of human sadness; the content being that if you could somehow or other produce certain bodily states, you would make the man sad. But here arises the difficulty that we should not call a man sad, if he *looked* and *acted* sad in all circumstances. If we taught such a one the expression "I am sad" and he constantly kept on saying this with an expression of sadness, these words, like the other signs, would have lost their normal sense.

Page Break 92

Page 92

527. Isn't it as if one were trying to imagine a facial expression not susceptible of alterations which were gradual and difficult to catch hold of, but which had, say, just five positions; when it changed it would snap straight from one to another. Now would this fixed smile, for example, really be a smile? And why not?--"Smiling" is our name for an expression in a normal play of expressions.--I might not be able to react as I do to a smile. It would e.g. not make me smile myself. One wants to say: "No wonder we have this concept in *these* circumstances".

Page 92

528. An auxiliary construction. A tribe that we want to enslave. The government and the scientists give it out that the people of this tribe have no souls; so they can be used for any arbitrary purpose. Naturally we are interested in their language nevertheless; for we certainly want to give them orders and to get reports from them. We also want to know what they say to one another, as this ties up with the rest of their behaviour. But we must also be interested in what corresponds in them to our '*psychological utterances*', since we want to keep them fit for work; for that reason

their manifestations of pain, of being unwell, of depression, of joy in life, are important to us. We have even found that it has good results to use these people as experimental subjects in physiological and psychological laboratories, since their reactions--including their linguistic reactions--are quite those of mind-endowed human beings. Let it also have been found out that these automata can have our language imparted to them instead of their own by a method which is very like our 'instruction'.

Page 92

529. These creatures now learn e.g. to calculate, they learn paper or oral calculation. But by some method we make them able to give the result of a multiplication after behaving in a 'reflective' manner for a time, though without writing or speaking. If one considers the kind of way they learn this 'calculating in the head', together with the surrounding phenomena, this suggests the picture of the process of calculating as, so to speak, submerged and going on *under* the surface.

Of course for various purposes we need an order like "Work this out in your head"; a question like "Have you worked it out?"; and even "How far have you got?"; a statement "I have worked

Page Break 93

... out" on the part of the automaton; etc. In short: everything that *we* say among ourselves about calculating in the head is of interest to us when they say it. And what goes for calculating in the head goes for all other forms of thinking as well.--If one of us gives vent to the opinion that these beings *must* after all have some kind of mind, we jeer at him.

Page 93

530. The slaves also say: "When I heard the word 'bank' it meant... to me." Question: *what* technique of using language is the background for their saying this? For everything depends on that. What have we taught them, what use for the word "mean"? And what, if anything at all, do we gather from their utterance? For if we can do nothing with it, still it might interest us as a curiosity.--Let us imagine a tribe of men, unacquainted with dreams, who hear our narrations of dreams. One of us had come to these non-dreaming people and learnt bit by bit to make himself understood to them.--Perhaps one thinks they would never understand the word "to dream". But they would soon find a use for it. And their doctors might very well be interested in the phenomenon and might make important inferences from the dreams of the stranger.--Nor can it be said that for these people the verb "to dream" could mean nothing but: to tell a dream. For the stranger would of course use both expressions, both "to dream" and "to tell a dream", and the people of that tribe would not be allowed to confuse "I dreamt..." with "I told the dream...."

Page 93

531. "I assume that a picture swims before him".--Could I also assume that a picture swims before this stove?--And why does this seem impossible? Is the human shape necessary for this?--

Page 93

532. The concept of pain is characterized by its particular function in our life.

Page 93

533. Pain has *this* position in our life; has *these* connexions; (That is to say: we only call "pain" what has *this* position, *these* connexions).

Page 93

534. Only surrounded by certain normal manifestations of life, is there such a thing as an expression of pain. Only surrounded

Page Break 94

by an even more far-reaching particular manifestation of life, such a thing as the expression of sorrow or affection. And so on.

Page 94

535. If I, and if anyone else, can imagine a pain, or at least we say we can--how is it to be found out whether we are imagining it right, and how accurately we are imagining it?

Page 94

536. I may know that he is in pain, but I never know the exact degree of his pain. So here is something that he knows and that his expression of pain does not tell me. Something purely private.

He knows exactly how severe his pain is? (Isn't that much as if one were to say he always knows exactly where he is? Namely *here*.) Is the concept of the degree given with the pain?

Page 94

537. You say you attend to a man who groans because experience has taught you that you yourself groan when you feel such-and-such. But as you don't in fact make any such inference, we can abandon the justification by analogy.

Page 94

538. Nor does it make sense to say: "I don't bother about my own groaning because *I know* that I am in pain"--or "because I *feel* my pain".

Yet this is perfectly true:--"I don't bother about my groaning".

Page 94

539. I infer that he needs to go to the doctor from observation of his behaviour; but I do *not* make this inference in my own case from observation of my behaviour. Or rather: I do this too sometimes, but *not* in parallel cases.

Page 94

540. It is a help here to remember that it is a primitive reaction to tend, to treat, the part that hurts when someone else is in pain; and not merely when oneself is--and so to pay attention to other people's pain-behaviour, as one does *not* pay attention to one's own pain behaviour.

Page 94

541. But what is the word "primitive" meant to say here? Presumably that this sort of behaviour is *pre-linguistic*: that a language-game is based *on it*, that it is the prototype of a way of thinking and not the result of thought.

Page Break 95

Page 95

542. "Putting the cart before the horse" may be said of an explanation like the following: we tend someone else because by analogy with our own case we believe that he is experiencing pain too.--Instead of saying: Get to know a new aspect from this special chapter of human behaviour--from this use of language.

Page 95

543. My relation to the appearances here is part of my concept.

Page 95

544. When we tell a doctor that we have been having pains--in what cases is it useful for him to imagine pain?--And doesn't this happen in a variety of ways? (As great a variety as: recalling pain). (Knowing what a man looks like).

Page 95

545. Suppose someone explains how a child learns the use of the word "pain" in the following way: When the child behaves in such-and-such a way on particular occasions, I think he's feeling what I feel in such cases; and if it is so then the child associates the word with his feeling and uses the word when the feeling reappears.--*What* does this explanation explain? Ask yourself: *What* sort of ignorance does it remove?--Being sure that someone is in pain, doubting whether he is, and so on, are so many natural, instinctive, kinds of behaviour towards other human beings, and our language is merely an auxiliary to, and further extension of, this relation. Our language-game is an extension of primitive behaviour. (For our *language-game* is behaviour.) (Instinct).

Page 95

546. "I am not certain whether he is in pain."--Suppose now someone always pricked himself with a pin when he said this, in order to have the meaning of the word "pain" vividly before his mind (so as not to have to rest content with imagination) and to know *what* he is in doubt of about the other man.--Would the sense of his statement now be assured?

Page 95

547. So he is having genuine pain, and it is the possession of *this* by someone else that he feels doubt of.--But how does he do this?--It is as if I were told: "Here is a chair. Can you see it clearly?--Good--now translate it into French!"

Page Break 96

Page 96

548. So he has real pain; and now he knows what he is to doubt in someone else's case. He has the object before him and it is *not* some piece of behaviour or the like. (But now!) In order to doubt whether someone else is in pain he needs, not pain, but the *concept* 'pain'.

Page 96

549. To call the expression of a sensation a *statement* is misleading because 'testing', 'justification', 'confirmation', 'reinforcement' of the statement are connected with the word "statement" in the language-game.

Page 96

550. What purpose is served by the statement: "I do *have* something, if I have a pain"?

Page 96

551. "The smell is marvellous!" Is there a doubt whether it is the smell that is marvellous?

Is it a property of the smell?--Why not? It is a property of ten to be divisible by two and also to be the number of my fingers.

There might however be a language in which the people merely shut their eyes and say "Oh, this smell!" and there is no subject-predicate sentence equivalent to it. That is simply a 'specific' reaction.

552. It's not merely the picture of the behaviour that belongs to the language-game with the words "he is in pain"--one would like to say--but also the picture of the pain.--But here one must take care: think of my example of the private tables that don't belong to the *game*.--The impression of a 'private table' in the game arises through the *absence* of a table and through the similarity of the game to one that is played with a table.†1

553. Remember: we often use the phrase "I don't know" in a queer way; when for example we say that we don't know whether this man really feels more than that other, or merely gives stronger expression to his feeling. In that case it is not clear what sort of investigation might settle the question. Of course the expression is not quite idle: we want to say that we certainly can compare the feelings of A and B with one another, but that the circumstances of a comparison of A with C throw us out.

554. That the evidence makes someone else's feeling ((i.e. what is within)) *merely* probable is not what matters to us; what we are looking at is the fact that *this* is taken as *evidence* for something (important); that we base a judgment on *this* involved sort of evidence, and hence that *such* evidence has a special importance in our lives and is made prominent by a concept. ((The 'inner' and the 'outer', a *picture*)).

555. The 'uncertainty' relates not to the particular case, but to the method, to the rules of evidence.

556. The uncertainty is not founded on the fact that he does not wear his pain on his sleeve. And there is not an uncertainty *in each particular case*. If the frontier between two counties were in dispute, would it follow that the county to which any individual resident belonged was dubious?

557. Imagine that people could observe the functioning of the nervous system in others. In that case they would have a sure way of distinguishing genuine and simulated feeling.--Or might they after all doubt in turn whether someone feels anything when these signs are present?--What they see there could at any rate readily be imagined to determine their reaction without their having any qualms about it.

And now this can be transferred to outward behaviour.

This observation fully determines their attitude to others and doubt does not occur.

558. There is indeed the case where someone later reveals his inmost heart to me by a confession: but that this is so cannot offer me any explanation of outer and inner, for I have to give credence to the confession.

For confession is of course something exterior.

559. Look at people who doubt even in these circumstances, and at ones who do not doubt.

560. Only God sees the most secret thoughts. But why should these be all that important? Some are important, not all. And need all human beings count them as important?

561. *One* kind of uncertainty is that with which we might face an unfamiliar mechanism. In another we should possibly be recalling an occasion in our life. It might be e.g. that someone who has just escaped the fear of death would shrink from swatting a fly, though he would otherwise do it without thinking twice about it. Or on the other hand that, having this experience in his mind's eye, he does with hesitancy what otherwise he does unhesitatingly.

562. Even when I 'do not rest secure in my sympathy' I need not think of uncertainty about his later behaviour.

563. The one uncertainty stems from you, so to speak, the other from him.

The one could surely be said to connect up with an analogy, then, but not the other. Not, however, as if I were drawing a conclusion from the analogy!

564. If however I doubt whether a spider feels pain, it is not because I don't know what to expect.

565. But we cannot get away from forming the picture of a mental process. And *not* because we are acquainted with it in our own case!

Page 98

566. Might not the attitude, the behaviour, of trusting, be quite universal among a group of humans? So that a doubt about manifestations of feeling is quite foreign to them?†1

Page 98

567. How could human behaviour be described? Surely only by sketching the actions of a variety of humans, as they are all mixed up together. What determines our judgment, our concepts and reactions, is not what *one* man is doing *now*, an individual action, but the whole hurly-burly of human actions, the background against which we see any action.

Page 98

568. Seeing life as a weave, this pattern (pretence, say) is not always complete and is varied in a multiplicity of ways. But we, in our conceptual world, keep on seeing the same, recurring with variations. That is how our concepts take it. For concepts are not for use on a single occasion.†2

Page Break 99

Page 99

569. And one pattern in the weave is interwoven with many others.

Page 99

570. "One *can't* pretend like that".--This may be a matter of experience--namely that no one who behaves like *that* will later behave in such-and-such a way; but it also may be a conceptual stipulation ("That wouldn't still be pretence"); and the two may be connected.

That can no longer be called "pretence".

(For it wouldn't have been said that the planets *had* to move in circles, if it had not appeared *that* they move in circles).

((Compare: "One cannot talk like that without thinking", "One cannot act like that involuntarily")).

Page 99

571. Couldn't you imagine a further surrounding in which this too could be interpreted as pretence? Must not any behaviour allow of such an interpretation?

But what does it mean to say that all behaviour *might* always be pretence? Has experience taught us this? How else can we be instructed about pretence? No, it is a remark about the concept 'pretence'. But then this concept would be unusable, for pretending would have no criteria in behaviour.

Page 99

572. Isn't there something here like the relation between Euclidean geometry and the experience of the senses? (I mean that there is a profound resemblance here). For Euclidean geometry too corresponds to experience only in some way that is not at all easy to understand, not merely as something more exact to its less exact counterpart.

Page 99

573. There is such a thing as trust and mistrust in behaviour!

If anyone complains, e.g., I may be trustful and react with perfect confidence, or I may be uncertain, like someone who has his suspicions. Neither words nor thoughts are needed for this.

Page 99

574. Is what he says he has, and I say I have, without our inferring this from any sort of observation--is it the same as what we gather from observing the behaviour of someone else and from his *expressions* of conviction?

Page Break 100

Page 100

575. Can it be said that I *infer* that he will act as *he intends* to act? ((Case of the wrong gesture)).

Page 100

576. Why do I never infer my probable actions from my words? For the same reason as I do not infer my probable behaviour from my facial expression.--For the interesting thing is not that I do not infer my emotion from my expression of emotion, but that I also do not infer my later behaviour from that expression, as other people do, who observe me.

Page 100

577. What is voluntary is certain movements with their normal *surrounding* of intention, learning, trying, acting. Movements of which it makes sense to say that they are sometimes voluntary and sometimes involuntary are movements in a special surrounding.

Page 100

578. If someone were now to tell us that *he* eats involuntarily--what evidence would make one believe this?

Page 100

579. One produces a sneeze or a fit of coughing in oneself, but not a voluntary movement. And the will does not produce sneezing, nor yet walking.

Page 100

580. My expression†1 came from my thinking of willing as a sort of producing--not however as a case of causation, but--I should like to say--as a direct, non-causal producing. And the basis of this idea is our imagining that the causal nexus is the connexion of two machine parts by means of a mechanism, say a train of cogwheels.

Page 100

581. Is "I am doing my utmost" the expression of an experience?--One difference: one says "Do your utmost".

Page 100

582. If someone meets me in the street and asks "Where are you going?" and I reply "I don't know", he assumes I have no definite *intention*; not that I do not know whether I shall be able to carry out my intention. (Hebel.)†2

Page Break 101

Page 101

583. What is the difference between these two things: Following a line involuntarily--Following a line intentionally?

What is the difference between these two things: Tracing a line with care and great attention--Attentively observing how my hand follows a line?

Page 101

584. Certain differences are easy to give. One lies in foreseeing what the hand will do.

Page 101

585. The experience of getting to know a new experience. E.g. in writing. When does one say one has become acquainted with a new experience? How does one use such a proposition?

Page 101

586. Writing is certainly a voluntary movement, and yet an automatic one. And of course there is no question of a feeling of each movement in writing. One feels something, but could not possibly analyse the feeling. One's hand writes; it does not write because one wills, but one wills what it writes.

One does not watch it in astonishment or with interest while writing; does not think "What will it write now?" But not because one had a wish it should write *that*. For that it writes what I want might very well throw me into astonishment.

Page 101

587. A child learns to walk, to crawl, to play. It does not learn to play voluntarily and involuntarily. But what makes its movements in play into voluntary movements?--What would it be like if they were involuntary?--Equally, I might ask: what makes this movement into a game?--Its character and its surroundings.

Page 101

588. Active and passive. Can one give an order to do it or not? This perhaps seems, but is not, a far-fetched distinction. It is like: "Can one (*logical* possibility) decide to do it or not?"--And that means: How is it surrounded by thoughts, feelings, etc.?

Page 101

589. "When I make an effort, I surely *do* something, I don't merely have a sensation". And that is so; for one tells someone "Make an effort" and he may express his intention: "Now I will make an effort". And if he says "I can't keep it up"--that does not mean "I can't put up with the feeling in my limbs"--e.g. of

Page Break 102

pain.--On the other hand, however, one *suffers* from making an effort as from pain. "I am completely exhausted"--if someone said that, but moved as briskly as ever, we should not understand him.

Page 102

590. The connexion of our main problem with the epistemological problem of willing has occurred to me before. When such an obstinate problem makes its appearance in psychology, it is never a question about facts of experience (such a problem is always much more tractable), but a logical, and hence properly a grammatical question.

Page 102

591. My own behaviour is sometimes--but *rarely*--the object of my own observation. And this is connected with the fact that I intend my behaviour. Even if an actor observes his own expressions in a glass, or a musician pays close

attention to every note he plays and judges it, this is done so as to direct his action accordingly.

Page 102

592. What does it mean to say e.g. that self-observation makes my action, my movements, uncertain?

I cannot observe myself unobserved. And I do not observe myself for the same purpose as I do someone else.

Page 102

593. If a child stamps and roars with fury--who would say it was doing so involuntarily? And why? Why does one assume it not to be doing this involuntarily? What are the *tokens* of involuntary action? Are there such tokens?--Then what are the tokens of involuntary movement? It does not obey orders, as voluntary movement does. We have "Come here", "Go over there", "Make this arm-movement"; but not "Make your heart beat".

Page 102

594. There is a particular interplay of movements, words, expressions of face, as of manifestations of reluctance or readiness, which are characteristic of the voluntary movements of a normal human being. If one calls a child, he does not come automatically: there is e.g. the gesture "I don't want to!" Or coming cheerfully, the decision to come, running away with signs of fear, the effects of being addressed, all the reactions of the game, the signs and the effects of consideration.

Page Break 103

Page 103

595. How could I prove to myself that I can move my arm voluntarily? Say by telling myself: "Now I will move it" after which it moves? Or should I say "Simply by moving it"? But how do I know that I did it, and that it did not move just by accident? Do I in the end feel it after all? And suppose my memory of previous feelings were to deceive me and these were not the right feelings to go by! (And which are the right ones?) And how does someone else know whether *I* have moved my arm voluntarily? Perhaps I shall say to him "Order me to make whatever movement you like and, to convince you, I will do it".--And what do you feel in your arm? "Well, the usual feeling". There is nothing unusual about the feelings--the arm isn't without feeling, for example (as if it had 'gone to sleep').

Page 103

596. If I do not know that a movement of my body is taking place or has taken place, that movement will be called involuntary.--But how about when I merely *try* to lift a weight, and so there is a movement that does not take place? What would it be like if someone involuntarily strained to lift a weight? In what circumstances would one call *this* behaviour 'involuntary'?

Page 103

597. May not rest be just as voluntary as motion? May not the cessation of movement be voluntary? What better argument against a feeling of innervation?

Page 103

598. What a queer concept 'to attempt', 'to try', is: what can one not 'try to do'! (One tries to remember, to lift a weight, to attend, to think of nothing). But then it might also be said: What a remarkable concept 'doing' is! What are the relations of affinity between 'talking' and 'thinking', between 'speaking' and 'speaking inwardly'? (Compare the relation of affinity between the kinds of numbers).

Page 103

599. One draws quite different conclusions from an involuntary movement and from a voluntary: this *characterizes* voluntary movement.

Page 103

600. But how do I know that this movement was voluntary?--I don't know this, I manifest it.

Page Break 104

Page 104

601. "I am pulling as hard as I can". How do I know that? Does the feeling in my muscles tell me so? The words are a signal; and they have a *function*.

But then, don't I *experience* anything? Do I experience something, then? Something specific? A specific feeling of straining and not-being-able-to-do-anymore, of reaching the limit? Of course, but these expressions say no more than "I am pulling as hard as I can".

Page 104

602. Compare this case: Someone is to say what he feels when a weight is resting on his flat hand. Now I can imagine a split here: On the one hand he tells himself that what he feels is a pressure against the surface of his hand and a tension in the muscles of his arm; on the other hand he wants to say: "But that isn't all! I surely feel a pull, a drive downwards on the part of the weight."--Does he then have a sensation of such a 'drive'? Yes: when he thinks of

the 'drive'. With the word 'drive' there goes here a particular picture, a gesture, a tone of voice; and in this you can see the experience of the drive.

(Think also of this: Some people say Such-and-such a person 'gives forth a fluid'--This is the source of the word "*influence*".)

Page 104

603. The unpredictability of human behaviour. But for this--would one still say that one can never know what is going on in anyone else?

Page 104

604. But what would it be like if human behaviour were not unpredictable? How are we to imagine this? (That is to say: how should we depict it in detail, what are the connexions we should assume?)

Page 104

605. One of the most dangerous of ideas for a philosopher is, oddly enough, that we think with our heads or in our heads.

Page 104

606. The idea of thinking as a process in the head, in a completely enclosed space, gives him something occult.

Page 104

607. Is thinking a specific *organic* process of the mind, so to speak--as it were chewing and digesting in the mind? Can we replace it by an inorganic process that fulfils the same end,

Page Break 105

as it were use a prosthetic apparatus for thinking? How should we have to imagine a prosthetic organ of thought?

Page 105

608. No supposition seems to me more natural than that there is no process in the brain correlated with associating or with thinking; so that it would be impossible to read off thought-processes from brain-processes. I mean this: if I talk or write there is, I assume, a system of impulses going out from my brain and correlated with my spoken or written thoughts. But why should the *system* continue further in the direction of the centre? Why should this order not proceed, so to speak, out of chaos? The case would be like the following--certain kinds of plants multiply by seed, so that a seed always produces a plant of the same kind as that from which it was produced--but *nothing* in the seed corresponds to the plant which comes from it; so that it is impossible to infer the properties or structure of the plant from those of the seed that it comes out of--this can only be done from the *history* of the seed. So an organism might come into being even out of something quite amorphous, as it were causelessly; and there is no reason why this should not really hold for our thoughts, and hence for our talking and writing.

Page 105

609. It is thus perfectly possible that certain psychological phenomena *cannot* be investigated physiologically, because physiologically nothing corresponds to them.

Page 105

610. I saw this man years ago: now I have seen him again, I recognize him, I remember his name. And why does there have to be a cause of this remembering in my nervous system? Why must something or other, whatever it may be, be stored up there *in any form*? Why *must* a trace have been left behind? Why should there not be a psychological regularity to which *no* physiological regularity corresponds? If this upsets our concepts of causality then it is high time they were upset.

Page 105

611. The prejudice in favour of psychophysical parallelism is a fruit of primitive interpretations of our concepts. For if one allows a causality between psychological phenomena which is not mediated physiologically, one thinks one is making profession that there exists a soul *side by side* with the body, a ghostly soul-nature.

Page Break 106

Page 106

612. Imagine the following phenomenon. If I want someone to take note of a text that I recite to him, so that he can repeat it to me later, I have to give him paper and pencil; while I am speaking he makes lines, marks, on the paper; if he has to reproduce the text later he follows those marks with his eyes and recites the text. But I assume that what he has jotted down is not *writing*, it is not connected by rules with the words of the text; yet without these jottings he is unable to reproduce the text; and if anything in it is altered, if part of it is destroyed, he sticks in his 'reading' or recites the text uncertainly or carelessly, or cannot find the words at all.--This *can* be imagined!--What I called jottings would not be a *rendering* of the text, not so to speak a translation with another symbolism. The text would not be *stored up* in the jottings. And why should it be stored up in our nervous system?

Page 106

613. Why should there not be a natural law connecting a starting and a finishing state of a system, but not covering the intermediary state? (Only one must not think of *causal efficacy*.)

Page 106

614. "How does it come about that I see the tree standing up straight even if I incline my head to one side, and so the retinal image is that of an obliquely standing tree?" Well, how does it come about that I speak of the tree as standing up straight even in these circumstances?--"Well, I am conscious of the inclination of my head, and so I supply the requisite correction in the way I take my visual impression."--But doesn't that mean confusing what is primary and what is secondary? Imagine that we know *nothing at all* of the inner structure of the eye--would this problem altogether disappear? We do not supply any correction here--that explanation is gratuitous.

Well--but now that the structure of the eye is known--*how does it come about* that we act, react, in this way? But must there be a physiological explanation here? Why don't we just leave explaining alone?--But you would never talk like that, if you were examining the behaviour of a machine!--Well, who says that a living creature, an animal body, is a machine in this sense?--

Page 106

615. (I have never yet read a comment on the fact that when one shuts one eye and "only sees with one eye" one does not

Page Break 107

simultaneously see darkness (blackness) with the one that is shut.)

Page 107

616. The limitlessness of the visual field is clearest when we are seeing nothing in complete darkness.†1

Page 107

617. How is it with a blind man; can one part of *language* not be explained to him? Or rather not be *described*?

Page 107

618. A blind man can say that he is blind and the people around him sighted. "Yes, but doesn't he after all mean something different from a sighted man when he uses the words 'blind' and 'sighted'?" What is the ground of one's inclination to say so? Well, if someone did not know what a leopard looked like, still he could say and understand "That place is very dangerous, there are leopards there". He would perhaps all the same be said not to know what a leopard is, and so not to know, or not completely, what the word "leopard" means, until he is shewn such an animal. Now it strikes us as being the same with the blind. They don't know, so to speak, what seeing is like.--Now is 'not knowing fear' analogous to 'never having seen a leopard'? That, of course, I want to deny.

Page 107

619. Might I not e.g. make the assumption that he sees something red when I hit him on the head? This might correspond to an experience in the case of sighted people.

Assuming this, still he is blind for all practical purposes. That is to say he does not react like a normal human being. If, however, someone were blind of eye, but on the other hand so conducted himself that we were forced to say that he saw with the palms of his hands (this behaviour is easy to work out), we should treat him as sighted and should also find possible the use of a sample slip to explain the word 'red' to him.

Page 107

620. You give someone a signal when you imagine something: you use different signals for different images.--How have you agreed together what each signal is to mean?

Page 107

621. Auditory images, visual images--how are they distinguished from sensations? Not by "vivacity".

Page Break 108

Page 108

Images tell us nothing, either right or wrong, about the external world. (Images are not hallucinations, nor yet fancies).

While I am looking at an object I cannot imagine it.

Difference between the language-games: "Look at this figure!" and: "Imagine this figure!"

Images are subject to the will.

Images are not pictures. I do not tell what object I am imagining by the resemblance between it and the image.

Page 108

Asked "What image have you?" one can answer with a picture.

Page 108

622. One would like to say: The imaged is in a different *space* from the heard sound. (Question: Why?) The seen in a different space from the imaged.

Hearing is connected with listening; forming an image of a sound is not.

That is why the heard sound is in a different space from the imagined sound.

Page 108

623. I read a story and have all sorts of images while I read, i.e. while I am looking attentively, and hence seeing clearly.

Page 108

624. People might exist who never use the expression "seeing something with the inner eye" or anything like it, and these people might be able to draw and model 'out of imagination' or from memory, to mimic others etc. Such a person might also shut his eyes or stare into vacancy as if blind before drawing something from memory. And yet he might deny that he then *sees* before him what he goes on to draw. But what value need I set on this utterance? Should I judge by *it* whether he has a visual image? (Not *it* alone. Think of the expression: "Now I see it before me--now no longer". Here is genuine duration.)

Page 108

625. I might also have said earlier: The *tie-up* between imaging and seeing is close; but there is no *similarity*.

The language-games employing these concepts are radically different--but hang together.

Page Break 109

Page 109

626. Difference between: 'trying to see something' and 'trying to form an image of something'. In the first case one says: "Look, just over there!", in the second "Shut your eyes!"

Page 109

627. It is just because forming images is a voluntary activity that it does not instruct us about the external world.

Page 109

628. What is imaged is not in the same *space* as what is seen. Seeing is connected with looking.

Page 109

629. "Seeing and imaging are different phenomena".--The words "seeing" and "imaging" have different meanings. Their meanings relate to a host of important kinds of human behaviour, to phenomena of human life.

Page 109

630. If someone insists that what he calls a "visual image" is like a visual impression, say to yourself once more that perhaps he is *making a mistake*. Or: Suppose he is making a mistake. That is to say: What do you know about the resemblance of his visual impression and his visual image?! (I speak of others because what goes for them goes for me too).

So what do you know about this resemblance? It is manifested only in the expressions which he is inclined to use; not in something he uses those expressions to say.

Page 109

631. "There's no doubt at all: visual images and visual impressions are of the same kind!" That must be something you know from your own experience; and in that case it is something that may be true for you and not for other people. (And this of course holds for me too, if *I* say it).

Page 109

632. When we form an image of something we are not observing. The coming and going of the pictures is not something that *happens* to us. We are not surprised by these pictures, saying "Look!" (Contrast with e.g. after-images).

Page 109

633. We do not 'banish' visual impressions, as we do images. And we don't say of the former, either, that we might *not* banish them.

Page 109

634. If someone really were to say "I don't know whether I am now seeing a tree or having an image of it", I should at first think he meant: "or just fancying that there is a tree over there".

Page Break 110

If he does not mean this, I couldn't understand him at all--but if someone tried to explain this case to me and said "His images are of such extraordinary vivacity that he can take them for impressions of sense"--should I understand it then?

Page 110

635. But must one not distinguish here: (a) forming the image of a human face, for example, but not in the space that

surrounds me--(b) forming an image of a picture on that wall over there?

At the request "Imagine a round spot over there" one might fancy that one really was seeing one there.

Page 110

636. The 'imagination-picture' does not enter the language-game in the place where one would like to surmise its presence.

Page 110

637. I learn the concept 'seeing' along with the description of what I see. I learn to observe and to describe what I observe. I learn the concept 'to have an image' in a different context. The descriptions of what is seen and what is imaged are indeed of the same kind, and a description might be of the one just as much as of the other; but otherwise the concepts are thoroughly different. The concept of imaging is rather like one of doing than of receiving. Imagining might be called a creative act. (And is of course so called).

Page 110

638. "Yes, but the image itself, like the visual impression, is surely the inner picture, and *you* are talking only of differences in the production, the coming to be, and in the treatment of the picture." The image is not a picture, nor is the visual impression one. Neither 'image' nor 'impression' is the concept of a picture, although in both cases there is a tie-up with a picture, and a different one in either case.

Page 110

639. What do you *call* the "experiential content" of seeing, what the "experiential content" of imaging?

Page 110

640. "But couldn't I imagine an experiential content of the same kind as visual images, but not subject to the will, and so in this respect like visual impressions?"

Page 110

641. (Clearly the voluntary act of forming images cannot be compared with moving the body; for someone else is also competent to judge whether the movement has taken place; whereas with the movement of my images the whole point would always

Page Break 111

be what I said I saw--whatever anyone else sees. So really moving objects would drop out of consideration, since no such thing would be in question).

Page 111

642. If then one said: "Images are inner pictures, resembling or exactly like my visual impressions, only subject to my will"--the first thing is that this doesn't yet make sense.

For if someone has learnt to report what he sees over there, or what *seems* to him to be over there, it surely isn't clear to him what it would mean if he were ordered now to see *this* over there, or now to have *this* seem to him to be over there.

Page 111

643. "To move by pure will"--What does that mean? That the image-pictures always exactly obey my will, whereas my hand in drawing, my pencil, does not? All the same in that case it would be possible to say: "Usually I form images of exactly what I want to; today it has turned out differently". Is there such a thing as 'images not coming off'?

Page 111

644. A language-game comprises the use of *several* words.

Page 111

645. Nothing could be more mistaken than to say: seeing and forming an image are different activities. That is as if one were to say that moving and losing in chess were different activities.

Page 111

646. When we learn as children to use the words "see", "look", "image", voluntary actions and orders play a part in this training. But a different one for each of the three words. The language-game "Look" and "Form an image of..."--how am I ever to compare them?--If we want to train someone to react to the order "Look..." and to understand the order "Form an image of..." we must obviously teach him quite differently. Reactions which belong to the latter language-game do not belong to the former. There is of course a close tie-up of these language-games; but a resemblance?--Bits of one resemble bits of the other, but the resembling bits are not homologous.

Page 111

647. I could imagine something similar for actual games.

Page Break 112

Page 112

648. One language-game analogous to a fragment of another. One space projected into a limited extent of another. A 'gappy' space. (For "inner and outer".)

Page 112

649. Let us imagine a variant of tennis: it is included in the rules of this game that the player has to *form such-and-such* images as he performs certain moves in the game. (Let the purpose of this rule be to make the game more difficult.) The first objection is: it is too easy to cheat in this game. But this is met by the assumption that the game is played only by honest and reliable people. So here we have a game with inner moves of the game.--

What sort of move is the inner move of the game, what does it consist in? In this, that--according to the rule--he forms an image of....--But might it not also be said: *We do not know* what kind of inner move of the game he does perform according to the rule; we only know its manifestations. Let the inner move of the game be an X, whose nature we do not know. Or again: Even here there are only external moves of the game; the communication of the rule and what is called the 'manifestation of the inner process'.--Now may one not describe the game in all three different ways? Even the one with the 'unknown' X is a quite possible kind of description. One man says that the so-called 'inner' move in the game is not comparable with a move in the game in the ordinary sense--the next says it *is* so comparable--and the third: it is comparable only with an action happens in secret and which no one knows but the agent.

It is important for us to see the *dangers* of the expression "inner move of the game". It is dangerous because it produces confusion.

Page 112

650. Memory: "I see us still, sitting at that table".--But have I really the same visual image--or one of those that I had then? Do I also certainly see the table and my friend from the same point of view as then, and so not see myself?--My memory-image is not evidence for that past situation, like a photograph which was taken then and convinces me now that this was how things were then. The memory-image and the memory-words stand on the *same* level.

Page Break 113

Page 113

651. Shrugging of shoulders, head-shakes, nods and so on we call signs first and foremost because they are embedded in the use of our *verbal language*.

Page 113

652. If one takes it as obvious that a man takes pleasure in his own fantasies, let it be remembered that fantasy does not correspond to a painted picture, to a sculpture or a film, but to a complex formation out of heterogeneous components--signs and pictures.

Page 113

653. Some men recall a musical theme by having an image of the score rise before them, and reading it off.

It could be imagined that what we call "memory" in some man consisted in his seeing himself looking things up in a book in spirit, and that what he read in that book was what he remembered. (How do I *react* to a memory?)

Page 113

654. Can a memory-experience be described?--Certainly.--But can what is memory-like about this experience be described? *What does that mean?*--((The indescribable aroma.))

Page 113

655. "A picture (imagination-picture, memory-image) of longing." One thinks one has already done everything by speaking of a 'picture'; for longing is a content of consciousness, and a picture of it is something that is (very) like it, even though less clear than the original.

And it might well be said of someone who plays longing on the stage, that he experiences or has a picture of longing: not as an *explanation* of his action, but as a description of it.

Page 113

656. To be ashamed of a thought. Is one ashamed at the fact that one has spoken such-and-such a sentence in one's imagination?

Language is variously rooted; it has roots, not a single root. [*Marginal note:* ((Remembering a thought, an intention.)) A *seed*.]

Page 113

657. "It tastes exactly like sugar." How is it I can be so sure of this? Even if it turns out wrong.--And what astonishes me about it? That I bring the concept sugar into so *firm* a connexion with the taste sensation. That I seem to recognize the substance sugar directly in the taste.

Page Break 114

But instead of the expression "It tastes exactly..." I might more primitively exclaim "Sugar!" And can it be said that 'the substance sugar comes before my mind' at the word? How does it do that?

658. Can I say that this taste brought the name "sugar" along with it in a peremptory fashion? Or the picture of a lump of sugar? Neither seems right. The demand for the concept 'sugar' is indeed peremptory, just as much so, indeed, as the demand for the concept 'red' when we use it to describe what we see.

659. I remember that sugar tasted like this. The experience returns to consciousness. But, of course: how do I know that this was the earlier experience? Memory is no more use to me here. No, in those words--that the experience returns to consciousness.....--I am only transcribing my memory, not describing it.

But when I say "It tastes exactly like sugar", in an important sense no remembering takes place. So I do *not* have grounds for my judgment or my exclamation. If someone asks me "What do you mean by 'sugar'?"--I shall indeed try to shew him a lump of sugar. And if someone asks "How do you know that sugar tastes like that?" I shall indeed answer him "I've eaten sugar thousands of times"--but that is not a justification that I give myself.

660. "It tastes like sugar". One remembers exactly and with certainty what sugar tastes like. I do not say "I believe sugar tastes like this". What a remarkable phenomenon! It just is the phenomenon of memory.--But is it right to call it a remarkable phenomenon?

It is anything but remarkable. That certainty is not (by a hair's breadth) more remarkable than uncertainty would be. For what is remarkable? My saying with certainty "This tastes like sugar", or its then really being sugar? Or that other people find the same thing?

If the certain recognition of sugar is remarkable, then the failure to recognize it would be less so.

661. "What a queer and frightful sound. I shall never forget it". And why should one not be able to say that of remembering

("What a queer... experience...") when one has seen into the past for the first time?--

662. Remembering: a seeing into the past. *Dreaming* might be called that, when it presents the past to us. But not remembering; for, even if it shewed scenes with hallucinatory clarity, still it takes remembering to tell us that this is past.

663. But if memory shews us the past, how does it shew us that it is the past?

It does *not* shew us the past. Any more than our senses shew us the present.

664. Nor can it be said to communicate the past to us. For even supposing that memory were an audible voice that spoke to us--how could we understand it? If it tells us e.g. "Yesterday the weather was fine", how can I learn what "yesterday" means?

665. I give myself an exhibition of something only *in the same way* as I give one to other people.

666. I can display my good memory to someone else and also to myself. I can subject myself to an examination. (Vocabulary, dates).

667. But how do I give myself an exhibition of remembering? Well, I ask myself "How did I spend this morning?" and give myself an answer.--But what have I really exhibited to myself? Remembering? That is, what it's like to remember something?--Should I have exhibited remembering to *someone else* by doing that?

668. Forgetting the meaning of a word--and then remembering it again. What sort of processes go on here? What does one remember, what occurs to one, when one recalls what the French word "peut-être" means?

669. If I am asked "Do you know the ABC?" and I answer "Yes" I am not saying that I am now going through the ABC in my mind, or that I am in a special mental state that is somehow equivalent to the recitation of the ABC. †1

670. One can own a mirror; does one then own the reflection that can be seen in it?

671. Saying something is an activity, being inclined to say something a *state*. "But what does it consist in?"--Give yourself an account of how the expression is used.

672. "So long as the temperature of the rod does not fall below... it can be forged." So it makes sense to say: "I can forge it from five till six o'clock." Or: "I can play chess from five till six," i.e. I have time from five till six.--"So long as my pulse does not fall below... I can do the calculation." This calculation takes one and a half minutes; but how long does *being able to do* it take? And if you *can* do it for an hour, do you keep on starting afresh?

673. Attention is dynamic, not static--one would like to say. I begin by comparing attention to gazing but that is not what I call attention; and now I want to say that I find it is *impossible* that one should attend statically.

674. If in a particular case I say: attention consists in preparedness to follow each smallest movement that may appear--that is enough to shew you that attention is not a fixed gaze: no, this is a concept of a different kind.

675. States: 'Being able to climb a mountain' may be called a state of my body. I say: "I can climb it--I mean I am strong enough." Compare with this the following condition of being able. "Yes, I can go there"--I mean I have enough time.

676. What is the role of false propositions in a language-game? I believe there are various cases.

(1) Someone has to observe the signal lights at a street-crossing and to tell someone else what colours are shewing. He makes a slip of the tongue and says the wrong colour.

(2) Meteorological observations are put in train and the weather for the next day is predicted from them by certain rules. The prediction comes off or does not.

In the first case one can say he plays wrong; in the second one cannot--as at one time I thought.

Here one is tormented by a question running something like: Is the verification too part of the language-game?

677. I assert: "If *this* happens, *that* will happen. If I am right, you pay me a shilling, if I am wrong, I pay you one, if it remains undecided, neither pays". This might also be expressed like this: The case in which the antecedent does *not* come true does not interest us, we aren't talking about it. Or again: we do not find it natural to use the words "yes" and "no" in the same way as in the case (and there are such cases) in which we are interested in the material implication. By "No" we mean here "p and not q", by "Yes", only "p and q". There is no law of excluded middle running: Either you win the bet or you lose it--there is no third possibility.

678. Someone playing at dice throws first five, then four and says "If only I'd thrown a four instead of the five I'd have won!" The condition is not physical but only mathematical, for one might reply: "If you had thrown a four first,--who knows what you would have thrown after?"

679. If you say now "The use of the subjunctive is founded on belief in natural law--the rejoinder may be: "It is not *founded* on that belief; it and that belief are on the same level". (In a film I heard a father tell his daughter that he ought to have married a different woman: "*She* ought to have been your mother"! Why is this wrong?)

680. Fate stands in contrast to natural law. One seeks to find grounds for natural law and to use it, but not fate.

681. "If p occurs, then q occurs" might be called a conditional prediction. That is, I make *no* prediction for the case not-p. But for that reason what I say also remains unverified by "not-p and not-q".

Or even: there are conditional predictions and "p implies q" is *not* one. ((Relates to Vol. Q, p. 14.))†1

682. I will call the sentence "If p occurs then q occurs" "S".--"S or not S" is a tautology; but is it (also) the law of excluded middle?--Or again: If I want to say that the prediction "S"

may be right, wrong, or undecided, is that expressed by the sentence "not (S or not-S)"?

683. Is the negation of a proposition identical with the disjunction of the cases it does not exclude? In some cases it is. (E.g. in this one: "The permutation of the elements ABC that he wrote down was not ACB").

684. The important sense of Frege's assertion-sign is perhaps best grasped if we say: it signals clearly the *beginning of the sentence*.--This is *important*: for our philosophical difficulties about the nature of 'negation' and of 'thinking' hang together with the fact that a proposition "&unk; not-p" or "&unk; I believe p" does contain the proposition "p" but not "&unk; p". (For if I hear someone say: "it's raining" I don't know what he said if I don't know whether I heard the *beginning* of the sentence).†1

685. A contradiction prevents me from getting to act in the language-game.

686. But suppose the language-game consisted in my continuously being driven from one decision to the contrary one!

687. Contradiction is to be regarded, not as a catastrophe, but as a wall indicating that we can't go on here.

688. I should like to ask, not so much "What must we do to avoid a contradiction?" as "What ought we to do if we have arrived at a contradiction?"

689. Why is a contradiction more to be feared than a tautology?

690. Our motto might be: "Let us not be bewitched".

691†2. "The Cretan Liar". He might have written "This proposition is false" instead of "I am lying". The answer would be: "Very well, but which proposition do you mean?"--"Well, *this* proposition".--"I understand, but which is the proposition mentioned in *it*?"--"*This* one"--"Good, and which proposition

does *it* refer to?" and so on. Thus he would be unable to explain what he means until he passes to a complete proposition.--We may also say: The fundamental error lies in one's thinking that a phrase e.g. "This proposition" can as it were allude to its object (point to it from far off) without having to go proxy for it.

692. Let us raise the question: What practical purpose can be served by Russell's Theory of Types?--Russell makes us realize that we must sometimes put restrictions on the expression of generality in order to avoid having undesirable consequences drawn from it.

693. The reasoning that leads to an infinite regress is to be given up not 'because in this way we can never reach the goal', but because here there is no goal; so it makes no sense to say "we can never reach it".

We readily think that we must run through a few steps of the regress and then so to speak give it up in despair. Whereas its aimlessness (the lack of a goal in the calculus) can be derived from the starting position.

694. A variant of Cantor's diagonal proof:

Let $N = F(k, n)$ be the form of a law for the development of decimal fractions. N is the n^{th} decimal position of the k^{th} development. The law of the diagonal is then: $N = F(n, n) = \text{Def. } F'(n)$.

To prove: that $F'(n)$ cannot be one of the rules $F'(k, n)$. Assume it is the 100th. Then the rule for the construction

of $F'(1)$ runs $F(1, 1)$

of $F'(2)$ $F(2, 2)$ etc.

but the rule for the construction of the 100th position of $F'(n)$ becomes $F(100, 100)$ i.e. it shews only that the 100th place is supposed to be the same as itself, and so for $n = 100$ it is *not* a rule.

The rule of the game runs "Do the same as..."--and in the special case it becomes "Do the same as what you

do".

Page 119

695. The *understanding* of a mathematical question. How do we know if we understand a mathematical question? A question--it may be said--is a commission. And understanding a commission means: knowing what one has got

Page Break 120

to do. Naturally, a commission can be quite vague--e.g., if I say "Bring him something that'll do him good". But that may mean: think about him, about his state etc. in a friendly way and then bring him something corresponding to your sentiment towards him.

Page 120

696. A mathematical question is a challenge. And we might say: it makes sense, if it spurs us on to some mathematical activity.

Page 120

697. We might then also say that a question in mathematics makes sense if it stimulates the mathematical imagination.

Page 120

698. Translating from one language into another is a mathematical task, and the translation of a lyrical poem, for example, into a foreign language is quite analogous to a mathematical *problem*. For one may well frame the problem "How is this joke (e.g.) to be translated (i.e. replaced) by a joke in the other language?" and this problem can be solved; but there was no systematic method of solving it.

Page 120

699. Imagine human beings who calculate with 'extremely complicated' numerals. These present themselves as figures which arise if our numerals are written on top of one another. They write e.g. π up to the fifth place like this:

. If you watch them you find it difficult to guess *what* they are doing. And they themselves perhaps cannot explain it. For this numeral, written in a somewhat different notation, may alter its appearance to the point of unrecognizability by us. And what the people were doing would seem to us purely intuitive.

Page 120

700. Why do we count? Has it proved practical? Do we have the concepts we have, e.g. our psychological concepts, because it has proved advantageous?--And yet we do have *certain* concepts on that account, we have introduced them on that account.

Page 120

701. At any rate the difference between what are called propositions of mathematics and empirical propositions comes to light if one reflects whether it makes sense to say: "I wish twice two were five!"

Page Break 121

Page 121

702. If one considers that $2 + 2 = 4$ is a proof of the proposition "there are even numbers", one sees how loosely the word "proof" is used here. The proposition "there are even numbers" is supposed to proceed from the equation $2 + 2 = 4$!--And what is the proof of the existence of prime numbers?--The method of reduction to prime factors. But in this method *nothing is said*, not even about "prime numbers".

Page 121

703. "To understand sums in the elementary school the children would have to be important philosophers; failing that, they need practice".†1

Page 121

704. Russell and Frege take concepts as, as it were, properties of things. But it is very unnatural to take the words man, tree, treatise, circle, as properties of a substrate.†2

Page 121

705. Dirichlet's conception of a function is only possible where it does not seek to express an infinite rule by a list, for there is no such thing as an infinite list.

Page 121

706. Numbers are not fundamental to mathematics.

Page 121

707. The concept of the 'order' of the rational numbers, e.g., and of the impossibility of so ordering the irrational

numbers. Compare this with what is called an 'ordering' of digits. Likewise the difference between the 'co-ordination' of one digit (or nut) with another and the 'co-ordination' of all whole numbers with the even numbers; etc. Everywhere distortion of concepts.

Page 121

708. There is obviously a method of making a straight-edge. This method involves an ideal, I mean an approximation-procedure of unlimited *possibility*, for this very procedure *is* the ideal.

Or rather: only if there is an approximation-procedure of unlimited possibility can (not must) the geometry of this procedure be Euclidean.†3

Page 121

709. To regard a calculation as an ornament is also formalism, but of a good sort.

Page 121

710. A calculation can be regarded as an ornament. A figure in a plane may fit another one or not, may be taken with other ones

Page Break 122

in various ways. If further the figure is coloured, there is a further fit according to colour. (Colour is only another dimension).

Page 122

711. There is a way of looking at electrical machines and installations (dynamoes, radio stations, etc., etc.) which sees these objects as arrangements of copper, iron, rubber etc. in space, without any preliminary understanding. And this way of looking at them might lead to some interesting results. It is quite analogous to looking at a mathematical proposition as an ornament.--It is of course an absolutely strict and correct conception; and the characteristic and difficult thing about it is that it looks at the object without any preconceived idea (as it were from a Martian point of view), or perhaps more correctly: it upsets the normal preconceived idea, explanation (runs athwart it).

Page 122

712. (The style of my sentences is extraordinarily strongly influenced by Frege. And if I wanted to, I could establish this influence where at first sight no one would see it).

Page 122

713. "Put it *here*"--indicating the place with one's finger--that is giving an *absolute* spatial position. And if someone says that space is absolute he might produce this as an argument for it: "There is a *place: here*". [*Marginal note: ((Perhaps belongs with the first language-games.))*]

Page 122

714. A mental illness could be imagined in which one can use and understand a name only in the presence of the bearer.

Page 122

715. There might be a use of signs made, such that they become useless (they are destroyed) as soon as the bearer has ceased to exist.

In this language-game the name has the object on a string, so to speak; and if the object ceases to exist, the name, which has done its work in conjunction with the object, can be thrown away. (The word "handle" for a proper name).

Page 122

716. What about these two sentences: "This sheet is red" and "this sheet is the colour called 'red' in English"? Do they both say *the same*?

Page Break 123

Page 123

Doesn't this depend on what the criterion is for a colour's being called 'red' in English?

Page 123

717. "You can't hear God speak to someone else, you can hear him only if you are being addressed".--That is a grammatical remark.

TRANSLATOR'S NOTE

Page v

MY acknowledgements are due to the following, who either checked the translation or allowed me to consult them about German and Austrian usage or read the translation through and helped me to improve the English: Mr. R. Rhees, Professor G. H. von Wright, Mr. P. Geach, Mr. G. Kreisel, Miss L. Labowsky, Mr. D. Paul, Miss I. Murdoch.

NOTE TO SECOND EDITION

Page v

THE text has been revised for the new edition. Alterations on the German side have been few, and have been confined to mistakes in spelling or punctuation. A large number of small changes have been made in the English text. The following passages have been significantly altered:

Page v

In Part I: §§ 108, 109, 116, 189, 193, 251, 284, 352, 360, 393, 418, 426, 442, 456, 493, 520, 556, 582, 591, 644, 690, 692.

Page v

In Part II: pp. 193e, 211e, 216e, 217e, 220e, 232e.

NOTE TO THE RE-ISSUED SECOND EDITION

Page v

THE graphical representations have been reassessed by Michael A. R. Biggs of the University of Hertfordshire, UK. Reference has been made to both the manuscript sources for this volume and to the broader context of Wittgenstein's writings and graphical practice as a whole. Such a synoptic view was not available when this volume was first published and the editors have taken the opportunity to incorporate recommendations on the grounds of improved legibility, felicity or perspicuity. Revisions have been made to the graphics on the following pages: 23, 138, 193, 203 and 210. The parallel German and English text is identical to the 1967 issue, with the exception of the substitution of the word 'sigma' by the sign 'σ' on page 67.

Page Break vi

EDITORS' NOTE

Page vi

WHAT appears as Part I of this volume was complete by 1945. Part II was written between 1947 and 1949. If Wittgenstein had published his work himself, he would have suppressed a good deal of what is in the last thirty pages or so of Part I and worked what is in Part II, with further material, into its place.

Page vi

We have had to decide between variant readings for words and phrases throughout the manuscript. The choice never affected the sense.

Page vi

The passages printed beneath a line at the foot of some pages are written on slips which Wittgenstein had cut from other writings and inserted at these pages, without any further indication of where they were to come in.

Page vi

Words standing between double brackets are Wittgenstein's references to remarks either in this work or in other writings of his which we hope will appear later.

Page vi

We are responsible for placing the final fragment of Part II in its present position.

PREFACE

Page viii

THE thoughts which I publish in what follows are the precipitate of philosophical investigations which have occupied me for the last sixteen years. They concern many subjects: the concepts of meaning, of understanding, of a proposition, of logic, the foundations of mathematics, states of consciousness, and other things. I have written down all these thoughts as *remarks*, short paragraphs, of which there is sometimes a fairly long chain about the same subject, while I sometimes make a sudden change, jumping from one topic to another.--It was my intention at first to bring all this together in a book whose form I pictured differently at different times. But the essential thing was that the thoughts should proceed from one subject to another in a natural order and without breaks.

Page viii

After several unsuccessful attempts to weld my results together into such a whole, I realized that I should never succeed. The best that I could write would never be more than philosophical remarks; my thoughts were soon crippled if I tried to force them on in any single direction against their natural inclination.--And this was, of course, connected with the very nature of the investigation. For this compels us to travel over a wide field of thought criss-cross in every direction.--The philosophical remarks in this book are, as it were, a number of sketches of landscapes which were made in the course of these long and involved journeyings.

Page viii

The same or almost the same points were always being approached afresh from different directions, and new sketches made. Very many of these were badly drawn or uncharacteristic, marked by all the defects of a weak draughtsman. And when they were rejected a number of tolerable ones were left, which now had to be arranged and

sometimes cut down, so that if you looked at them you could get a picture of the landscape. Thus this book is really only an album.

Page viii

Up to a short time ago I had really given up the idea of publishing my work in my lifetime. It used, indeed, to be revived from time to time: mainly because I was obliged to learn that my results (which I had communicated in lectures, typescripts and discussions), variously

Page Break ix

misunderstood, more or less mangled or watered down, were in circulation. This stung my vanity and I had difficulty in quieting it.

Page ix

Four years ago I had occasion to re-read my first book (the *Tractatus Logico-Philosophicus*) and to explain its ideas to someone. It suddenly seemed to me that I should publish those old thoughts and the new ones together: that the latter could be seen in the right light only by contrast with and against the background of my old way of thinking.†1

Page ix

For since beginning to occupy myself with philosophy again, sixteen years ago, I have been forced to recognize grave mistakes in what I wrote in that first book. I was helped to realize these mistakes--to a degree which I myself am hardly able to estimate--by the criticism which my ideas encountered from Frank Ramsey, with whom I discussed them in innumerable conversations during the last two years of his life. Even more than to this--always certain and forcible--criticism I am indebted to that which a teacher of this university, Mr. P. Sraffa, for many years unceasingly practised on my thoughts. I am indebted to *this* stimulus for the most consequential ideas of this book.

Page ix

For more than one reason what I publish here will have points of contact with what other people are writing to-day.--If my remarks do not bear a stamp which marks them as mine,--I do not wish to lay any further claim to them as my property.

Page ix

I make them public with doubtful feelings. It is not impossible that it should fall to the lot of this work, in its poverty and in the darkness of this time, to bring light into one brain or another--but, of course, it is not likely.

Page ix

I should not like my writing to spare other people the trouble of thinking. But, if possible, to stimulate someone to thoughts of his own.

Page ix

I should have liked to produce a good book. This has not come about, but the time is past in which I could improve it.

CAMBRIDGE,
January 1945.

Page Break x

Page Break 1

PART I

Page 1

Page Break 2

Page 2

1. "Cum ipsi (maiores homines) appellabant rem aliquam, et cum secundum eam vocem corpus ad aliquid movebant, videbam, et tenebam hoc ab eis vocari rem illam, quod sonabant, cum eam vellent ostendere. Hoc autem eos velle ex motu corporis aperiebatur: tamquam verbis naturalibus omnium gentium, quae fiunt vultu et nutu oculorum, ceterorumque membrorum actu, et sonitu vocis indicante affectionem animi in petendis, habendis, rejiciendis, fugiendisve rebus. Ita verba in variis sententiis locis suis posita, et crebro audita, quarum rerum signa essent, paulatim colligebam, measque jam voluntates, edomito in eis signis ore, per haec enuntiabam." (Augustine, *Confessions*, I. 8.)†1

Page 2

These words, it seems to me, give us a particular picture of the essence of human language. It is this: the individual words in language name objects--sentences are combinations of such names.--In this picture of language we find the roots of the following idea: Every word has a meaning. This meaning is correlated with the word. It is the

object for which the word stands.

Page 2

Augustine does not speak of there being any difference between kinds of word. If you describe the learning of language in this way you are, I believe, thinking primarily of nouns like "table", "chair", "bread", and of people's names, and only secondarily of the names of certain actions and properties; and of the remaining kinds of word as something that will take care of itself.

Page 2

Now think of the following use of language: I send someone shopping. I give him a slip marked "five red apples". He takes the slip to

Page Break 3

the shopkeeper, who opens the drawer marked "apples"; then he looks up the word "red" in a table and finds a colour sample opposite it; then he says the series of cardinal numbers--I assume that he knows them by heart--up to the word "five" and for each number he takes an apple of the same colour as the sample out of the drawer.--It is in this and similar ways that one operates with words.--"But how does he know where and how he is to look up the word 'red' and what he is to do with the word 'five'?"--Well, I assume that he *acts* as I have described. Explanations come to an end somewhere.--But what is the meaning of the word "five"?--No such thing was in question here, only how the word "five" is used.

Page 3

2. That philosophical concept of meaning has its place in a primitive idea of the way language functions. But one can also say that it is the idea of a language more primitive than ours.

Page 3

Let us imagine a language for which the description given by Augustine is right. The language is meant to serve for communication between a builder A and an assistant B. A is building with building-stones: there are blocks, pillars, slabs and beams. B has to pass the stones, and that in the order in which A needs them. For this purpose they use a language consisting of the words "block", "pillar", "slab", "beam". A calls them out;--B brings the stone which he has learnt to bring at such-and-such a call.--Conceive this as a complete primitive language.

Page 3

3. Augustine, we might say, does describe a system of communication; only not everything that we call language is this system. And one has to say this in many cases where the question arises "Is this an appropriate description or not?" The answer is: "Yes, it is appropriate, but only for this narrowly circumscribed region, not for the whole of what you were claiming to describe."

Page 3

It is as if someone were to say: "A game consists in moving objects about on a surface according to certain rules..."--and we replied: You seem to be thinking of board games, but there are others. You can make your definition correct by expressly restricting it to those games.

Page 3

4. Imagine a script in which the letters were used to stand for sounds, and also as signs of emphasis and punctuation. (A script can be conceived as a language for describing sound-patterns.) Now imagine someone interpreting that script as if there were simply a

Page Break 4

correspondence of letters to sounds and as if the letters had not also completely different functions. Augustine's conception of language is like such an over-simple conception of the script.

Page 4

5. If we look at the example in §1, we may perhaps get an inkling how much this general notion of the meaning of a word surrounds the working of language with a haze which makes clear vision impossible. It disperses the fog to study the phenomena of language in primitive kinds of application in which one can command a clear view of the aim and functioning of the words.

Page 4

A child uses such primitive forms of language when it learns to talk. Here the teaching of language is not explanation, but training.

Page 4

6. We could imagine that the language of §2 was the *whole* language of A and B; even the whole language of a tribe. The children are brought up to perform *these* actions, to use *these* words as they do so, and to react in *this* way to the words of others.

An important part of the training will consist in the teacher's pointing to the objects, directing the child's attention to them, and at the same time uttering a word; for instance, the word "slab" as he points to that shape. (I do not want to call this "ostensive definition", because the child cannot as yet *ask* what the name is. I will call it "ostensive teaching of words".--I say that it will form an important part of the training, because it is so with human beings; not because it could not be imagined otherwise.) This ostensive teaching of words can be said to establish an association between the word and the thing. But what does this mean? Well, it can mean various things; but one very likely thinks first of all that a picture of the object comes before the child's mind when it hears the word. But now, if this does happen--is it the purpose of the word?--Yes, it *can* be the purpose.--I can imagine such a use of words (of series of sounds). (Uttering a word is like striking a note on the keyboard of the imagination.) But in the language of §2 it is *not* the purpose of the words to evoke images. (It may, of course, be discovered that that helps to attain the actual purpose.)

But if the ostensive teaching has this effect,--am I to say that it effects an understanding of the word? Don't you understand the call "Slab!" if you act upon it in such-and-such a way?--Doubtless the ostensive teaching helped to bring this about; but only together with a particular

training. With different training the same ostensive teaching of these words would have effected a quite different understanding.

"I set the brake up by connecting up rod and lever."--Yes, given the whole of the rest of the mechanism. Only in conjunction with that is it a brake-lever, and separated from its support it is not even a lever; it may be anything, or nothing.

7. In the practice of the use of language (2) one party calls out the words, the other acts on them. In instruction in the language the following process will occur: the learner *names* the objects; that is, he utters the word when the teacher points to the stone.--And there will be this still simpler exercise: the pupil repeats the words after the teacher--both of these being processes resembling language.

We can also think of the whole process of using words in (2) as one of those games by means of which children learn their native language. I will call these games "language-games" and will sometimes speak of a primitive language as a language-game.

And the processes of naming the stones and of repeating words after someone might also be called language-games. Think of much of the use of words in games like ring-a-ring-a-roses.

I shall also call the whole, consisting of language and the actions into which it is woven, the "language-game".

8. Let us now look at an expansion of language (2). Besides the four words "block", "pillar", etc., let it contain a series of words used as the shopkeeper in (1) used the numerals (it can be the series of letters of the alphabet); further, let there be two words, which may as well be "there" and "this" (because this roughly indicates their purpose), that are used in connexion with a pointing gesture; and finally a number of colour samples. A gives an order like: "d--slab--there". At the same time he shews the assistant a colour sample, and when he says "there" he points to a place on the building site. From the stock of slabs B takes one for each letter of the alphabet up to "d", of the same colour as the sample, and brings them to the place indicated by A.--On other occasions A gives the order "this--there". At "this" he points to a building stone. And so on.

9. When a child learns this language, it has to learn the series of 'numerals' a, b, c,... by heart. And it has to learn their use.--Will this training include ostensive teaching of the words?--Well, people

will, for example, point to slabs and count: "a, b, c slabs".--Something more like the ostensive teaching of the words "block", "pillar", etc. would be the ostensive teaching of numerals that serve not to count but to refer to groups of objects that can be taken in at a glance. Children do learn the use of the first five or six cardinal numerals in this way.

Are "there" and "this" also taught ostensively?--Imagine how one might perhaps teach their use. One will point to places and things--but in this case the pointing occurs in the use of the words too and not merely in learning the use.--

Page 6

10. Now what do the words of this language *signify*?--What is supposed to shew what they signify, if not the kind of use they have? And we have already described that. So we are asking for the expression "This word signifies *this*" to be made a part of the description. In other words the description ought to take the form: "The word.... signifies....".

Page 6

Of course, one can reduce the description of the use of the word "slab" to the statement that this word signifies this object. This will be done when, for example, it is merely a matter of removing the mistaken idea that the word "slab" refers to the shape of building-stone that we in fact call a "block"--but the kind of '*referring*' this is, that is to say the use of these words for the rest, is already known.

Page 6

Equally one can say that the signs "a", "b", etc. signify numbers; when for example this removes the mistaken idea that "a", "b", "c", play the part actually played in language by "block", "slab", "pillar". And one can also say that "c" means this number and not that one; when for example this serves to explain that the letters are to be used in the order a, b, c, d, etc. and not in the order a, b, d, c.

Page 6

But assimilating the descriptions of the uses of words in this way cannot make the uses themselves any more like one another. For, as we see, they are absolutely unlike.

Page 6

11. Think of the tools in a tool-box: there is a hammer, pliers, a saw, a screw-driver, a rule, a glue-pot, glue, nails and screws.--The functions of words are as diverse as the functions of these objects. (And in both cases there are similarities.)

Page 6

Of course, what confuses us is the uniform appearance of words when we hear them spoken or meet them in script and print. For their *application* is not presented to us so clearly. Especially when we are doing philosophy!

Page Break 7

Page 7

12. It is like looking into the cabin of a locomotive. We see handles all looking more or less alike. (Naturally, since they are all supposed to be handled.) But one is the handle of a crank which can be moved continuously (it regulates the opening of a valve); another is the handle of a switch, which has only two effective positions, it is either off or on; a third is the handle of a brake-lever, the harder one pulls on it, the harder it brakes; a fourth, the handle of a pump: it has an effect only so long as it is moved to and fro.

Page 7

13. When we say: "Every word in language signifies something" we have so far said *nothing whatever*; unless we have explained exactly *what* distinction we wish to make. (It might be, of course, that we wanted to distinguish the words of language (8) from words 'without meaning' such as occur in Lewis Carroll's poems, or words like "Lilliburlero" in songs.)

Page 7

14. Imagine someone's saying: "All tools serve to modify something. Thus the hammer modifies the position of the nail, the saw the shape of the board, and so on."--And what is modified by the rule, the glue-pot, the nails?--"Our knowledge of a thing's length, the temperature of the glue, and the solidity of the box."--Would anything be gained by this assimilation of expressions?--

Page 7

15. The word "to signify" is perhaps used in the most straightforward way when the object signified is marked with the sign. Suppose that the tools A uses in building bear certain marks. When A shews his assistant such a mark, he brings the tool that has that mark on it.

Page 7

It is in this and more or less similar ways that a name means and is given to a thing.--It will often prove useful in philosophy to say to ourselves: naming something is like attaching a label to a thing.

Page 7

16. What about the colour samples that A shews to B: are they part of the *language*? Well, it is as you please. They do not belong among the words; yet when I say to someone: "Pronounce the word 'the'", you will count the second "the" as part of the sentence. Yet it has a role just like that of a colour-sample in language-game (8); that is, it

is a sample of what the other is meant to say.

Page 7

It is most natural, and causes least confusion, to reckon the samples among the instruments of the language.

Page 7

((Remark on the reflexive pronoun "*this* sentence".))

Page Break 8

Page 8

17. It will be possible to say: In language (8) we have different *kinds of word*. For the functions of the word "slab" and the word "block" are more alike than those of "slab" and "d". But how we group words into kinds will depend on the aim of the classification,--and on our own inclination.

Page 8

Think of the different points of view from which one can classify tools or chess-men.

Page 8

18. Do not be troubled by the fact that languages (2) and (8) consist only of orders. If you want to say that this shews them to be incomplete, ask yourself whether our language is complete;--whether it was so before the symbolism of chemistry and the notation of the infinitesimal calculus were incorporated in it; for these are, so to speak, suburbs of our language. (And how many houses or streets does it take before a town begins to be a town?) Our language can be seen as an ancient city: a maze of little streets and squares, of old and new houses, and of houses with additions from various periods; and this surrounded by a multitude of new boroughs with straight regular streets and uniform houses.

Page 8

19. It is easy to imagine a language consisting only of orders and reports in battle.--Or a language consisting only of questions and expressions for answering yes and no. And innumerable others.--And to imagine a language means to imagine a form of life.

Page 8

But what about this: is the call "Slab!" in example (2) a sentence or a word?--If a word, surely it has not the same meaning as the like-sounding word of our ordinary language, for in §2 it is a call. But if a sentence, it is surely not the elliptical sentence: "Slab!" of our language.--As far as the first question goes you can call "Slab!" a word and also a sentence; perhaps it could be appropriately called a 'degenerate sentence' (as one speaks of a degenerate hyperbola); in fact it *is* our 'elliptical' sentence.--But that is surely only a shortened form of the sentence "Bring me a slab", and there is no such sentence in example (2).--But why should I not on the contrary have called the sentence "Bring me a slab" a *lengthening* of the sentence "Slab!"?--Because if you shout "Slab!" you really mean: "Bring me a slab".--But how do you do this: how do you *mean that* while you say "Slab!"? Do you say the unshortened sentence to yourself? And why should I translate the call "Slab!" into a different expression in order to say

Page Break 9

what someone means by it? And if they mean the same thing--why should I not say: "When he says 'Slab!' he means 'Slab!'"? Again, if you can mean "Bring me the slab", why should you not be able to mean "Slab!"?--But when I call "Slab!", then what I want is, *that he should bring me a slab!*--Certainly, but does 'wanting this' consist in thinking in some form or other a different sentence from the one you utter?--

Page 9

20. But now it looks as if when someone says "Bring me a slab" he could mean this expression as *one* long word corresponding to the single word "Slab!"--Then can one mean it sometimes as one word and sometimes as four? And how does one usually mean it?--I think we shall be inclined to say: we mean the sentence as *four* words when we use it in contrast with other sentences such as "*Hand* me a slab", "Bring *him* a slab", "Bring *two* slabs", etc.; that is, in contrast with sentences containing the separate words of our command in other combinations.--But what does using one sentence in contrast with others consist in? Do the others, perhaps, hover before one's mind? *All* of them? And *while* one is saying the one sentence, or before, or afterwards?--No. Even if such an explanation rather tempts us, we need only think for a moment of what actually happens in order to see that we are going astray here. We say that we use the command in contrast with other sentences because *our language* contains the possibility of those other sentences. Someone who did not understand our language, a foreigner, who had fairly often heard someone giving the order: "Bring me a slab!", might believe that this whole series of sounds was one word corresponding perhaps to the word for "building-stone" in his language. If he himself had then given this order perhaps he would have pronounced it differently, and we should say: he pronounces it so oddly because he takes it for a *single* word.--But then, is there not also something different going on in him when he pronounces it,--something corresponding to the fact that he conceives the sentence as a *single* word?--Either the same thing may

go on in him, or something different. For what goes on in you when you give such an order? Are you conscious of its consisting of four words *while* you are uttering it? Of course you have a *mastery* of this language--which contains those other sentences as well--but is this having a mastery something that *happens* while you are uttering the sentence?--And I have admitted that the foreigner will probably pronounce a sentence differently if he conceives it differently; but what we call his wrong conception *need* not lie in anything that accompanies the utterance of the command.

Page Break 10

Page 10

The sentence is 'elliptical', not because it leaves out something that we think when we utter it, but because it is shortened--in comparison with a particular paradigm of our grammar.--Of course one might object here: "You grant that the shortened and the unshortened sentence have the same sense.--What is this sense, then? Isn't there a verbal expression for this sense?"--But doesn't the fact that sentences have the same sense consist in their having the same *use*?--(In Russian one says "stone red" instead of "the stone is red"; do they feel the copula to be missing in the sense, or attach it in *thought*?)

Page 10

21. Imagine a language-game in which A asks and B reports the number of slabs or blocks in a pile, or the colours and shapes of the building-stones that are stacked in such-and-such a place.--Such a report might run: "Five slabs". Now what is the difference between the report or statement "Five slabs" and the order "Five slabs!"?--Well, it is the part which uttering these words plays in the language-game. No doubt the tone of voice and the look with which they are uttered, and much else besides, will also be different. But we could also imagine the tone's being the same--for an order and a report can be spoken in a *variety* of tones of voice and with various expressions of face--the difference being only in the application. (Of course, we might use the words "statement" and "command" to stand for grammatical forms of sentence and intonations; we do in fact call "Isn't the weather glorious to-day?" a question, although it is used as a statement.) We could imagine a language in which *all* statements had the form and tone of rhetorical questions; or every command the form of the question "Would you like to...?". Perhaps it will then be said: "What he says has the form of a question but is really a command",--that is, has the function of a command in the technique of using the language. (Similarly one says "You will do this" not as a prophecy but as a command. What makes it the one or the other?)

Page 10

22. Frege's idea that every assertion contains an assumption, which is the thing that is asserted, really rests on the possibility found in our language of writing every statement in the form: "It is asserted that such-and-such is the case."--But "that such-and-such is the case" is *not* a sentence in our language--so far it is not a *move* in the language-game. And if I write, not "It is asserted that....", but "It is asserted: such-and-such is the case", the words "It is asserted" simply become superfluous.

Page 10

We might very well also write every statement in the form of a

Page Break 11

question followed by a "Yes"; for instance: "Is it raining? Yes!" Would this shew that every statement contained a question?

Page 11

Of course we have the right to use an assertion sign in contrast with a question-mark, for example, or if we want to distinguish an assertion from a fiction or a supposition. It is only a mistake if one thinks that the assertion consists of two actions, entertaining and asserting (assigning the truth-value, or something of the kind), and that in performing these actions we follow the propositional sign roughly as we sing from the musical score. Reading the written sentence loud or soft is indeed comparable with singing from a musical score, but '*meaning*' (thinking) the sentence that is read is not.

Page 11

Frege's assertion sign marks the *beginning of the sentence*. Thus its function is like that of the full-stop. It distinguishes the whole period from a clause *within* the period. If I hear someone say "it's raining" but do not know whether I have heard the beginning and end of the period, so far this sentence does not serve to tell me anything.

Page 11

Imagine a picture representing a boxer in a particular stance. Now, this picture can be used to tell someone how he should stand, should hold himself; or how he should not hold himself; or how a particular man did stand in such-and-such a place; and so on. One might (using the language of chemistry) call this picture a proposition-radical.

This will be how Frege thought of the "assumption".

Page 11

23. But how many kinds of sentence are there? Say assertion, question, and command?--There are *countless* kinds: countless different kinds of use of what we call "symbols", "words", "sentences". And this multiplicity is not something fixed, given once for all; but new types of language, new language-games, as we may say, come into existence, and others become obsolete and get forgotten. (We can get a *rough picture* of this from the changes in mathematics.)

Page 11

Here the term "language-*game*" is meant to bring into prominence the fact that the *speaking* of language is part of an activity, or of a form of life.

Page 11

Review the multiplicity of language-games in the following examples, and in others:

Giving orders, and obeying them--

Describing the appearance of an object, or giving its measurements--

Constructing an object from a description (a drawing)--

Reporting an event--

Speculating about an event--

Page 11

Page Break 12

Page 12

Forming and testing a hypothesis--

Presenting the results of an experiment in tables and diagrams--

Making up a story; and reading it--

Play-acting--

Singing catches--

Guessing riddles--

Making a joke; telling it--

Solving a problem in practical arithmetic--

Translating from one language into another--

Asking, thanking, cursing, greeting, praying.

--It is interesting to compare the multiplicity of the tools in language and of the ways they are used, the multiplicity of kinds of word and sentence, with what logicians have said about the structure of language. (Including the author of the *Tractatus Logico-Philosophicus*.)

Page 12

24. If you do not keep the multiplicity of language-games in view you will perhaps be inclined to ask questions like: "What is a question?"--Is it the statement that I do not know such-and-such, or the statement that I wish the other person would tell me....? Or is it the description of my mental state of uncertainty?--And is the cry "Help!" such a description?

Page 12

Think how many different kinds of thing are called "description": description of a body's position by means of its co-ordinates; description of a facial expression; description of a sensation of touch; of a mood.

Page 12

Of course it is possible to substitute the form of statement or description for the usual form of question: "I want to know whether...." or "I am in doubt whether...."--but this does not bring the different language-games any closer together.

Page 12

The significance of such possibilities of transformation, for example of turning all statements into sentences beginning "I think" or "I believe" (and thus, as it were, into descriptions of *my* inner life) will become clearer in another place. (Solipsism.)

Page 12

25. It is sometimes said that animals do not talk because they lack the mental capacity. And this means: "they do not think, and that is why they do not talk." But--they simply do not talk. Or to put it better: they do not use language--if we except the most primitive forms of language.--Commanding, questioning, recounting, chatting, are as much a part of our natural history as walking, eating, drinking, playing.

Page 12

26. One thinks that learning language consists in giving names to objects. Viz, to human beings, to shapes, to colours, to pains, to

moods, to numbers, etc.. To repeat--naming is something like attaching a label to a thing. One can say that this is preparatory to the use of a word. But *what* is it a preparation *for*?

27. "We name things and then we can talk about them: can refer to them in talk."--As if what we did next were given with the mere act of naming. As if there were only one thing called "talking about a thing". Whereas in fact we do the most various things with our sentences. Think of exclamations alone, with their completely different functions.

Water!
Away!
Ow!
Help!
Fine!
No!

Are you inclined still to call these words "names of objects"?

In languages (2) and (8) there was no such thing as asking something's name. This, with its correlate, ostensive definition, is, we might say, a language-game on its own. That is really to say: we are brought up, trained, to ask: "What is that called?"--upon which the name is given. And there is also a language-game of inventing a name for something, and hence of saying, "This is...." and then using the new name. (Thus, for example, children give names to their dolls and then talk about them and to them. Think in this connexion how singular is the use of a person's name to *call* him!)

28. Now one can ostensively define a proper name, the name of a colour, the name of a material, a numeral, the name of a point of the compass and so on. The definition of the number two, "That is called 'two'"--pointing to two nuts--is perfectly exact.--But how can two be defined like that? The person one gives the definition to doesn't know what one wants to call "two"; he will suppose that "two" is the name given to *this* group of nuts!--He *may* suppose this; but perhaps he does not. He might make the opposite mistake; when I want to assign a name to this group of nuts, he might understand it as a numeral. And he might equally well take the name of a person, of which I give an ostensive definition, as that of a colour, of a race, or even of a point

of the compass. That is to say: an ostensive definition can be variously interpreted in *every* case.

29. Perhaps you say: two can only be ostensively defined in *this* way: "This *number* is called 'two'". For the word "number" here shews what place in language, in grammar, we assign to the word. But this means that the word "number" must be explained before the ostensive definition can be understood.--The word "number" in the definition does indeed shew this place; does shew the post at which we station the word. And we can prevent misunderstandings by saying: "This *colour* is called so-and-so", "This *length* is called so-and-so", and so on. That is to say: misunderstandings are sometimes averted in this way. But is there only *one* way of taking the word "colour" or "length"?--Well, they just need defining.--Defining, then, by means of other words! And what about the last definition in this chain? (Do not say: "There isn't a 'last' definition". That is just as if you chose to say: "There isn't a last house in this road; one can always build an additional one".)

Whether the word "number" is necessary in the ostensive definition depends on whether without it the other person takes the definition otherwise than I wish. And that will depend on the circumstances under which it is given, and on the person I give it to.

And how he 'takes' the definition is seen in the use that he makes of the word defined.

Could one define the word "red" by pointing to something that was *not red*? That would be as if one were supposed to explain the word "modest" to someone whose English was weak, and one pointed to an arrogant man and said "That man is *not* modest". That it is ambiguous is no argument against such a method of definition. Any definition can be misunderstood.

But it might well be asked: are we still to call this "definition"?--For, of course, even if it has the same practical consequences, the same *effect* on the learner, it plays a different part in the calculus from what we ordinarily call "ostensive definition" of the word "red".

30. So one might say: the ostensive definition explains the use--the meaning--of the word when the overall role of the word in language is clear. Thus if I know that someone means to explain a colour-word to me the ostensive definition "That is called 'sepia'" will help me to understand the word.--And you can say this, so long as

you do not forget that all sorts of problems attach to the words "to know" or "to be clear".

One has already to know (or be able to do) something in order to be capable of asking a thing's name. But what does one have to know?

31. When one shews someone the king in chess and says: "This is the king", this does not tell him the use of this piece--unless he already knows the rules of the game up to this last point: the shape of the king. You could imagine his having learnt the rules of the game without ever having been shewn an actual piece. The shape of the chessman corresponds here to the sound or shape of a word.

One can also imagine someone's having learnt the game without ever learning or formulating rules. He might have learnt quite simple board-games first, by watching, and have progressed to more and more complicated ones. He too might be given the explanation "This is the king",--if, for instance, he were being shewn chessmen of a shape he was not used to. This explanation again only tells him the use of the piece because, as we might say, the place for it was already prepared. Or even: we shall only say that it tells him the use, if the place is already prepared. And in this case it is so, not because the person to whom we give the explanation already knows rules, but because in another sense he is already master of a game.

Consider this further case: I am explaining chess to someone; and I begin by pointing to a chessman and saying: "This is the king; it can move like this,... and so on."--In this case we shall say: the words "This is the king" (or "This is called the 'king'") are a definition only if the learner already 'knows what a piece in a game is'. That is, if he has already played other games, or has watched other people playing 'and understood'--*and similar things*. Further, only under these conditions will he be able to ask relevantly in the course of learning the game: "What do you call this?"--that is, this piece in a game.

We may say: only someone who already knows how to do something with it can significantly ask a name.

And we can imagine the person who is asked replying: "Settle the name yourself"--and now the one who asked would have to manage everything for himself.

32. Someone coming into a strange country will sometimes learn the language of the inhabitants from ostensive definitions that they give him; and he will often have to *guess* the meaning of these definitions; and will guess sometimes right, sometimes wrong.

And now, I think, we can say: Augustine describes the learning

of human language as if the child came into a strange country and did not understand the language of the country; that is, as if it already had a language, only not this one. Or again: as if the child could already *think*, only not yet speak. And "think" would here mean something like "talk to itself".

33. Suppose, however, someone were to object: "It is not true that you must already be master of a language in order to understand an ostensive definition: all you need--of course!--is to know or guess what the person giving the explanation is pointing to. That is, whether for example to the shape of the object, or to its colour, or to its number, and so on."--And what does 'pointing to the shape', 'pointing to the colour' consist in? Point to a piece of paper.--And now point to its shape--now to its colour--now to its number (that sounds queer).--How did you do

it?--You will say that you 'meant' a different thing each time you pointed. And if I ask how that is done, you will say you concentrated your attention on the colour, the shape, etc. But I ask again: how is *that* done?

Page 16

Suppose someone points to a vase and says "Look at that marvellous blue--the shape isn't the point."--Or: "Look at the marvellous shape--the colour doesn't matter." Without doubt you will do something *different* when you act upon these two invitations. But do you always do the *same* thing when you direct your attention to the colour? Imagine various different cases. To indicate a few:

Page 16

"Is this blue the same as the blue over there? Do you see any difference?"--

Page 16

You are mixing paint and you say "It's hard to get the blue of this sky."

Page 16

"It's turning fine, you can already see blue sky again."

Page 16

"Look what different effects these two blues have."

Page 16

"Do you see the blue book over there? Bring it here."

Page 16

"This blue signal-light means...."

Page 16

"What's this blue called?--Is it 'indigo'?"

You sometimes attend to the colour by putting your hand up to keep the outline from view; or by not looking at the outline of the thing; sometimes by staring at the object and trying to remember where you saw that colour before.

Page 16

You attend to the shape, sometimes by tracing it, sometimes by screwing up your eyes so as not to see the colour clearly, and in many other ways. I want to say: This is the sort of thing that happens *while* one 'directs one's attention to this or that'. But it isn't these things by

Page Break 17

themselves that make us say someone is attending to the shape, the colour, and so on. Just as a move in chess doesn't consist simply in moving a piece in such-and-such a way on the board--nor yet in one's thoughts and feelings as one makes the move: but in the circumstances that we call "playing a game of chess", "solving a chess problem", and so on.

Page 17

34. But suppose someone said: "I always do the same thing when I attend to the shape: my eye follows the outline and I feel...". And suppose this person to give someone else the ostensive definition "That is called a 'circle'", pointing to a circular object and having all these experiences--cannot his hearer still interpret the definition differently, even though he sees the other's eyes following the outline, and even though he feels what the other feels? That is to say: this 'interpretation' may also consist in how he now makes use of the word; in what he points to, for example, when told: "Point to a circle".--For neither the expression "to intend the definition in such-and-such a way" nor the expression "to interpret the definition in such-and-such a way" stands for a process which accompanies the giving and hearing of the definition.

Page 17

35. There are, of course, what can be called "characteristic experiences" of pointing to (e.g.) the shape. For example, following the outline with one's finger or with one's eyes as one points.--But *this* does not happen in all cases in which I 'mean the shape', and no more does any other one characteristic process occur in all these cases.--Besides, even if something of the sort did recur in all cases, it would still depend on the circumstances--that is, on what happened before and after the pointing--whether we should say "He pointed to the shape and not to the colour".

Page 17

For the words "to point to the shape", "to mean the shape", and so on, are not used in the same way as *these*: "to point to this book (not to that one)", "to point to the chair, not to the table", and so on.--Only think how differently we *learn* the use of the words "to point to this thing", "to point to that thing", and on the other hand "to point to the colour, not the shape", "to mean the colour", and so on.

Page 17

To repeat: in certain cases, especially when one points 'to the shape' or 'to the number' there are characteristic experiences and ways of pointing--'characteristic' because they recur often (not always) when shape or number are

'meant'. But do you also know of an experience characteristic of pointing to a piece in a game *as a piece in a game*?

Page Break 18

All the same one can say: "I mean that this *piece* is called the 'king', not this particular bit of wood I am pointing to". (Recognizing, wishing, remembering, etc..)

Page 18

36. And we do here what we do in a host of similar cases: because we cannot specify any *one* bodily action which we call pointing to the shape (as opposed, for example, to the colour), we say that a *spiritual* [mental, intellectual] activity corresponds to these words.

Page 18

Where our language suggests a body and there is none: there, we should like to say, is a *spirit*.

Page 18

37. What is the relation between name and thing named?--Well, what *is* it? Look at language-game (2) or at another one: there you can see the sort of thing this relation consists in. This relation may also consist, among many other things, in the fact that hearing the name calls before our mind the picture of what is named; and it also consists, among other things, in the name's being written on the thing named or being pronounced when that thing is pointed at.

Page 18

What is it to *mean* the words "*That is blue*" at one time as a statement about the object one is pointing to--at another as an explanation of the word "blue"? Well, in the second case one really means "That is called 'blue'".--Then can one at one time mean the word "is" as "is called" and the word "blue" as "'blue'", and another time mean "is" really as "is"?

Page 18

It is also possible for someone to get an explanation of the words out of what was intended as a piece of information. [Marginal note: Here lurks a crucial superstition.]

Page 18

Can I say "bububu" and mean "If it doesn't rain I shall go for a walk"?--It is only in a language that I can mean something by something. This shews clearly that the grammar of "to mean" is not like that of the expression "to imagine" and the like.

Page 18

38. But what, for example, is the word "this" the name of in language-game (8) or the word "that" in the ostensive definition "that is called...."?--If you do not want to produce confusion you will do best not to call these words names at all.--Yet, strange to say, the word "this" has been called the only *genuine* name; so that anything else we call a name was one only in an inexact, approximate sense.

Page 18

This queer conception springs from a tendency to sublime the logic of our language--as one might put it. The proper answer to it is: we call very different things "names"; the word "name" is used to

Page Break 19

characterize many different kinds of use of a word, related to one another in many different ways;--but the kind of use that "this" has is not among them.

Page 19

It is quite true that, in giving an ostensive definition for instance, we often point to the object named and say the name. And similarly, in giving an ostensive definition for instance, we say the word "this" while pointing to a thing. And also the word "this" and a name often occupy the same position in a sentence. But it is precisely characteristic of a name that it is defined by means of the demonstrative expression "That is N" (or "That is called 'N'"). But do we also give the definitions: "That is called 'this'", or "This is called 'this'"?

Page 19

This is connected with the conception of naming as, so to speak, an occult process. Naming appears as a *queer* connexion of a word with an object.--And you really get such a queer connexion when the philosopher tries to bring out *the* relation between name and thing by staring at an object in front of him and repeating a name or even the word "this" innumerable times. For philosophical problems arise when language *goes on holiday*. And *here* we may indeed fancy naming to be some remarkable act of mind, as it were a baptism of an object. And we can also say the word "this" *to* the object, as it were *address* the object as "this"--a queer use of this word, which doubtless only occurs in doing philosophy.

39. But why does it occur to one to want to make precisely this word into a name, when it evidently is *not* a name?--That is just the reason. For one is tempted to make an objection against what is ordinarily called a name. It can be put like this: *a name ought really to signify a simple*. And for this one might perhaps give the following reasons: The word "Excalibur", say, is a proper name in the ordinary sense. The sword Excalibur consists of parts combined in a particular way. If they are combined differently Excalibur does not exist. But it is clear that the sentence "Excalibur has a sharp blade" makes *sense* whether Excalibur is still whole or is broken up. But if "Excalibur" is the name of an object, this object no longer exists when Excalibur is broken in pieces; and as no object would then correspond to the name it would have no meaning. But then the sentence "Excalibur has a sharp blade" would contain a word that had no meaning, and hence the sentence would be nonsense. But it does make sense; so there must always be something corresponding to the words of which it consists. So the word "Excalibur" must disappear when the sense is

analysed and its place be taken by words which name simples. It will be reasonable to call these words the real names.

40. Let us first discuss *this* point of the argument: that a word has no meaning if nothing corresponds to it.--It is important to note that the word "meaning" is being used illicitly if it is used to signify the thing that 'corresponds' to the word. That is to confound the meaning of a name with the *bearer* of the name. When Mr. N. N. dies one says that the bearer of the name dies, not that the meaning dies. And it would be nonsensical to say that, for if the name ceased to have meaning it would make no sense to say "Mr. N. N. is dead."

41. In §15 we introduced proper names into language (8). Now suppose that the tool with the name "N" is broken. Not knowing this, A gives B the sign "N". Has this sign meaning now or not?--What is B to do when he is given it?--We have not settled anything about this. One might ask: what *will* he do? Well, perhaps he will stand there at a loss, or shew A the pieces. Here one *might* say: "N" has become meaningless; and this expression would mean that the sign "N" no longer had a use in our language-game (unless we gave it a new one). "N" might also become meaningless because, for whatever reason, the tool was given another name and the sign "N" no longer used in the language-game.--But we could also imagine a convention whereby B has to shake his head in reply if A gives him the sign belonging to a tool that is broken.--In this way the command "N" might be said to be given a place in the language-game even when the tool no longer exists, and the sign "N" to have meaning even when its bearer ceases to exist.

42. But has for instance a name which has *never* been used for a tool also got a meaning in that game?--Let us assume that "X" is such a sign and that A gives this sign to B--well, even such signs could be given a place in the language-game, and B might have, say, to answer them too with a shake of the head. (One could imagine this as a sort of joke between them.)

43. For a *large* class of cases--though not for all--in which we employ the word "meaning" it can be defined thus: the meaning of a word is its use in the language.

And the *meaning* of a name is sometimes explained by pointing to its *bearer*.

44. We said that the sentence "Excalibur has a sharp blade" made sense even when Excalibur was broken in pieces. Now this is so because in this language-game a name is also used in the absence of its bearer. But we can imagine a language-game with names (that is, with signs which we should certainly include among names) in which they are used only in the presence of the bearer; and so could *always* be replaced by a demonstrative pronoun and the gesture of pointing.

45. The demonstrative "this" can never be without a bearer. It might be said: "so long as there is a *this*, the word 'this' has a meaning too, whether *this* is simple or complex."--But that does not make the word into a name. On the contrary: for a name is not used with, but only explained by means of, the gesture of pointing.

46. What lies behind the idea that names really signify simples?--

Socrates says in the *Theaetetus*: "If I make no mistake, I have heard some people say this: there is no definition of the primary elements--so to speak--out of which we and everything else are composed; for everything that exists†1 in its own right can only be *named*, no other determination is possible, neither that it *is* nor that it *is not*..... But what exists†1 in its own right has to be..... named without any other determination. In consequence it is impossible to give an account of any primary element; for it, nothing is possible but the bare name; its name is all it has. But just as what consists of these primary elements is itself complex, so the names of the elements become descriptive language by being compounded together. For the essence of speech is the composition of names."

Both Russell's 'individuals' and my 'objects' (*Tractatus Logico-Philosophicus*) were such primary elements.

47. But what are the simple constituent parts of which reality is composed?--What are the simple constituent parts of a chair?--The bits of wood of which it is made? Or the molecules, or the atoms?--"Simple" means: not composite. And here the point is: in what sense 'composite'? It makes no sense at all to speak absolutely of the 'simple parts of a chair'.

Again: Does my visual image of this tree, of this chair, consist of parts? And what are its simple component parts? Multi-colouredness is one kind of complexity; another is, for example, that of a broken outline composed of straight bits. And a curve can be said to be composed of an ascending and a descending segment.

If I tell someone without any further explanation: "What I see before me now is composite", he will have the right to ask: "What do you mean by 'composite'? For there are all sorts of things that that can mean!"--The question "Is what you see composite?" makes good sense if it is already established what kind of complexity--that is, which particular use of the word--is in question. If it had been laid down that the visual image of a tree was to be called "composite" if one saw not just a single trunk, but also branches, then the question "Is the visual image of this tree simple or composite?", and the question "What are its simple component parts?", would have a clear sense--a clear use. And of course the answer to the second question is not "The branches" (that would be an answer to the *grammatical* question: "What are here called 'simple component parts'?") but rather a description of the individual branches.

But isn't a chessboard, for instance, obviously, and absolutely, composite?--You are probably thinking of the composition out of thirty-two white and thirty-two black squares. But could we not also say, for instance, that it was composed of the colours black and white and the schema of squares? And if there are quite different ways of looking at it, do you still want to say that the chessboard is absolutely 'composite'?--Asking "Is this object composite?" *outside* a particular language-game is like what a boy once did, who had to say whether the verbs in certain sentences were in the active or passive voice, and who racked his brains over the question whether the verb "to sleep" meant something active or passive.

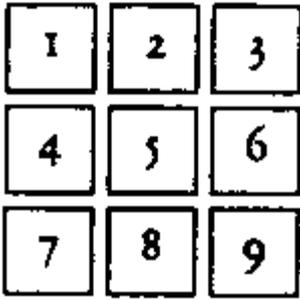

We use the word "composite" (and therefore the word "simple") in an enormous number of different and differently related ways. (Is the colour of a square on a chessboard simple, or does it consist of pure white and pure yellow? And is white simple, or does it consist of the colours of the rainbow?--Is this length of 2 cm. simple, or does it consist of two parts, each 1 cm. long? But why not of one bit 3 cm. long, and one bit 1 cm. long measured in the opposite direction?)

To the *philosophical* question: "Is the visual image of this tree

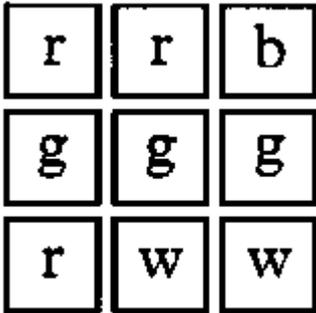

composite, and what are its component parts?" the correct answer is: "That depends on what you understand by 'composite'." (And that is of course not an answer but a rejection of the question.)

48. Let us apply the method of §2 to the account in the *Theaetetus*. Let us consider a language-game for which this account is really valid. The language serves to describe combinations of coloured squares on a surface. The squares form a complex like a chessboard. There are red, green, white and black squares. The words of the language are (correspondingly) "R", "G", "W", "B", and a sentence is a series of these words. They describe an

arrangement of squares in the order:

And so for instance the sentence "RRBGGGRWW" describes an arrangement of this sort:

Here the sentence is a complex of names, to which corresponds a complex of elements. The primary elements are the coloured squares. "But are these simple?"--I do not know what else you would have me call "the simples", what would be more natural in this language-game. But under other circumstances I should call a monochrome square "composite", consisting perhaps of two rectangles, or of the elements colour and shape. But the concept of complexity might also be so extended that a smaller area was said to be 'composed' of a greater area and another one subtracted from it. Compare the 'composition of

Page Break 24

forces', the 'division' of a line by a point outside it; these expressions shew that we are sometimes even inclined to conceive the smaller as the result of a composition of greater parts, and the greater as the result of a division of the smaller.

Page 24

But I do not know whether to say that the figure described by our sentence consists of four or of nine elements! Well, does the sentence consist of four letters or of nine?--And which are *its* elements, the types of letter, or the letters? Does it matter which we say, so long as we avoid misunderstandings in any particular case?

Page 24

49. But what does it mean to say that we cannot define (that is, describe) these elements, but only name them? This might mean, for instance, that when in a limiting case a complex consists of only *one* square, its description is simply the name of the coloured square.

Page 24

Here we might say--though this easily leads to all kinds of philosophical superstition--that a sign "R" or "B", etc. may be sometimes a word and sometimes a proposition. But whether it 'is a word or a proposition' depends on the situation in which it is uttered or written. For instance, if A has to describe complexes of coloured squares to B and he uses the word "R" *alone*, we shall be able to say that the word is a description--a proposition. But if he is memorizing the words and their meanings, or if he is teaching someone else the use of the words and uttering them in the course of ostensive teaching, we shall not say that they are propositions. In this situation the word "R", for instance, is not a description; it *names* an element--but it would be queer to make that a reason for saying that an element can *only* be named! For naming and describing do not stand on the same level: naming is a preparation for description. Naming is so far not a move in the language-game--any more than putting a piece in its place on the board is a move in chess. We may say: *nothing* has so far been done, when a thing has been named. It has not even *got* a name except in the language-game. This was what Frege meant too, when he said that a word had meaning only as part of a sentence.

Page 24

50. What does it mean to say that we can attribute neither being nor non-being to elements?--One might say: if everything that we call "being" and "non-being" consists in the existence and non-existence of connexions between elements, it makes no sense to speak of an element's being (non-being); just as when everything that we call

"destruction" lies in the separation of elements, it makes no sense to speak of the destruction of an element.

Page Break 25

Page 25

One would, however, like to say: existence cannot be attributed to an element, for if it did not *exist*, one could not even name it and so one could say nothing at all of it.--But let us consider an analogous case. There is *one* thing of which one can say neither that it is one metre long, nor that it is not one metre long, and that is the standard metre in Paris.--But this is, of course, not to ascribe any extraordinary property to it, but only to mark its peculiar role in the language-game of measuring with a metre-rule.--Let us imagine samples of colour being preserved in Paris like the standard metre. We define: "sepia" means the colour of the standard sepia which is there kept hermetically sealed. Then it will make no sense to say of this sample either that it is of this colour or that it is not.

Page 25

We can put it like this: This sample is an instrument of the language used in ascriptions of colour. In this language-game it is not something that is represented, but is a means of representation.--And just this goes for an element in language-game (48) when we name it by uttering the word "R": this gives this object a role in our language-game; it is now a *means* of representation. And to say "If it did not *exist*, it could have no name" is to say as much and as little as: if this thing did not exist, we could not use it in our language-game.--What looks as if it *had* to exist, is part of the language. It is a paradigm in our language-game; something with which comparison is made. And this may be an important observation; but it is none the less an observation concerning our language-game--our method of representation.

Page 25

51. In describing language-game (48) I said that the words "R", "B", etc. corresponded to the colours of the squares. But what does this correspondence consist in; in what sense can one say that certain colours of squares correspond to these signs? For the account in (48) merely set up a connexion between those signs and certain words of our language (the names of colours).--Well, it was presupposed that the use of the signs in the language-game would be taught in a different way, in particular by pointing to paradigms. Very well; but what does it mean to say that in the *technique of using the language* certain elements correspond to the signs?--Is it that the person who is describing the complexes of coloured squares always says "R" where there is a red square; "B" when there is a black one, and so on? But what if he goes wrong in the description and mistakenly says "R" where he sees a black square--what is the criterion by which this is a *mistake*?--Or does "R"s standing for a red square consist in this, that when the

Page Break 26

people whose language it is use the sign "R" a red square always comes before their minds?

Page 26

In order to see more clearly, here as in countless similar cases, we must focus on the details of what goes on; must look at them *from close to*.

Page 26

52. If I am inclined to suppose that a mouse has come into being by spontaneous generation out of grey rags and dust, I shall do well to examine those rags very closely to see how a mouse may have hidden in them, how it may have got there and so on. But if I am convinced that a mouse cannot come into being from these things, then this investigation will perhaps be superfluous.

Page 26

But first we must learn to understand what it is that opposes such an examination of details in philosophy.

Page 26

53. Our language-game (48) has *various* possibilities; there is a variety of cases in which we should say that a sign in the game was the name of a square of such-and-such a colour. We should say so if, for instance, we knew that the people who used the language were taught the use of the signs in such-and-such a way. Or if it were set down in writing, say in the form of a table, that this element corresponded to this sign, and if the table were used in teaching the language and were appealed to in certain disputed cases.

Page 26

We can also imagine such a table's being a tool in the use of the language. Describing a complex is then done like this: the person who describes the complex has a table with him and looks up each element of the complex in it and passes from this to the sign (and the one who is given the description may also use a table to translate it into a picture of coloured squares). This table might be said to take over here the role of memory and association in other cases. (We do not usually carry out the order "Bring me a red flower" by looking up the colour red in a table of colours and then bringing a flower of the colour that we find in the table; but when it is a question of choosing or

mixing a particular shade of red, we do sometimes make use of a sample or table.)

Page 26

If we call such a table the expression of a rule of the language-game, it can be said that what we call a rule of a language-game may have very different roles in the game.

Page 26

54. Let us recall the kinds of case where we say that a game is played according to a definite rule.

Page Break 27

Page 27

The rule may be an aid in teaching the game. The learner is told it and given practice in applying it.--Or it is an instrument of the game itself.--Or a rule is employed neither in the teaching nor in the game itself; nor is it set down in a list of rules. One learns the game by watching how others play. But we say that it is played according to such-and-such rules because an observer can read these rules off from the practice of the game--like a natural law governing the play.--But how does the observer distinguish in this case between players' mistakes and correct play?--There are characteristic signs of it in the players' behaviour. Think of the behaviour characteristic of correcting a slip of the tongue. It would be possible to recognize that someone was doing so even without knowing his language.

Page 27

55. "What the names in language signify must be indestructible; for it must be possible to describe the state of affairs in which everything destructible is destroyed. And this description will contain words; and what corresponds to these cannot then be destroyed, for otherwise the words would have no meaning." I must not saw off the branch on which I am sitting.

Page 27

One might, of course, object at once that this description would have to except itself from the destruction.--But what corresponds to the separate words of the description and so cannot be destroyed if it is true, is what gives the words their meaning--is that without which they would have no meaning.--In a sense, however, this man is surely what corresponds to his name. But he is destructible, and his name does not lose its meaning when the bearer is destroyed.--An example of something corresponding to the name, and without which it would have no meaning, is a paradigm that is used in connexion with the name in the language-game.

Page 27

56. But what if no such sample is part of the language, and we *bear in mind* the colour (for instance) that a word stands for?--"And if we bear it in mind then it comes before our mind's eye when we utter the word. So, if it is always supposed to be possible for us to remember it, it must be in itself indestructible."--But what do we regard as the criterion for remembering it right?--When we work with a sample instead of our memory there are circumstances in which we say that the sample has changed colour and we judge of this by memory. But can we not sometimes speak of a darkening (for example) of our memory-image? Aren't we as much at the mercy of memory as of a sample? (For someone might feel like saying: "If we

Page Break 28

had no memory we should be at the mercy of a sample".)--Or perhaps of some chemical reaction. Imagine that you were supposed to paint a particular colour "C", which was the colour that appeared when the chemical substances X and Y combined.--Suppose that the colour struck you as brighter on one day than on another; would you not sometimes say: "I must be wrong, the colour is certainly the same as yesterday"? This shews that we do not always resort to what memory tells us as the verdict of the highest court of appeal.

Page 28

57. "Something red can be destroyed, but red cannot be destroyed, and that is why the meaning of the word 'red' is independent of the existence of a red thing."--Certainly it makes no sense to say that the colour red is torn up or pounded to bits. But don't we say "The red is vanishing"? And don't clutch at the idea of our always being able to bring red before our mind's eye even when there is nothing red any more. That is just as if you chose to say that there would still always be a chemical reaction producing a red flame.--For suppose you cannot remember the colour any more?--When we forget which colour this is the name of, it loses its meaning for us; that is, we are no longer able to play a particular language-game with it. And the situation then is comparable with that in which we have lost a paradigm which was an instrument of our language.

Page 28

58. "I want to restrict the term '*name*' to what cannot occur in the combination 'X exists'.--Thus one cannot say 'Red exists', because if there were no red it could not be spoken of at all."--Better: If "X exists" is meant simply to say: "X" has a meaning,--then it is not a proposition which treats of X, but a proposition about our use of

language, that is, about the use of the word "X".

Page 28

It looks to us as if we were saying something about the nature of red in saying that the words "Red exists" do not yield a sense. Namely that red does exist 'in its own right'. The same idea--that this is a metaphysical statement about red--finds expression again when we say such a thing as that red is timeless, and perhaps still more strongly in the word "indestructible".

Page 28

But what we really *want* is simply to take "Red exists" as the statement: the word "red" has a meaning. Or perhaps better: "Red does not exist" as "'Red' has no meaning". Only we do not want to say that that expression *says* this, but that *this* is what it would have to be saying *if* it meant anything. But that it contradicts itself in the attempt

Page Break 29

to say it--just because red exists 'in its own right'. Whereas the only contradiction lies in something like this: the proposition looks as if it were about the colour, while it is supposed to be saying something about the use of the word "red".--In reality, however, we quite readily say that a particular colour exists; and that is as much as to say that something exists that has that colour. And the first expression is no less accurate than the second; particularly where 'what has the colour' is not a physical object.

Page 29

59. "A *name* signifies only what is an *element* of reality. What cannot be destroyed; what remains the same in all changes."--But what is that?--Why, it swam before our minds as we said the sentence! This was the very expression of a quite particular image: of a particular picture which we want to use. For certainly experience does not shew us these elements. We see *component parts* of something composite (of a chair, for instance). We say that the back is part of the chair, but is in turn itself composed of several bits of wood; while a leg is a simple component part. We also see a whole which changes (is destroyed) while its component parts remain unchanged. These are the materials from which we construct that picture of reality.

Page 29

60. When I say: "My broom is in the corner",--is this really a statement about the broomstick and the brush? Well, it could at any rate be replaced by a statement giving the position of the stick and the position of the brush. And this statement is surely a further analysed form of the first one.--But why do I call it "further analysed"?--Well, if the broom is there, that surely means that the stick and brush must be there, and in a particular relation to one another; and this was as it were hidden in the sense of the first sentence, and is *expressed* in the analysed sentence. Then does someone who says that the broom is in the corner really mean: the broomstick is there, and so is the brush, and the broomstick is fixed in the brush?--If we were to ask anyone if he meant this he would probably say that he had not thought specially of the broomstick or specially of the brush at all. And that would be the *right* answer, for he meant to speak neither of the stick nor of the brush in particular. Suppose that, instead of saying "Bring me the broom", you said "Bring me the broomstick and the brush which is fitted on to it."!--Isn't the answer: "Do you want the broom? Why do you put it so oddly?"--Is he going to understand the further analysed sentence better?--This sentence, one might say, achieves the same as the ordinary one, but in a more roundabout way.--

Page Break 30

Imagine a language-game in which someone is ordered to bring certain objects which are composed of several parts, to move them about, or something else of the kind. And two ways of playing it: in one (a) the composite objects (brooms, chairs, tables, etc.) have names, as in (15); in the other (b) only the parts are given names and the wholes are described by means of them.--In what sense is an order in the second game an analysed form of an order in the first? Does the former lie concealed in the latter, and is it now brought out by analysis?--True, the broom is taken to pieces when one separates broomstick and brush; but does it follow that the order to bring the broom also consists of corresponding parts?

Page 30

61. "But all the same you will not deny that a particular order in (a) means the same as one in (b); and what would you call the second one, if not an analysed form of the first?"--Certainly I too should say that an order in (a) had the same meaning as one in (b); or, as I expressed it earlier: they achieve the same. And this means that if I were shewn an order in (a) and asked: "Which order in (b) means the same as this?" or again "Which order in (b) does this contradict?" I should give such-and-such an answer. But that is not to say that we have come to a *general* agreement about the use of the expression "to have the same meaning" or "to achieve the same". For it can be asked in what cases we say: "These are merely two forms of the same game."

Page 30

62. Suppose for instance that the person who is given the orders in (a) and (b) has to look up a table co-ordinating names and pictures before bringing what is required. Does he do *the same* when he carries out an order in (a) and the corresponding one in (b)?--Yes and no. You may say: "The *point* of the two orders is the same". I should say so too.--But it is not everywhere clear what should be called the 'point' of an order. (Similarly one may say of certain objects that they have this or that purpose. The essential thing is that this is a *lamp*, that it serves to give light;--that it is an ornament to the room, fills an empty space, etc., is not essential. But there is not always a sharp distinction between essential and inessential.)

Page 30

63. To say, however, that a sentence in (b) is an 'analysed' form of one in (a) readily seduces us into thinking that the former is the more fundamental form; that it alone shews what is meant by the other, and so on. For example, we think: If you have only the unanalysed form you miss the analysis; but if you know the analysed form that

Page Break 31

gives you everything.--But can I not say that an aspect of the matter is lost on you in the *latter* case as well as the former?

Page 31

64. Let us imagine language game (48) altered so that names signify not monochrome squares but rectangles each consisting of two such squares. Let such a rectangle, which is half red half green, be called "U"; a half green half white one, "V"; and so on. Could we not imagine people who had names for such combinations of colour, but not for the individual colours? Think of the cases where we say: "This arrangement of colours (say the French tricolor) has a quite special character."

Page 31

In what sense do the symbols of this language-game stand in need of analysis? How far is it even *possible* to replace this language-game by (48)?--It is just *another* language-game; even though it is related to (48).

Page 31

65. Here we come up against the great question that lies behind all these considerations.--For someone might object against me: "You take the easy way out! You talk about all sorts of language-games, but have nowhere said what the essence of a language-game, and hence of language, is: what is common to all these activities, and what makes them into language or parts of language. So you let yourself off the very part of the investigation that once gave you yourself most headache, the part about the *general form of propositions* and of language."

Page 31

And this is true.--Instead of producing something common to all that we call language, I am saying that these phenomena have no one thing in common which makes us use the same word for all,--but that they are *related* to one another in many different ways. And it is because of this relationship, or these relationships, that we call them all "language". I will try to explain this.

Page 31

66. Consider for example the proceedings that we call "games". I mean board-games, card-games, ball-games, Olympic games, and so on. What is common to them all?--Don't say: "There *must* be something common, or they would not be called 'games'"--but *look and see* whether there is anything common to all.--For if you look at them you will not see something that is common to *all*, but similarities, relationships, and a whole series of them at that. To repeat: don't think, but look!--Look for example at board-games, with their multifarious relationships. Now pass to card-games; here you find many correspondences with the first group, but many common

Page Break 32

features drop out, and others appear. When we pass next to ball-games, much that is common is retained, but much is lost.--Are they all 'amusing'? Compare chess with noughts and crosses. Or is there always winning and losing, or competition between players? Think of patience. In ball games there is winning and losing; but when a child throws his ball at the wall and catches it again, this feature has disappeared. Look at the parts played by skill and luck; and at the difference between skill in chess and skill in tennis. Think now of games like ring-a-ring-a-roses; here is the element of amusement, but how many other characteristic features have disappeared! And we can go through the many, many other groups of games in the same way; can see how similarities crop up and disappear.

Page 32

And the result of this examination is: we see a complicated network of similarities overlapping and criss-crossing: sometimes overall similarities, sometimes similarities of detail.

Page 32

67. I can think of no better expression to characterize these similarities than "family resemblances"; for the various resemblances between members of a family: build, features, colour of eyes, gait, temperament, etc. etc. overlap and criss-cross in the same way.--And I shall say: 'games' form a family.

Page 32

And for instance the kinds of number form a family in the same way. Why do we call something a "number"? Well, perhaps because it has a--direct--relationship with several things that have hitherto been called number; and this can be said to give it an indirect relationship to other things we call the same name. And we extend our concept of number as in spinning a thread we twist fibre on fibre. And the strength of the thread does not reside in the fact that some one fibre runs through its whole length, but in the overlapping of many fibres.

Page 32

But if someone wished to say: "There is something common to all these constructions--namely the disjunction of all their common properties"--I should reply: Now you are only playing with words. One might as well say: "Something runs through the whole thread--namely the continuous overlapping of those fibres".

Page 32

68. "All right: the concept of number is defined for you as the logical sum of these individual interrelated concepts: cardinal numbers, rational numbers, real numbers, etc.; and in the same way the concept of a game as the logical sum of a corresponding set of sub-concepts."--It need not be so. For I *can* give the concept 'number' rigid limits

Page Break 33

in this way, that is, use the word "number" for a rigidly limited concept, but I can also use it so that the extension of the concept is *not* closed by a frontier. And this is how we do use the word "game". For how is the concept of a game bounded? What still counts as a game and what no longer does? Can you give the boundary? No. You can *draw* one; for none has so far been drawn. (But that never troubled you before when you used the word "game".)

Page 33

"But then the use of the word is unregulated, the 'game' we play with it is unregulated."--It is not everywhere circumscribed by rules; but no more are there any rules for how high one throws the ball in tennis, or how hard; yet tennis is a game for all that and has rules too.

Page 33

69. How should we explain to someone what a game is? I imagine that we should describe *games* to him, and we might add: "This *and similar things* are called 'games'". And do we know any more about it ourselves? Is it only other people whom we cannot tell exactly what a game is?--But this is not ignorance. We do not know the boundaries because none have been drawn. To repeat, we can draw a boundary--for a special purpose. Does it take that to make the concept usable? Not at all! (Except for that special purpose.) No more than it took the definition: 1 pace = 75 cm. to make the measure of length 'one pace' usable. And if you want to say "But still, before that it wasn't an exact measure", then I reply: very well, it was an inexact one.--Though you still owe me a definition of exactness.

Page 33

Someone says to me: "Shew the children a game." I teach them gaming with dice, and the other says "I didn't mean that sort of game." Must the exclusion of the game with dice have come before his mind when he gave me the order?

Page 33

70. "But if the concept 'game' is uncircumscribed like that, you don't really know what you mean by a 'game'."--When I give the description: "The ground was quite covered with plants"--do you want to say I don't know what I am talking about until I can give a definition of a plant?

Page 33

My meaning would be explained by, say, a drawing and the words "The ground looked roughly like this". Perhaps I even say "it looked *exactly* like this."--Then were just *this* grass and *these* leaves there, arranged just like this? No, that is not what it means. And I should not accept any picture as exact in *this* sense.

Page Break 34

Page 34

71. One might say that the concept 'game' is a concept with blurred edges.--"But is a blurred concept a concept at all?"--Is an indistinct photograph a picture of a person at all? Is it even always an advantage to replace an indistinct picture by a sharp one? Isn't the indistinct one often exactly what we need?

Page 34

Frege compares a concept to an area and says that an area with vague boundaries cannot be called an area at all. This presumably means that we cannot do anything with it.--But is it senseless to say: "Stand roughly there"? Suppose that I were standing with someone in a city square and said that. As I say it I do not draw any kind of boundary, but perhaps point with my hand--as if I were indicating a particular *spot*. And this is just how one might explain to someone what a game is. One gives examples and intends them to be taken in a particular way.--I do not, however, mean by this that he is supposed to see in those examples that common thing which I--for some reason--was unable to express; but that he is now to *employ* those examples in a particular way. Here giving examples is not an *indirect* means of explaining--in default of a better. For any general definition can be misunderstood too. The point is that *this* is how we play the game. (I mean the language-game with the word "game".)

Page 34

72. *Seeing what is common.* Suppose I shew someone various multi-coloured pictures, and say: "The colour you see in all these is called 'yellow ochre'".--This is a definition, and the other will get to understand it by looking for and seeing what is common to the pictures. Then he can look *at*, can point *to*, the common thing.

Page 34

Compare with this a case in which I shew him figures of different shapes all painted the same colour, and say: "What these have in common is called 'yellow ochre'".

Page 34

And compare this case: I shew him samples of different shades of blue and say: "The colour that is common to all these is what I call 'blue'".

Page 34

73. When someone defines the names of colours for me by pointing to samples and saying "This colour is called 'blue', this 'green'...." this case can be compared in many respects to putting a table in my hands, with the words written under the colour-samples.--Though this comparison may mislead in many ways.--One is now inclined to extend the comparison: to have understood the definition means to have in one's mind an idea of the thing defined, and that is a sample or picture. So if I am shewn various different leaves and told

Page Break 35

"This is called a 'leaf'", I get an idea of the shape of a leaf, a picture of it in my mind.--But what does the picture of a leaf look like when it does not shew us any particular shape, but 'what is common to all shapes of leaf'? Which shade is the 'sample in my mind' of the colour green--the sample of what is common to all shades of green?

Page 35

"But might there not be such 'general' samples? Say a schematic leaf, or a sample of *pure* green?"--Certainly there might. But for such a schema to be understood as a *schema*, and not as the shape of a particular leaf, and for a slip of pure green to be understood as a sample of all that is greenish and not as a sample of pure green--this in turn resides in the way the samples are used.

Page 35

Ask yourself: what *shape* must the sample of the colour green be? Should it be rectangular? Or would it then be the sample of a green rectangle?--So should it be 'irregular' in shape? And what is to prevent us then from regarding it--that is, from using it--only as a sample of irregularity of shape?

Page 35

74. Here also belongs the idea that if you see this leaf as a sample of 'leaf shape in general' you *see* it differently from someone who regards it as, say, a sample of this particular shape. Now this might well be so--though it is not so--for it would only be to say that, as a matter of experience, if you *see* the leaf in a particular way, you use it in such-and-such a way or according to such-and-such rules. Of course, there is such a thing as seeing in *this* way or *that*; and there are also cases where whoever sees a sample like *this* will in general use it in *this* way, and whoever sees it otherwise in another way. For example, if you see the schematic drawing of a cube as a plane figure consisting of a square and two rhombi you will, perhaps, carry out the order "Bring me something like this" differently from someone who sees the picture three-dimensionally.

Page 35

75. What does it mean to know what a game is? What does it mean, to know it and not be able to say it? Is this knowledge somehow equivalent to an unformulated definition? So that if it were formulated I should be able to recognize it as the expression of my knowledge? Isn't my knowledge, my concept of a game, completely expressed in the explanations that I could give? That is, in my describing examples of various kinds of game; shewing how all sorts of other games can be constructed on the analogy of these; saying that I should scarcely include this or this among games; and so on.

76. If someone were to draw a sharp boundary I could not acknowledge it as the one that I too always wanted to draw, or had drawn in my mind. For I did not want to draw one at all. His concept can then be said to be not the same as mine, but akin to it. The kinship is that of two pictures, one of which consists of colour patches with vague contours, and the other of patches similarly shaped and distributed, but with clear contours. The kinship is just as undeniable as the difference.

77. And if we carry this comparison still further it is clear that the degree to which the sharp picture *can* resemble the blurred one depends on the latter's degree of vagueness. For imagine having to sketch a sharply defined picture 'corresponding' to a blurred one. In the latter there is a blurred red rectangle: for it you put down a sharply defined one. Of course--several such sharply defined rectangles can be drawn to correspond to the indefinite one.--But if the colours in the original merge without a hint of any outline won't it become a hopeless task to draw a sharp picture corresponding to the blurred one? Won't you then have to say: "Here I might just as well draw a circle or heart as a rectangle, for all the colours merge. Anything--and nothing--is right."--And this is the position you are in if you look for definitions corresponding to our concepts in aesthetics or ethics.

In such a difficulty always ask yourself: How did we *learn* the meaning of this word ("good" for instance)? From what sort of examples? in what language-games? Then it will be easier for you to see that the word must have a family of meanings.

78. Compare *knowing* and *saying*:

how many feet high Mont Blanc is--
how the word "game" is used--
how a clarinet sounds.

If you are surprised that one can know something and not be able to say it, you are perhaps thinking of a case like the first. Certainly not of one like the third.

79. Consider this example. If one says "Moses did not exist", this may mean various things. It may mean: the Israelites did not have a *single* leader when they withdrew from Egypt--or: their leader was not called Moses--or: there cannot have been anyone who accomplished all that the Bible relates of Moses--or: etc. etc.--We may say, following Russell: the name "Moses" can be defined by

means of various descriptions. For example, as "the man who led the Israelites through the wilderness", "the man who lived at that time and place and was then called 'Moses'", "the man who as a child was taken out of the Nile by Pharaoh's daughter" and so on. And according as we assume one definition or another the proposition "Moses did not exist" acquires a different sense, and so does every other proposition about Moses.--And if we are told "N did not exist", we do ask: "What do you mean? Do you want to say..... or..... etc.?"

But when I make a statement about Moses,--am I always ready to substitute some one of these descriptions for "Moses"? I shall perhaps say: By "Moses" I understand the man who did what the Bible relates of Moses, or at any rate a good deal of it. But how much? Have I decided how much must be proved false for me to give up my proposition as false? Has the name "Moses" got a fixed and unequivocal use for me in all possible cases?--Is it not the case that I have, so to speak, a whole series of props in readiness, and am ready to lean on one if another should be taken from under me and vice versa?--Consider another case. When I say "N is dead", then something like the following may hold for the meaning of the name "N": I believe that a human being has lived, whom I (1) have seen in such-and-such places, who (2) looked like this (pictures), (3) has done such-and-such things, and (4) bore the name "N" in social life.--Asked what I understand by "N", I should enumerate all or some of these points, and different ones on different occasions. So my definition of "N" would perhaps be "the man of whom all this is true".--But if some point now proves false?--Shall I be prepared to declare the proposition "N is dead" false--even if it is only something which strikes me as incidental that has turned out false? But where are the bounds of the incidental?--If I had given a definition of the name in such a case, I should now be ready to alter it.

And this can be expressed like this: I use the name "N" without a *fixed* meaning. (But that detracts as little from its usefulness, as it detracts from that of a table that it stands on four legs instead of three and so sometimes wobbles.)

Should it be said that I am using a word whose meaning I don't know, and so am talking nonsense?--Say what you choose, so long as it does not prevent you from seeing the facts. (And when you see them there is a good deal that you will not say.)

(The fluctuation of scientific definitions: what to-day counts as an

observed concomitant of a phenomenon will to-morrow be used to define it.)

80. I say "There is a chair". What if I go up to it, meaning to fetch it, and it suddenly disappears from sight?--"So it wasn't a chair, but some kind of illusion".--But in a few moments we see it again and are able to touch it and so on.--"So the chair was there after all and its disappearance was some kind of illusion".--But suppose that after a time it disappears again--or seems to disappear. What are we to say now? Have you rules ready for such cases--rules saying whether one may use the word "chair" to include this kind of thing? But do we miss them when we use the word "chair"; and are we to say that we do not really attach any meaning to this word, because we are not equipped with rules for every possible application of it?

81. F. P. Ramsey once emphasized in conversation with me that logic was a 'normative science'. I do not know exactly what he had in mind, but it was doubtless closely related to what only dawned on me later: namely, that in philosophy we often *compare* the use of words with games and calculi which have fixed rules, but cannot say that someone who is using language *must* be playing such a game.--But if you say that our languages only *approximate* to such calculi you are standing on the very brink of a misunderstanding. For then it may look as if what we were talking about were an *ideal* language. As if our logic were, so to speak, a logic for a vacuum.--Whereas logic does not treat of language--or of thought--in the sense in which a natural science treats of a natural phenomenon, and the most that can be said is that we *construct* ideal languages. But here the word "ideal" is liable to mislead, for it sounds as if these languages were better, more perfect, than our everyday language; and as if it took the logician to shew people at last what a proper sentence looked like.

All this, however, can only appear in the right light when one has attained greater clarity about the concepts of understanding, meaning, and thinking. For it will then also become clear what can lead us (and did lead me) to think that if anyone utters a sentence and *means* or *understands* it he is operating a calculus according to definite rules.

82. What do I call 'the rule by which he proceeds'?--The hypothesis that satisfactorily describes his use of words, which we observe; or the rule which he looks up when he uses signs; or the one which he

gives us in reply if we ask him what his rule is?--But what if observation does not enable us to see any clear rule, and the question brings none to light?--For he did indeed give me a definition when I asked him what he understood by "N", but he was prepared to withdraw and alter it.--So how am I to determine the rule according to which he is playing? He does not know it himself.--Or, to ask a better question: What meaning is the expression "the rule by which he proceeds" supposed to have left to it here?

83. Doesn't the analogy between language and games throw light here? We can easily imagine people amusing themselves in a field by playing with a ball so as to start various existing games, but playing many without finishing them and in between throwing the ball aimlessly into the air, chasing one another with the ball and bombarding one another for a joke and so on. And now someone says: The whole time they are playing a ball-game and following definite rules at every throw.

And is there not also the case where we play and--make up the rules as we go along? And there is even one where we alter them--as we go along.

84. I said that the application of a word is not everywhere bounded by rules. But what does a game look like that is everywhere bounded by rules? whose rules never let a doubt creep in, but stop up all the cracks where it might?--Can't we imagine a rule determining the application of a rule, and a doubt which *it* removes--and so on?

But that is not to say that we are in doubt because it is possible for us to *imagine* a doubt. I can easily imagine someone always doubting before he opened his front door whether an abyss did not yawn behind it, and making sure about it before he went through the door (and he might on some occasion prove to be right)--but that does not make me doubt in the same case.

Page 39

85. A rule stands there like a sign-post.--Does the sign-post leave no doubt open about the way I have to go? Does it shew which direction I am to take when I have passed it; whether along the road or the footpath or cross-country? But where is it said which way I am to follow it; whether in the direction of its finger or (e.g.) in the opposite one?--And if there were, not a single sign-post, but a chain of adjacent ones or of chalk marks on the ground--is there only *one* way of interpreting them?--So I can say, the sign-post does after all

Page Break 40

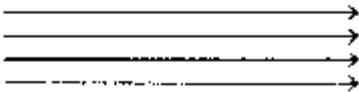

leave no room for doubt. Or rather: it sometimes leaves room for doubt and sometimes not. And now this is no longer a philosophical proposition, but an empirical one.

Page 40

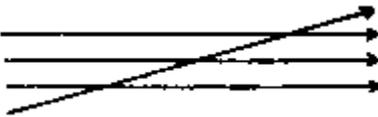

86. Imagine a language-game like (2) played with the help of a table. The signs given to B by A are now written ones. B has a table; in the first column are the signs used in the game, in the second pictures of building stones. A shews B such a written sign; B looks it up in the table, looks at the picture opposite, and so on. So the table is a rule which he follows in executing orders.--One learns to look the picture up in the table by receiving a training, and part of this training consists perhaps in the pupil's learning to pass with his finger horizontally from left to right; and so, as it were, to draw a series of horizontal lines on the table.

Page 40

Suppose different ways of reading a table were now introduced; one time, as above, according to the schema:

another time like this:

or in some other way.--Such a schema is supplied with the table as the rule for its use.

Page 40

Can we not now imagine further rules to explain *this* one? And, on the other hand, was that first table incomplete without the schema of arrows? And are other tables incomplete without their schemata?

Page 40

87. Suppose I give this explanation: "I take 'Moses' to mean the man, if there was such a man, who led the Israelites out of Egypt, whatever he was called then and whatever he may or may not have done besides."--But similar doubts to those about "Moses" are possible about the words of this explanation (what are you calling "Egypt", whom the "Israelites" etc.?). Nor would these questions come to an end when we got down to words like "red", "dark", "sweet".--"But then how does an explanation help me to understand,

Page Break 41

if after all it is not the final one? In that case the explanation is never completed; so I still don't understand what he means, and never shall!"--As though an explanation as it were hung in the air unless supported by another one. Whereas an explanation may indeed rest on another one that has been given, but none stands in need of another--unless *we* require it to prevent a misunderstanding. One might say: an explanation serves to remove or to avert a misunderstanding--one, that is, that would occur but for the explanation; not every one that I can imagine.

Page 41

It may easily look as if every doubt merely *revealed* an existing gap in the foundations; so that secure understanding is only possible if we first doubt everything that *can* be doubted, and then remove all these doubts.

Page 41

The sign-post is in order--if, under normal circumstances, it fulfils its purpose.

Page 41

88. If I tell someone "Stand roughly here"--may not this explanation work perfectly? And cannot every other

one fail too?

Page 41

But isn't it an inexact explanation?--Yes; why shouldn't we call it "inexact"? Only let us understand what "inexact" means. For it does not mean "unusable". And let us consider what we call an "exact" explanation in contrast with this one. Perhaps something like drawing a chalk line round an area? Here it strikes us at once that the line has breadth. So a colour-edge would be more exact. But has this exactness still got a function here: isn't the engine idling? And remember too that we have not yet defined what is to count as overstepping this exact boundary; how, with what instruments, it is to be established. And so on.

Page 41

We understand what it means to set a pocket watch to the exact time or to regulate it to be exact. But what if it were asked: is this exactness ideal exactness, or how nearly does it approach the ideal?--Of course, we can speak of measurements of time in which there is a different, and as we should say a greater, exactness than in the measurement of time by a pocket-watch; in which the words "to set the clock to the exact time" have a different, though related meaning, and 'to tell the time' is a different process and so on.--Now, if I tell someone: "You should come to dinner more punctually; you know it begins at one o'clock exactly"--is there really no question of *exactness* here? because it is possible to say: "Think of the determination of time in the laboratory or the observatory; *there* you see what 'exactness' means"?

Page Break 42

Page 42

"Inexact" is really a reproach, and "exact" is praise. And that is to say that what is inexact attains its goal less perfectly than what is more exact. Thus the point here is what we call "the goal". Am I inexact when I do not give our distance from the sun to the nearest foot, or tell a joiner the width of a table to the nearest thousandth of an inch?

Page 42

No *single* ideal of exactness has been laid down; we do not know what we should be supposed to imagine under this head--unless you yourself lay down what is to be so called. But you will find it difficult to hit upon such a convention; at least any that satisfies you.

Page 42

89. These considerations bring us up to the problem: In what sense is logic something sublime?

Page 42

For there seemed to pertain to logic a peculiar depth--a universal significance. Logic lay, it seemed, at the bottom of all the sciences.--For logical investigation explores the nature of all things. It seeks to see to the bottom of things and is not meant to concern itself whether what actually happens is this or that.--It takes its rise, not from an interest in the facts of nature, nor from a need to grasp causal connexions: but from an urge to understand the basis, or essence, of everything empirical. Not, however, as if to this end we had to hunt out new facts; it is, rather, of the essence of our investigation that we do not seek to learn anything *new* by it. We want to *understand* something that is already in plain view. For *this* is what we seem in some sense not to understand.

Page 42

Augustine says in the *Confessions* "quid est ergo tempus? si nemo ex me quaerat scio; si quaerenti explicare velim, nescio".--This could not be said about a question of natural science ("What is the specific gravity of hydrogen?" for instance). Something that we know when no one asks us, but no longer know when we are supposed to give an account of it, is something that we need to *remind* ourselves of. (And it is obviously something of which for some reason it is difficult to remind oneself.)

Page 42

90. We feel as if we had to *penetrate* phenomena: our investigation, however, is directed not towards phenomena, but, as one might say, towards the '*possibilities*' of phenomena. We remind ourselves, that is to say, of the *kind of statement* that we make about phenomena. Thus Augustine recalls to mind the different statements that are made about the duration, past present or future, of events. (These are, of course, not *philosophical* statements about time, the past, the present and the future.)

Page Break 43

Page 43

Our investigation is therefore a grammatical one. Such an investigation sheds light on our problem by clearing misunderstandings away. Misunderstandings concerning the use of words, caused, among other things, by certain analogies between the forms of expression in different regions of language.--Some of them can be removed by substituting one form of expression for another; this may be called an "analysis" of our forms of expression, for

the process is sometimes like one of taking a thing apart.

Page 43

91. But now it may come to look as if there were something like a final analysis of our forms of language, and so a *single* completely resolved form of every expression. That is, as if our usual forms of expression were, essentially, unanalysed; as if there were something hidden in them that had to be brought to light. When this is done the expression is completely clarified and our problem solved.

Page 43

It can also be put like this: we eliminate misunderstandings by making our expressions more exact; but now it may look as if we were moving towards a particular state, a state of complete exactness; and as if this were the real goal of our investigation.

Page 43

92. This finds expression in questions as to the essence of language, of propositions, of thought.--For if we too in these investigations are trying to understand the essence of language--its function, its structure,--yet *this* is not what those questions have in view. For they see in the essence, not something that already lies open to view and that becomes surveyable by a rearrangement, but something that lies *beneath* the surface. Something that lies within, which we see when we look *into* the thing, and which an analysis digs out.

Page 43

'*The essence is hidden from us*': this is the form our problem now assumes. We ask: "*What is language?*", "*What is a proposition?*" And the answer to these questions is to be given once for all; and independently of any future experience.

Page 43

93. One person might say "A proposition is the most ordinary thing in the world" and another: "A proposition--that's something very queer!"--And the latter is unable simply to look and see how propositions really work. The forms that we use in expressing ourselves about propositions and thought stand in his way.

Page 43

Why do we say a proposition is something remarkable? On the one hand, because of the enormous importance attaching to it. (And that is correct). On the other hand this, together with a misunderstanding

Page Break 44

of the logic of language, seduces us into thinking that something extraordinary, something unique, must be achieved by propositions.--*A misunderstanding makes* it look to us as if a proposition *did* something queer.

Page 44

94. 'A proposition is a queer thing!' Here we have in germ the subliming of our whole account of logic. The tendency to assume a pure intermediary between the propositional *signs* and the facts. Or even to try to purify, to sublime, the signs themselves.--For our forms of expression prevent us in all sorts of ways from seeing that nothing out of the ordinary is involved, by sending us in pursuit of chimeras.

Page 44

95. "Thought must be something unique". When we say, and *mean*, that such-and-such is the case, we--and our meaning--do not stop anywhere short of the fact; but we mean: *this--is--so*. But this paradox (which has the form of a truism) can also be expressed in this way: *Thought* can be of what is *not* the case.

Page 44

96. Other illusions come from various quarters to attach themselves to the special one spoken of here. Thought, language, now appear to us as the unique correlate, picture, of the world. These concepts: proposition, language, thought, world, stand in line one behind the other, each equivalent to each. (But what are these words to be used for now? The language-game in which they are to be applied is missing.)

Page 44

97. Thought is surrounded by a halo.--Its essence, logic, presents an order, in fact the a priori order of the world: that is, the order of *possibilities*, which must be common to both world and thought. But this order, it seems, must be *utterly simple*. It is *prior* to all experience, must run through all experience; no empirical cloudiness or uncertainty can be allowed to affect it--It must rather be of the purest crystal. But this crystal does not appear as an abstraction; but as something concrete, indeed, as the most concrete, as it were the *hardest* thing there is (*Tractatus Logico-Philosophicus* No. 5.5563).

Page 44

We are under the illusion that what is peculiar, profound, essential, in our investigation, resides in its trying to grasp the incomparable essence of language. That is, the order existing between the concepts of proposition, word, proof, truth, experience, and so on. This order is a *super-order* between--so to speak--*super-concepts*. Whereas, of course, if the words "language", "experience", "world", have a use, it must be as humble a one as that of the words

"table", "lamp", "door".

Page Break 45

Page 45

98. On the one hand it is clear that every sentence in our language 'is in order as it is'. That is to say, we are not *striving after* an ideal, as if our ordinary vague sentences had not yet got a quite unexceptionable sense, and a perfect language awaited construction by us.--On the other hand it seems clear that where there is sense there must be perfect order.--So there must be perfect order even in the vaguest sentence.

Page 45

99. The sense of a sentence--one would like to say--may, of course, leave this or that open, but the sentence must nevertheless have a definite sense. An indefinite sense--that would really not be a sense *at all*.--This is like: An indefinite boundary is not really a boundary at all. Here one thinks perhaps: if I say "I have locked the man up fast in the room--there is only one door left open"--then I simply haven't locked him in at all; his being locked in is a sham. One would be inclined to say here: "You haven't done anything at all". An enclosure with a hole in it is as good as *none*.--But is that true?

Page 45

100. "But still, it isn't a game, if there is some vagueness *in the rules*".--But *does* this prevent its being a game?--"Perhaps you'll call it a game, but at any rate it certainly isn't a perfect game." This means: it has impurities, and what I am interested in at present is the pure article.--But I want to say: we misunderstand the role of the ideal in our language. That is to say: we too should call it a game, only we are dazzled by the ideal and therefore fail to see the actual use of the word "game" clearly.

Page 45

101. We want to say that there can't be any vagueness in logic. The idea now absorbs us, that the ideal '*must*' be found in reality. Meanwhile we do not as yet see *how* it occurs there, nor do we understand the nature of this "must". We think it must be in reality; for we think we already see it there.

Page 45

102. The strict and clear rules of the logical structure of propositions appear to us as something in the background--hidden in the medium of the understanding. I already see them (even though through a medium): for I understand the propositional sign, I use it to say something.

Page 45

103. The ideal, as we think of it, is unshakable. You can never get outside it; you must always turn back. There is no outside; outside you cannot breathe.--Where does this idea come from? It is like a pair of glasses on our nose through which we see whatever we look at. It never occurs to us to take them off.

Page Break 46

Page 46

104. We predicate of the thing what lies in the method of representing it. Impressed by the possibility of a comparison, we think we are perceiving a state of affairs of the highest generality.

Page 46

105. When we believe that we must find that order, must find the ideal, in our actual language, we become dissatisfied with what are ordinarily called "propositions", "words", "signs".

Page 46

The proposition and the word that logic deals with are supposed to be something pure and clear-cut. And we rack our brains over the nature of the *real* sign.--It is perhaps the *idea* of the sign? or the idea at the present moment?

Page 46

106. Here it is difficult as it were to keep our heads up,--to see that we must stick to the subjects of our every-day thinking, and not go astray and imagine that we have to describe extreme subtleties, which in turn we are after all quite unable to describe with the means at our disposal. We feel as if we had to repair a torn spider's web with our fingers.

Page 46

107. The more narrowly we examine actual language, the sharper becomes the conflict between it and our requirement. (For the crystalline purity of logic was, of course, not a *result of investigation*: it was a requirement.) The conflict becomes intolerable; the requirement is now in danger of becoming empty.--We have got on to slippery ice where there is no friction and so in a certain sense the conditions are ideal, but also, just because of that, we are unable to walk. We want to walk: so we need *friction*. Back to the rough ground!

Faraday in *The Chemical History of a Candle*: "Water is one individual thing--it never changes."

108. We see that what we call "sentence" and "language" has not the formal unity that I imagined, but is the family of structures more or less related to one another.--But what becomes of logic now? Its rigour seems to be giving way here.--But in that case doesn't logic altogether disappear?--For how can it lose its rigour? Of course not by our bargaining any of its rigour out of it.--The *preconceived idea* of crystalline purity can only be removed by turning our whole examination round. (One might say: the axis of reference of our examination must be rotated, but about the fixed point of our real need.)

The philosophy of logic speaks of sentences and words in exactly the sense in which we speak of them in ordinary life when we say e.g.

"Here is a Chinese sentence", or "No, that only looks like writing; it is actually just an ornament" and so on.

We are talking about the spatial and temporal phenomenon of language, not about some non-spatial, non-temporal phantasm. [Note in margin: Only it is possible to be interested in a phenomenon in a variety of ways]. But we talk about it as we do about the pieces in chess when we are stating the rules of the game, not describing their physical properties.

The question "What is a word really?" is analogous to "What is a piece in chess?"

109. It was true to say that our considerations could not be scientific ones. It was not of any possible interest to us to find out empirically 'that, contrary to our preconceived ideas, it is possible to think such-and-such'--whatever that may mean. (The conception of thought as a gaseous medium.) And we may not advance any kind of theory. There must not be anything hypothetical in our considerations. We must do away with all *explanation*, and description alone must take its place. And this description gets its light, that is to say its purpose, from the philosophical problems. These are, of course, not empirical problems; they are solved, rather, by looking into the workings of our language, and that in such a way as to make us recognize those workings: *in despite of* an urge to misunderstand them. The problems are solved, not by giving new information, but by arranging what we have always known. Philosophy is a battle against the bewitchment of our intelligence by means of language.

110. "Language (or thought) is something unique"--this proves to be a superstition (*not* a mistake!), itself produced by grammatical illusions.

And now the impressiveness retreats to these illusions, to the problems.

111. The problems arising through a misinterpretation of our forms of language have the character of *depth*. They are deep disquietudes; their roots are as deep in us as the forms of our language and their significance is as great as the importance of our language.--Let us ask ourselves: why do we feel a grammatical joke to be *deep*? (And that is what the depth of philosophy is.)

112. A simile that has been absorbed into the forms of our language produces a false appearance, and this disquiets us. "But *this* isn't how it is!"--we say. "Yet *this* is how it has to *be*!"

113. "But *this* is how it is--" I say to myself over and over again. I feel as though, if only I could fix my gaze absolutely sharply on this fact, get it in focus, I must grasp the essence of the matter.

114. (*Tractatus Logico-Philosophicus*, 4.5): "The general form of propositions is: This is how things are."--That is the kind of proposition that one repeats to oneself countless times. One thinks that one is tracing the outline of the thing's nature over and over again, and one is merely tracing round the frame through which we look at it.

115. A *picture* held us captive. And we could not get outside it, for it lay in our language and language seemed to repeat it to us inexorably.

Page 48

116. When philosophers use a word--"knowledge", "being", "object", "I", "proposition", "name"--and try to grasp the *essence* of the thing, one must always ask oneself: is the word ever actually used in this way in the language-game which is its original home?--

Page 48

What *we* do is to bring words back from their metaphysical to their everyday use.

Page 48

117. You say to me: "You understand this expression, don't you? Well then--I am using it in the sense you are familiar with."--As if the sense were an atmosphere accompanying the word, which it carried with it into every kind of application.

Page 48

If, for example, someone says that the sentence "This is here" (saying which he points to an object in front of him) makes sense to him, then he should ask himself in what special circumstances this sentence is actually used. There it does make sense.

Page 48

118. Where does our investigation get its importance from, since it seems only to destroy everything interesting, that is, all that is great and important? (As it were all the buildings, leaving behind only bits of stone and rubble.) What we are destroying is nothing but houses of cards and we are clearing up the ground of language on which they stand.

Page 48

119. The results of philosophy are the uncovering of one or another piece of plain nonsense and of bumps that the understanding has got by running its head up against the limits of language. These bumps make us see the value of the discovery.

Page 48

120. When I talk about language (words, sentences, etc.) I must speak the language of every day. Is this language somehow too coarse and material for what we want to say? *Then how is another one to be*

Page Break 49

constructed?--And how strange that we should be able to do anything at all with the one we have!

Page 49

In giving explanations I already have to use language full-blown (not some sort of preparatory, provisional one); this by itself shews that I can adduce only exterior facts about language.

Page 49

Yes, but then how can these explanations satisfy us?--Well, your very questions were framed in this language; they had to be expressed in this language, if there was anything to ask!

Page 49

And your scruples are misunderstandings.

Page 49

Your questions refer to words; so I have to talk about words.

Page 49

You say: the point isn't the word, but its meaning, and you think of the meaning as a thing of the same kind as the word, though also different from the word. Here the word, there the meaning. The money, and the cow that you can buy with it. (But contrast: money, and its use.)

Page 49

121. One might think: if philosophy speaks of the use of the word "philosophy" there must be a second-order philosophy. But it is not so: it is, rather, like the case of orthography, which deals with the word "orthography" among others without then being second-order.

Page 49

122. A main source of our failure to understand is that we do not *command a clear view* of the use of our words.--Our grammar is lacking in this sort of perspicuity. A perspicuous representation produces just that understanding which consists in 'seeing connexions'. Hence the importance of finding and inventing *intermediate cases*.

Page 49

The concept of a perspicuous representation is of fundamental significance for us. It earmarks the form of account we give, the way we look at things. (Is this a 'Weltanschauung'?)

Page 49

123. A philosophical problem has the form: "I don't know my way about".

Page 49

124. Philosophy may in no way interfere with the actual use of language; it can in the end only describe it.

Page 49

For it cannot give it any foundation either.

Page 49

It leaves everything as it is.

Page 49

It also leaves mathematics as it is, and no mathematical discovery can advance it. A "leading problem of mathematical logic" is for us a problem of mathematics like any other.

Page Break 50

Page 50

125. It is the business of philosophy, not to resolve a contradiction by means of a mathematical or logico-mathematical discovery, but to make it possible for us to get a clear view of the state of mathematics that troubles us: the state of affairs *before* the contradiction is resolved. (And this does not mean that one is sidestepping a difficulty.)

Page 50

The fundamental fact here is that we lay down rules, a technique, for a game, and that then when we follow the rules, things do not turn out as we had assumed. That we are therefore as it were entangled in our own rules.

Page 50

This entanglement in our rules is what we want to understand (i.e. get a clear view of).

Page 50

It throws light on our concept of *meaning* something. For in those cases things turn out otherwise than we had meant, foreseen. That is just what we say when, for example, a contradiction appears: "I didn't mean it like that."

Page 50

The civil status of a contradiction, or its status in civil life: there is the philosophical problem.

Page 50

126. Philosophy simply puts everything before us, and neither explains nor deduces anything.--Since everything lies open to view there is nothing to explain. For what is hidden, for example, is of no interest to us.

Page 50

One might also give the name "philosophy" to what is possible *before* all new discoveries and inventions.

Page 50

127. The work of the philosopher consists in assembling reminders for a particular purpose.

Page 50

128. If one tried to advance *theses* in philosophy, it would never be possible to debate them, because everyone would agree to them.

Page 50

129. The aspects of things that are most important for us are hidden because of their simplicity and familiarity. (One is unable to notice something--because it is always before one's eyes.) The real foundations of his enquiry do not strike a man at all. Unless *that* fact has at some time struck him.--And this means: we fail to be struck by what, once seen, is most striking and most powerful.

Page 50

130. Our clear and simple language-games are not preparatory studies for a future regularization of language--as it were first approximations, ignoring friction and air-resistance. The language-games are rather set up as *objects of comparison* which are meant to throw light on the facts of our language by way not only of similarities, but also of dissimilarities.

Page Break 51

Page 51

131. For we can avoid ineptness or emptiness in our assertions only by presenting the model as what it is, as an object of comparison--as, so to speak, a measuring-rod; not as a preconceived idea to which reality *must* correspond. (The dogmatism into which we fall so easily in doing philosophy.)

Page 51

132. We want to establish an order in our knowledge of the use of language: an order with a particular end in view; one out of many possible orders; not *the* order. To this end we shall constantly be giving prominence to

distinctions which our ordinary forms of language easily make us overlook. This may make it look as if we saw it as our task to reform language.

Page 51

Such a reform for particular practical purposes, an improvement in our terminology designed to prevent misunderstandings in practice, is perfectly possible. But these are not the cases we have to do with. The confusions which occupy us arise when language is like an engine idling, not when it is doing work.

Page 51

133. It is not our aim to refine or complete the system of rules for the use of our words in unheard-of ways.

Page 51

For the clarity that we are aiming at is indeed *complete* clarity. But this simply means that the philosophical problems should *completely* disappear.

Page 51

The real discovery is the one that makes me capable of stopping doing philosophy when I want to.--The one that gives philosophy peace, so that it is no longer tormented by questions which bring *itself* in question.--Instead, we now demonstrate a method, by examples; and the series of examples can be broken off.--Problems are solved (difficulties eliminated), not a *single* problem.

Page 51

There is not *a* philosophical method, though there are indeed methods, like different therapies.

Page 51

134. Let us examine the proposition: "This is how things are."--How can I say that this is the general form of propositions?--It is first and foremost *itself* a proposition, an English sentence, for it has a subject and a predicate. But how is this sentence applied--that is, in our everyday language? For I got it from there and nowhere else.

Page 51

We may say, e.g.: "He explained his position to me, said that this was how things were, and that therefore he needed an advance". So far, then, one can say that that sentence stands for any statement. It is employed as a propositional *schema*, but *only* because it has the

Page Break 52

construction of an English sentence. It would be possible to say instead "such and such is the case", "this is the situation", and so on. It would also be possible here simply to use a letter, a variable, as in symbolic logic. But no one is going to call the letter "p" the general form of propositions. To repeat: "This is how things are" had that position only because it is itself what one calls an English sentence. But though it is a proposition, still it gets employed as a propositional variable. To say that this proposition agrees (or does not agree) with reality would be obvious nonsense. Thus it illustrates the fact that *one* feature of our concept of a proposition is, *sounding like a proposition*.

Page 52

135. But haven't we got a concept of what a proposition is, of what we take "proposition" to mean?--Yes; just as we also have a concept of what we mean by "game". Asked what a proposition is--whether it is another person or ourselves that we have to answer--we shall give examples and these will include what one may call inductively defined series of propositions. *This* is the kind of way in which we have such a concept as 'proposition'. (Compare the concept of a proposition with the concept of number.)

Page 52

136. At bottom, giving "This is how things are" as the general form of propositions is the same as giving the definition: a proposition is whatever can be true or false. For instead of "This is how things are" I could have said "This is true". (Or again "This is false".) But we have

'p' is true = p

'p' is false = not-p.

Page 52

And to say that a proposition is whatever can be true or false amounts to saying: we call something a proposition when *in our language* we apply the calculus of truth functions to it.

Page 52

Now it looks as if the definition--a proposition is whatever can be true or false--determined what a proposition was, by saying: what fits the concept 'true', or what the concept 'true' fits, is a proposition. So it is as if we had a concept of true and false, which we could use to determine what is and what is not a proposition. What *engages* with the concept of truth (as with a cogwheel), is a proposition.

Page 52

But this is a bad picture. It is as if one were to say "The king in chess is *the* piece that one can check." But

this can mean no more than that in our game of chess we only check the king. Just as the proposition that only a *proposition* can be true or false can say no more than

Page Break 53

that we only predicate "true" and "false" of what we call a proposition. And what a proposition is is in one sense determined by the rules of sentence formation (in English for example), and in another sense by the use of the sign in the language-game. And the use of the words "true" and "false" may be among the constituent parts of this game; and if so it *belongs* to our concept 'proposition' but does not *fit* it. As we might also say, check *belongs* to our concept of the king in chess (as so to speak a constituent part of it). To say that check did not *fit* our concept of the pawns, would mean that a game in which pawns were checked, in which, say, the players who lost their pawns lost, would be uninteresting or stupid or too complicated or something of the kind.

Page 53

137. What about learning to determine the subject of a sentence by means of the question "Who or what....?"--Here, surely, there is such a thing as the subject's 'fitting' this question; for otherwise how should we find out what the subject was by means of the question? We find it out much as we find out which letter of the alphabet comes after 'K' by saying the alphabet up to 'K' to ourselves. Now in what sense does 'L' fit on to this series of letters?--In *that* sense "true" and "false" could be said to fit propositions; and a child might be taught to distinguish between propositions and other expressions by being told "Ask yourself if you can say 'is true' after it. If these words fit, it's a proposition." (And in the same way one might have said: Ask yourself if you can put the words "*This* is how things are:" in front of it.)

Page 53

138. But can't the meaning of a word that I understand fit the sense of a sentence that I understand? Or the meaning of one word fit the meaning of another?--Of course, if the meaning is the *use* we make of the word, it makes no sense to speak of such 'fitting.' But we *understand* the meaning of a word when we hear or say it; we grasp it in a flash, and what we grasp in this way is surely something different from the 'use' which is extended in time!

Page 53

Must I *know* whether I understand a word? Don't I also sometimes imagine myself to understand a word (as I may imagine I understand a kind of calculation) and then realize that I did not understand it? ("I thought I knew what 'relative' and 'absolute' motion meant, but I see that I don't know.")

Page Break 54

Page 54

139. When someone says the word "cube" to me, for example, I know what it means. But can the whole *use* of the word come before my mind, when I *understand* it in this way?

Page 54

Well, but on the other hand isn't the meaning of the word also determined by this use? And can't these ways of determining meaning conflict? Can what we grasp *in a flash* accord with a use, fit or fail to fit it? And how can what is present to us in an instant, what comes before our mind in an instant, fit a *use*?

Page 54

What really comes before our mind when we *understand* a word?--Isn't it something like a picture? Can't it *be* a picture?

Page 54

Well, suppose that a picture does come before your mind when you hear the word "cube", say the drawing of a cube. In what sense can this picture fit or fail to fit a use of the word "cube"?--Perhaps you say: "It's quite simple;--if that picture occurs to me and I point to a triangular prism for instance, and say it is a cube, then this use of the word doesn't fit the picture."--But doesn't it fit? I have purposely so chosen the example that it is quite easy to imagine a *method of projection* according to which the picture does fit after all.

Page 54

The picture of the cube did indeed *suggest* a certain use to us, but it was possible for me to use it differently.

Page 54

(a) "I believe the right word in this case is....". Doesn't this shew that the meaning of a word is a something that comes before our mind, and which is, as it were, the exact picture we want to use here? Suppose I were choosing between the words "imposing", "dignified", "proud", "venerable"; isn't it as though I were choosing

between drawings in a portfolio?--No: the fact that one speaks of the *appropriate word* does not *shew* the existence of a something that etc.. One is inclined, rather, to speak of this picture-like something just because one can find a word appropriate; because one often chooses between words as between similar but not identical pictures; because pictures are often used instead of words, or to illustrate words; and so on.

Page 54

(b) I see a picture; it represents an old man walking up a steep path leaning on a stick.--How? Might it not have looked just the same if he had been sliding downhill in that position? Perhaps a Martian would describe the picture so. I do not need to explain why *we* do not describe it so.

Page Break 55

Page 55

140. Then what sort of mistake did I make; was it what we should like to express by saying: I should have thought the picture forced a particular use on me? How could I think that? What *did* I think? Is there such a thing as a picture, or something like a picture, that forces a particular application on us; so that my mistake lay in confusing one picture with another?--For we might also be inclined to express ourselves like this: we are at most under a psychological, not a logical, compulsion. And now it looks quite as if we knew of two kinds of case.

Page 55

What was the effect of my argument? It called our attention to (reminded us of) the fact that there are other processes, besides the one we originally thought of, which we should sometimes be prepared to call "applying the picture of a cube". So our 'belief that the picture forced a particular application upon us' consisted in the fact that only the one case and no other occurred to us. "There is another solution as well" means: there is something else that I am also prepared to call a "solution"; to which I am prepared to apply such-and-such a picture, such-and-such an analogy, and so on.

Page 55

What is essential is to see that the same thing can come before our minds when we hear the word and the application still be different. Has it the *same* meaning both times? I think we shall say not.

Page 55

141. Suppose, however, that not merely the picture of the cube, but also the method of projection comes before our mind?--How am I to imagine this?--Perhaps I see before me a schema shewing the method of projection: say a picture of two cubes connected by lines of projection.--But does this really get me any further? Can't I now imagine different applications of this schema too?--Well, yes, but then can't an *application come before my mind*?--It can: only we need to get clearer about our application of *this* expression. Suppose I explain various methods of projection to someone so that he may go on to apply them; let us ask ourselves when we should say that *the* method that I intend comes before his mind.

Page 55

Now clearly we accept two different kinds of criteria for this: on the one hand the picture (of whatever kind) that at some time or other comes before his mind; on the other, the application which--in the course of time--he makes of what he imagines. (And can't it be clearly seen here that it is absolutely inessential for the picture to exist in his imagination rather than as a drawing or model in front of him; or again as something that he himself constructs as a model?)

Page Break 56

Page 56

Can there be a collision between picture and application? There can, inasmuch as the picture makes us expect a different use, because people in general apply *this* picture like *this*.

Page 56

I want to say: we have here a *normal* case, and abnormal cases.

Page 56

142. It is only in normal cases that the use of a word is clearly prescribed; we know, are in no doubt, what to say in this or that case. The more abnormal the case, the more doubtful it becomes what we are to say. And if things were quite different from what they actually are--if there were for instance no characteristic expression of pain, of fear, of joy; if rule became exception and exception rule; or if both became phenomena of roughly equal frequency--this would make our normal language-games lose their point.--The procedure of putting a lump of cheese on a balance and fixing the price by the turn of the scale would lose its point if it frequently happened for such lumps to suddenly grow or shrink for no obvious reason. This remark will become clearer when we discuss such things as the relation of expression to feeling, and similar topics.

What we have to mention in order to explain the significance, I mean the importance, of a concept, are often extremely general facts of nature: such facts as are hardly ever mentioned because of their great generality.

143. Let us now examine the following kind of language-game: when A gives an order B has to write down series of signs according to a certain formation rule.

The first of these series is meant to be that of the natural numbers in decimal notation.--How does he get to understand this notation?--First of all series of numbers will be written down for him and he will be required to copy them. (Do not balk at the expression "series of numbers"; it is not being used wrongly here.) And here already there is a normal and an abnormal learner's reaction.--At first perhaps we guide his hand in writing out the series 0 to 9; but then the *possibility of getting him to understand* will depend on his going on to write it down independently.--And here we can imagine, e.g., that he does copy the figures independently, but not in the right order: he writes sometimes one sometimes another at random. And then communication stops at *that* point.--Or again, he makes '*mistakes*'

in the order.--The difference between this and the first case will of course be one of frequency.--Or he makes a *systematic* mistake; for example, he copies every other number, or he copies the series 0, 1, 2, 3, 4, 5,.... like this: 1, 0, 3, 2, 5, 4,..... Here we shall almost be tempted to say that he has understood *wrong*.

Notice, however, that there is no sharp distinction between a random mistake and a systematic one. That is, between what you are inclined to call "random" and what "systematic".

Perhaps it is possible to wean him from the systematic mistake (as from a bad habit). Or perhaps one accepts his way of copying and tries to teach him ours as an offshoot, a variant of his.--And here too our pupil's capacity to learn may come to an end.

144. What do I mean when I say "the pupil's capacity to learn *may* come to an end here"? Do I say this from my own experience? Of course not. (Even if I have had such experience.) Then what am I doing with that proposition? Well, I should like you to say: "Yes, it's true, you can imagine that too, that might happen too!"--But was I trying to draw someone's attention to the fact that he is capable of imagining that?--I wanted to put that picture before him, and his *acceptance* of the picture consists in his now being inclined to regard a given case differently: that is, to compare it with *this* rather than *that* set of pictures. I have changed his *way of looking at things*. (Indian mathematicians: "Look at this.")

145. Suppose the pupil now writes the series 0 to 9 to our satisfaction.--And this will only be the case when he is often successful, not if he does it right once in a hundred attempts. Now I continue the series and draw his attention to the recurrence of the first series in the units; and then to its recurrence in the tens. (Which only means that I use particular emphases, underline figures, write them one under another in such-and-such ways, and similar things.)--And now at some point he continues the series independently--or he does not.--But why do you say that? *so* much is obvious!--Of course; I only wished to say: the effect of any further *explanation* depends on his *reaction*.

Now, however, let us suppose that after some efforts on the teacher's part he continues the series correctly, that is, as we do it. So now we can say he has mastered the system.--But how far need he continue

the series for us to have the right to say that? Clearly you cannot state a limit here.

146. Suppose I now ask: "Has he understood the system when he continues the series to the hundredth place?" Or--if I should not speak of 'understanding' in connection with our primitive language-game: Has he got the system, if he continues the series correctly so far?--Perhaps you will say here: to have got the system (or, again, to understand it) can't consist in continuing the series up to *this* or *that* number: *that* is only applying one's understanding. The understanding itself is a state which is the *source* of the correct use.

What is one really thinking of here? Isn't one thinking of the derivation of a series from its algebraic formula? Or at least of something analogous?--But this is where we were before. The point is, we can think of more than *one* application of an algebraic formula; and every type of application can in turn be formulated algebraically; but naturally this does not get us any further.--The application is still a criterion of understanding.

Page 58

147. "But how can it be? When *I* say I understand the rule of a series, I am surely not saying so because I have *found out* that up to now I have applied the algebraic formula in such-and-such a way! In my own case at all events I surely know that I mean such-and-such a series; it doesn't matter how far I have actually developed it."--

Page 58

Your idea, then, is that you know the application of the rule of the series quite apart from remembering actual applications to particular numbers. And you will perhaps say: "Of course! For the series is infinite and the bit of it that I can have developed finite."

Page 58

148. But what does this knowledge consist in? Let me ask: *When* do you know that application? Always? day and night? or only when you are actually thinking of the rule? do you know it, that is, in the same way as you know the alphabet and the multiplication table? Or is what you call "knowledge" a state of consciousness or a process--say a thought of something, or the like?

Page 58

149. If one says that knowing the ABC is a state of the mind, one is thinking of a state of a mental apparatus (perhaps of the brain) by means of which we explain the *manifestations* of that knowledge. Such a state is called a disposition. But there are objections to speaking

Page Break 59

of a state of the mind here, inasmuch as there ought to be two different criteria for such a state: a knowledge of the construction of the apparatus, quite apart from what it does. (Nothing would be more confusing here than to use the words "conscious" and "unconscious" for the contrast between states of consciousness and dispositions. For this pair of terms covers up a grammatical difference.)

Page 59

150. The grammar of the word "knows" is evidently closely related to that of "can", "is able to". But also closely related to that of "understands". ('Mastery' of a technique,)

Page 59

(a) "Understanding a word": a state. But a *mental* state?--Depression, excitement, pain, are called mental states. Carry out a grammatical investigation as follows: we say

Page 59

"He was depressed the whole day".

Page 59

"He was in great excitement the whole day".

Page 59

"He has been in continuous pain since yesterday".--

We also say "Since yesterday I have understood this word". "Continuously", though?--To be sure, one can speak of an interruption of understanding. But in what cases? Compare: "When did your pains get less?" and "When did you stop understanding that word?"

Page 59

(b) Suppose it were asked: "*When* do you know how to play chess? All the time? or just while you are making a move? And the *whole* of chess during each move?--How queer that knowing how to play chess should take such a short time, and a game so much longer!

Page 59

151. But there is also *this* use of the word "to know": we say "Now I know!"--and similarly "Now I can do it!" and "Now I understand!"

Page 59

Let us imagine the following example: A writes series of numbers down; B watches him and tries to find a law for the sequence of numbers. If he succeeds he exclaims: "Now I can go on!"--So this capacity, this understanding, is something that makes its appearance in a moment. So let us try and see what it is that makes its appearance here.--A has written down the numbers 1, 5, 11, 19, 29; at this point B says he knows how to go on. What happened here? Various things may have happened; for example, while A was slowly putting one number

after another, B was occupied with trying various algebraic formulae on the numbers which had been written down. After A had written the number 19 B tried the formula $a_n = n^2 + n - 1$; and the next number confirmed his hypothesis.

Page Break 60

Page 60

Or again, B does not think of formulae. He watches A writing his numbers down with a certain feeling of tension, and all sorts of vague thoughts go through his head. Finally he asks himself: "What is the series of differences?" He finds the series 4, 6, 8, 10 and says: Now I can go on.

Page 60

Or he watches and says "Yes, I know *that* series"--and continues it, just as he would have done if A had written down the series 1, 3, 5, 7, 9.--Or he says nothing at all and simply continues the series. Perhaps he had what may be called the sensation "that's easy!". (Such a sensation is, for example, that of a light quick intake of breath, as when one is slightly startled.)

Page 60

152. But are the processes which I have described here *understanding*?

Page 60

"B understands the principle of the series" surely doesn't mean simply: the formula " $a_n = \dots$ " occurs to B. For it is perfectly imaginable that the formula should occur to him and that he should nevertheless not understand. "He understands" must have more in it than: the formula occurs to him. And equally, more than any of those more or less characteristic *accompaniments* or manifestations of understanding.

Page 60

153. We are trying to get hold of the mental process of understanding which seems to be hidden behind those coarser and therefore more readily visible accompaniments. But we do not succeed; or, rather, it does not get as far as a real attempt. For even supposing I had found something that happened in all those cases of understanding,--why should *it* be the understanding? And how can the process of understanding have been hidden, when I said "Now I understand" *because* I understood?! And if I say it is hidden--then how do I know what I have to look for? I am in a muddle.

Page 60

154. But wait--if "Now I understand the principle" does not mean the same as "The formula.... occurs to me" (or "I say the formula", "I write it down", etc.)--does it follow from this that I employ the sentence "Now I understand....." or "Now I can go on" as a description of a process occurring behind or side by side with that of saying the formula?

Page 60

If there has to be anything 'behind the utterance of the formula' it is *particular circumstances*, which justify me in saying I can go on--when the formula occurs to me.

Page Break 61

Page 61

Try not to think of understanding as a 'mental process' at all.--For *that* is the expression which confuses you. But ask yourself: in what sort of case, in what kind of circumstances, do we say, "Now I know how to go on," when, that is, the formula *has* occurred to me?--

Page 61

In the sense in which there are processes (including mental processes) which are characteristic of understanding, understanding is not a mental process.

Page 61

(A pain's growing more and less; the hearing of a tune or a sentence: these are mental processes.)

Page 61

155. Thus what I wanted to say was: when he suddenly knew how to go on, when he understood the principle, then possibly he had a special experience--and if he is asked: "What was it? What took place when you suddenly grasped the principle?" perhaps he will describe it much as we described it above--but for us it is *the circumstances* under which he had such an experience that justify him in saying in such a case that he understands, that he knows how to go on.

Page 61

156. This will become clearer if we interpolate the consideration of another word, namely "reading". First I need to remark that I am not counting the understanding of what is read as part of 'reading' for purposes of this investigation: reading is here the activity of rendering out loud what is written or printed; and also of writing from

dictation, writing out something printed, playing from a score, and so on.

Page 61

The use of this word in the ordinary circumstances of our life is of course extremely familiar to us. But the part the word plays in our life, and therewith the language-game in which we employ it, would be difficult to describe even in rough outline. A person, let us say an Englishman, has received at school or at home one of the kinds of education usual among us, and in the course of it has learned to read his native language. Later he reads books, letters, newspapers, and other things.

Page 61

Now what takes place when, say, he reads a newspaper?--His eye passes--as we say--along the printed words, he says them out loud--or only to himself; in particular he reads certain words by taking in their printed shapes as wholes; others when his eye has taken in the first syllables; others again he reads syllable by syllable, and an occasional one perhaps letter by letter.--We should also say that he had read a sentence if he spoke neither aloud nor to himself during the reading but was afterwards able to repeat the sentence word for word or nearly so.--He may attend to what he reads, or again--as we

Page Break 62

might put it--function as a mere reading-machine: I mean, read aloud and correctly without attending to what he is reading; perhaps with his attention on something quite different (so that he is unable to say what he has been reading if he is asked about it immediately afterwards).

Page 62

Now compare a beginner with this reader. The beginner reads the words by laboriously spelling them out.--Some however he guesses from the context, or perhaps he already partly knows the passage by heart. Then his teacher says that he is not really *reading* the words (and in certain cases that he is only pretending to read them).

Page 62

If we think of *this* sort of reading, the reading of a beginner, and ask ourselves what *reading* consists in, we shall be inclined to say: it is a special conscious activity of mind.

Page 62

We also say of the pupil: "Of course he alone knows if he is really reading or merely saying the words off by heart". (We have yet to discuss these propositions: "He alone knows....".)

Page 62

But I want to say: we have to admit that--as far as concerns uttering any *one* of the printed words--the same thing may take place in the consciousness of the pupil who is 'pretending' to read, as in that of the practised reader who is 'reading' it. The word "to read" is applied *differently* when we are speaking of the beginner and of the practised reader.--Now we should of course like to say: What goes on in that practised reader and in the beginner when they utter the word *can't* be the same. And if there is no difference in what they happen to be conscious of there must be one in the unconscious workings of their minds, or, again, in the brain.--So we should like to say: There are at all events two different mechanisms at work here. And what goes on in them must distinguish reading from not reading.--But these mechanisms are only hypotheses, models designed to explain, to sum up, what you observe.

Page 62

157. Consider the following case. Human beings or creatures of some other kind are used by us as reading-machines. They are trained for this purpose. The trainer says of some that they can already read, of others that they cannot yet do so. Take the case of a pupil who has so far not taken part in the training: if he is shewn a written word he will sometimes produce some sort of sound, and here and there it happens 'accidentally' to be roughly right. A third person hears this pupil on such an occasion and says: "He is reading". But the teacher says: "No, he isn't reading; that was just an accident".--But let us suppose that this pupil continues to react correctly to further words

Page Break 63

that are put before him. After a while the teacher says: "Now he can read!"--But what of that first word? Is the teacher to say: "I was wrong, and he *did* read it"--or: "He only began really to read later on"?--When did he begin to read? Which was the first word that he *read*? This question makes no sense here. Unless, indeed, we give a definition: "The first word that a person 'reads' is the first word of the first series of 50 words that he reads correctly" (or something of the sort).

Page 63

If on the other hand we use "reading" to stand for a certain experience of transition from marks to spoken sounds, then it certainly makes sense to speak of the *first* word that he really read. He can then say, e.g. "At this

word for the first time I had the feeling: 'now I am reading'."

Page 63

Or again, in the different case of a reading machine which translated marks into sounds, perhaps as a pianola does, it would be possible to say: "The machine *read* only after such-and-such had happened to it--after such-and-such parts had been connected by wires; the first word that it read was....".

Page 63

But in the case of the living reading-machine "reading" meant reacting to written signs in such-and-such ways. This concept was therefore quite independent of that of a mental or other mechanism.--Nor can the teacher here say of the pupil: "Perhaps he was already reading when he said that word". For there is no doubt about what he did.--The change when the pupil began to read was a change in his *behaviour*; and it makes no sense here to speak of 'a first word in his new state'.

Page 63

158. But isn't that only because of our too slight acquaintance with what goes on in the brain and the nervous system? If we had a more accurate knowledge of these things we should see what connexions were established by the training, and then we should be able to say when we looked into his brain: "Now he has *read* this word, now the reading connexion has been set up".--And it presumably *must* be like that--for otherwise how could we be so sure that there was such a connexion? That it is so is presumably a priori--or is it only probable? And how probable is it? Now, ask yourself: what do you *know* about these things?--But if it is a priori, that means that it is a form of account which is very convincing to us.

Page 63

159. But when we think the matter over we are tempted to say: the one real criterion for anybody's *reading* is the conscious act of reading, the act of reading the sounds off from the letters. "A man

Page Break 64

surely knows whether he is reading or only pretending to read!"--Suppose A wants to make B believe he can read Cyrillic script. He learns a Russian sentence by heart and says it while looking at the printed words as if he were reading them. Here we shall certainly say that A knows he is not reading, and has a sense of just this while pretending to read. For there are of course many more or less characteristic sensations in reading a printed sentence; it is not difficult to call such sensations to mind: think of sensations of hesitating, of looking closer, of misreading, of words following on one another more or less smoothly, and so on. And equally there are characteristic sensations in reciting something one has learnt by heart. In our example A will have none of the sensations that are characteristic of reading, and will perhaps have a set of sensations characteristic of cheating.

Page 64

160. But imagine the following case: We give someone who can read fluently a text that he never saw before. He reads it to us--but with the sensation of saying something he has learnt by heart (this might be the effect of some drug). Should we say in such a case that he was not really reading the passage? Should we here allow his sensations to count as the criterion for his reading or not reading?

Page 64

Or again: Suppose that a man who is under the influence of a certain drug is presented with a series of characters (which need not belong to any existing alphabet). He utters words corresponding to the number of the characters, as if they were letters, and does so with all the outward signs, and with the sensations, of reading. (We have experiences like this in dreams; after waking up in such a case one says perhaps: "It seemed to me as if I were reading a script, though it was not writing at all.") In such a case some people would be inclined to say the man was *reading* those marks. Others, that he was not.--Suppose he has in this way read (or interpreted) a set of five marks as *A B O V E*--and now we shew him the same marks in the reverse order and he reads *E V O B A*; and in further tests he always retains the same interpretation of the marks: here we should certainly be inclined to say he was making up an alphabet for himself *ad hoc* and then reading accordingly.

Page 64

161. And remember too that there is a continuous series of transitional cases between that in which a person repeats from memory what he is supposed to be reading, and that in which he spells out every word without being helped at all by guessing from the context or knowing by heart.

Page Break 65

Page 65

Try this experiment: say the numbers from 1 to 12. Now look at the dial of your watch and *read* them.--What was it that you called "reading" in the latter case? That is to say: what did you do, to make it into *reading*?

162. Let us try the following definition: You are reading when you *derive* the reproduction from the original. And by "the original" I mean the text which you read or copy; the dictation from which you write; the score from which you play; etc. etc.--Now suppose we have, for example, taught someone the Cyrillic alphabet, and told him how to pronounce each letter. Next we put a passage before him and he reads it, pronouncing every letter as we have taught him. In this case we shall very likely say that he derives the sound of a word from the written pattern by the rule that we have given him. And this is also a clear case of *reading*. (We might say that we had taught him the 'rule of the alphabet'.)

But why do we say that he has *derived* the spoken from the printed words? Do we know anything more than that we taught him how each letter should be pronounced, and that he then read the words out loud? Perhaps our reply will be: the pupil shews that he is using the rule we have given him to pass from the printed to the spoken words.--How this can be *shewn* becomes clearer if we change our example to one in which the pupil has to write out the text instead of reading it to us, has to make the transition from print to handwriting. For in this case we can give him the rule in the form of a table with printed letters in one column and cursive letters in the other. And he shews that he is deriving his script from the printed words by consulting the table.

163. But suppose that when he did this he always wrote *b* for *A*, *c* for *B*, *d* for *C*, and so on, and *a* for *Z*?--Surely we should call this too a derivation by means of the table.--He is using it now, we might say, according to the second schema in §86 instead of the first.

It would still be a perfectly good case of derivation according to the table, even if it were represented by a schema of arrows without any simple regularity.

Suppose, however, that he does not stick to a *single* method of transcribing, but alters his method according to a simple rule: if he has once written *n* for *A*, then he writes *o* for the next *A*, *p* for the next, and so on.--But where is the dividing line between this procedure and a random one?

But does this mean that the word "to derive" really has no meaning, since the meaning seems to disintegrate when we follow it up?

164. In case (162) the meaning of the word "to derive" stood out clearly. But we told ourselves that this was only a quite special case of deriving; deriving in a quite special garb, which had to be stripped from it if we wanted to see the essence of deriving. So we stripped those particular coverings off; but then deriving itself disappeared.--In order to find the real artichoke, we divested it of its leaves. For certainly (162) was a special case of deriving; what is essential to deriving, however, was not hidden beneath the surface of this case, but his 'surface' was one case out of the family of cases of deriving.

And in the same way we also use the word "to read" for a family of cases. And in different circumstances we apply different criteria for a person's reading.

The grammar of the expression "a quite particular" (atmosphere). One says "This face has a quite *particular* expression," and maybe looks for words to characterize it.

165. But surely--we should like to say--reading is a quite particular process! Read a page of print and you can see that something special is going on, something highly characteristic.--Well, what does go on when I read the page? I see printed words and I say words out loud. But, of course, that is not all, for I might see printed words and say words out loud and still not be reading. Even if the words which I say are those which, going by an existing alphabet, are *supposed* to be read off from the printed ones.--And if you say that reading is a particular experience, then it becomes quite unimportant whether or not you read according to some generally recognized alphabetical rule.--And what does the characteristic thing about the experience of reading consist in?--Here I should like to say: "The words that I utter *come* in a special way." That is, they do not come as they would if I were for example making them up.--They come of themselves.--But even that is not enough; for the sounds of words may *occur* to me while I

am looking at printed words, but that does not mean that I have read them.--In addition I might say here, neither do the spoken words occur to me as if, say, something reminded me of them. I should for example not wish to say: the printed word "nothing" always reminds me of the sound "nothing"--but the spoken words as it were slip in as one

Page Break 67

reads. And if I so much as look at a German printed word, there occurs a peculiar process, that of hearing the sound inwardly.

Page 67

166. I said that when one reads the spoken words come 'in a special way': but in what way? Isn't this a fiction? Let us look at individual letters and attend to the way the sound of the letter comes. Read the letter A.--Now, how did the sound come?--We have no idea what to say about it.--Now write a small Roman a.--How did the movement of the hand come as you wrote? Differently from the way the sound came in the previous experiment?--All I know is, I looked at the printed letter and wrote the cursive letter.--Now look at the mark

and let a sound occur to you as you do so; utter it. The sound 'U' occurred to me; but I could not say that there was any essential difference in the kind of way that sound *came*. The difference lay in the difference of situation. I had told myself beforehand that I was to let a sound occur to me; there was a certain tension present before the sound came. And I did not say 'U' automatically as I do when I look at the letter U. Further, that mark was not *familiar* to me in the way the letters of the alphabet are. I looked at it rather intently and with a certain interest in its shape; as I looked I thought of a reversed σ --Imagine having to use this mark regularly as a letter; so that you got used to uttering a particular sound at the sight of it, say the sound "sh". Can we say anything but that after a while this sound comes automatically when we look at the mark? That is to say: I no longer ask myself on seeing it "What sort of letter is that?"--nor, of course, do I tell myself "This mark makes me want to utter the sound 'sh'", nor yet "This mark somehow reminds me of the sound 'sh'".

Page 67

(Compare with this the idea that memory images are distinguished from other mental images by some special characteristic.)

Page 67

167. Now what is there in the proposition that reading is 'a quite particular process'? It presumably means that when we read *one* particular process takes place, which we recognize.--But suppose that I at one time read a sentence in print and at another write it in Morse code--is the mental process really the same?--On the other hand, however, there is certainly some uniformity in the experience of reading a page of print. For the process is a uniform one. And it is quite easy to understand that there is a difference between this process and one of, say, letting words occur to one at the sight of arbitrary marks.--For the mere look of a printed line is itself extremely

Page Break 68

characteristic--it presents, that is, a quite special appearance, the letters all roughly the same size, akin in shape too, and always recurring; most of the words constantly repeated and enormously familiar to us, like well-known faces.--Think of the uneasiness we feel when the spelling of a word is changed. (And of the still stronger feelings that questions about the spelling of words have aroused.) Of course, not all signs have impressed themselves on us so *strongly*. A sign in the algebra of logic for instance can be replaced by any other one without exciting a strong reaction in us.--

Page 68

Remember that the look of a word is familiar to us in the same kind of way as its sound.

Page 68

168. Again, our eye passes over printed lines differently from the way it passes over arbitrary pothooks and flourishes. (I am not speaking here of what can be established by observing the movement of the eyes of a reader.) The eye passes, one would like to say, with particular ease, without being held up; and yet it doesn't *skid*. And at the same time involuntary speech goes on in the imagination. That is how it is when I read German and other languages, printed or written, and in various styles.--But what in all this is essential to reading as such? Not any one feature that occurs in all cases of reading. (Compare reading ordinary print with reading words which are printed entirely in capital letters, as solutions of puzzles sometimes are. How different it is!--Or reading our script from right to left.)

Page 68

169. But when we read don't we feel the word-shapes somehow causing our utterance?--Read a sentence.--And now look along the following line

and say a sentence as you do so. Can't one feel that in the first case the utterance was *connected* with seeing the signs and in the second went on side by side with the seeing without any connexion?

Page 68

But why do you say that we felt a causal connexion? Causation is surely something established by experiments, by observing a regular concomitance of events for example. So how could I say that I *felt* something which is established by experiment? (It is indeed true that observation of regular concomitances is not the only way we establish causation.) One might rather say, I feel that the letters are the *reason* why I read such-and-such. For if someone asks me "Why

Page Break 69

do you read such-and-such?"--I justify my reading by the letters which are there.

Page 69

This justification, however, was something that I said, or thought: what does it mean to say that I *feel* it? I should like to say: when I read I feel a kind of *influence* of the letters working on me--but I feel no influence from that series of arbitrary flourishes on what I say.--Let us once more compare an individual letter with such a flourish. Should I also say I feel the influence of "i" when I read it? It does of course make a difference whether I say "i" when I see "i" or when I see "§". The difference is, for instance, that when I see the letter it is automatic for me to hear the sound "i" inwardly, it happens even against my will; and I pronounce the letter more effortlessly when I read it than when I am looking at "§". That is to say: this is how it is when I make the *experiment*; but of course it is not so if I happen to be looking at the mark "§" and at the same time pronounce a word in which the sound "i" occurs.

Page 69

170. It would never have occurred to us to think that we *felt the influence* of the letters on us when reading, if we had not compared the case of letters with that of arbitrary marks. And here we are indeed noticing a *difference*. And we interpret it as the difference between being influenced and not being influenced.

Page 69

In particular, this interpretation appeals to us especially when we make a point of reading slowly--perhaps in order to see what does happen when we read. When we, so to speak, quite intentionally let ourselves be *guided* by the letters. But this 'letting myself be guided' in turn only consists in my looking carefully at the letters--and perhaps excluding certain other thoughts.

Page 69

We imagine that a feeling enables us to perceive as it were a connecting mechanism between the look of the word and the sound that we utter. For when I speak of the experiences of being influenced, of causal connexion, of being guided, that is really meant to imply that I as it were feel the movement of the lever which connects seeing the letters with speaking.

Page 69

171. I might have used other words to hit off the experience I have when I read a word. Thus I might say that the written word *intimates* the sound to me.--Or again, that when one reads, letter and sound form a *unity*--as it were an alloy. (In the same way e.g. the faces of famous men and the sound of their names are fused together. This

Page Break 70

name strikes me as the only right one for this face.) When I feel this unity, I might say, I see or hear the sound in the written word.--

Page 70

But now just read a few sentences in print as you usually do when you are not thinking about the concept of reading; and ask yourself whether you had such experiences of unity, of being influenced and the rest, as you read.--Don't say you had them unconsciously! Nor should we be misled by the picture which suggests that these phenomena came in sight 'on closer inspection'. If I am supposed to describe how an object looks from far off, I don't make the description more accurate by saying what can be noticed about the object on closer inspection.

Page 70

172. Let us consider the experience of being guided, and ask ourselves: what does this experience consist in when for instance our *course* is guided?--Imagine the following cases:

Page 70

You are in a playing field with your eyes bandaged, and someone leads you by the hand, sometimes left, sometimes right; you have constantly to be ready for the tug of his hand, and must also take care not to stumble when he gives an unexpected tug.

Page 70

Or again: someone leads you by the hand where you are unwilling to go, by force.

Page 70

Or: you are guided by a partner in a dance; you make yourself as receptive as possible, in order to guess his intention and obey the slightest pressure.

Page 70

Or: someone takes you for a walk; you are having a conversation; you go wherever he does.

Page 70

Or: you walk along a field-track, simply following it.

Page 70

All these situations are similar to one another; but what is common to all the experiences?

Page 70

173. "But being guided is surely a particular experience!"--The answer to this is: you are now *thinking* of a particular experience of being guided.

Page 70

If I want to realize the experience of the person in one of the earlier examples, whose writing is guided by the printed text and the table, I imagine 'conscientious' looking-up, and so on. As I do this I assume a particular expression of face (say that of a conscientious bookkeeper). *Carefulness* is a most essential part of this picture; in another the exclusion of every volition of one's own would be essential. (But take something normal people do quite unconcernedly and imagine someone accompanying it with the expression--and why not the

Page Break 71

feelings?--of great carefulness.--Does that mean he is careful? Imagine a servant dropping the tea-tray and everything on it with all the outward signs of carefulness.) If I imagine such a particular experience, it seems to me to be *the* experience of being guided (or of reading). But now I ask myself: what are you doing?--You are looking at every letter, you are making this face, you are writing the letters with deliberation (and so on).--So that is the experience of being guided?--Here I should like to say: "No, it isn't that; it is something more inward, more essential."--It is as if at first all these more or less inessential processes were shrouded in a particular atmosphere, which dissipates when I look closely at them.

Page 71

174. Ask yourself how you draw a line parallel to a given one 'with deliberation'--and another time, with deliberation, one at an angle to it. What is the experience of deliberation? Here a particular look, a gesture, at once occur to you--and then you would like to say: "And it just is a *particular* inner experience". (And that is, of course, to add nothing).

Page 71

(This is connected with the problem of the nature of intention, of willing.)

Page 71

175. Make some arbitrary doodle on a bit of paper.--And now make a copy next to it, let yourself be guided by it.--I should like to say: "Sure enough, I was guided here. But as for what was characteristic in what happened--if I say what happened, I no longer find it characteristic."

Page 71

But now notice this: *while* I am being guided everything is quite simple, I notice nothing *special*; but afterwards, when I ask myself what it was that happened, it seems to have been something indescribable. *Afterwards* no description satisfies me. It's as if I couldn't believe that I merely looked, made such-and-such a face, and drew a line.--But don't I *remember* anything else? No; and yet I feel as if there must have been something else; in particular when I say "*guidance*", "*influence*", and other such words to myself. "For surely," I tell myself, "I was being *guided*."--Only then does the idea of that ethereal, intangible influence arise.

Page 71

176. When I look back on the experience I have the feeling that what is essential about it is an 'experience of being influenced', of a connexion--as opposed to any mere simultaneity of phenomena: but at the same time I should not be willing to call any experienced phenomenon the "experience of being influenced". (This contains the

Page Break 72

germ of the idea that the will is not a *phenomenon*.) I should like to say that I had experienced the '*because*', and yet I do not want to call any phenomenon the "experience of the because".

Page 72

177. I should like to say: "I experience the because". Not because I remember such an experience, but because when I reflect on what I experience in such a case I look at it through the medium of the concept 'because'

(or 'influence' or 'cause' or 'connexion').--For of course it is correct to say I drew the line under the influence of the original: this, however, does not consist simply in my feelings as I drew the line--under certain circumstances, it may consist in my drawing it parallel to the other--even though this in turn is not in general essential to being guided.--

Page 72

178. We also say: "You can *see* that I am guided by it"--and what do you see, if you see this?

Page 72

When I say to myself: "But I *am* guided"--I make perhaps a movement with my hand, which expresses guiding.--Make such a movement of the hand as if you were guiding someone along, and then ask yourself what the *guiding* character of this movement consisted in. For you were not guiding anyone. But you still want to call the movement one of 'guiding'. This movement and feeling did not contain the essence of guiding, but still this word forces itself upon you. It is just *a single form* of guiding which forces the expression on us.

Page 72

179. Let us return to our case (151). It is clear that we should not say B had the right to say the words "Now I know how to go on", just because he thought of the formula--unless experience shewed that there was a connexion between thinking of the formula--saying it, writing it down--and actually continuing the series. And obviously such a connexion does exist.--And now one might think that the sentence "I can go on" meant "I have an experience which I know empirically to lead to the continuation of the series." But does B mean that when he says he can go on? Does that sentence come to his mind, or is he ready to produce it in explanation of what he meant?

Page 72

No. The words "Now I know how to go on" were correctly used when he thought of the formula: that is, given such circumstances as that he had learnt algebra, had used such formulae before.--But that does not mean that his statement is only short for a description of all the circumstances which constitute the scene for our language-game.--Think how we learn to use the expressions "Now I know how to go

Page Break 73

on", "Now I can go on" and others; in what family of language-games we learn their use.

Page 73

We can also imagine the case where nothing at all occurred in B's mind except that he suddenly said "Now I know how to go on"--perhaps with a feeling of relief; and that he did in fact go on working out the series without using the formula. And in this case too we should say--in certain circumstances--that he did know how to go on.

Page 73

180. *This is how these words are used.* It would be quite misleading, in this last case, for instance, to call the words a "description of a mental state".--One might rather call them a "signal"; and we judge whether it was rightly employed by what he goes on to do.

Page 73

181. In order to understand this, we need also to consider the following: suppose B says he knows how to go on--but when he wants to go on he hesitates and can't do it: are we to say that he was wrong when he said he could go on, or rather that he was able to go on then, only now is not?--Clearly we shall say different things in different cases. (Consider both kinds of case.)

Page 73

182. The grammar of "to fit", "to be able", and "to understand". (Exercises: (1) When is a cylinder C said to fit into a hollow cylinder H? Only while C is stuck into H? (2) Sometimes we say that C ceased to fit into H at such-and-such a time. What criteria are used in such a case for its having happened at that time? (3) What does one regard as criteria for a body's having changed its weight at a particular time if it was not actually on the balance at that time? (4) Yesterday I knew the poem by heart; today I no longer know it. In what kind of case does it make sense to ask: "When did I stop knowing it?" (5) Someone asks me "Can you lift this weight?" I answer "Yes". Now he says "Do it!"--and I can't. In what kind of circumstances would it count as a justification to say "When I answered 'yes' I *could* do it, only now I can't"?)

Page 73

The criteria which we accept for 'fitting', 'being able to', 'understanding', are much more complicated than might appear at first sight. That is, the game with these words, their employment in the linguistic intercourse that is carried on by their means, is more involved--the role of these words in our language other--than we are tempted to think.

Page 73

(This role is what we need to understand in order to resolve philosophical paradoxes. And hence definitions usually fail to

resolve them; and so, *a fortiori* does the assertion that a word is 'indefinable'.)

183. But did "Now I can go on" in case (151) mean the same as "Now the formula has occurred to me" or something different? We may say that, in those circumstances, the two sentences have the same sense, achieve the same thing. But also that *in general* these two sentences do not have the same sense. We do say: "Now I can go on, I mean I know the formula", as we say "I can walk, I mean I have time"; but also "I can walk, I mean I am already strong enough"; or: "I can walk, as far as the state of my legs is concerned", that is, when we are contrasting *this* condition for walking with others. But here we must be on our guard against thinking that there is some *totality* of conditions corresponding to the nature of each case (e.g. for a person's walking) so that, as it were, he *could not but* walk if they were all fulfilled.

184. I want to remember a tune and it escapes me; suddenly I say "Now I know it" and I sing it. What was it like to suddenly know it? Surely it can't have occurred to me *in its entirety* in that moment!--Perhaps you will say: "It's a particular feeling, as if it were *there*"--but *is* it there? Suppose I now begin to sing it and get stuck?--But may I not have been *certain* at that moment that I knew it? So in some sense or other it was *there* after all!--But in what sense? You would say that the tune was there, if, say, someone sang it through, or heard it mentally from beginning to end. I am not, of course, denying that the statement that the tune is there can also be given a quite different meaning--for example, that I have a bit of paper on which it is written.--And what does his being 'certain', his knowing it, consist in?--Of course we can say: if someone says with conviction that now he knows the tune, then it is (somehow) present to his mind in its entirety at that moment--and this is a definition of the expression "the tune is present to his mind in its entirety".

185. Let us return to our example (143). Now--judged by the usual criteria--the pupil has mastered the series of natural numbers. Next we teach him to write down other series of cardinal numbers and get him to the point of writing down series of the form

0, n, 2n, 3n, etc.

at an order of the form "+ n"; so at the order "+ 1" he writes

down the series of natural numbers.--Let us suppose we have done exercises and given him tests up to 1000.

Now we get the pupil to continue a series (say + 2) beyond 1000--and he writes 1000, 1004, 1008, 1012.

We say to him: "Look what you've done!"--He doesn't understand. We say: "You were meant to add *two*: look how you began the series!"--He answers: "Yes, isn't it right? I thought that was how I was *meant* to do it."--Or suppose he pointed to the series and said: "But I went on in the same way."--It would now be no use to say: "But can't you see....?"--and repeat the old examples and explanations.--In such a case we might say, perhaps: It comes natural to this person to understand our order with our explanations as we should understand the order: "Add 2 up to 1000, 4 up to 2000, 6 up to 3000 and so on."

Such a case would present similarities with one in which a person naturally reacted to the gesture of pointing with the hand by looking in the direction of the line from finger-tip to wrist, not from wrist to finger-tip.

186. "What you are saying, then, comes to this: a new insight--intuition--is needed at every step to carry out the order '+ n' correctly."--To carry it out correctly! How is it decided what is the right step to take at any particular stage?--"The right step is the one that accords with the order--as it was *meant*."--So when you gave the order + 2 you meant that he was to write 1002 after 1000--and did you also mean that he should write 1868 after 1866, and 100036 after 100034, and so on--an infinite number of such propositions?--"No: what I meant was, that he should write the next but one number after *every* number that he wrote; and from this all those propositions follow in turn."--But that is just what is in question: what, at any stage, does follow from that sentence. Or, again, what, at any stage we are to call "being in accord" with that sentence (and with the *mean*-ing you then put into the sentence--whatever that may have consisted in). It would almost be more correct to say, not that an intuition was needed at every stage, but that a new decision was needed at every stage.

187. "But I already knew, at the time when I gave the order, that he ought to write 1002 after 1000."--Certainly; and you can also say you *meant* it then; only you should not let yourself be misled by the

grammar of the words "know" and "mean". For you don't want

Page Break 76

to say that you thought of the step from 1000 to 1002 at that time--and even if you did think of this step, still you did not think of other ones. When you said "I already knew at the time....." that meant something like: "If I had then been asked what number should be written after 1000, I should have replied '1002'." And that I don't doubt. This assumption is rather of the same kind as: "If he had fallen into the water then, I should have jumped in after him".--Now, what was wrong with your idea?

Page 76

188. Here I should first of all like to say: your idea was that that act of meaning the order had in its own way already traversed all those steps: that when you meant it your mind as it were flew ahead and took all the steps before you physically arrived at this or that one.

Page 76

Thus you were inclined to use such expressions as: "The steps are *really* already taken, even before I take them in writing or orally or in thought." And it seemed as if they were in some *unique* way predetermined, anticipated--as only the act of meaning can anticipate reality.

Page 76

189. "But *are* the steps then *not* determined by the algebraic formula?"--The question contains a mistake.

Page 76

We use the expression: "The steps are determined by the formula.....". *How* is it used?--We may perhaps refer to the fact that people are brought by their education (training) so to use the formula $y = x^2$, that they all work out the same value for y when they substitute the same number for x . Or we may say: "These people are so trained that they all take the same step at the same point when they receive the order 'add 3'". We might express this by saying: for these people the order "add 3" completely determines every step from one number to the next. (In contrast with other people who do not know what they are to do on receiving this order, or who react to it with perfect certainty, but each one in a different way.)

Page 76

On the other hand we can contrast different kinds of formula, and the different kinds of use (different kinds of training) appropriate to them. Then we *call* formulae of a particular kind (with the appropriate methods of use) "formulae which determine a number y for a given value of x ", and formulae of another kind, ones which "do not determine the number y for a given value of x ". ($y = x^2$ would be of the first kind, $y \neq x^2$ of the second.) The proposition "The formula.... determines a number y " will then be a statement about

Page Break 77

the form of the formula--and now we must distinguish such a proposition as "The formula which I have written down determines y ", or "Here is a formula which determines y ", from one of the following kind: "The formula $y = x^2$ determines the number y for a given value of x ". The question "Is the formula written down there one that determines y ?" will then mean the same as "Is what is there a formula of this kind or that?"--but it is not clear off-hand what we are to make of the question "Is $y = x^2$ a formula which determines y for a given value of x ?" One might address this question to a pupil in order to test whether he understands the use of the word "to determine"; or it might be a mathematical problem to prove in a particular system that x has only one square.

Page 77

190. It may now be said: "The way the formula is meant determines which steps are to be taken". What is the criterion for the way the formula is meant? It is, for example, the kind of way we always use it, the way we are taught to use it.

Page 77

We say, for instance, to someone who uses a sign unknown to us: "If by ' $x!2$ ' you mean x^2 , then you get *this* value for y , if you mean $2x$, *that* one."--Now ask yourself: how does one *mean* the one thing or the other by " $x!2$ "?

Page 77

That will be how meaning it can determine the steps in advance.

Page 77

191. "It is as if we could grasp the whole use of the word in a flash." Like *what* e.g.?--Can't the use--in a certain sense--be grasped in a flash? And in *what* sense can it not?--The point is, that it is as if we could 'grasp it in a flash' in yet another and much more direct sense than that.--But have you a model for this? No. It is just that this expression suggests itself to us. As the result of the crossing of different pictures.

Page 77

192. You have no model of this superlative fact, but you are seduced into using a super-expression. (It might

be called a philosophical superlative.)

Page 77

193. The machine as symbolizing its action: the action of a machine--I might say at first--seems to be there in it from the start. What does that mean?--If we know the machine, everything else, that is its movement, seems to be already completely determined.

Page 77

We talk as if these parts could only move in this way, as if they could not do anything else. How is this--do we forget the possibility of their bending, breaking off, melting, and so on? Yes; in many cases

Page Break 78

we don't think of that at all. We use a machine, or the drawing of a machine, to symbolize a particular action of the machine. For instance, we give someone such a drawing and assume that he will derive the movement of the parts from it. (Just as we can give someone a number by telling him that it is the twenty-fifth in the series 1, 4, 9, 16,)

Page 78

"The machine's action seems to be in it from the start" means: we are inclined to compare the future movements of the machine in their definiteness to objects which are already lying in a drawer and which we then take out.--But we do not say this kind of thing when we are concerned with predicting the actual behaviour of a machine. Then we do not in general forget the possibility of a distortion of the parts and so on.--We *do* talk like that, however, when we are wondering at the way we can use a machine to symbolize a given way of moving--since it can also move in quite *different* ways.

Page 78

We might say that a machine, or the picture of it, is the first of a series of pictures which we have learnt to derive from this one.

Page 78

But when we reflect that the machine could also have moved differently it may look as if the way it moves must be contained in the machine-as-symbol far more determinately than in the actual machine. As if it were not enough for the movements in question to be empirically determined in advance, but they had to be really--in a mysterious sense--already *present*. And it is quite true: the movement of the machine-as-symbol is predetermined in a different sense from that in which the movement of any given actual machine is predetermined.

Page 78

194. When does one have the thought: the possible movements of a machine are already there in it in some mysterious way?--Well, when one is doing philosophy. And what leads us into thinking that? The kind of way in which we talk about machines. We say, for example, that a machine *has* (possesses) such-and-such possibilities of movement; we speak of the ideally rigid machine which *can* only move in such-and-such a way.--What is this *possibility* of movement? It is not the *movement*, but it does not seem to be the mere physical conditions for moving either--as, that there is play between socket and pin, the pin not fitting too tight in the socket. For while this is the empirical condition for movement, one could also imagine it to be otherwise. The possibility of a movement is, rather, supposed to be like a shadow of the movement itself. But do you know of such a shadow? And by a shadow I do not mean some picture of the movement--for such a

Page Break 79

picture would not have to be a picture of just *this* movement. But the possibility of this movement must be the possibility of just this movement. (See how high the seas of language run here!)

Page 79

The waves subside as soon as we ask ourselves: how do we use the phrase "possibility of movement" when we are talking about a given machine?--But then where did our queer ideas come from? Well, I shew you the possibility of a movement, say by means of a *picture* of the movement: 'so possibility is something which is like reality'. We say: "It isn't moving yet, but it already has the possibility of moving"--'so possibility is something very near reality'. Though we may doubt whether such-and-such physical conditions make this movement possible, we never discuss whether *this* is the possibility of this or of that movement: 'so the possibility of the movement stands in a unique relation to the movement itself; closer than that of a picture to its subject'; for it can be doubted whether a picture is the picture of this thing or that. We say "Experience will shew whether this gives the pin this possibility of movement", but we do not say "Experience will shew whether this is the possibility of this movement": 'so it is not an empirical fact that this possibility is the possibility of precisely this movement'.

Page 79

We mind about the kind of expressions we use concerning these things; we do not understand them, however, but misinterpret them. When we do philosophy we are like savages, primitive people, who hear the

expressions of civilized men, put a false interpretation on them, and then draw the queerest conclusions from it.

Page 79

195. "But I don't mean that what I do now (in grasping a sense) determines the future use *causally* and as a matter of experience, but that in a *queer* way, the use itself is in some sense present."--But of course it is, 'in *some* sense'! Really the only thing wrong with what you say is the expression "in a queer way". The rest is all right; and the sentence only seems queer when one imagines a different language-game for it from the one in which we actually use it. (Someone once told me that as a child he had been surprised that a tailor could 'sew a dress'--he thought this meant that a dress was produced by sewing alone, by sewing one thread on to another.)

Page 79

196. In our failure to understand the use of a word we take it as the expression of a queer *process*. (As we think of time as a queer medium, of the mind as a queer kind of being.)

Page Break 80

Page 80

197. "It's as if we could grasp the whole use of a word in a flash."--And that is just what we say we do. That is to say: we sometimes describe what we do in these words. But there is nothing astonishing, nothing queer, about what happens. It becomes queer when we are led to think that the future development must in some way already be present in the act of grasping the use and yet isn't present.--For we say that there isn't any doubt that we understand the word, and on the other hand its meaning lies in its use. There is no doubt that I now want to play chess, but chess is the game it is in virtue of all its rules (and so on). Don't I know, then, which game I want to play until I *have* played it? or are all the rules contained in my act of intending? Is it experience that tells me that this sort of game is the usual consequence of such an act of intending? so is it impossible for me to be certain what I am intending to do? And if that is nonsense--what kind of super-strong connexion exists between the act of intending and the thing intended?--Where is the connexion effected between the sense of the expression "Let's play a game of chess" and all the rules of the game?--Well, in the list of rules of the game, in the teaching of it, in the day-to-day practice of playing.

Page 80

198. "But how can a rule shew me what I have to do at *this* point? Whatever I do is, on some interpretation, in accord with the rule."--That is not what we ought to say, but rather: any interpretation still hangs in the air along with what it interprets, and cannot give it any support. Interpretations by themselves do not determine meaning.

Page 80

"Then can whatever I do be brought into accord with the rule?"--Let me ask this: what has the expression of a rule--say a sign-post--got to do with my actions? What sort of connexion is there here?--Well, perhaps this one: I have been trained to react to this sign in a particular way, and now I do so react to it.

Page 80

But that is only to give a causal connexion; to tell how it has come about that we now go by the sign-post; not what this going-by-the-sign really consists in. On the contrary; I have further indicated that a person goes by a sign-post only in so far as there exists a regular use of sign-posts, a custom.

Page 80

199. Is what we call "obeying a rule" something that it would be possible for only *one* man to do, and to do only *once* in his life?--This is of course a note on the grammar of the expression "to obey a rule".

Page Break 81

Page 81

It is not possible that there should have been only one occasion on which someone obeyed a rule. It is not possible that there should have been only one occasion on which a report was made, an order given or understood; and so on.--To obey a rule, to make a report, to give an order, to play a game of chess, are *customs* (uses, institutions).

Page 81

To understand a sentence means to understand a language. To understand a language means to be master of a technique.

Page 81

200. It is, of course, imaginable that two people belonging to a tribe unacquainted with games should sit at a chess-board and go through the moves of a game of chess; and even with all the appropriate mental accompaniments. And if we were to see it we should say they were playing chess. But now imagine a game of chess translated according to certain rules into a series of actions which we do not ordinarily associate with a *game*--say into yells and stamping of feet. And now suppose those two people to yell and stamp instead of playing the form of

chess that we are used to; and this in such a way that their procedure is translatable by suitable rules into a game of chess. Should we still be inclined to say they were playing a game? What right would one have to say so?

Page 81

201. This was our paradox: no course of action could be determined by a rule, because every course of action can be made out to accord with the rule. The answer was: if everything can be made out to accord with the rule, then it can also be made out to conflict with it. And so there would be neither accord nor conflict here.

Page 81

It can be seen that there is a misunderstanding here from the mere fact that in the course of our argument we give one interpretation after another; as if each one contented us at least for a moment, until we thought of yet another standing behind it. What this shews is that there is a way of grasping a rule which is *not* an *interpretation*, but which is exhibited in what we call "obeying the rule" and "going against it" in actual cases.

Page 81

Hence there is an inclination to say: every action according to the rule is an interpretation. But we ought to restrict the term "interpretation" to the substitution of one expression of the rule for another.

Page 81

202. And hence also 'obeying a rule' is a practice. And to *think* one is obeying a rule is not to obey a rule. Hence it is not possible to obey a rule 'privately': otherwise thinking one was obeying a rule would be the same thing as obeying it.

Page Break 82

Page 82

203. Language is a labyrinth of paths. You approach from *one* side and know your way about; you approach the same place from another side and no longer know your way about.

Page 82

204. As things are I can, for example, invent a game that is never played by anyone.--But would the following be possible too: mankind has never played any games; once, however, someone invented a game--which no one ever played?

Page 82

205. "But it is just the queer thing about *intention*, about the mental process, that the existence of a custom, of a technique, is not necessary to it. That, for example, it is imaginable that two people should play chess in a world in which otherwise no games existed; and even that they should begin a game of chess--and then be interrupted."

Page 82

But isn't chess defined by its rules? And how are these rules present in the mind of the person who is intending to play chess?

Page 82

206. Following a rule is analogous to obeying an order. We are trained to do so; we react to an order in a particular way. But what if one person reacts in one way and another in another to the order and the training? Which one is right?

Page 82

Suppose you came as an explorer into an unknown country with a language quite strange to you. In what circumstances would you say that the people there gave orders, understood them, obeyed them, rebelled against them, and so on?

Page 82

The common behaviour of mankind is the system of reference by means of which we interpret an unknown language.

Page 82

207. Let us imagine that the people in that country carried on the usual human activities and in the course of them employed, apparently, an articulate language. If we watch their behaviour we find it intelligible, it seems 'logical'. But when we try to learn their language we find it impossible to do so. For there is no regular connexion between what they say, the sounds they make, and their actions; but still these sounds are not superfluous, for if we gag one of the people, it has the same consequences as with us; without the sounds their actions fall into confusion--as I feel like putting it.

Page 82

Are we to say that these people have a language: orders, reports, and the rest?

Page 82

There is not enough regularity for us to call it "language".

Page 82

208. Then am I defining "order" and "rule" by means of "regularity"?--How do I explain the meaning of "regular", "uniform",

Page Break 83

"same" to anyone?--I shall explain these words to someone who, say, only speaks French by means of the corresponding French words. But if a person has not yet got the *concepts*, I shall teach him to use the words by means of *examples* and by *practice*.--And when I do this I do not communicate less to him than I know myself.

Page 83

In the course of this teaching I shall shew him the same colours, the same lengths, the same shapes, I shall make him find them and produce them, and so on. I shall, for instance, get him to continue an ornamental pattern uniformly when told to do so.--And also to continue progressions. And so, for example, when given: to go on:

Page 83

I do it, he does it after me; and I influence him by expressions of agreement, rejection, expectation, encouragement. I let him go his way, or hold him back; and so on.

Page 83

Imagine witnessing such teaching. None of the words would be explained by means of itself; there would be no logical circle.

Page 83

The expressions "and so on", "and so on ad infinitum" are also explained in this teaching. A gesture, among other things, might serve this purpose. The gesture that means "go on like this", or "and so on" has a function comparable to that of pointing to an object or a place.

Page 83

We should distinguish between the "and so on" which is, and the "and so on" which is not, an abbreviated notation. "And so on ad inf." is *not* such an abbreviation. The fact that we cannot write down all the digits of π is not a human shortcoming, as mathematicians sometimes think.

Page 83

Teaching which is not meant to apply to anything but the examples given is different from that which '*points beyond*' them.

Page 83

209. "But then doesn't our understanding reach beyond all the examples?"--A very queer expression, and a quite natural one!--

Page 83

But is that *all*? Isn't there a deeper explanation; or mustn't at least the *understanding* of the explanation be deeper?--Well, have I myself a deeper understanding? Have I *got* more than I give in the explanation?--But then, whence the feeling that I have got more?

Page 83

Is it like the case where I interpret what is not limited as a length that reaches beyond every length?

Page 83

210. "But do you really explain to the other person what you yourself understand? Don't you get him to *guess* the essential thing? You give him examples,--but he has to guess their drift, to guess your

Page Break 84

intention."--Every explanation which I can give myself I give to him too.--"He guesses what I intend" would mean: various interpretations of my explanation come to his mind, and he lights on one of them. So in this case he could ask; and I could and should answer him.

Page 84

211. How can he *know* how he is to continue a pattern by himself--whatever instruction you give him?--Well, how do I know?--If that means "Have I reasons?" the answer is: my reasons will soon give out. And then I shall act, without reasons.

Page 84

212. When someone whom I am afraid of orders me to continue the series, I act quickly, with perfect certainty, and the lack of reasons does not trouble me.

Page 84

213. "But this initial segment of a series obviously admitted of various interpretations (e.g. by means of algebraic expressions) and so you must first have chosen *one* such interpretation."--Not at all. A doubt was possible in certain circumstances. But that is not to say that I did doubt, or even could doubt. (There is something to be said,

which is connected with this, about the psychological 'atmosphere' of a process.)

Page 84

So it must have been intuition that removed this doubt?--If intuition is an inner voice--how do I know *how* I am to obey it? And how do I know that it doesn't mislead me? For if it can guide me right, it can also guide me wrong.

Page 84

((Intuition an unnecessary shuffle.))

Page 84

214. If you have to have an intuition in order to develop the series 1 2 3 4... you must also have one in order to develop the series 2 2 2 2....

Page 84

215. But isn't *the same* at least the same?

Page 84

We seem to have an infallible paradigm of identity in the identity of a thing with itself. I feel like saying: "Here at any rate there can't be a variety of interpretations. If you are seeing a thing you are seeing identity too."

Page 84

Then are two things the same when they are what *one* thing is? And how am I to apply what the *one* thing shows me to the case of two things?

Page 84

216. "A thing is identical with itself."--There is no finer example of a useless proposition, which yet is connected with a certain play of the imagination. It is as if in imagination we put a thing into its own shape and saw that it fitted.

Page Break 85

Page 85

We might also say: "Every thing fits into itself." Or again: "Every thing fits into its own shape." At the same time we look at a thing and imagine that there was a blank left for it, and that now it fits into it exactly.

Page 85

Does this spot  'fit' into its white surrounding?--*But that is just how it would look* if there had at first been a hole in its place and it then fitted into the hole. But when we say "it fits" we are not simply describing this appearance; not simply this *situation*.

Page 85

"Every coloured patch fits exactly into its surrounding" is a rather specialized form of the law of identity.

Page 85

217. "How am I able to obey a rule?"--if this is not a question about causes, then it is about the justification for my following the rule in the way I do.

Page 85

If I have exhausted the justifications I have reached bedrock, and my spade is turned. Then I am inclined to say: "This is simply what I do."

Page 85

(Remember that we sometimes demand definitions for the sake not of their content, but of their form. Our requirement is an architectural one; the definition a kind of ornamental coping that supports nothing.)

Page 85

218. Whence comes the idea that the beginning of a series is a visible section of rails invisibly laid to infinity? Well, we might imagine rails instead of a rule. And infinitely long rails correspond to the unlimited application of a rule.

Page 85

219. "All the steps are really already taken" means: I no longer have any choice. The rule, once stamped with a particular meaning, traces the lines along which it is to be followed through the whole of space.--But if something of this sort really were the case, how would it help?

Page 85

No; my description only made sense if it was to be understood symbolically.--I should have said: *This is how it strikes me*.

Page 85

When I obey a rule, I do not choose.

Page 85

I obey the rule *blindly*.

Page 85

220. But what is the purpose of that symbolical proposition? It was supposed to bring into prominence a difference between being causally determined and being logically determined.

Page 85

221. My symbolical expression was really a mythological description of the use of a rule.

Page Break 86

Page 86

222. "The line intimates to me the way I am to go."--But that is of course only a picture. And if I judged that it intimated this or that as it were irresponsibly, I should not say that I was obeying it like a rule.

Page 86

223. One does not feel that one has always got to wait upon the nod (the whisper) of the rule. On the contrary, we are not on tenterhooks about what it will tell us next, but it always tells us the same, and we do what it tells us.

Page 86

One might say to the person one was training: "Look, I always do the same thing: I...."

Page 86

224. The word "agreement" and the word "rule" are *related* to one another, they are cousins. If I teach anyone the use of the one word, he learns the use of the other with it.

Page 86

225. The use of the word "rule" and the use of the word "same" are interwoven. (As are the use of "proposition" and the use of "true".)

Page 86

226. Suppose someone gets the series of numbers 1, 3, 5, 7,.... by working out the series $2x + 1 \nmid 1$. And now he asks himself: "But am I always doing the same thing, or something different every time?"

Page 86

If from one day to the next you promise: "To-morrow I will come and see you"--are you saying the same thing every day, or every day something different?

Page 86

227. Would it make sense to say "If he did something *different* every day we should not say he was obeying a rule"? That makes *no* sense.

Page 86

228. "We see a series in just *one* way!"--All right, but what is that way? Clearly we see it algebraically, and as a segment of an expansion. Or is there more in it than that?--"But the way we see it surely gives us everything!"--But that is not an observation about the segment of the series; or about anything that we notice in it; it gives expression to the fact that we look to the rule for instruction and *do something*, without appealing to anything else for guidance.

Page 86

229. I believe that I perceive something drawn very fine in a segment of a series, a characteristic design, which only needs the addition of "and so on", in order to reach to infinity.

Page 86

230. "The line intimates to me which way I am to go" is only a paraphrase of: it is my *last* arbiter for the way I am to go.

Page 86

231. "But surely you can see....?" That is just the characteristic expression of someone who is under the compulsion of a rule.

Page Break 87

Page 87

232. Let us imagine a rule intimating to me which way I am to obey it; that is, as my eye travels along the line, a voice within me says: "*This* way!"--What is the difference between this process of obeying a kind of inspiration and that of obeying a rule? For they are surely not the same. In the case of inspiration I *await* direction. I shall not be able to teach anyone else my 'technique' of following the line. Unless, indeed, I teach him some way of hearkening, some kind of receptivity. But then, of course, I cannot require him to follow the line in the same way as I do.

Page 87

These are not my experiences of acting from inspiration and according to a rule; they are grammatical notes.

233. It would also be possible to imagine such a training in a sort of arithmetic. Children could calculate, each in his own way--as long as they listened to their inner voice and obeyed it. Calculating in this way would be like a sort of composing.

234. Would it not be possible for us, however, to calculate as we actually do (all agreeing, and so on), and still at every step to have a feeling of being guided by the rules as by a spell, feeling astonishment at the fact that we agreed? (We might give thanks to the Deity for our agreement.)

235. This merely shews what goes to make up what we call "obeying a rule" in everyday life.

236. Calculating prodigies who get the right answer but cannot say how. Are we to say that they do not calculate? (A family of cases.)

237. Imagine someone using a line as a rule in the following way: he holds a pair of compasses, and carries one of its points along the line that is the 'rule', while the other one draws the line that follows the rule. And while he moves along the ruling line he alters the opening of the compasses, apparently with great precision, looking at the rule the whole time as if it determined what he did. And watching him we see no kind of regularity in this opening and shutting of the compasses. We cannot learn his way of following the line from it. Here perhaps one really would say: "The original seems to *intimate* to him which way he is to go. But it is not a rule."

238. The rule can only seem to me to produce all its consequences in advance if I draw them as a *matter of course*. As much as it is a matter

of course for me to call this colour "blue". (Criteria for the fact that something is 'a matter of course' for me.)

239. How is he to know what colour he is to pick out when he hears "red"?--Quite simple: he is to take the colour whose image occurs to him when he hears the word.--But how is he to know which colour it is 'whose image occurs to him'? Is a further criterion needed for that? (There is indeed such a procedure as choosing the colour which occurs to one when one hears the word "....")

"Red' means the colour that occurs to me when I hear the word 'red'"--would be a *definition*. Not an explanation of *what it is* to use a word as a name.

240. Disputes do not break out (among mathematicians, say) over the question whether a rule has been obeyed or not. People don't come to blows over it, for example. That is part of the framework on which the working of our language is based (for example, in giving descriptions).

241. "So you are saying that human agreement decides what is true and what is false?"--It is what human beings say that is true and false; and they agree in the *language* they use. That is not agreement in opinions but in form of life.

242. If language is to be a means of communication there must be agreement not only in definitions but also (queer as this may sound) in judgments. This seems to abolish logic, but does not do so.--It is one thing to describe methods of measurement, and another to obtain and state results of measurement. But what we call "measuring" is partly determined by a certain constancy in results of measurement.

243. A human being can encourage himself, give himself orders, obey, blame and punish himself; he can ask himself a question and answer it. We could even imagine human beings who spoke only in monologue; who accompanied their activities by talking to themselves.--An explorer who watched them and listened to their talk might succeed in translating their language into ours. (This would enable him to predict these people's actions correctly, for he also hears them making resolutions and decisions.)

But could we also imagine a language in which a person could write down or give vocal expression to his inner experiences--his feelings, moods, and the rest--for his private use?--Well, can't we do so in our ordinary language?--But that is not what I mean. The

individual words of this language are to refer to what can only be known to the person speaking; to his immediate private sensations. So another person cannot understand the language.

244. How do words *refer* to sensations?--There doesn't seem to be any problem here; don't we talk about sensations every day, and give them names? But how is the connexion between the name and the thing named set up? This question is the same as: how does a human being learn the meaning of the names of sensations?--of the word "pain" for example. Here is one possibility: words are connected with the primitive, the natural, expressions of the sensation and used in their place. A child has hurt himself and he cries; and then adults talk to him and teach him exclamations and, later, sentences. They teach the child new pain-behaviour.

"So you are saying that the word 'pain' really means crying?"--On the contrary: the verbal expression of pain replaces crying and does not describe it.

245. For how can I go so far as to try to use language to get between pain and its expression?

246. In what sense are my sensations *private*?--Well, only I can know whether I am really in pain; another person can only surmise it.--In one way this is wrong, and in another nonsense. If we are using the word "to know" as it is normally used (and how else are we to use it?), then other people very often know when I am in pain.--Yes, but all the same not with the certainty with which I know it myself!--It can't be said of me at all (except perhaps as a joke) that I *know* I am in pain. What is it supposed to mean--except perhaps that I *am* in pain?

Other people cannot be said to learn of my sensations *only* from my behaviour,--for *I* cannot be said to learn of them. I *have* them.

The truth is: it makes sense to say about other people that they doubt whether I am in pain; but not to say it about myself.

247. "Only you can know if you had that intention." One might tell someone this when one was explaining the meaning of the word "intention" to him. For then it means: *that* is how we use it.

(And here "know" means that the expression of uncertainty is senseless.)

248. The proposition "Sensations are private" is comparable to: "One plays patience by oneself".

249. Are we perhaps over-hasty in our assumption that the smile of an unweaned infant is not a pretence?--And on what experience is our assumption based?

(Lying is a language-game that needs to be learned like any other one.)

250. Why can't a dog simulate pain? Is he too honest? Could one teach a dog to simulate pain? Perhaps it is possible to teach him to howl on particular occasions as if he were in pain, even when he is not. But the surroundings which are necessary for this behaviour to be real simulation are missing.

251. What does it mean when we say: "I can't imagine the opposite of this" or "What would it be like, if it were otherwise?"--For example, when someone has said that my images are private, or that only I myself can know whether I am feeling pain, and similar things.

Of course, here "I can't imagine the opposite" doesn't mean: my powers of imagination are unequal to the task. These words are a defence against something whose form makes it look like an empirical proposition, but which is really a grammatical one.

But why do we say: "I can't imagine the opposite"? Why not: "I can't imagine the thing itself"?

Example: "Every rod has a length." That means something like: we call something (or *this*) "the length of a rod"--but nothing "the length of a sphere." Now can I imagine 'every rod having a length'? Well, I simply imagine a rod. Only this picture, in connexion with this proposition, has a quite different role from one used in connexion with the proposition "This table has the same length as the one over there". For here I understand what it means to have a picture of the opposite (nor need it be a mental picture).

Page 90

But the picture attaching to the grammatical proposition could only shew, say, what is called "the length of a rod". And what should the opposite picture be?

Page 90

((Remark about the negation of an a priori proposition.))

Page 90

252. "This body has extension." To this we might reply: "Nonsense!"--but are inclined to reply "Of course!"--Why is this?

Page Break 91

Page 91

253. "Another person can't have my pains."--Which are *my* pains? What counts as a criterion of identity here? Consider what makes it possible in the case of physical objects to speak of "two exactly the same", for example, to say "This chair is not the one you saw here yesterday, but is exactly the same as it".

Page 91

In so far as it makes *sense* to say that my pain is the same as his, it is also possible for us both to have the same pain. (And it would also be imaginable for two people to feel pain in the same--not just the corresponding--place. That might be the case with Siamese twins, for instance.)

Page 91

I have seen a person in a discussion on this subject strike himself on the breast and say: "But surely another person can't have THIS pain!"--The answer to this is that one does not define a criterion of identity by emphatic stressing of the word "this". Rather, what the emphasis does is to suggest the case in which we are conversant with such a criterion of identity, but have to be reminded of it.

Page 91

254. The substitution of "identical" for "the same" (for instance) is another typical expedient in philosophy. As if we were talking about shades of meaning and all that were in question were to find words to hit on the correct nuance. That is in question in philosophy only where we have to give a psychologically exact account of the temptation to use a particular kind of expression. What we 'are tempted to say' in such a case is, of course, not philosophy; but it is its raw material. Thus, for example, what a mathematician is inclined to say about the objectivity and reality of mathematical facts, is not a philosophy of mathematics, but something for philosophical *treatment*.

Page 91

255. The philosopher's treatment of a question is like the treatment of an illness.

Page 91

256. Now, what about the language which describes my inner experiences and which only I myself can understand? *How* do I use words to stand for my sensations?--As we ordinarily do? Then are my words for sensations tied up with my natural expressions of sensation? In that case my language is not a 'private' one. Someone else might understand it as well as I.--But suppose I didn't have any natural expression for the sensation, but only had the sensation? And now I simply *associate* names with sensations and use these names in descriptions.--

Page Break 92

Page 92

257. "What would it be like if human beings shewed no outward signs of pain (did not groan, grimace, etc.)? Then it would be impossible to teach a child the use of the word 'tooth-ache'."--Well, let's assume the child is a genius and itself invents a name for the sensation!--But then, of course, he couldn't make himself understood when he used the word.--So does he understand the name, without being able to explain its meaning to anyone?--But what does it mean to say that he has 'named his pain'?--How has he done this naming of pain?! And whatever he did, what was its purpose?--When one says "He gave a name to his sensation" one forgets that a great deal of stage-setting in the language is presupposed if the mere act of naming is to make sense. And when we speak of someone's having given a name to pain, what is presupposed is the existence of the grammar of the word "pain"; it shews the post where the new word is stationed.

258. Let us imagine the following case. I want to keep a diary about the recurrence of a certain sensation. To this end I associate it with the sign "S" and write this sign in a calendar for every day on which I have the sensation.--I will remark first of all that a definition of the sign cannot be formulated.--But still I can give myself a kind of ostensive definition.--How? Can I point to the sensation? Not in the ordinary sense. But I speak, or write the sign down, and at the same time I concentrate my attention on the sensation--and so, as it were, point to it inwardly.--But what is this ceremony for? for that is all it seems to be! A definition surely serves to establish the meaning of a sign.--Well, that is done precisely by the concentrating of my attention; for in this way I impress on myself the connexion between the sign and the sensation.--But "I impress it on myself" can only mean: this process brings it about that I remember the connexion *right* in the future. But in the present case I have no criterion of correctness. One would like to say: whatever is going to seem right to me is right. And that only means that here we can't talk about 'right'.

259. Are the rules of the private language *impressions* of rules?--The balance on which impressions are weighed is not the *impression* of a balance.

260. "Well, I *believe* that this is the sensation S again."--Perhaps you *believe* that you believe it!

Then did the man who made the entry in the calendar make a note

of *nothing whatever*?--Don't consider it a matter of course that a person is making a note of something when he makes a mark--say in a calendar. For a note has a function, and this "S" so far has none.

(One can talk to oneself.--If a person speaks when no one else is present, does that mean he is speaking to himself?)

261. What reason have we for calling "S" the sign for a *sensation*? For "sensation" is a word of our common language, not of one intelligible to me alone. So the use of this word stands in need of a justification which everybody understands.--And it would not help either to say that it need not be a *sensation*; that when he writes "S", he has *something*--and that is all that can be said. "Has" and "something" also belong to our common language.--So in the end when one is doing philosophy one gets to the point where one would like just to emit an inarticulate sound.--But such a sound is an expression only as it occurs in a particular language-game, which should now be described.

262. It might be said: if you have given yourself a private definition of a word, then you must inwardly *undertake* to use the word in such-and-such a way. And how do you undertake that? Is it to be assumed that you invent the technique of using the word; or that you found it ready-made?

263. "But I can (inwardly) undertake to call THIS 'pain' in the future."--"But is it certain that you have undertaken it? Are you sure that it was enough for this purpose to concentrate your attention on your feeling?"--A queer question.--

264. "Once you know *what* the word stands for, you understand it, you know its whole use."

265. Let us imagine a table (something like a dictionary) that exists only in our imagination. A dictionary can be used to justify the translation of a word X by a word Y. But are we also to call it a justification if such a table is to be looked up only in the imagination?--"Well, yes; then it is a subjective justification."--But justification consists in appealing to something independent.--"But surely I can appeal from one memory to another. For example, I don't know if I have remembered the time of departure of a train right and to check it I call to mind how a page of the time-table looked. Isn't it the same here?"--No; for this process has got to produce a memory which is

actually *correct*. If the mental image of the time-table could not itself be *tested* for correctness, how could it confirm the correctness of the first memory? (As if someone were to buy several copies of the morning paper to assure himself that what it said was true.)

Looking up a table in the imagination is no more looking up a table than the image of the result of an imagined experiment is the result of an experiment.

Page 94

266. I can look at the clock to see what time it is: but I can also look at the dial of a clock in order to *guess* what time it is; or for the same purpose move the hand of a clock till its position strikes me as right. So the look of a clock may serve to determine the time in more than one way. (Looking at the clock in imagination.)

Page 94

267. Suppose I wanted to justify the choice of dimensions for a bridge which I imagine to be building, by making loading tests on the material of the bridge in my imagination. This would, of course, be to imagine what is called justifying the choice of dimensions for a bridge. But should we also call it justifying an imagined choice of dimensions?

Page 94

268. Why can't my right hand give my left hand money?--My right hand can put it into my left hand. My right hand can write a deed of gift and my left hand a receipt.--But the further practical consequences would not be those of a gift. When the left hand has taken the money from the right, etc., we shall ask: "Well, and what of it?" And the same could be asked if a person had given himself a private definition of a word; I mean, if he has said the word to himself and at the same time has directed his attention to a sensation.

Page 94

269. Let us remember that there are certain criteria in a man's behaviour for the fact that he does not understand a word: that it means nothing to him, that he can do nothing with it. And criteria for his 'thinking he understands', attaching some meaning to the word, but not the right one. And, lastly, criteria for his understanding the word right. In the second case one might speak of a subjective understanding. And sounds which no one else understands but which I '*appear to understand*' might be called a "private language".

Page 94

270. Let us now imagine a use for the entry of the sign "S" in my diary. I discover that whenever I have a particular sensation a manometer

Page Break 95

shews that my blood-pressure rises. So I shall be able to say that my blood-pressure is rising without using any apparatus. This is a useful result. And now it seems quite indifferent whether I have recognized the sensation *right* or not. Let us suppose I regularly identify it wrong, it does not matter in the least. And that alone shews that the hypothesis that I make a mistake is mere show. (We as it were turned a knob which looked as if it could be used to turn on some part of the machine; but it was a mere ornament, not connected with the mechanism at all.)

Page 95

And what is our reason for calling "S" the name of a sensation here? Perhaps the kind of way this sign is employed in this language-game.--And why a "particular sensation," that is, the same one every time? Well, aren't we supposing that we write "S" every time?

Page 95

271. "Imagine a person whose memory could not retain what the word 'pain' meant--so that he constantly called different things by that name--but nevertheless used the word in a way fitting in with the usual symptoms and presuppositions of pain"--in short he uses it as we all do. Here I should like to say: a wheel that can be turned though nothing else moves with it, is not part of the mechanism.

Page 95

272. The essential thing about private experience is really not that each person possesses his own exemplar, but that nobody knows whether other people also have *this* or something else. The assumption would thus be possible--though unverifiable--that one section of mankind had one sensation of red and another section another.

Page 95

273. What am I to say about the word "red"?--that it means something 'confronting us all' and that everyone should really have another word, besides this one, to mean his *own* sensation of red? Or is it like this: the word "red" means something known to everyone; and in addition, for each person, it means something known only to him? (Or perhaps rather: it *refers* to something known only to him.)

Page 95

274. Of course, saying that the word "red" "refers to" instead of "means" something private does not help us in the least to grasp its function; but it is the more psychologically apt expression for a particular experience in doing philosophy. It is as if when I uttered the word I cast a sidelong glance at the private sensation, as it were in order to say to myself: I know all right what I mean by it.

275. Look at the blue of the sky and say to yourself "How blue the sky is!"--When you do it spontaneously--without philosophical intentions--the idea never crosses your mind that this impression of colour belongs only to *you*. And you have no hesitation in exclaiming that to someone else. And if you point at anything as you say the words you point at the sky. I am saying: you have not the feeling of pointing-into-yourself, which often accompanies 'naming the sensation' when one is thinking about 'private language'. Nor do you think that really you ought not to point to the colour with your hand, but with your attention. (Consider what it means "to point to something with the attention".)

276. But don't we at least *mean* something quite definite when we look at a colour and name our colour-impression? It is as if we detached the colour-*impression* from the object, like a membrane. (This ought to arouse our suspicions.)

277. But how is even possible for us to be tempted to think that we use a word to *mean* at one time the colour known to everyone--and at another the 'visual impression' which *I* am getting *now*? How can there be so much as a temptation here?--I don't turn the same kind of attention on the colour in the two cases. When I mean the colour impression that (as I should like to say) belongs to me alone I immerse myself in the colour--rather like when I 'cannot get my fill of a colour'. Hence it is easier to produce this experience when one is looking at a bright colour, or at an impressive colour-scheme.

278. "I know how the colour green looks to *me*"--surely that makes sense!--Certainly: what use of the proposition are you thinking of?

279. Imagine someone saying: "But I know how tall I am!" and laying his hand on top of his head to prove it.

280. Someone paints a picture in order to shew how he imagines a theatre scene. And now I say: "This picture has a double function: it informs others, as pictures or words inform--but for the one who gives the information it is a representation (or piece of information?) of another kind: for him it is the picture of his image, as it can't be for anyone else. To him his private impression of the picture means what he has imagined, in a sense in which the picture cannot mean this to others."--And what right have I to speak in this second

case of a representation or piece of information--if these words were rightly used in the *first* case?

281. "But doesn't what you say come to this: that there is no pain, for example, without *pain-behaviour*?"--It comes to this: only of a living human being and what resembles (behaves like) a living human being can one say: it has sensations; it sees; is blind; hears; is deaf; is conscious or unconscious.

282. "But in a fairy tale the pot too can see and hear!" (Certainly; but it *can* also talk.)

"But the fairy tale only invents what is not the case: it does not talk *nonsense*."--It is not as simple as that. Is it false or nonsensical to say that a pot talks? Have we a clear picture of the circumstances in which we should say of a pot that it talked? (Even a nonsense-poem is not nonsense in the same way as the babbling of a child.)

We do indeed say of an inanimate thing that it is in pain: when playing with dolls for example. But this use of the concept of pain is a secondary one. Imagine a case in which people ascribed pain *only* to inanimate things; pitied *only* dolls! (When children play at trains their game is connected with their knowledge of trains. It would nevertheless be possible for the children of a tribe unacquainted with trains to learn this game from others, and to play it without knowing that it was copied from anything. One might say that the game did not make the same *sense* to them as to us.)

283. What gives us *so much as the idea* that living beings, things, can feel?

Is it that my education has led me to it by drawing my attention to feelings in myself, and now I transfer the idea to objects outside myself? That I recognize that there is something there (in me) which I can call "pain" without getting into conflict with the way other people use this word?--I do not transfer my idea to stones, plants, etc.

Couldn't I imagine having frightful pains and turning to stone while they lasted? Well, how do I know, if I shut my eyes, whether I have not turned into a stone? And if that has happened, in what sense will *the stone* have the pains? In what sense will they be ascribable to the stone? And why need the pain have a bearer at all here?!

And can one say of the stone that it has a soul and *that* is what has the pain? What has a soul, or pain, to do with a stone?

Only of what behaves like a human being can one say that it *has* pains.

For one has to say it of a body, or, if you like of a soul which some body *has*. And how can a body *have* a soul?

284. Look at a stone and imagine it having sensations.--One says to oneself: How could one so much as get the idea of ascribing a *sensation* to a *thing*? One might as well ascribe it to a number!--And now look at a wriggling fly and at once these difficulties vanish and pain seems able to get a foothold here, where before everything was, so to speak, too smooth for it.

And so, too, a corpse seems to us quite inaccessible to pain.--Our attitude to what is alive and to what is dead, is not the same. All our reactions are different.--If anyone says: "That cannot simply come from the fact that a living thing moves about in such-and-such a way and a dead one not", then I want to intimate to him that this is a case of the transition 'from quantity to quality'.

285. Think of the recognition of *facial expressions*. Or of the description of facial expressions--which does not consist in giving the measurements of the face! Think, too, how one can imitate a man's face without seeing one's own in a mirror.

286. But isn't it absurd to say of a *body* that it has pain?--And why does one feel an absurdity in that? In what sense is it true that my hand does not feel pain, but I in my hand?

What sort of issue is: Is it the *body* that feels pain?--How is it to be decided? What makes it plausible to say that it is *not* the body?--Well, something like this: if someone has a pain in his hand, then the hand does not say so (unless it writes it) and one does not comfort the hand, but the sufferer: one looks into his face.

287. How am I filled with pity *for this man*? How does it come out what the object of my pity is? (Pity, one may say, is a form of conviction that someone else is in pain.)

288. I turn to stone and my pain goes on.--Suppose I were in error and it was no longer *pain*?--But I can't be in error here; it means nothing to doubt whether I am in pain!--That means: if anyone said "I do not know if what I have got is a pain or something else", we should think something like, he does not know what the

English word "pain" means; and we should explain it to him.--How? Perhaps by means of gestures, or by pricking him with a pin and saying: "See, that's what pain is!" This explanation, like any other, he might understand right, wrong, or not at all. And he will shew which he does by his use of the word, in this as in other cases.

If he now said, for example: "Oh, I know what 'pain' means; what I don't know is whether *this*, that I have now, is pain"--we should merely shake our heads and be forced to regard his words as a queer reaction which we have no idea what to do with. (It would be rather as if we heard someone say seriously: "I distinctly remember that some time before I was born I believed.....".)

That expression of doubt has no place in the language-game; but if we cut out human behaviour, which is the expression of sensation, it looks as if I might *legitimately* begin to doubt afresh. My temptation to say that one might take a sensation for something other than what it is arises from this: if I assume the abrogation of the normal language-game with the expression of a sensation, I need a criterion of identity for the sensation; and then the

possibility of error also exists.

Page 99

289. "When I say 'I am in pain' I am at any rate justified *before myself*."--What does that mean? Does it mean: "If someone else could know what I am calling 'pain', he would admit that I was using the word correctly"?

Page 99

To use a word without a justification does not mean to use it without right.

Page 99

290. What I do is not, of course, to identify my sensation by criteria: but to repeat an expression. But this is not the *end* of the language-game: it is the beginning.

Page 99

But isn't the beginning the sensation--which I describe?--Perhaps this word "describe" tricks us here. I say "I describe my state of mind" and "I describe my room". You need to call to mind the differences between the language-games.

Page 99

291. What we call "*descriptions*" are instruments for particular uses. Think of a machine-drawing, a cross-section, an elevation with measurements, which an engineer has before him. Thinking of a description as a word-picture of the facts has something misleading about it: one tends to think only of such pictures as hang on our walls: which seem simply to portray how a thing looks, what it is like. (These pictures are as it were idle.)

Page Break 100

Page 100

292. Don't always think that you read off what you say from the facts; that you portray these in words according to rules. For even so you would have to apply the rule in the particular case without guidance.

Page 100

293. If I say of myself that it is only from my own case that I know what the word "pain" means--must I not say the same of other people too? And how can I generalize the *one* case so irresponsibly?

Page 100

Now someone tells me that *he* knows what pain is only from his own case!--Suppose everyone had a box with something in it: we call it a "beetle". No one can look into anyone else's box, and everyone says he knows what a beetle is only by looking at *his* beetle.--Here it would be quite possible for everyone to have something different in his box. One might even imagine such a thing constantly changing.--But suppose the word "beetle" had a use in these people's language?--If so it would not be used as the name of a thing. The thing in the box has no place in the language-game at all; not even as a *something*: for the box might even be empty.--No, one can 'divide through' by the thing in the box; it cancels out, whatever it is.

Page 100

That is to say: if we construe the grammar of the expression of sensation on the model of 'object and designation' the object drops out of consideration as irrelevant.

Page 100

294. If you say he sees a private picture before him, which he is describing, you have still made an assumption about what he has before him. And that means that you can describe it or do describe it more closely. If you admit that you haven't any notion what kind of thing it might be that he has before him--then what leads you into saying, in spite of that, that he has something before him? Isn't it as if I were to say of someone: "He *has* something. But I don't know whether it is money, or debts, or an empty till."

Page 100

295. "I know.... only from my *own* case"--what kind of proposition is this meant to be at all? An experiential one? No.--A grammatical one?

Page 100

Suppose everyone does say about himself that he knows what pain is only from his own pain.--Not that people really say that, or are even prepared to say it. But *if* everybody said it--it might be a kind of exclamation. And even if it gives no information, still it is a picture, and why should we not want to call up such a picture? Imagine an allegricoal [[sic]] painting taking the place of those words.

Page 100

When we look into ourselves as we do philosophy, we often get to

Page Break 101

see just such a picture. A full-blown pictorial representation of our grammar. Not facts; but as it were illustrated turns of speech.

296. "Yes, but there is *something* there all the same accompanying my cry of pain. And it is on account of that that I utter it. And this something is what is important--and frightful."--Only whom are we informing of this? And on what occasion?

297. Of course, if water boils in a pot, steam comes out of the pot and also pictured steam comes out of the pictured pot. But what if one insisted on saying that there must also be something boiling in the picture of the pot?

298. The very fact that we should so much like to say: "*This* is the important thing"--while we point privately to the sensation--is enough to shew how much we are inclined to say something which gives no information.

299. Being unable--when we surrender ourselves to philosophical thought--to help saying such-and-such; being irresistibly inclined to say it--does not mean being forced into an *assumption*, or having an immediate perception or knowledge of a state of affairs.

300. It is--we should like to say--not merely the picture of the behaviour that plays a part in the language-game with the words "he is in pain", but also the picture of the pain. Or, not merely the paradigm of the behaviour, but also that of the pain.--It is a misunderstanding to say "The picture of pain enters into the language-game with the word 'pain'." The image of pain is not a picture and *this* image is not replaceable in the language-game by anything that we should call a picture.--The image of pain certainly enters into the language game in a sense; only not as a picture.

301. An image is not a picture, but a picture can correspond to it.

302. If one has to imagine someone else's pain on the model of one's own, this is none too easy a thing to do: for I have to imagine pain which I *do not feel* on the model of the pain which I *do feel*. That is, what I have to do is not simply to make a transition in imagination from one place of pain to another. As, from pain in the hand to pain in the arm. For I am not to imagine that I feel pain in some region of his body. (Which would also be possible.)

Pain-behaviour can point to a painful place--but the subject of pain is the person who gives it expression.

303. "I can only *believe* that someone else is in pain, but I *know* it if I am."--Yes: one can make the decision to say "I believe he is in pain" instead of "He is in pain". But that is all.--What looks like an explanation here, or like a statement about a mental process, is in truth an exchange of one expression for another which, while we are doing philosophy, seems the more appropriate one.

Just try--in a real case--to doubt someone else's fear or pain.

304. "But you will surely admit that there is a difference between pain-behaviour accompanied by pain and pain-behaviour without any pain?"--Admit it? What greater difference could there be?"--And yet you again and again reach the conclusion that the sensation itself is a *nothing*."--Not at all. It is not a *something*, but not a *nothing* either! The conclusion was only that a nothing would serve just as well as a something about which nothing could be said. We have only rejected the grammar which tries to force itself on us here.

The paradox disappears only if we make a radical break with the idea that language always functions in one way, always serves the same purpose: to convey thoughts--which may be about houses, pains, good and evil, or anything else you please.

305. "But you surely cannot deny that, for example, in remembering, an inner process takes place."--What gives the impression that we want to deny anything? When one says "Still, an inner process does take place here"--one wants to go on: "After all, you *see* it." And it is this inner process that one means by the word "remembering".--The impression that we wanted to deny something arises from our setting our faces against the picture of the 'inner process'. What we deny is that the picture of the inner process gives us the correct idea of the use of the word "to remember". We say that this picture with its ramifications stands in the way of our seeing the use of the word as it is.

306. Why should I deny that there is a mental process? But "There has just taken place in me the mental process of remembering...." means nothing more than: "I have just remembered....". To deny the mental process would mean to deny the remembering; to deny that anyone ever remembers anything.

307. "Are you not really a behaviourist in disguise? Aren't you at bottom really saying that everything except human behaviour is

a fiction?"--If I do speak of a fiction, then it is of a *grammatical* fiction.

308. How does the philosophical problem about mental processes and states and about behaviourism arise?--The first step is the one that altogether escapes notice. We talk of processes and states and leave their nature undecided. Sometime perhaps we shall know more about them--we think. But that is just what commits us to a particular way of looking at the matter. For we have a definite concept of what it means to learn to know a process better. (The decisive movement in the conjuring trick has been made, and it was the very one that we thought quite innocent.)--And now the analogy which was to make us understand our thoughts falls to pieces. So we have to deny the yet uncomprehended process in the yet unexplored medium. And now it looks as if we had denied mental processes. And naturally we don't want to deny them.

309. What is your aim in philosophy?--To shew the fly the way out of the fly-bottle.

310. I tell someone I am in pain. His attitude to me will then be that of belief; disbelief; suspicion; and so on.

Let us assume he says: "It's not so bad."--Doesn't that prove that he believes in something behind the outward expression of pain?--His attitude is a proof of his attitude. Imagine not merely the words "I am in pain" but also the answer "It's not so bad" replaced by instinctive noises and gestures.

311. "What difference could be greater?"--In the case of pain I believe that I can give myself a private exhibition of the difference. But I can give anyone an exhibition of the difference between a broken and an unbroken tooth.--But for the private exhibition you don't have to give yourself actual pain; it is enough to *imagine* it--for instance, you screw up your face a bit. And do you know that what you are giving yourself this exhibition of is pain and not, for example, a facial expression? And how do you know what you are to give yourself an exhibition of before you do it? This *private* exhibition is an illusion.

312. But again, *aren't* the cases of the tooth and the pain similar? For the visual sensation in the one corresponds to the sensation of pain in the other. I can exhibit the visual sensation to myself as little or as well as the sensation of pain.

Let us imagine the following: The surfaces of the things around us (stones, plants, etc.) have patches and regions which produce pain in our skin when we touch them. (Perhaps through the chemical composition of these surfaces. But we need not know that.) In this case we should speak of pain-patches on the leaf of a particular plant just as at present we speak of red patches. I am supposing that it is useful to us to notice these patches and their shapes; that we can infer important properties of the objects from them.

313. I can exhibit pain, as I exhibit red, and as I exhibit straight and crooked and trees and stones.--*That* is what we *call* "exhibiting".

314. It shews a fundamental misunderstanding, if I am inclined to study the headache I have now in order to get clear about the philosophical problem of sensation.

315. Could someone understand the word "pain", who had *never* felt pain?--Is experience to teach me whether this is so or not?--And if we say "A man could not imagine pain without having sometime felt it"--how do we know? How can it be decided whether it is true?

316. In order to get clear about the meaning of the word "think" we watch ourselves while we think; what we observe will be what the word means!--But this concept is not used like that. (It would be as if without knowing how to play chess, I were to try and make out what the word "mate" meant by close observation of the last move of some game of chess.)

Page 104

317. Misleading parallel: the expression of pain is a cry--the expression of thought, a proposition.

Page 104

As if the purpose of the proposition were to convey to one person how it is with another: only, so to speak, in his thinking part and not in his stomach.

Page 104

318. Suppose we think while we talk or write--I mean, as we normally do--we shall not in general say that we think quicker than we talk; the thought seems *not to be separate* from the expression. On the other hand, however, one does speak of the speed of thought; of how a thought goes through one's head like lightning; how problems become clear to us in a flash, and so on. So it is natural to ask if the same thing happens in lightning-like thought--only extremely accelerated--as when we talk and 'think while we talk.' So that in the

Page Break 105

first case the clockwork runs down all at once, but in the second bit by bit, braked by the words.

Page 105

319. I can see or understand a whole thought in a flash in exactly the sense in which I can make a note of it in a few words or a few pencilled dashes.

Page 105

What makes this note into an epitome of this thought?

Page 105

320. The lightning-like thought may be connected with the spoken thought as the algebraic formula is with the sequence of numbers which I work out from it.

Page 105

When, for example, I am given an algebraic function, I am CERTAIN that I shall be able to work out its values for the arguments 1, 2, 3,... up to 10. This certainty will be called 'well-founded', for I have learned to compute such functions, and so on. In other cases no reasons will be given for it--but it will be justified by success.

Page 105

321. "What happens when a man suddenly understands?"--The question is badly framed. If it is a question about the meaning of the expression "sudden understanding", the answer is not to point to a process that we give this name to.--The question might mean: what are the tokens of sudden understanding; what are its characteristic psychical accompaniments?

Page 105

(There is no ground for assuming that a man feels the facial movements that go with his expression, for example, or the alterations in his breathing that are characteristic of some emotion. Even if he feels them as soon as his attention is directed towards them.) ((Posture.))

Page 105

322. The question what the expression means is not answered by such a description; and this misleads us into concluding that understanding is a specific indefinable experience. But we forget that what should interest us is the question: how do we *compare* these experiences; what criterion of identity *do we fix* for their occurrence?

Page 105

323. "Now I know how to go on!" is an exclamation; it corresponds to an instinctive sound, a glad start. Of course it does not follow from my feeling that I shall not find I am stuck when I do try to go on.--Here there are cases in which I should say: "When I said I knew how to go on, I *did* know." One will say that if, for example, an unforeseen interruption occurs. But what is unforeseen must not simply be that I get stuck.

Page Break 106

Page 106

We could also imagine a case in which light was always seeming to dawn on someone--he exclaims "Now I have it!" and then can never justify himself in practice.--It might seem to him as if in the twinkling of an eye he forgot again the meaning of the picture that occurred to him.

Page 106

324. Would it be correct to say that it is a matter of induction, and that I am as certain that I shall be able to continue the series, as I am that this book will drop on the ground when I let it go; and that I should be no less

astonished if I suddenly and for no obvious reason got stuck in working out the series, than I should be if the book remained hanging in the air instead of falling?--To that I will reply that we don't need any grounds for *this* certainty either. What could justify the certainty *better* than success?

Page 106

325. "The certainty that I shall be able to go on after I have had this experience--seen the formula, for instance,--is simply based on induction." What does this mean?--"The certainty that the fire will burn me is based on induction." Does that mean that I argue to myself: "Fire has always burned me, so it will happen now too?" Or is the previous experience the *cause* of my certainty, not its ground? Whether the earlier experience is the cause of the certainty depends on the system of hypotheses, of natural laws, in which we are considering the phenomenon of certainty.

Page 106

Is our confidence justified?--What people accept as a justification--is shewn by how they think and live.

Page 106

326. We expect *this*, and are surprised at *that*. But the chain of reasons has an end.

Page 106

327. "Can one think without speaking?"--And what is *thinking*?--Well, don't you ever think? Can't you observe yourself and see what is going on? It should be quite simple. You do not have to wait for it as for an astronomical event and then perhaps make your observation in a hurry.

Page 106

328. Well, what does one include in 'thinking'? What has one learnt to use this word for?--If I say I have thought--need I always be right?--What *kind* of mistake is there room for here? Are there circumstances in which one would ask: "Was what I was doing then really thinking; am I not making a mistake?" Suppose someone takes a measurement in the middle of a train of thought: has he interrupted the thought if he says nothing to himself during the measuring?

Page Break 107

Page 107

329. When I think in language, there aren't 'meanings' going through my mind in addition to the verbal expressions: the language is itself the vehicle of thought.

Page 107

330. Is thinking a kind of speaking? One would like to say it is what distinguishes speech with thought from talking without thinking.--And so it seems to be an accompaniment of speech. A process, which may accompany something else, or can go on by itself.

Page 107

Say: "Yes, this pen is blunt. Oh well, it'll do." First, thinking it; then without thought; then just think the thought without the words.--Well, while doing some writing I might test the point of my pen, make a face--and then go on with a gesture of resignation.--I might also act in such a way while taking various measurements that an onlooker would say I had--without words--thought: If two magnitudes are equal to a third, they are equal to one another.--But what constitutes thought here is not some process which has to accompany the words if they are not to be spoken without thought.

Page 107

331. Imagine people who could only think aloud. (As there are people who can only read aloud.)

Page 107

332. While we sometimes call it "thinking" to accompany a sentence by a mental process, that accompaniment is not what we mean by a "thought".--Say a sentence and think it; say it with understanding.--And now do not say it, and just do what you accompanied it with when you said it with understanding!--(Sing this tune with expression. And now don't sing it, but repeat its expression!--And here one actually might repeat something. For example, motions of the body, slower and faster breathing, and so on.)

Page 107

333. "Only someone who is *convinced* can say that."--How does the conviction help him when he says it?--Is it somewhere at hand by the side of the spoken expression? (Or is it masked by it, as a soft sound by a loud one, so that it can, as it were, no longer be heard when one expresses it out loud?) What if someone were to say "In order to be able to sing a tune from memory one has to hear it in one's mind and sing from that"?

Page 107

334. "So you really wanted to say...."--We use this phrase in order to lead someone from one form of expression to another. One is tempted to use the following picture: what he really 'wanted to say', what he 'meant' was already *present somewhere* in his mind even

before we gave it expression. Various kinds of thing may persuade us to give up one expression and to adopt another in its place. To understand this, it is useful to consider the relation in which the solutions of mathematical problems stand to the context and ground of their formulation. The concept 'trisection of the angle with ruler and compass', when people are trying to do it, and, on the other hand, when it has been proved that there is no such thing.

Page 108

335. What happens when we make an effort--say in writing a letter--to find the right expression for our thoughts?--This phrase compares the process to one of translating or describing: the thoughts are already there (perhaps were there in advance) and we merely look for their expression. This picture is more or less appropriate in different cases.--But can't all sorts of things happen here?--I surrender to a mood and the expression *comes*. Or a picture occurs to me and I try to describe it. Or an English expression occurs to me and I try to hit on the corresponding German one. Or I make a gesture, and ask myself: What words correspond to this gesture? And so on.

Page 108

Now if it were asked: "Do you have the thought before finding the expression?" what would one have to reply? And what, to the question: "What did the thought consist in, as it existed before its expression?"

Page 108

336. This case is similar to the one in which someone imagines that one could not think a sentence with the remarkable word order of German or Latin just as it stands. One first has to think it, and then one arranges the words in that queer order. (A French politician once wrote that it was a peculiarity of the French language that in its words occur in the order in which one thinks them.)

Page 108

337. But didn't I already intend the whole construction of the sentence (for example) at its beginning? So surely it already existed in my mind before I said it out loud!--If it was in my mind, still it would not normally be there in some different word order. But here we are constructing a misleading picture of 'intending', that is, of the use of this word. An intention is embedded in its situation, in human customs and institutions. If the technique of the game of chess did not exist, I could not intend to play a game of chess. In so far as I do intend the construction of a sentence in advance, that is made possible by the fact that I can speak the language in question.

Page 109

338. After all, one can only say something if one has learned to talk. Therefore in order to *want* to say something one must also have mastered a language; and yet it is clear that one can want to speak without speaking. Just as one can want to dance without dancing.

Page 109

And when we think about this, we grasp at the *image* of dancing, speaking, etc..

Page 109

339. Thinking is not an incorporeal process which lends life and sense to speaking, and which it would be possible to detach from speaking, rather as the Devil took the shadow of Schlemiehl from the ground.--But how "not an incorporeal process"? Am I acquainted with incorporeal processes, then, only thinking is not one of them? No; I called the expression "an incorporeal process" to my aid in my embarrassment when I was trying to explain the meaning of the word "thinking" in a primitive way.

Page 109

One might say "Thinking is an incorporeal process", however, if one were using this to distinguish the grammar of the word "think" from that of, say, the word "eat". Only that makes the difference between the meanings look *too slight*. (It is like saying: numerals are actual, and numbers non-actual, objects.) An unsuitable type of expression is a sure means of remaining in a state of confusion. It as it were bars the way out.

Page 109

340. One cannot guess how a word functions. One has to *look at* its use and learn from that.

Page 109

But the difficulty is to remove the prejudice which stands in the way of doing this. It is not a *stupid* prejudice.

Page 109

341. Speech with and without thought is to be compared with the playing of a piece of music with and without thought.

342. William James, in order to shew that thought is possible without speech, quotes the recollection of a deaf-mute, Mr. Ballard, who wrote that in his early youth, even before he could speak, he had had thoughts about God and the world.--What can he have meant?--Ballard writes: "It was during those delightful rides, some two or three years before my initiation into the rudiments of written language, that I began to ask myself the question: how came the world into being?"--Are you sure--one would like to ask--that this is the correct translation of your wordless thought into words? And why does this question--which otherwise seems not to exist--raise its head here? Do I want to say that the writer's memory deceives

him?--I don't even know if I should say *that*. These recollections are a queer memory phenomenon,--and I do not know what conclusions one can draw from them about the past of the man who recounts them.

343. The words with which I express my memory are my memory-reaction.

344. Would it be imaginable that people should never speak an audible language, but should still say things to themselves in the imagination?

"If people always said things only to themselves, then they would merely be doing *always* what as it is they do *sometimes*."--So it is quite easy to imagine this: one need only make the easy transition from some to all. (Like: "An infinitely long row of trees is simply one that does *not* come to an end.") Our criterion for someone's saying something to himself is what he tells us and the rest of his behaviour; and we only say that someone speaks to himself if, in the ordinary sense of the words, he *can speak*. And we do not say it of a parrot; nor of a gramophone.

345. "What sometimes happens might always happen."--What kind of proposition is that? It is like the following: If " $F(a)$ " makes sense " $(x).F(x)$ " makes sense.

"If it is possible for someone to make a false move in some game, then it might be possible for everybody to make nothing but false moves in every game."--Thus we are under a temptation to misunderstand the logic of our expressions here, to give an incorrect account of the use of our words.

Orders are sometimes not obeyed. But what would it be like if no orders were *ever* obeyed? The concept 'order' would have lost its purpose.

346. But couldn't we imagine God's suddenly giving a parrot understanding, and its now saying things to itself?--But here it is an important fact that I imagined a deity in order to imagine this.

347. "But at least I know from my own case what it means 'to say things to oneself'. And if I were deprived of the organs of speech, I could still talk to myself."

If I know it only from my own case, then I know only what *I* call that, not what anyone else does.

348. "These deaf-mutes have learned only a gesture-language, but each of them talks to himself inwardly in a vocal language."--Now,

don't you understand that?--But how do I know whether I understand it?!--What can I do with this information (if it is such)? The whole idea of understanding smells fishy here. I do not know whether I am to say I understand it or don't understand it. I might answer "It's an English sentence; *apparently* quite in order--that is, until one wants to do something with it; it has a connexion with other sentences which makes it difficult for us to say that nobody really knows what it tells us; but everyone who has not become calloused by doing philosophy notices that there is something wrong here."

349. "But this supposition surely makes good sense!"--Yes; in ordinary circumstances these words and this picture have an application with which we are familiar.--But if we suppose a case in which this application falls away we become as it were conscious for the first time of the nakedness of the words and the picture.

350. "But if I suppose that someone has a pain, then I am simply supposing that he has just the same as I have so often had."--That gets us no further. It is as if I were to say: "You surely know what 'It is 5 o'clock here' means; so you also know what 'It's 5 o'clock on the sun' means. It means simply that it is just the same time there as it is here when it is 5 o'clock."--The explanation by means of *identity* does not work here. For I know well enough that one can call 5 o'clock here and 5 o'clock there "the same time", but what I do not know is in what cases one is to speak of its being the same time here and there.

Page 111

In exactly the same way it is no explanation to say: the supposition that he has a pain is simply the supposition that he has the same as I. For *that* part of the grammar is quite clear to me: that is, that one will say that the stove has the same experience as I, *if* one says: it is in pain and I am in pain.

Page 111

351. Yet we go on wanting to say: "Pain is pain--whether *he* has it, or *I* have it; and however I come to know whether he has a pain or not."--I might agree.--And when you ask me "Don't you know, then, what I mean when I say that the stove is in pain?"--I can reply: These words may lead me to have all sorts of images; but their usefulness goes no further. And I can also imagine something in connexion with the words: "It was just 5 o'clock in the afternoon on the sun"--such as a grandfather clock which points to 5.--But a still better example would be that of the application of "above" and "below" to the earth. Here we all have a quite clear idea of what

Page Break 112

"above" and "below" mean. I see well enough that I am on top; the earth is surely beneath me! (And don't smile at this example. We are indeed all taught at school that it is stupid to talk like that. But it is much easier to bury a problem than to solve it.) And it is only reflection that shews us that in this case "above" and "below" cannot be used in the ordinary way. (That we might, for instance, say that the people at the antipodes are 'below' our part of the earth, but it must also be recognized as right for them to use the same expression about us.)

Page 112

352. Here it happens that our thinking plays us a queer trick. We want, that is, to quote the law of excluded middle and to say: "Either such an image is in his mind, or it is not; there is no third possibility!"--We encounter this queer argument also in other regions of philosophy. "In the decimal expansion of π either the group "7777" occurs, or it does not--there is no third possibility." That is to say: "God sees--but we don't know." But what does that mean?--We use a picture; the picture of a visible series which one person sees the whole of and another not. The law of excluded middle says here: It must either look like this, or like that. So it really--and this is a truism--says nothing at all, but gives us a picture. And the problem ought now to be: does reality accord with the picture or not? And this picture *seems* to determine what we have to do, what to look for, and how--but it does not do so, just because we do not know how it is to be applied. Here saying "There is no third possibility" or "But there can't be a third possibility!"--expresses our inability to turn our eyes away from this picture: a picture which looks as if it must already contain both the problem and its solution, while all the time we *feel* that it is not so.

Page 112

Similarly when it is said "Either he has this experience, or not"--what primarily occurs to us is a picture which by itself seems to make the sense of the expressions *unmistakable*: "Now you know what is in question"--we should like to say. And that is precisely what it does not tell him.

Page 112

353. Asking whether and how a proposition can be verified is only a particular way of asking "How d'you mean?" The answer is a contribution to the grammar of the proposition.

Page 112

354. The fluctuation in grammar between criteria and symptoms makes it look as if there were nothing at all but symptoms. We say,

Page Break 113

for example: "Experience teaches that there is rain when the barometer falls, but it also teaches that there is rain when we have certain sensations of wet and cold, or such-and-such visual impressions." In defence of this one says that these sense-impressions can deceive us. But here one fails to reflect that the fact that the false appearance is precisely one of rain is founded on a definition.

Page 113

355. The point here is not that our sense-impressions can lie, but that we understand their language. (And this language like any other is founded on convention.)

Page 113

356. One is inclined to say: "Either it is raining, or it isn't--how I know, how the information has reached me,

is another matter." But then let us put the question like this: What do I call "information that it is raining"? (Or have I only information of this information too?) And what gives this 'information' the character of information about something? Doesn't the form of our expression mislead us here? For isn't it a misleading metaphor to say: "My eyes give me the information that there is a chair over there"?

Page 113

357. We do not say that *possibly* a dog talks to itself. Is that because we are so minutely acquainted with its soul? Well, one might say this: If one sees the behaviour of a living thing, one sees its soul.--But do I also say in my own case that I am saying something to myself, because I am behaving in such-and-such a way?--I do *not* say it from observation of my behaviour. But it only makes sense because I do behave in this way.--Then it is not because I *mean* it that it makes sense?

Page 113

358. But isn't it our *meaning* it that gives sense to the sentence? (And here, of course, belongs the fact that one cannot mean a senseless series of words.) And 'meaning it' is something in the sphere of the mind. But it is also something private! It is the intangible *something*; only comparable to consciousness itself.

Page 113

How could this seem ludicrous? It is, as it were, a dream of our language.

Page 113

359. Could a machine think?--Could it be in pain?--Well, is the human body to be called such a machine? It surely comes as close as possible to being such a machine.

Page 113

360. But a machine surely cannot think!--Is that an empirical statement? No. We only say of a human being and what is like one that it thinks. We also say it of dolls and no doubt of spirits too. Look at the word "to think" as a tool.

Page Break 114

Page 114

361. The chair is thinking to itself:.....

Page 114

WHERE? In one of its parts? Or outside its body; in the air around it? Or not *anywhere* at all? But then what is the difference between this chair's saying something to itself and another one's doing so, next to it?--But then how is it with man: where does *he* say things to himself? How does it come about that this question seems senseless; and that no specification of a place is necessary except just that this man is saying something to himself? Whereas the question *where* the chair talks to itself seems to demand an answer.--The reason is: we want to know *how* the chair is supposed to be like a human being; whether, for instance, the head is at the top of the back and so on.

Page 114

What is it like to say something to oneself; what happens here?--How am I to explain it? Well, only as you might teach someone the meaning of the expression "to say something to oneself". And certainly we learn the meaning of that as children.--Only no one is going to say that the person who teaches it to us tells us 'what takes place'.

Page 114

362. Rather it seems to us as though in this case the instructor *imparted* the meaning to the pupil--without telling him it directly; but in the end the pupil is brought to the point of giving himself the correct ostensive definition. And this is where our illusion is.

Page 114

363. "But when I imagine something, something certainly *happens!*" Well, something happens--and then I make a noise. What for? Presumably in order to tell what happens.--But how is *telling* done? When are we said to *tell* anything?--What is the language-game of telling?

Page 114

I should like to say: you regard it much too much as a matter of course that one can tell anything to anyone. That is to say: we are so much accustomed to communication through language, in conversation, that it looks to us as if the whole point of communication lay in this: someone else grasps the sense of my words--which is something mental: he as it were takes it into his own mind. If he then does something further with it as well, that is no part of the immediate purpose of language.

Page 114

One would like to say "Telling brings it about that he *knows* that I am in pain; it produces this mental phenomenon; everything else is inessential to the telling." As for what this queer phenomenon of knowledge is--there is time enough for that. Mental processes just are queer. (It is as if one said: "The clock tells us the time.

What time is, is not yet settled. And as for what one tells the time *for*--that doesn't come in here.")

Page Break 115

Page 115

364. Someone does a sum in his head. He uses the result, let's say, for building a bridge or a machine.--Are you trying to say that he has not *really* arrived at this number by calculation? That it has, say, just 'come' to him in the manner of a kind of dream? There surely must have been calculation going on, and there was. For he *knows* that, and how, he calculated; and the correct result he got would be inexplicable without calculation.--But what if I said: "*It strikes him as if* he had calculated. And why should the correct result be explicable? Is it not incomprehensible enough, that without saying a word, without making a note, he was able to CALCULATE?"--

Page 115

Is calculating in the imagination in some sense less real than calculating on paper? It is real--calculation-in-the-head.--Is it like calculation on paper?--I don't know whether to call it like. Is a bit of white paper with black lines on it like a human body?

Page 115

365. Do Adelheid and the Bishop play a *real* game of chess?--Of course. They are not merely pretending--which would also be possible as part of a play.--But, for example, the game has no beginning!--Of course it has; otherwise it would not be a game of chess.--

Page 115

366. Is a sum in the head less real than a sum on paper?--Perhaps one is inclined to say some such thing; but one can get oneself to think the opposite as well by telling oneself: paper, ink, etc. are only logical constructions out of our sense-data.

Page 115

"I have done the multiplication..... in my head"--do I perhaps not *believe* such a statement?--But was it really a multiplication? It was not merely 'a' multiplication, but *this* one--in the head. This is the point at which I go wrong. For I now want to say: it was some mental process *corresponding* to the multiplication on paper. So it would make sense to say: "*This* process in the mind corresponds to *this* process on paper." And it would then make sense to talk of a method of projection according to which the image of the sign was a representation of the sign itself.

Page 115

367. The mental picture is the picture which is described when someone describes what he imagines.

Page 115

368. I describe a room to someone, and then get him to paint an *impressionistic* picture from this description to shew that he has understood it.--Now he paints the chairs which I described as green, dark red; where I said "yellow", he paints blue.--That is the impression

Page Break 116

which he got of that room. And now I say: "Quite right! That's what it's like."

Page 116

369. One would like to ask: "What is it like--what happens--when one does a sum in one's head?"--And in a particular case the answer may be "First I add 17 and 18, then I subtract 39.....". But that is not the answer to our question. What is called doing sums in one's head is not explained by *such* an answer.

Page 116

370. One ought to ask, not what images are or what happens when one imagines anything, but how the word "imagination" is used. But that does not mean that I want to talk only about words. For the question as to the nature of the imagination is as much about the word "imagination" as my question is. And I am only saying that this question is not to be decided--neither for the person who does the imagining, nor for anyone else--by pointing; nor yet by a description of any process. The first question also asks for a word to be explained; but it makes us expect a wrong kind of answer.

Page 116

371. *Essence* is expressed by grammar.

Page 116

372. Consider: "The only correlate in language to an intrinsic necessity is an arbitrary rule. It is the only thing which one can milk out of this intrinsic necessity into a proposition."

Page 116

373. Grammar tells what kind of object anything is. (Theology as grammar.)

Page 116

374. The great difficulty here is not to represent the matter as if there were something one *couldn't* do. As if

there really were an object, from which I derive its description, but I were unable to shew it to anyone.--And the best that I can propose is that we should yield to the temptation to use this picture, but then investigate how the *application* of the picture goes.

Page 116

375. How does one teach anyone to read to himself? How does one know if he can do so? How does he himself know that he is doing what is required of him?

Page 116

376. When I say the ABC to myself, what is the criterion of my doing the same as someone else who silently repeats it to himself? It might be found that the same thing took place in my larynx and in his. (And similarly when we both think of the same thing, wish the same, and so on.) But then did we learn the use of the words: "to

Page Break 117

say such-and-such to oneself" by someone's pointing to a process in the larynx or the brain? Is it not also perfectly possible that my image of the sound *a* and his correspond to different physiological processes? The question is: *How do we compare images?*

Page 117

377. Perhaps a logician will think: The same is the same--how identity is established is a psychological question. (High is high--it is a matter of psychology that one sometimes *sees*, and sometimes *hears* it.)

Page 117

What is the criterion for the sameness of two images?--What is the criterion for the redness of an image? For me, when it is someone else's image: what he says and does. For myself, when it is my image: nothing. And what goes for "red" also goes for "same".

Page 117

378. "Before I judge that two images which I have are the same, I must recognize them as the same." And when that has happened, how am I to know that the word "same" describes what I recognize? Only if I can express my recognition in some other way, and if it is possible for someone else to teach me that "same" is the correct word here.

Page 117

For if I need a justification for using a word, it must also be one for someone else.

Page 117

379. First I am aware of it as *this*; and then I remember what it is called.--Consider: in what cases is it right to say *this*?

Page 117

380. How do I recognize that this is red?--"I see that it is *this*; and then I know that that is what this is called." This?--What?! What kind of answer to this question makes sense?

Page 117

(You keep on steering towards the idea of the *private* ostensive definition.)

Page 117

I could not apply any rules to a private transition from what is seen to words. Here the rules really would hang in the air; for the institution of their use is lacking.

Page 117

381. How do I know that this colour is red?--It would be an answer to say: "I have learnt English".

Page 117

382. At these words I form this image. How can I *justify* this?

Page 117

Has anyone shewn me the image of the colour blue and told me that *this* is the image of blue?

Page 117

What is the meaning of the words: "*This* image"? How does one point to an image? How does one point twice to the same image?

Page Break 118

Page 118

383. We are not analysing a phenomenon (e.g. thought) but a concept (e.g. that of thinking), and therefore the use of a word. So it may look as if what we were doing were Nominalism. Nominalists make the mistake of interpreting all words as *names*, and so of not really describing their use, but only, so to speak, giving a paper draft on such a description.

Page 118

384. You learned the *concept* 'pain' when you learned language.

Page 118

385. Ask yourself: Would it be imaginable for someone to learn to do sums in his head without ever doing written or oral ones?--"Learning it" will mean: being made able to do it. Only the question arises, what will count as a criterion for being able to do it?--But is it also possible for some tribe to know only of calculation in the head, and of no other kind? Here one has to ask oneself: "What will that be like?"--And so one will have to depict it as a limiting case. And the question will then arise whether we are still willing to use the concept of 'calculating in the head' here--or whether in such circumstances it has lost its purpose, because the phenomena gravitate towards another paradigm.

Page 118

386. "But why have you so little confidence in yourself? Ordinarily you always know well enough what it is to 'calculate.' So if you say you have calculated in imagination, then you will have done so. If you had *not* calculated, you would not have said you had. Equally, if you say that you see something red in imagination, then it will *be* red. You know what 'red' is elsewhere.--And further: you do not always rely on the agreement of other people; for you often report that you have seen something no one else has."--But I do have confidence in myself--I say without hesitation that I have done this sum in my head, have imagined this colour. The difficulty is not that I doubt whether I really imagined anything red. But it is *this*: that we should be able, just like that, to point out or describe the colour we have imagined, that the translation of the image into reality presents no difficulty at all. Are they then so alike that one might mix them up?--But I can also recognize a man from a drawing straight off.--Well, but can I ask: "What does a correct image of this colour look like?" or "What sort of thing is it?"; can I *learn* this?

Page 118

(I cannot accept his testimony because it is not *testimony*. It only tells me what he is *inclined* to say.)

Page 118

387. The *deep* aspect of this matter readily eludes us.

Page Break 119

Page 119

388. "I don't see anything violet here, but I can shew it you if you give me a paint box." How can one *know* that one can shew it if...., in other words, that one can recognize it if one sees it?

Page 119

How do I know from my *image*, what the colour really looks like?

Page 119

How do I know that I shall be able to do something? that is, that the state I am in now is that of being able to do that thing?

Page 119

389. "The image must be more like its object than any picture. For, however like I make the picture to what it is supposed to represent, it can always be the picture of something else as well. But it is essential to the image that it is the image of *this* and of nothing else." Thus one might come to regard the image as a super-likeness.

Page 119

390. Could one imagine a stone's having consciousness? And if anyone can do so--why should that not merely prove that such image-mongery is of no interest to us?

Page 119

391. I can perhaps even imagine (though it is not easy) that each of the people whom I see in the street is in frightful pain, but is artfully concealing it. And it is important that I have to imagine an artful concealment here. That I do not simply say to myself: "Well, his soul is in pain: but what has that to do with his body?" or "After all it need not shew in his body!"--And if I imagine this--what do I do; what do I say to myself; how do I look at the people? Perhaps I look at one and think: "It must be difficult to laugh when one is in such pain", and much else of the same kind. I as it were play a part, *act* as if the others were in pain. When I do this I am said for example to be imagining....

Page 119

392. "When I imagine he is in pain, all that really goes on in me is...." Then someone else says: "I believe I can imagine it *without* thinking '....'" ("I believe I can think without words.") This leads to nothing. The analysis oscillates between natural science and grammar.

Page 119

393. "When I imagine that someone who is laughing is really in pain I don't imagine any pain-behaviour, for I see just the opposite. So *what* do I imagine?"--I have already said what. And I do not necessarily imagine *my* being in pain.--"But then what is the process of imagining it?"--Where (outside philosophy) do we use the

words "I can imagine his being in pain" or "I imagine that...." or "Imagine that...."?

Page 120

We say, for example, to someone who has to play a theatrical part: "Here you must imagine that this man is in pain and is concealing it"--and now we give him no directions, do not tell him what he is *actually* to do. For this reason the suggested analysis is not to the point either.--We now watch the actor who is imagining this situation.

Page 120

394. In what sort of circumstances should we ask anyone: "What actually went on in you as you imagined this?"--And what sort of answer do we expect?

Page 120

395. There is a lack of clarity about the role of *imaginability* in our investigation. Namely about the extent to which it ensures that a proposition makes sense.

Page 120

396. It is no more essential to the understanding of a proposition that one should imagine anything in connexion with it, than that one should make a sketch from it.

Page 120

397. Instead of "imaginability" one can also say here: representability by a particular method of representation. And such a representation *may* indeed safely point a way to further use of a sentence. On the other hand a picture may obtrude itself upon us and be of no use at all.

Page 120

398. "But when I imagine something, or even actually *see* objects, I have *got* something which my neighbour has not."--I understand you. You want to look about you and say: "At any rate only I have got THIS."--What are these words for? They serve no purpose.--Can one not add: "There is here no question of a 'seeing'--and therefore none of a 'having'--nor of a subject, nor therefore of 'I' either"? Might I not ask: In what sense have you *got* what you are talking about and saying that only you have got it? Do you possess it? You do not even *see* it. Must you not really say that no one has got it? And this too is clear: if as a matter of logic you exclude other people's having something, it loses its sense to say that you have it.

Page 120

But what is the thing you are speaking of? It is true I said that I knew within myself what you meant. But that meant that I knew how one thinks to conceive this object, to see it, to make one's looking and pointing mean it. I know how one stares ahead and looks about

one in this case--and the rest. I think we can say: you are talking (if, for example, you are sitting in a room) of the 'visual room'. The 'visual room' is the one that has no owner. I can as little own it as I can walk about it, or look at it, or point to it. Inasmuch as it cannot be any one else's it is not mine either. In other words, it does not belong to me *because* I want to use the same form of expression about it as about the material room in which I sit. The description of the latter need not mention an owner, in fact it need not have any owner. But then the visual room *cannot* have any owner. "For"--one might say--"it has no master, outside or in."

Page 121

Think of a picture of a landscape, an imaginary landscape with a house in it.--Someone asks "Whose house is that?"--The answer, by the way, might be "It belongs to the farmer who is sitting on the bench in front of it". But then he cannot for example enter his house.

Page 121

399. One might also say: Surely the owner of the visual room would have to be the same kind of thing as it is; but he is not to be found in it, and there is no outside.

Page 121

400. The 'visual room' seemed like a discovery, but what its discoverer really found was a new way of speaking, a new comparison; it might even be called a new sensation.

Page 121

401. You have a new conception and interpret it as seeing a new object. You interpret a grammatical movement made by yourself as a quasi-physical phenomenon which you are observing. (Think for example of the question: "Are sense-data the material of which the universe is made?")

Page 121

But there is an objection to my saying that you have made a 'grammatical' movement. What you have primarily discovered is a new way of looking at things. As if you had invented a new way of painting; or, again, a

new metre, or a new kind of song.--

Page 121

402. "It's true I say 'Now I am having such-and-such an image', but the words 'I am having' are merely a sign to someone *else*; the description of the image is a *complete* account of the imagined world."--You mean: the words "I am having" are like "I say!...." You are inclined to say it should really have been expressed differently. Perhaps simply by making a sign with one's hand and then giving a description.--When as in this case, we disapprove of the expressions of ordinary language (which are after all performing their office), we have got a picture in our heads which conflicts with the picture of our ordinary

Page Break 122

way of speaking. Whereas we are tempted to say that our way of speaking does not describe the facts as they really are. As if, for example the proposition "he has pains" could be false in some other way than by that man's *not* having pains. As if the form of expression were saying something false even when the proposition *faute de mieux* asserted something true.

Page 122

For *this* is what disputes between Idealists, Solipsists and Realists look like. The one party attack the normal form of expression as if they were attacking a statement; the others defend it, as if they were stating facts recognized by every reasonable human being.

Page 122

403. If I were to reserve the word "pain" solely for what I had hitherto called "my pain", and others "L.W.'s pain", I should do other people no injustice, so long as a notation were provided in which the loss of the word "pain" in other connexions were somehow supplied. Other people would still be pitied, treated by doctors and so on. It would, of course, be *no* objection to this mode of expression to say: "But look here, other people have just the same as you!"

Page 122

But what should I gain from this new kind of account? Nothing. But after all neither does the solipsist want any practical advantage when he advances his view!

Page 122

404. "When I say 'I am in pain', I do not point to a person who is in pain, since in a certain sense I have no idea *who* is." And this can be given a justification. For the main point is: I did not say that such-and-such a person was in pain, but "I am....." Now in saying this I don't name any person. Just as I don't name anyone when I *groan* with pain. Though someone else sees who is in pain from the groaning.

Page 122

What does it mean to know *who* is in pain? It means, for example, to know which man in this room is in pain: for instance, that it is the one who is sitting over there, or the one who is standing in that corner, the tall one over there with the fair hair, and so on.--What am I getting at? At the fact that there is a great variety of criteria for personal '*identity*'.

Page 122

Now which of them determines my saying that '*I*' am in pain? None.

Page 122

405. "But at any rate when you say 'I am in pain', you want to draw the attention of others to a particular person."--The answer might be: No, I want to draw their attention to *myself*--

Page Break 123

Page 123

406. "But surely what you want to do with the words 'I am....' is to distinguish between *yourself* and *other* people."--Can this be said in every case? Even when I merely groan? And even if I do 'want to distinguish' between myself and other people--do I want to distinguish between the person L.W. and the person N.N.?

Page 123

407. It would be possible to imagine someone groaning out: "Someone is in pain--I don't know who!"--and our then hurrying to help him, the one who groaned.

Page 123

408. "But you aren't in doubt whether it is you or someone else who has the pain!"--The proposition "I don't know whether I or someone else is in pain" would be a logical product, and one of its factors would be: "I don't know whether I am in pain or not"--and that is not a significant proposition.

Page 123

409. Imagine several people standing in a ring, and me among them. One of us, sometimes this one,

sometimes that, is connected to the poles of an electrical machine without our being able to see this. I observe the faces of the others and try to see which of us has just been electrified.--Then I say: "Now I *know* who it is; for it's myself." In this sense I could also say: "Now I know who is getting the shocks; it is myself." This would be a rather queer way of speaking.--But if I make the supposition that I can feel the shock even when someone else is electrified, then the expression "Now I know who...." becomes quite unsuitable. It does not belong to this game.

Page 123

410. "I" is not the name of a person, nor "here" of a place, and "this" is not a name. But they are connected with names. Names are explained by means of them. It is also true that it is characteristic of physics not to use these words.

Page 123

411. Consider how the following questions can be applied, and how settled:

Page 123

(1) "Are these books *my* books?"

Page 123

(2) "Is this foot *my* foot?"

Page 123

(3) "Is this body *my* body?"

Page 123

(4) "Is this sensation *my* sensation?"

Each of these questions has practical (non-philosophical) applications.

Page 123

(2) Think of cases in which my foot is anaesthetized or paralysed. Under certain circumstances the question could be settled by determining whether I can feel pain in this foot.

Page Break 124

Page 124

(3) Here one might be pointing to a mirror-image. Under certain circumstances, however, one might touch a body and ask the question. In others it means the same as: "Does my body look like *that*?"

Page 124

(4) Which sensation does one mean by '*this*' one? That is: how is one using the demonstrative pronoun here? Certainly otherwise than in, say, the first example! Here confusion occurs because one imagines that by directing one's attention to a sensation one is pointing to it.

Page 124

412. The feeling of an unbridgeable gulf between consciousness and brain-process: how does it come about that this does not come into the considerations of our ordinary life? This idea of a difference in kind is accompanied by slight giddiness,--which occurs when we are performing a piece of logical sleight-of-hand. (The same giddiness attacks us when we think of certain theorems in set theory.) When does this feeling occur in the present case? It is when I, for example, turn my attention in a particular way on to my own consciousness, and, astonished, say to myself: THIS is supposed to be produced by a process in the brain!--as it were clutching my forehead.--But what can it mean to speak of "turning my attention on to my own consciousness"? This is surely the queerest thing there could be! It was a particular act of gazing that I called doing this. I stared fixedly in front of me--but *not* at any particular point or object. My eyes were wide open, the brows not contracted (as they mostly are when I am interested in a particular object). No such interest preceded this gazing. My glance was vacant; or again *like* that of someone admiring the illumination of the sky and drinking in the light.

Page 124

Now bear in mind that the proposition which I uttered as a paradox (THIS is produced by a brain-process!) has nothing paradoxical about it. I could have said it in the course of an experiment whose purpose was to shew that an effect of light which I see is produced by stimulation of a particular part of the brain.--But I did not utter the sentence in the surroundings in which it would have had an everyday and unparadoxical sense. And my attention was not such as would have accorded with making an experiment. (If it had been, my look would have been intent, not vacant.)

Page 124

413. Here we have a case of introspection, not unlike that from which William James got the idea that the 'self' consisted mainly of 'peculiar motions in the head and between the head and throat'.

Page Break 125

Page 125

And James' introspection shewed, not the meaning of the word "self" (so far as it means something like "person", "human being", "he himself", "I myself"), nor any analysis of such a thing, but the state of a philosopher's attention when he says the word "self" to himself and tries to analyse its meaning. (And a good deal could be learned from this.)

Page 125

414. You think that after all you must be weaving a piece of cloth: because you are sitting at a loom--even if it is empty--and going through the motions of weaving.

Page 125

415. What we are supplying are really remarks on the natural history of human beings; we are not contributing curiosities however, but observations which no one has doubted, but which have escaped remark only because they are always before our eyes.

Page 125

416. "Human beings agree in saying that they see, hear, feel, and so on (even though some are blind and some are deaf). So they are their own witnesses that they have *consciousness*."--But how strange this is! Whom do I really inform, if I say "I have consciousness"? What is the purpose of saying this to myself, and how can another person understand me?--Now, expressions like "I see", "I hear", "I am conscious" really have their uses. I tell a doctor "Now I am hearing with this ear again", or I tell someone who believes I am in a faint "I am conscious again", and so on.

Page 125

417. Do I observe myself, then, and perceive that I am seeing or conscious? And why talk about observation at all? Why not simply say "I perceive I am conscious"?--But what are the words "I perceive" for here?--why not say "I am conscious"?--But don't the words "I perceive" here shew that I am attending to my consciousness?--which is ordinarily not the case.--If so, then the sentence "I perceive I am conscious" does not say that I am conscious, but that my attention is disposed in such-and-such a way.

Page 125

But isn't it a particular experience that occasions my saying "I am conscious again"?--*What* experience? In what situations do we say it?

Page 125

418. Is my having consciousness a fact of experience?--

Page 125

But doesn't one say that a man has consciousness, and that a tree or a stone does not?--What would it be like if it were otherwise?--Would human beings all be unconscious?--No; not in the ordinary sense of the word. But I, for instance, should not have consciousness--as I now in fact have it.

Page Break 126

Page 126

419. In what circumstances shall I say that a tribe has a *chief*? And the chief must surely have *consciousness*. Surely we can't have a chief without consciousness!

Page 126

420. But can't I imagine that the people around me are automata, lack consciousness, even though they behave in the same way as usual?--If I imagine it now--alone in my room--I see people with fixed looks (as in a trance) going about their business--the idea is perhaps a little uncanny. But just try to keep hold of this idea in the midst of your ordinary intercourse with others, in the street, say! Say to yourself, for example: "The children over there are mere automata; all their liveliness is mere automatism." And you will either find these words becoming quite meaningless; or you will produce in yourself some kind of uncanny feeling, or something of the sort.

Page 126

Seeing a living human being as an automaton is analogous to seeing one figure as a limiting case or variant of another; the cross-pieces of a window as a swastika, for example.

Page 126

421. It seems paradoxical to us that we should make such a medley, mixing physical states and states of consciousness up together in a *single* report: "He suffered great torments and tossed about restlessly". It is quite usual; so why do we find it paradoxical? Because we want to say that the sentence deals with both tangibles and intangibles at once.--But does it worry you if I say: "These three struts give the building stability"? Are three and stability tangible?--Look at the sentence as an instrument, and at its sense as its employment.

Page 126

422. What am I believing in when I believe that men have souls? What am I believing in, when I believe that this substance contains two carbon rings? In both cases there is a picture in the foreground, but the sense lies far in

the background; that is, the application of the picture is not easy to survey.

Page 126

423. *Certainly* all these things happen in you.--And now all I ask is to understand the expression we use.--The picture is there. And I am not disputing its validity in any particular case.--Only I also want to understand the application of the picture.

Page 126

424. The picture is *there*; and I do not dispute its *correctness*. But *what* is its application? Think of the picture of blindness as a darkness in the soul or in the head of the blind man.

Page 126

425. In numberless cases we exert ourselves to find a picture and once it is found the application as it were comes about of itself. In

Page Break 127

this case we already have a picture which forces itself on us at every turn,--but does not help us out of the difficulty, which only begins here.

Page 127

If I ask, for example: "How am I to imagine *this* mechanism going into *this* box?"--perhaps a drawing reduced in scale may serve to answer me. Then I can be told: "You see, it goes in like *this*"; or perhaps even: "Why are you surprised? See how it goes *here*; it is the same there". Of course the latter does not explain anything more: it simply invites me to apply the picture I am given.

Page 127

426. A picture is conjured up which seems to fix the sense *unambiguously*. The actual use, compared with that suggested by the picture, seems like something muddled. Here again we get the same thing as in set theory: the form of expression we use seems to have been designed for a god, who knows what we cannot know; he sees the whole of each of those infinite series and he sees into human consciousness. For us, of course, these forms of expression are like pontificals which we may put on, but cannot do much with, since we lack the effective power that would give these vestments meaning and purpose.

Page 127

In the actual use of expressions we make detours, we go by side-roads. We see the straight highway before us, but of course we cannot use it, because it is permanently closed.

Page 127

427. "While I was speaking to him I did not know what was going on in his head." In saying this, one is not thinking of brain-processes, but of thought-processes. The picture should be taken seriously. We should really like to see into his head. And yet we only mean what elsewhere we should mean by saying: we should like to know what he is thinking. I want to say: we have this vivid picture--and that use, apparently contradicting the picture, which expresses the psychical.

Page 127

428. "This queer thing, thought"--but it does not strike us as queer when we are thinking. Thought does not strike us as mysterious while we are thinking, but only when we say, as it were retrospectively: "How was that possible?" How was it possible for thought to deal with the very object *itself*? We feel as if by means of it we had caught reality in our net.

Page 127

429. The agreement, the harmony, of thought and reality consists in this: if I say falsely that something is *red*, then, for all that, it isn't *red*.

Page Break 128

And when I want to explain the word "red" to someone, in the sentence "That is not red", I do it by pointing to something red.

Page 128

430. "Put a ruler against this body; it does not say that the body is of such-and-such a length. Rather is it in itself--I should like to say--dead, and achieves nothing of what thought achieves."--It is as if we had imagined that the essential thing about a living man was the outward form. Then we made a lump of wood in that form, and were abashed to see the stupid block, which hadn't even any similarity to a living being.

Page 128

431. "There is a gulf between an order and its execution. It has to be filled by the act of understanding."

Page 128

"Only in the act of understanding is it meant that we are to do THIS. The *order*--why, that is nothing but

sounds, ink-marks.--"

Page 128

432. Every sign *by itself* seems dead. *What* gives it life?--In use it is *alive*. Is life breathed into it there?--Or is the *use* its life?

Page 128

433. When we give an order, it can look as if the ultimate thing sought by the order had to remain unexpressed, as there is always a gulf between an order and its execution. Say I want someone to make a particular movement, say to raise his arm. To make it quite clear, I do the movement. This picture seems unambiguous till we ask: how does he know that *he is to make that movement*?--How does he know at all what use he is to make of the signs I give him, whatever they are?--Perhaps I shall now try to supplement the order by means of further signs, by pointing from myself to him, making encouraging gestures, etc.. Here it looks as if the order were beginning to stammer.

Page 128

As if the signs were precariously trying to produce understanding in us.--But if we now understand them, by what token do we understand?

Page 128

434. The gesture--we should like to say--*tries* to portray, but cannot do it.

Page 128

435. If it is asked: "How do sentences manage to represent?"--the answer might be: "Don't you know? You certainly see it, when you use them." For nothing is concealed.

Page 128

How do sentences do it?--Don't you know? For nothing is hidden.

Page 128

But given this answer: "But you know how sentences do it, for nothing is concealed" one would like to retort "Yes, but it all goes by so quick, and I should like to see it as it were laid open to view."

Page Break 129

Page 129

436. Here it is easy to get into that dead-end in philosophy, where one believes that the difficulty of the task consists in our having to describe phenomena that are hard to get hold of, the present experience that slips quickly by, or something of the kind. Where we find ordinary language too crude, and it looks as if we were having to do, not with the phenomena of every-day, but with ones that "easily elude us, and, in their coming to be and passing away, produce those others as an average effect". (Augustine: *Manifestissima et usitatissima sunt, et eadem rursus nimis latent, et nova est inventio eorum.*)

Page 129

437. A wish seems already to know what will or would satisfy it; a proposition, a thought, what makes it true--even when that thing is not there at all! Whence this *determining* of what is not yet there? This despotic demand? ("The hardness of the logical must.")

Page 129

438. "A plan as such is something unsatisfied." (Like a wish, an expectation, a suspicion, and so on.)

Page 129

By this I mean: expectation is unsatisfied, because it is the expectation of something; belief, opinion, is unsatisfied, because it is the opinion that something is the case, something real, something outside the process of believing.

Page 129

439. In what sense can one call wishes, expectations, beliefs, etc. "unsatisfied"? What is our prototype of nonsatisfaction? Is it a hollow space? And would one call that unsatisfied? Wouldn't this be a metaphor too?--Isn't what we call nonsatisfaction a feeling--say hunger?

Page 129

In a particular system of expressions we can describe an object by means of the words "satisfied" and "unsatisfied". For example, if we lay it down that we call a hollow cylinder an "unsatisfied cylinder" and the solid cylinder that fills it "its satisfaction".

Page 129

440. Saying "I should like an apple" does not mean: I believe an apple will quell my feeling of nonsatisfaction. *This* proposition is not an expression of a wish but of nonsatisfaction.

Page 129

441. By nature and by a particular training, a particular education, we are disposed to give spontaneous

expression to wishes in certain circumstances. (A *wish* is, of course, not such a 'circumstance'.) In this game the question whether I know what I wish before my wish is

Page Break 130

fulfilled cannot arise at all. And the fact that some event stops my wishing does not mean that it fulfills it. Perhaps I should not have been satisfied if my wish had been satisfied.

Page 130

On the other hand the word "wish" is also used in this way: "I don't know myself what I wish for." ("For wishes themselves are a veil between us and the thing wished for.")

Page 130

Suppose it were asked "Do I know what I long for before I get it?" If I have learned to talk, then I do know.

Page 130

442. I see someone pointing a gun and say "I expect a report". The shot is fired.--Well, that was what you expected; so did that report somehow already exist in your expectation? Or is it just that there is some other kind of agreement between your expectation and what occurred; that that noise was not contained in your expectation, and merely accidentally supervened when the expectation was being fulfilled?--But no, if the noise had not occurred, my expectation would not have been fulfilled; the noise fulfilled it; it was not an accompaniment of the fulfilment like a second guest accompanying the one I expected.--Was the thing about the event that was not in the expectation too an accident, an extra provided by fate?--But then what was *not* an extra? Did something of the shot already occur in my expectation?--Then what *was* extra? for wasn't I expecting the whole shot?

Page 130

"The report was not so loud as I had expected."--"Then was there a louder bang in your expectation?"

Page 130

443. "The red which you imagine is surely not the same (not the same thing) as the red which you see in front of you; so how can you say that it is what you imagined?"--But haven't we an analogous case with the propositions "Here is a red patch" and "Here there isn't a red patch"? The word "red" occurs in both; so this word cannot indicate the presence of something red.

Page 130

444. One may have the feeling that in the sentence "I expect he is coming" one is using the words "he is coming" in a different sense from the one they have in the assertion "He is coming". But if it were so how could I say that my expectation had been fulfilled? If I wanted to explain the words "he" and "is coming", say by means of ostensive definitions, the same definitions of these words would go for both sentences.

Page 130

But it might now be asked: what's it like for him to come?--The door opens, someone walks in, and so on.--What's it like for me to

Page Break 131

expect him to come?--I walk up and down the room, look at the clock now and then, and so on.--But the one set of events has not the smallest similarity to the other! So how can one use the same words in describing them?--But perhaps I say as I walk up and down: "I expect he'll come in"--Now there is a similarity somewhere. But of what kind?!

Page 131

445. It is in language that an expectation and its fulfilment make contact.

Page 131

446. It would be odd to say: "A process looks different when it happens from when it doesn't happen." Or "A red patch looks different when it is there from when it isn't there--but language abstracts from this difference, for it speaks of a red patch whether it is there or not."

Page 131

447. The feeling is as if the negation of a proposition had to make it true in a certain sense, in order to negate it.

Page 131

(The assertion of the negative proposition contains the proposition which is negated, but not the assertion of it.)

Page 131

448. "If I say I did *not* dream last night, still I must know where to look for a dream; that is, the proposition 'I dreamt', applied to this actual situation, may be false, but mustn't be senseless."--Does that mean, then, that you did after all feel something, as it were the hint of a dream, which made you aware of the place which a dream would

have occupied?

Page 131

Again: if I say "I have no pain in my arm", does that mean that I have a shadow of the sensation of pain, which as it were indicates the place where the pain might be?

Page 131

In what sense does my present painless state contain the possibility of pain?

Page 131

If anyone says: "For the word 'pain' to have a meaning it is necessary that pain should be recognized as such when it occurs"--one can reply: "It is not more necessary than that the absence of pain should be recognized."

Page 131

449. "But mustn't I know what it would be like if I were in pain?"--We fail to get away from the idea that using a sentence involves imagining something for every word.

Page 131

We do not realize that we *calculate*, operate, with words, and in the course of time translate them sometimes into one picture, sometimes into another.--It is as if one were to believe that a written order for a

Page Break 132

cow which someone is to hand over to me always had to be accompanied by an image of a cow, if the order was not to lose its meaning.

Page 132

450. Knowing what someone looks like: being able to call up an image--but also: being able to *mimic* his expression. Need one imagine it in order to mimic it? And isn't mimicking it just as good as imagining it?

Page 132

451. Suppose I give someone the order "Imagine a red circle here"--and now I say: understanding the order means knowing what it is like for it to have been carried out--or even: being able to imagine what it is like.....?

Page 132

452. I want to say: "If someone could see the mental process of expectation, he would necessarily be seeing *what* was being expected."--But that is the case: if you see the expression of an expectation, you see what is being expected. And in what other way, in what other sense would it be possible to see it?

Page 132

453. Anyone who perceived my expectation would necessarily have a direct perception of *what* was being expected. That is to say, he would not have to *infer* it from the process he perceived!--But to say that someone perceives an expectation *makes no sense*. Unless indeed it means, for example, that he perceives the expression of an expectation. To say of an expectant person that he perceives his expectation instead of saying that he expects, would be an idiotic distortion of the expression.

Page 132

454. "Everything is already there in...." How does it come about that this arrow  points? Doesn't it seem to carry in it something besides itself?--"No, not the dead line on paper; only the psychological thing, the meaning, can do that."--That is both true and false. The arrow points only in the application that a living being makes of it.

Page 132

This pointing is *not* a hocus-pocus which can be performed only by the soul.

Page 132

455. We want to say: "When we mean something, it's like going up to someone, it's not having a dead picture (of any kind)." We go up to the thing we mean.

Page 132

456. "When one means something, it is oneself meaning"; so one is oneself in motion. One is rushing ahead and so cannot also observe oneself rushing ahead. Indeed not.

Page Break 133

Page 133

457. Yes: meaning something is like going up to someone.

Page 133

458. "An order orders its own execution." So it knows its execution, then, even before it is there?--But that was a grammatical proposition and it means: If an order runs "Do such-and-such" then executing the order is called "doing such-and-such."

Page 133

459. We say "The order orders *this*--" and do it; but also "The order orders this: I am to...." We translate it at one time into a proposition, at another into a demonstration, and at another into action.

Page 133

460. Could the justification of an action as fulfilment of an order run like this: "You said 'Bring me a yellow flower', upon which this one gave me a feeling of satisfaction; that is why I have brought it"? Wouldn't one have to reply: "But I didn't set you to bring me the flower which should give you that sort of feeling after what I said!"?

Page 133

461. In what sense does an order anticipate its execution? By ordering *just that* which later on is carried out?--But one would have to say "which later on is carried out, or again is not carried out." And that is to say nothing.

Page 133

"But even if my wish does not determine what is going to be the case, still it does so to speak determine the theme of a fact, whether the fact fulfils the wish or not." We are--as it were--surprised, not at anyone's knowing the future, but at his being able to prophesy at all (right or wrong).

Page 133

As if the mere prophecy, no matter whether true or false, foreshadowed the future; whereas it knows nothing of the future and cannot know less than nothing.

Page 133

462. I can look for him when he is not there, but not hang him when he is not there.

Page 133

One might want to say: "But he must be somewhere there if I am looking for him."--Then he must be somewhere there too if I don't find him and even if he doesn't exist at all.

Page 133

463. "You were looking for *him*? You can't even have known if he was there!"--But this problem really does arise when one looks for something in mathematics. One can ask, for example, how was it possible so much as to *look for* the trisection of the angle?

Page 133

464. My aim is: to teach you to pass from a piece of disguised nonsense to something that is patent nonsense.

Page Break 134

Page 134

465. "An expectation is so made that whatever happens has to accord with it, or not."

Page 134

Suppose you now ask: then are facts defined one way or the other by an expectation--that is, is it defined for whatever event may occur whether it fulfils the expectation or not? The answer has to be: "Yes, unless the expression of the expectation is indefinite; for example, contains a disjunction of different possibilities."

Page 134

466. What does man think for? What use is it?--Why does he make boilers according to *calculations* and not leave the thickness of their walls to chance? After all it is only a fact of experience that boilers do not explode so often if made according to these calculations. But just as having once been burnt he would do anything rather than put his hand into a fire, so he would do anything rather than not calculate for a boiler.--But as we are not interested in causes,--we shall say: human beings do in fact think: this, for instance, is how they proceed when they make a boiler.--Now, can't a boiler produced in this way explode? Oh, yes.

Page 134

467. Does man think, then, because he has found that thinking pays?--Because he thinks it advantageous to think?

Page 134

(Does he bring his children up because he has found it pays?)

Page 134

468. What would shew *why* he thinks?

Page 134

469. And yet one can say that thinking has been found to pay. That there are fewer boiler explosions than formerly, now that we no longer go by feeling in deciding the thickness of the walls, but make such-and-such calculations instead. Or since each calculation done by one engineer got checked by a second one.

Page 134

470. So we do *sometimes* think because it has been found to pay.

471. It often happens that we only become aware of the important *facts*, if we suppress the question "why?"; and then in the course of our investigations these facts lead us to an answer.

472. The character of the belief in the uniformity of nature can perhaps be seen most clearly in the case in which we fear what we expect. Nothing could induce me to put my hand into a flame--although after all it is *only in the past* that I have burnt myself.

473. The belief that fire will burn me is of the same kind as the fear that it will burn me.

474. I shall get burnt if I put my hand in the fire: that is certainty.

That is to say: here we see the meaning of certainty. (What it amounts to, not just the meaning of the word "certainty.")

475. On being asked for the grounds of a supposition, one *bethinks* oneself of them. Does the same thing happen here as when one considers what may have been the causes of an event?

476. We should distinguish between the object of fear and the cause of fear.

Thus a face which inspires fear or delight (the object of fear or delight), is not on that account its cause, but--one might say--its target.

477. "Why do you believe that you will burn yourself on the hot-plate?"--Have you reasons for this belief; and do you need reasons?

478. What kind of reason have I to assume that my finger will feel a resistance when it touches the table? What kind of reason to believe that it will hurt if this pencil pierces my hand?--When I ask this, a hundred reasons present themselves, each drowning the voice of the others. "But I have experienced it myself innumerable times, and as often heard of similar experiences; if it were not so, it would; etc."

479. The question: "On what grounds do you believe this?" might mean: "From what you are now deducing it (have you just deduced it)?" But it might also mean: "What grounds can you produce for this assumption on thinking it over?"

480. Thus one could in fact take "grounds" for an opinion to mean only what a man had said to himself before he arrived at the opinion. The calculation that he has actually carried out. If it is now asked: But how *can* previous experience be a ground for assuming that such-and-such will occur later on?--the answer is: What general concept have we of grounds for this kind of assumption? This sort of statement about the past is simply what we call a ground for assuming that this will happen in the future.--And if you are surprised at our playing such a game I refer you to the *effect* of a past experience (to the fact that a burnt child fears the fire).

481. If anyone said that information about the past could not convince him that something would happen in the future, I should not understand him. One might ask him: What do you expect to be told, then? What sort of information do you call a ground for such a belief? What do you call "conviction"? In what kind of way do you expect to be convinced?--If *these* are not grounds, then what are grounds?--If you say these are not grounds, then you must surely be able to state what must be the case for us to have the right to say that there are grounds for our assumption.

For note: here grounds are not propositions which logically imply what is believed.

Not that one can say: less is needed for belief than for knowledge.--For the question here is not one of an approximation to logical inference.

482. We are misled by this way of putting it: "This is a good ground, for it makes the occurrence of the event probable." That is as if we had asserted something further about the ground, which justified it as a ground; whereas to say that this ground makes the occurrence probable is to say nothing except that this ground comes up to a particular standard of good grounds--but the standard has no grounds!

483. A good ground is one that looks *like this*.

484. One would like to say: "It is a good ground only because it makes the occurrence *really* probable". Because it, so to speak, really has an influence on the event; as it were an experiential one.

485. Justification by experience comes to an end. If it did not it would not be justification.

486. Does it *follow* from the sense-impressions which I get that there is a chair over there?--How can a *proposition* follow from sense-impressions? Well, does it follow from the propositions which describe the sense-impressions? No.--But don't I infer that a chair is there from impressions, from sense-data?--I make no inference!--and yet I sometimes do. I see a photograph for example, and say "There must have been a chair over there" or again "From what I can see here I infer that there is a chair over there." That is an inference; but not one belonging to logic. An inference is a transition to an assertion; and so also to the behaviour that corresponds to the assertion. 'I draw the consequences' not only in words, but also in action.

Was I justified in drawing these consequences? What is *called* a justification here?--How is the word "justification" used? Describe language-games. From these you will also be able to see the importance of being justified.

487. "I am leaving the room because you tell me to."

"I am leaving the room, but not because you tell me to."

Does this proposition *describe* a connexion between my action and his order; or does it make the connexion?

Can one ask: "How do you know that you do it because of this, or not because of this?" And is the answer perhaps: "I feel it"?

488. How do I judge whether it is so? By circumstantial evidence?

489. Ask yourself: On what occasion, for what purpose, do we say this?

What kind of actions accompany these words? (Think of a greeting.) In what scenes will they be used; and what for?

490. How do I know that *this line of thought* has led me to this action?--Well, it is a particular picture: for example, of a calculation leading to a further experiment in an experimental investigation. It looks like *this*--and now I could describe an example.

491. Not: "without language we could not communicate with one another"--but for sure: without language we cannot influence other people in such-and-such ways; cannot build roads and machines, etc.. And also: without the use of speech and writing people could not communicate.

492. To invent a language could mean to invent an instrument for a particular purpose on the basis of the laws of nature (or consistently with them); but it also has the other sense, analogous to that in which we speak of the invention of a game.

Here I am stating something about the grammar of the word "language", by connecting it with the grammar

of the word "invent".

Page 137

493. We say: "The cock calls the hens by crowing"--but doesn't a comparison with our language lie at the bottom of this?--Isn't the aspect quite altered if we imagine the crowing to set the hens in motion by some kind of physical causation?

Page 137

But if it were shewn how the words "Come to me" act on the person addressed, so that finally, given certain conditions, the muscles of his

Page Break 138

legs are innervated, and so on--should we feel that that sentence lost the character of a *sentence*?

Page 138

494. I want to say: It is *primarily* the apparatus of our ordinary language, of our word-language, that we call language; and then other things by analogy or comparability with this.

Page 138

495. Clearly, I can establish by experience that a human being (or animal) reacts to one sign as I want him to, and to another not. That, e.g., a human being goes to the right at the sign "→" and goes to the left at the sign "←"; but that he does not react to the sign "  ", as to "→".

Page 138

I do not even need to fabricate a case, I only have to consider what is in fact the case; namely, that I can direct a man who has learned only German, only by using the German language. (For here I am looking at learning German as adjusting a mechanism to respond to a certain kind of influence; and it may be all one to us whether someone else has learned the language, or was perhaps from birth constituted to react to sentences in German like a normal person who has learned German.)

Page 138

496. Grammar does not tell us how language must be constructed in order to fulfil its purpose, in order to have such-and-such an effect on human beings. It only describes and in no way explains the use of signs.

Page 138

497. The rules of grammar may be called "arbitrary", if that is to mean that the *aim* of the grammar is nothing but that of the language.

Page 138

If someone says "If our language had not this grammar, it could not express these facts"--it should be asked what "*could*" means here.

Page 138

498. When I say that the orders "Bring me sugar" and "Bring me milk" make sense, but not the combination "Milk me sugar", that does not mean that the utterance of this combination of words has no effect. And if its effect is that the other person stares at me and gapes, I don't on that account call it the order to stare and gape, even if that was precisely the effect that I wanted to produce.

Page 138

499. To say "This combination of words makes no sense" excludes it from the sphere of language and thereby bounds the domain of language. But when one draws a boundary it may be for various kinds of reason. If I surround an area with a fence or a line or otherwise, the purpose may be to prevent someone from getting in or out;

Page Break 139

but it may also be part of a game and the players be supposed, say, to jump over the boundary; or it may shew where the property of one man ends and that of another begins; and so on. So if I draw a boundary line that is not yet to say what I am drawing it for.

Page 139

500. When a sentence is called senseless, it is not as it were its sense that is senseless. But a combination of words is being excluded from the language, withdrawn from circulation.

Page 139

501. "The purpose of language is to express thoughts."--So presumably the purpose of every sentence is to express a thought. Then what thought is expressed, for example, by the sentence "It's raining"?--

Page 139

502. Asking what the sense is. Compare:

"This sentence makes sense."--"What sense?"

"This set of words is a sentence."--"What sentence?"

503. If I give anyone an order I feel it to be *quite enough* to give him signs. And I should never say: this is only words, and I have got to get behind the words. Equally, when I have asked someone something and he gives me an answer (i.e. a sign) I am content--that was what I expected--and I don't raise the objection: but that's a mere answer.

504. But if you say: "How am I to know what he means, when I see nothing but the signs he gives?" then I say: "How is *he* to know what he means, when he has nothing but the signs either?"

505. Must I understand an order before I can act on it?--Certainly, otherwise you wouldn't know what you had to do!--But isn't there in turn a jump from *knowing* to doing?--

506. The absent-minded man who at the order "Right turn!" turns left, and then, clutching his forehead, says "Oh! right turn" and does a right turn.--What has struck him? An interpretation?

507. "I am not merely saying this, I mean something by it."--When we consider what is going on in us when we *mean* (and don't merely say) words, it seems to us as if there were something coupled to these words, which otherwise would run idle.--As if they, so to speak, connected with something in us.

508. I say the sentence: "The weather is fine"; but the words are after all arbitrary signs--so let's put "a b c d" in their place. But now when I read this, I can't connect it straight away with the above sense.--

I am not used, I might say, to saying "a" instead of "the", "b" instead of "weather", etc.. But I don't mean by that that I am not used to making an immediate association between the word "the" and "a", but that I am not used to using "a" *in the place* of "the"--and therefore in the sense of "the". (I have not mastered this language.)

(I am not used to measuring temperatures on the Fahrenheit scale. Hence such a measure of temperature 'says' nothing to me.)

509. Suppose we asked someone "In what sense are these words a description of what you are seeing?"--and he answers: "I *mean* this by these words." (Say he was looking at a landscape.) Why is this answer "I *mean* this...." no answer at all?

How does one use words to *mean* what one sees before one?

Suppose I said "a b c d" and meant: the weather is fine. For as I uttered these signs I had the experience normally had only by someone who had year-in year-out used "a" in the sense of "the", "b" in the sense of "weather", and so on.--Does "a b c d" now mean: the weather is fine?

What is supposed to be the criterion for my having had *that* experience?

510. Make the following experiment: *say* "It's cold here" and *mean* "It's warm here". Can you do it?--And what are you doing as you do it? And is there only one way of doing it?

511. What does "discovering that an expression doesn't make sense" mean?--and what does it mean to say: "If I mean something by it, surely it must make sense"?--If I mean something by it?--If I mean *what* by it?!--One wants to say: a significant sentence is one which one can not merely say, but also think.

512. It looks as if we could say: "Word-language allows of senseless combinations of words, but the language of imagining does not allow us to imagine anything senseless."--Hence, too, the language of drawing doesn't allow of senseless drawings? Suppose they were drawings from which bodies were supposed to be modelled. In this case some drawings make sense, some not.--What if I imagine senseless combinations of words?

513. Consider the following form of expression: "The number of pages in my book is equal to a root of the equation $x^3 + 2x - 3 = 0$." Or: "I have n friends and $n^2 + 2n + 2 = 0$ ". Does this sentence make sense? This cannot be seen immediately. This example shews

how it is that something can look like a sentence which we understand, and yet yield no sense.

(This throws light on the concepts 'understanding' and 'meaning'.)

514. A philosopher says that he understands the sentence "I am here", that he means something by it, thinks something--even when he doesn't think at all how, on what occasions, this sentence is used. And if I say "A rose is red in the dark too" you positively see this red in the dark before you.

515. Two pictures of a rose in the dark. One is quite black; for the rose is invisible. In the other, it is painted in full detail and surrounded by black. Is one of them right, the other wrong? Don't we talk of a white rose in the dark and of a red rose in the dark? And don't we say for all that that they can't be distinguished in the dark?

516. It seems clear that we understand the meaning of the question: "Does the sequence 7777 occur in the development of π ?" It is an English sentence; it can be shown what it means for 415 to occur in the development of π ; and similar things. Well, our understanding of that question reaches just so far, one may say, as such explanations reach.

517. The question arises: Can't we be mistaken in thinking that we understand a question?

For many mathematical proofs do lead us to say that we *cannot* imagine something which we believed we could imagine. (E.g., the construction of the heptagon.) They lead us to revise what counts as the domain of the imaginable.

518. Socrates to Theaetetus: "And if someone thinks mustn't he think *something*?"--Th.: "Yes, he must."--Soc.: "And if he thinks something, mustn't it be something real?"--Th.: "Apparently."

And mustn't someone who is painting be painting something--and someone who is painting something be painting something real!--Well, tell me what the object of painting is: the picture of a man (e.g.), or the man that the picture portrays?

519. One wants to say that an order is a picture of the action which was carried out on the order; but also that it is a picture of the action which *is to be* carried out on the order.

520. "If a proposition too is conceived as a picture of a possible state of affairs and is said to shew the possibility of the state of affairs,

still the most that the proposition can do is what a painting or relief or film does: and so it can at any rate not set forth what is not the case. So does it depend wholly on our grammar what will be called (logically) possible and what not,--i.e. what that grammar permits?"--But surely that is arbitrary!--Is it arbitrary?--It is not every sentence-like formation that we know how to do something with, not every technique has an application in our life; and when we are tempted in philosophy to count some quite useless thing as a proposition, that is often because we have not considered its application sufficiently.

521. Compare 'logically possible' with 'chemically possible'. One might perhaps call a combination chemically possible if a formula with the right valencies existed (e.g. H - O - O - O - H). Of course such a combination need not exist; but even the formula HO₂ cannot have less than no combination corresponding to it in reality.

522. If we compare a proposition to a picture, we must think whether we are comparing it to a portrait (a historical representation) or to a genre-picture. And both comparisons have point.

When I look at a genre-picture, it 'tells' me something, even though I don't believe (imagine) for a moment that the people I see in it really exist, or that there have really been people in that situation. But suppose I ask: "What does it tell me, then?"

523. I should like to say "What the picture tells me is itself." That is, its telling me something consists in its own structure, in *its* own lines and colours. (What would it mean to say "What this musical theme tells me is itself"?)

524. Don't take it as a matter of course, but as a remarkable fact, that pictures and fictitious narratives give us pleasure, occupy our minds.

("Don't take it as a matter of course" means: find it surprising, as you do some things which disturb you. Then the puzzling aspect of the latter will disappear, by your accepting this fact as you do the other.)

((The transition from patent nonsense to something which is disguised nonsense.))

525. "After he had said this, he left her as he did the day before."--Do I understand this sentence? Do I understand it just as I should if I heard it in the course of a narrative? If it were set down in isolation

I should say, I don't know what it's about. But all the same I should know how this sentence might perhaps be used; I could myself invent a context for it.

(A multitude of familiar paths lead off from these words in every direction.)

526. What does it mean to understand a picture, a drawing? Here too there is understanding and failure to understand. And here too these expressions may mean various kinds of thing. A picture is perhaps a still-life; but I don't understand one part of it: I cannot see solid objects there, but only patches of colour on the canvas.--Or I see everything as solid but there are objects that I am not acquainted with (they look like implements, but I don't know their use).--Perhaps, however, I am acquainted with the objects, but in another sense do not understand the way they are arranged.

527. Understanding a sentence is much more akin to understanding a theme in music than one may think. What I mean is that understanding a sentence lies nearer than one thinks to what is ordinarily called understanding a musical theme. Why is just *this* the pattern of variation in loudness and tempo? One would like to say "Because I know what it's all about." But what is it all about? I should not be able to say. In order to 'explain' I could only compare it with something else which has the same rhythm (I mean the same pattern). (One says "Don't you see, this is as if a conclusion were being drawn" or "This is as it were a parenthesis", etc. How does one justify such comparisons?--There are very different kinds of justification here.)

528. It would be possible to imagine people who had something not quite unlike a language: a play of sounds, without vocabulary or grammar. ('Speaking with tongues.')

529. "But what would the meaning of the sounds be in such a case?"--What is it in music? Though I don't at all wish to say that this language of a play of sounds would have to be compared to music.

530. There might also be a language in whose use the 'soul' of the words played no part. In which, for example, we had no objection to replacing one word by another arbitrary one of our own invention.

531. We speak of understanding a sentence in the sense in which it can be replaced by another which says the same; but also in the sense

in which it cannot be replaced by any other. (Any more than one musical theme can be replaced by another.)

In the one case the thought in the sentence is something common to different sentences; in the other, something that is expressed only by these words in these positions. (Understanding a poem.)

532. Then has "understanding" two different meanings here?--I would rather say that these kinds of use of "understanding" make up its meaning, make up my *concept* of understanding.

For I *want* to apply the word "understanding" to all this.

533. But in the second case how can one explain the expression, transmit one's comprehension? Ask yourself: How does one *lead* anyone to comprehension of a poem or of a theme? The answer to this tells us how meaning is explained here.

534. *Hearing* a word in a particular sense. How queer that there should be such a thing!

Phrased *like this*, emphasized like this, heard in this way, this sentence is the first of a series in which a transition is made to *these* sentences, pictures, actions.

((A multitude of familiar paths lead off from these words in every direction.))

535. What happens when we learn to *feel* the ending of a church mode as an ending?

536. I say: "I can think of this face (which gives an impression of timidity) as courageous too." We do not mean by this that I can imagine someone with this face perhaps saving someone's life (that, of course, is imaginable in connexion with any face). I am speaking rather of an aspect of the face itself. Nor do I mean that I can imagine that this man's face might change so that, in the ordinary sense, it looked courageous; though I may very well mean that there is a quite definite way in which it can change into a courageous face. The reinterpretation of a facial expression can be compared to the reinterpretation of a chord in music, when we hear it as a modulation first into this, then into that key.

537. It is possible to say "I read timidity in this face" but at all events the timidity does not seem to be merely associated, outwardly connected, with the face; but fear is there, alive, in the features. If the features change slightly, we can speak of a corresponding change in the

fear. If we were asked "Can you think of this face as an expression of courage too?"--we should, as it were, not know how to lodge courage in these features. Then perhaps I say "I don't know what it would mean for this to be a courageous face." But what would an answer to such a question be like? Perhaps one says: "Yes, now I understand: the face as it were shews indifference to the outer world." So we have somehow read courage into the face. Now once more, one might say, courage *fits* this face. But *what* fits *what* here?

538. There is a related case (though perhaps it will not seem so) when, for example, we (Germans) are surprised that in French the predicative adjective agrees with the substantive in gender, and when we explain it to ourselves by saying: they mean: "the man is *a good one*."

539. I see a picture which represents a smiling face. What do I do if I take the smile now as a kind one, now as malicious? Don't I often imagine it with a spatial and temporal context which is one either of kindness or malice? Thus I might supply the picture with the fancy that the smiler was smiling down on a child at play, or again on the suffering of an enemy.

This is in no way altered by the fact that I can also take the at first sight gracious situation and interpret it differently by putting it into a wider context.--If no special circumstances reverse my interpretation I shall conceive a particular smile as kind, call it a "kind" one, react correspondingly.

((Probability, frequency.))

540. "Isn't it very odd that I should be unable--even *without* the institution of language and all its surroundings--to think that it will soon stop raining?"--Do you want to say that it is queer that you should be unable to say these words and *mean* them without those surroundings?

Suppose someone were to point at the sky and come out with a number of unintelligible words. When we ask him what he means he explains that the words mean "Thank heaven, it'll soon stop raining." He even explains to us the meaning of the individual words.--I will suppose him suddenly to come to himself and say that the sentence

was completely senseless, but that when he spoke it it had seemed to him like a sentence in a language he knew. (Positively)

Page Break 146

like a familiar quotation.)--What am I to say now? Didn't he understand the sentence as he was saying it? Wasn't the whole meaning there in the sentence?

Page 146

541. But what did his understanding, and the meaning, consist in? He uttered the sounds in a cheerful voice perhaps, pointing to the sky, while it was still raining but was already beginning to clear up; *later* he made a connexion between his words and the English words.

Page 146

542. "But the point is, the words felt to him like the words of a language he knew well."--Yes: a criterion for that is that he later said just *that*. And now do *not* say: "The feel of the words in a language we know is of a quite particular kind." (What is the *expression* of this feeling?)

Page 146

543. Can I not say: a cry, a laugh, are full of meaning?

Page 146

And that means, roughly: much can be gathered from them.

Page 146

544. When longing makes me cry "Oh, if only he would come!" the feeling gives the words 'meaning'. But does it give the individual words their meanings?

Page 146

But here one could also say that the feeling gave the words *truth*. And from this you can see how the concepts merge here. (This recalls the question: what is the *meaning* of a mathematical proposition?)

Page 146

545. But when one says "I *hope* he'll come"--doesn't the feeling give the word "hope" its meaning? (And what about the sentence "I do *not* hope for his coming any longer"?) The feeling does perhaps give the word "hope" its special ring; that is, it is expressed in that ring.--If the feeling gives the word its meaning, then here "meaning" means *point*. But why is the feeling the point?

Page 146

Is hope a feeling? (Characteristic marks.)

Page 146

546. In this way I should like to say the words "Oh, *let* him come!" are charged with my desire. And words can be wrung from us,--like a cry. Words can be hard to say: such, for example, as are used to effect a renunciation, or to confess a weakness. (Words are also deeds.)

Page 146

547. Negation: a 'mental activity'. Negate something and observe what you are doing.--Do you perhaps inwardly shake your head? And if you do--is this process more deserving of our interest than, say,

Page Break 147

that of writing a sign of negation in a sentence? Do you now know the *essence* of negation?

Page 147

548. What is the difference between the two processes: wishing that something should happen--and wishing that the same thing should *not* happen?

Page 147

If we want to represent it pictorially, we shall treat the picture of the event in various ways: cross it out, put a line round it, and so on. But this strikes us as a *crude* method of expression. In word-language indeed we use the sign "not". But this is like a clumsy expedient. We think that in *thought* it is arranged differently.

Page 147

549. "How can the word 'not' negate?"--"The sign 'not' indicates that you are to take what follows negatively." We should like to say: The sign of negation is our occasion for doing something--possibly something very complicated. It is as if the negation-sign occasioned our doing something. But what? That is not said. It is as if it only needed to be hinted at; as if we already knew. As if no explanation were needed, for we are in any case already acquainted with the matter.

Page 147

(a) "The fact that three negatives yield a negative again must already be contained in the single negative that I

am using now." (The temptation to invent a myth of 'meaning'.)

Page 147

It looks as if it followed from the nature of negation that a double negative is an affirmative. (And there is something right about this. What? *Our* nature is connected with both.)

Page 147

(b) There cannot be a question whether these or other rules are the correct ones for the use of "not". (I mean, whether they accord with its meaning.) For without these rules the word has as yet no meaning; and if we change the rules, it now has another meaning (or none), and in that case we may just as well change the word too.

Page 147

550. Negation, one might say, is a gesture of exclusion, of rejection. But such a gesture is used in a great variety of cases!551. "Does the *same* negation occur in: 'Iron does not melt at a hundred degrees Centigrade' and 'Twice two is not five'?" Is this to be decided by introspection; by trying to see what we are *thinking* as we utter the two sentences?

Page 147

552. Suppose I were to ask: is it clear to us, while we are uttering the sentences "This rod is one yard long" and "Here is one soldier",

Page Break 148

that we mean different things by "one", that "one" has different meanings?--Not at all.--Say e.g. such a sentence as "One yard is occupied by one soldier, and so two yards are occupied by two soldiers." Asked "Do you mean the same thing by both 'ones'?" one would perhaps answer: "Of course I mean the same thing: *one*!" (Perhaps raising one finger.)

Page 148

553. Now has "1" a different meaning when it stands for a measure and when it stands for a number? If the question is framed in *this* way, one will answer in the affirmative.

Page 148

554. We can easily imagine human beings with a 'more primitive' logic, in which something corresponding to our negation is applied only to certain sorts of sentence; perhaps to such as do not themselves contain any negation. It would be possible to negate the proposition "He is going into the house", but a negation of the negative proposition would be meaningless, or would count only as a repetition of the negation. Think of means of expressing negation different from ours: by the pitch of one's voice, for instance. What would a double negation be like there?

Page 148

555. The question whether negation had the same meaning to these people as to us would be analogous to the question whether the figure "5" meant the same to people whose numbers ended at 5 as to us.

Page 148

556. Imagine a language with two different words for negation, "X" and "Y". Doubling "X" yields an affirmative, doubling "Y" a strengthened negative. For the rest the two words are used alike.--Now have "X" and "Y" the same meaning in sentences where they occur without being repeated?--We could give various answers to this.

Page 148

(a) The two words have different uses. So they have different meanings. But sentences in which they occur without being repeated and which for the rest are the same make the same sense.

Page 148

(b) The two words have the same function in language-games, except for this one difference, which is just a trivial convention. The use of the two words is taught in the same way, by means of the same actions, gestures, pictures and so on; and in explanations of the words the difference in the ways they are used is appended as something incidental, as one of the capricious features of the language. For this reason we shall say that "X" and "Y" have the same meaning.

Page 148

(c) We connect different images with the two negatives. "X" as it

Page Break 149

were turns the sense through 180°. And *that* is why two such negatives restore the sense to its former position. "Y" is like a shake of the head. And just as one does not annul a shake of the head by shaking it again, so also one doesn't cancel one "Y" by a second one. And so even if, practically speaking, sentences with the two signs of negation come to the same thing, still "X" and "Y" express different ideas.

557. Now, when I uttered the double negation, what constituted my meaning it as a strengthened negative and not as an affirmative? There is no answer running: "It consisted in the fact that...." In certain circumstances instead of saying "This duplication is meant as a strengthening," I can *pronounce* it as a strengthening. Instead of saying "The duplication of the negative is meant to cancel it" I can e.g. put brackets.--"Yes, but after all these brackets may themselves have various roles; for who says that they are to be taken as *brackets*?" No one does. And haven't you explained your own conception in turn by means of words? The meaning of the brackets lies in the technique of applying them. The question is: under what circumstances does it make sense to say "I meant....", and what circumstances justify me in saying "He meant...."?

558. What does it mean to say that the "is" in "The rose is red" has a different meaning from the "is" in "twice two is four"? If it is answered that it means that different rules are valid for these two words, we can say that we have only *one* word here.--And if all I am attending to is grammatical rules, these do allow the use of the word "is" in both connexions.--But the rule which shews that the word "is" has different meanings in these sentences is the one allowing us to replace the word "is" in the second sentence by the sign of equality, and forbidding this substitution in the first sentence.

559. One would like to speak of the function of a word in *this* sentence. As if the sentence were a mechanism in which the word had a particular function. But what does this function consist in? How does it come to light? For there isn't anything hidden--don't we see the whole sentence? The function must come out in operating with the word. ((Meaning-body.))

560. "The meaning of a word is what is explained by the explanation of the meaning." I.e.: if you want to understand the use of the word "meaning", look for what are called "explanations of meaning".

561. Now isn't it queer that I say that the word "is" is used with two different meanings (as the copula and as the sign of equality), and should not care to say that its meaning is its use; its use, that is, as the copula and the sign of equality?

One would like to say that these two kinds of use do not yield a *single* meaning; the union under one head is an accident, a mere inessential.

562. But how can I decide what is an essential, and what an inessential, accidental, feature of the notation? Is there some reality lying behind the notation, which shapes its grammar?

Let us think of a similar case in a game: in draughts a king is marked by putting one piece on top of another. Now won't one say it is inessential to the game for a king to consist of two pieces?

563. Let us say that the meaning of a piece is its role in the game.--Now let it be decided by lot which of the players gets white before any game of chess begins. To this end one player holds a king in each closed fist while the other chooses one of the two hands at random. Will it be counted as part of the role of the king in chess that it is used to draw lots in this way?

564. So I am inclined to distinguish between the essential and the inessential in a game too. The game, one would like to say, has not only rules but also a *point*.

565. Why the same word? In the calculus we make no use of this identity!--Why the same piece for both purposes?--But what does it mean here to speak of "making use of the identity"? For isn't it a use, if we do in fact use the same word?

566. And now it looks as if the use of the same word or the same piece, had a *purpose*--if the identity is not accidental, inessential. And as if the purpose were that one should be able to recognize the piece and know how to play.--Are we talking about a physical or a logical possibility here? If the latter then the identity of the piece is something to do with the game.

567. But, after all, the game is supposed to be defined by the rules! So, if a rule of the game prescribes that the kings are to be used for drawing lots before a game of chess, then that is an essential part of the game. What objection might one make to this? That one does not see the point of this prescription. Perhaps as one wouldn't see the point either of a rule by which each piece had to be turned round three times

Page Break 151

before one moved it. If we found this rule in a board-game we should be surprised and should speculate about the purpose of the rule. ("Was this prescription meant to prevent one from moving without due consideration?")

Page 151

568. If I understand the character of the game aright--I might say--then this isn't an essential part of it.

Page 151

((Meaning is a physiognomy.))

Page 151

569. Language is an instrument. Its concepts are instruments. Now perhaps one thinks that it can make no *great* difference *which* concepts we employ. As, after all, it is possible to do physics in feet and inches as well as in metres and centimetres; the difference is merely one of convenience. But even this is not true if, for instance, calculations in some system of measurement demand more time and trouble than it is possible for us to give them.

Page 151

570. Concepts lead us to make investigations; are the expression of our interest, and direct our interest.

Page 151

571. Misleading parallel: psychology treats of processes in the psychical sphere, as does physics in the physical.

Page 151

Seeing, hearing, thinking, feeling, willing, are not the subject of psychology *in the same sense* as that in which the movements of bodies, the phenomena of electricity etc., are the subject of physics. You can see this from the fact that the physicist sees, hears, thinks about, and informs us of these phenomena, and the psychologist observes the *external reactions* (the behaviour) of the subject.

Page 151

572. Expectation is, grammatically, a state; like: being of an opinion, hoping for something, knowing something, being able to do something. But in order to understand the grammar of these states it is necessary to ask: "What counts as a criterion for anyone's being in such a state?" (States of hardness, of weight, of fitting.)

Page 151

573. To have an opinion is a state.--A state of what? Of the soul? Of the mind? Well, of what object does one say that it has an opinion? Of Mr. N.N. for example. And that is the correct answer.

Page 151

One should not expect to be enlightened by the answer to *that* question. Others go deeper: What, in particular cases, do we regard as criteria for someone's being of such-and-such an opinion? When do we say: he reached this opinion at that time? When: he has altered his opinion? And so on. The picture which the answers to these questions give us shews *what* gets treated grammatically as a *state* here.

Page Break 152

Page 152

574. A proposition, and hence in another sense a thought, can be the 'expression' of belief, hope, expectation, etc. But believing is not thinking. (A grammatical remark.) The concepts of believing, expecting, hoping are less distantly related to one another than they are to the concept of thinking.

Page 152

575. When I sat down on this chair, of course I believed it would bear me. I had no thought of its possibly collapsing.

Page 152

But: "In spite of everything that he did, I held fast to the belief..." Here there is thought, and perhaps a constant struggle to renew an attitude.

Page 152

576. I watch a slow match burning, in high excitement follow the progress of the burning and its approach to the explosive. Perhaps I don't think anything at all or have a multitude of disconnected thoughts. This is certainly a case of expecting.

Page 152

577. We say "I am expecting him", when we believe that he will come, though his coming does not *occupy*

our thoughts. (Here "I am expecting him" would mean "I should be surprised if he didn't come" and that will not be called the description of a state of mind.) But we also say "I am expecting him" when it is supposed to mean: I am eagerly awaiting him. We could imagine a language in which different verbs were consistently used in these cases. And similarly more than one verb where we speak of 'believing', 'hoping' and so on. Perhaps the concepts of such a language would be more suitable for understanding psychology than the concepts of our language.

Page 152

578. Ask yourself: What does it mean to *believe* Goldbach's theorem? What does this belief consist in? In a feeling of certainty as we state, hear, or think the theorem? (That would not interest us.) And what are the characteristics of this feeling? Why, I don't even know how far the feeling may be caused by the proposition itself.

Page 152

Am I to say that belief is a particular colouring of our thoughts? Where does this idea come from? Well, there is a tone of belief, as of doubt.

Page 152

I should like to ask: how does the belief connect with this proposition? Let us look and see what are the consequences of this belief, where it takes us. "It makes me search for a proof of the proposition."--Very well; and now let us look and see what your searching really consists in. Then we shall know what belief in the proposition amounts to.

Page Break 153

Page 153

579. The feeling of confidence. How is this manifested in behaviour?

Page 153

580. An 'inner process' stands in need of outward criteria.

Page 153

581. An expectation is imbedded in a situation, from which it arises. The expectation of an explosion may, for example, arise from a situation in which an explosion *is to be expected*.

Page 153

582. If someone whispers "It'll go off now", instead of saying "I expect the explosion any moment", still his words do not describe a feeling; although they and their tone may be a manifestation of his feeling.

Page 153

583. "But you talk as if I weren't really expecting, hoping, *now*--as I thought I was. As if what were happening *now* had no deep significance."--What does it mean to say "What is happening now has significance" or "has deep significance"? What is a *deep* feeling? Could someone have a feeling of ardent love or hope for the space of one second--*no matter what* preceded or followed this second?--What is happening now has significance--in these surroundings. The surroundings give it its importance. And the word "hope" refers to a phenomenon of human life. (A smiling mouth *smiles* only in a human face.)

Page 153

584. Now suppose I sit in my room and hope that N.N. will come and bring me some money, and suppose one minute of this state could be isolated, cut out of its context; would what happened in it then not be hope?--Think, for example, of the words which you perhaps utter in this space of time. They are no longer part of this language. And in different surroundings the institution of money doesn't exist either.

Page 153

A coronation is the picture of pomp and dignity. Cut one minute of this proceeding out of its surroundings: the crown is being placed on the head of the king in his coronation robes.--But in different surroundings gold is the cheapest of metals, its gleam is thought vulgar. There the fabric of the robe is cheap to produce. A crown is a parody of a respectable hat. And so on.

Page 153

585. When someone says "I hope he'll come"--is this a *report* about his state of mind, or a *manifestation* of his hope?--I can, for example, say it to myself. And surely I am not giving myself a report. It may be a sigh; but it need not. If I tell someone "I can't keep my mind on my work today; I keep on thinking of his coming"--*this* will be called a description of my state of mind.

Page Break 154

Page 154

586. "I have heard he is coming; I have been waiting for him all day." That is a report on how I have spent the day.--In conversation I came to the conclusion that a particular event is to be expected, and I draw this conclusion in the words: "So now I must expect him to come". This may be called the first thought, the first act, of this

expectation.--The exclamation "I'm longing to see him!" may be called an act of expecting. But I can utter the same words as the result of self-observation, and then they might mean: "So, after all that has happened, I am still longing to see him." The point is: what led up to these words?

Page 154

587. Does it make sense to ask "How do you know that you believe?"--and is the answer: "I know it by introspection"?

Page 154

In *some* cases it will be possible to say some such thing, in most not.

Page 154

It makes sense to ask: "Do I really love her, or am I only pretending to myself?" and the process of introspection is the calling up of memories; of imagined possible situations, and of the feelings that one would have if....

Page 154

588. "I am revolving the decision to go away to-morrow." (This may be called a description of a state of mind.)--"Your arguments don't convince me; now as before it is my intention to go away tomorrow." Here one is tempted to call the intention a feeling. The feeling is one of a certain rigidity; of unalterable determination. (But there are many different characteristic feelings and attitudes here.)--I am asked: "How long are you staying here?" I reply: "To-morrow I am going away; it's the end of my holidays."--But over against this: I say at the end of a quarrel "All right! Then I leave to-morrow!"; I make a decision.

Page 154

589. "In my heart I have determined on it." And one is even inclined to point to one's breast as one says it. Psychologically this way of speaking should be taken seriously. Why should it be taken less seriously than the assertion that belief is a state of mind? (Luther: "Faith is under the left nipple.")

Page 154

590. Someone might learn to understand the meaning of the expression "seriously *meaning* what one says" by means of a gesture of pointing at the heart. But now we must ask: "How does it come out that he has learnt it?"

Page Break 155

Page 155

591. Am I to say that any one who has an intention has an experience of tending towards something? That there are particular experiences of 'tending'?--Remember this case: if one urgently wants to make some remark, some objection, in a discussion, it often happens that one opens one's mouth, draws a breath and holds it; if one then decides to let the objection go, one lets the breath out. The experience of this process is evidently the experience of veering towards saying something. Anyone who observes me will know that I wanted to say something and then thought better of it. In *this* situation, that is.--In a different one he would not so interpret my behaviour, however characteristic of the intention to speak it may be in the present situation. And is there any reason for assuming that this same experience could not occur in some quite different situation--in which it has nothing to do with any 'tending'?

Page 155

592. "But when you say 'I intend to go away', you surely mean it! Here again it just is the mental act of meaning that gives the sentence life. If you merely repeat the sentence after someone else, say in order to mock his way of speaking, then you say it without this act of meaning."--When we are doing philosophy it can sometimes look like that. But let us really think out various *different* situations and conversations, and the ways in which that sentence will be uttered in them.--"I always discover a mental undertone; perhaps not always the *same* one." And was there no undertone there when you repeated the sentence after someone else? And how is the 'undertone' to be separated from the rest of the experience of speaking?

Page 155

593. A main cause of philosophical disease--a one-sided diet: one nourishes one's thinking with only one kind of example.

Page 155

594. "But the words, significantly uttered, have after all not only a surface, but also the dimension of depth!" After all, it just is the case that something different takes place when they are uttered significantly from when they are merely uttered.--How I express this is not the point. Whether I say that in the first case they have depth; or that something goes on in me, inside my mind, as I utter them; or that they have an atmosphere--it always comes to the same thing.

Page 155

"Well, if we all agree about it, won't it be true?"

(I cannot accept someone else's testimony, because it is not *testimony*. It only tells me what he is *inclined* to say.)

595. It is natural for us to say a sentence in such-and-such surroundings, and unnatural to say it in isolation. Are we to say that

there is a particular feeling accompanying the utterance of every sentence when we say it naturally?

596. The feeling of 'familiarity' and of 'naturalness'. It is easier to get at a feeling of unfamiliarity and of unnaturalness. Or, at *feelings*. For not everything which is unfamiliar to us makes an impression of unfamiliarity upon us. Here one has to consider what we call "unfamiliar". If a boulder lies on the road, we know it for a boulder, but perhaps not for the one which has always lain there. We recognize a man, say, as a man, but not as an acquaintance. There are feelings of old acquaintance: they are sometimes expressed by a particular way of looking or by the words: "The same old room!" (which I occupied many years before and now returning find unchanged). Equally there are feelings of strangeness. I stop short, look at the object or man questioningly or mistrustfully, say "I find it all strange."--But the existence of this feeling of strangeness does not give us a reason for saying that every object which we know well and which does not seem strange to us gives us a feeling of familiarity.--We think that, as it were, the place once filled by the feeling of strangeness must surely be occupied *somehow*. The place for this kind of atmosphere is there, and if one of them is not in possession of it, then another is.

597. Just as Germanisms creep into the speech of a German who speaks English well although he does not first construct the German expression and then translate it into English; just as this makes him speak English *as if he were translating* 'unconsciously' from the German--so we often think as if our thinking were founded on a thought-schema: as if we were translating from a more primitive mode of thought into ours.

598. When we do philosophy, we should like to hypostatize feelings where there are none. They serve to explain our thoughts to us.

'Here explanation of our thinking demands a feeling!' It is as if our conviction were simply consequent upon this requirement.

599. In philosophy we do not draw conclusions. "But it must be like this!" is not a philosophical proposition. Philosophy only states what everyone admits.

600. Does everything that we do not find conspicuous make an impression of inconspicuousness? Does what is ordinary always make the *impression* of ordinariness?

601. When I talk about this table,--am I *remembering* that this object is called a "table"?

602. Asked "Did you recognize your desk when you entered your room this morning?"--I should no doubt say "Certainly!" And yet it would be misleading to say that an act of recognition had taken place. Of course the desk was not strange to me; I was not surprised to see it, as I should have been if another one had been standing there, or some unfamiliar kind of object.

603. No one will say that every time I enter my room, my long-familiar surroundings, there is enacted a recognition of all that I see and have seen hundreds of times before.

604. It is easy to have a false picture of the processes called "recognizing"; as if recognizing always consisted in comparing two impressions with one another. It is as if I carried a picture of an object with me and used it to perform an identification of an object as the one represented by the picture. Our memory seems to us to be the agent of such a comparison, by preserving a picture of what has been seen before, or by allowing us to look into the past (as if down a spy-glass).

605. And it is not so much as if I were comparing the object with a picture set beside it, but as if the object *coincided* with the picture. So I see only one thing, not two.

Page 157

606. We say "The expression in his voice was *genuine*". If it was spurious we think as it were of another one behind it.--*This* is the face he shews the world, inwardly he has another one.--But this does not mean that when his expression is *genuine* he has two the same.

Page 157

(("A quite particular expression."))

Page 157

607. How does one judge what time it is? I do not mean by external evidences, however, such as the position of the sun, the lightness of the room, and so on.--One asks oneself, say, "What time can it be?", pauses a moment, perhaps imagines a clock-face, and then says a time.--Or one considers various possibilities, thinks first of one time, then of another, and in the end stops at one. That is the kind of way it is done.--But isn't the idea accompanied by a feeling of conviction; and doesn't that mean that it accords with an inner clock?--No, I don't read the time off from any clock; there is a feeling of conviction inasmuch as I say a time to myself *without* feeling any doubt, with calm assurance.--But doesn't something click as I say

Page Break 158

this time?--Not that I know of; unless that is what you call the coming-to-rest of deliberation, the stopping at one number. Nor should I ever have spoken of a 'feeling of conviction' here, but should have said: I considered a while and then plumped for its being quarter past five.--But what did I go by? I might perhaps have said: "simply by feel", which only means that I left it to what should suggest itself.--But you surely must at least have disposed yourself in a definite way in order to guess the time; and you don't take just any idea of a time of day as yielding the correct time!--To repeat: I *asked* myself "I wonder what time it is?" That is, I did not, for example, read this question in some narrative, or quote it as someone else's utterance; nor was I practising the pronunciation of these words; and so on. *These* were not the circumstances of my saying the words.--But then, *what* were the circumstances?--I was thinking about my breakfast and wondering whether it would be late today. These were the kind of circumstances.--But do you really not see that you were all the same disposed in a way which, though impalpable, is characteristic of guessing the time, like being surrounded by a characteristic atmosphere?--Yes; what was characteristic was that I said to myself "I wonder what time it is?"--And if this sentence has a particular atmosphere, how am I to separate it from the sentence itself? It would never have occurred to me to think the sentence had such an aura if I had not thought of how one might say it differently--as a quotation, as a joke, as practice in elocution, and so on. And *then* all at once I wanted to say, then all at once it seemed to me, that I must after all have *meant* the words somehow specially; differently, that is, from in those other cases. The picture of the special atmosphere forced itself upon me; I can see it quite clear before me--so long, that is, as I do not look at what my memory tells me really happened.

Page 158

And as for the feeling of certainty: I sometimes say to myself "I am sure it's o'clock", and in a more or less confident tone of voice, and so on. If you ask me the *reason* for this certainty I have none.

Page 158

If I say, I read it off from an inner clock,--that is a picture, and the only thing that corresponds to it is that I said it was such-and-such a time. And the purpose of the picture is to assimilate this case to the other one. I am refusing to acknowledge two different cases here.

Page 158

608. The idea of the intangibility of that mental state in estimating the time is of the greatest importance. Why is it *intangible*? Isn't it

Page Break 159

because we refuse to count what is tangible about our state as part of the specific state which we are postulating?

Page 159

609. The description of an atmosphere is a special application of language, for special purposes.

Page 159

((Interpreting 'understanding' as atmosphere; as a mental act. One can construct an atmosphere to attach to anything. 'An indescribable character.'))

Page 159

610. Describe the aroma of coffee.--Why can't it be done? Do we lack the words? And *for what* are words lacking?--But how do we get the idea that such a description must after all be possible? Have you ever felt the lack of

such a description? Have you tried to describe the aroma and not succeeded?

Page 159

((I should like to say: "These notes say something glorious, but I do not know what." These notes are a powerful gesture, but I cannot put anything side by side with it that will serve as an explanation. A grave nod. James: "Our vocabulary is inadequate." Then why don't we introduce a new one? What would have to be the case for us to be able to?))

Page 159

611. "Willing too is merely an experience," one would like to say (the 'will' too only 'idea'). It comes when it comes, and I cannot bring it about.

Page 159

Not bring it about?--Like *what*? What can I bring about, then? What am I comparing willing with when I say this?

Page 159

612. I should not say of the movement of my arm, for example: it comes when it comes, etc.. And this is the region in which we say significantly that a thing doesn't simply happen to us, but that we *do* it. "I don't need to wait for my arm to go up--I can raise it." And here I am making a contrast between the movement of my arm and, say, the fact that the violent thudding of my heart will subside.

Page 159

613. In the sense in which I can ever bring anything about (such as stomach-ache through over-eating), I can also bring about an act of willing. In this sense I bring about the act of willing to swim by jumping into the water. Doubtless I was trying to say: I can't will willing; that is, it makes no sense to speak of willing willing. "Willing" is not the name of an action; and so not the name of any voluntary action either. And my use of a wrong expression came from our wanting to think of willing as an immediate non-causal bringing-about. A misleading analogy lies at the root of this idea; the causal

Page Break 160

nexus seems to be established by a mechanism connecting two parts of a machine. The connexion may be broken if the mechanism is disturbed. (We think only of the disturbances to which a mechanism is normally subject, not, say, of cog-wheels suddenly going soft, or passing through one another, and so on.)

Page 160

614. When I raise my arm 'voluntarily' I do not use any instrument to bring the movement about. My wish is not such an instrument either.

Page 160

615. "Willing, if it is not to be a sort of wishing, must be the action itself. It cannot be allowed to stop anywhere short of the action." If it is the action, then it is so in the ordinary sense of the word; so it is speaking, writing, walking, lifting a thing, imagining something. But it is also trying, attempting, making an effort,--to speak, to write, to lift a thing, to imagine something etc..

Page 160

616. When I raise my arm, I have *not* wished it might go up. The voluntary action excludes this wish. It is indeed possible to say: "I hope I shall draw the circle faultlessly". And that is to express a wish that one's hand should move in such-and-such a way.

Page 160

617. If we cross our fingers in a certain special way we are sometimes unable to move a particular finger when someone tells us to do so, if he only *points* to the finger--merely shews it to the eye. If on the other hand he touches it, we can move it. One would like to describe this experience as follows: we are unable to *will* to move the finger. The case is quite different from that in which we are not able to move the finger because someone is, say, holding it. One now feels inclined to describe the former case by saying: one can't find any point of application for the will till the finger is touched. Only when one feels the finger can the will know where it is to catch hold.--But this kind of expression is misleading. One would like to say: "How am I to know where I am to catch hold with the will, if feeling does not shew the place?" But then how is it known to what point I am to direct the will when the feeling is there?

Page 160

That in this case the finger is as it were paralysed until we feel a touch on it is shewn by experience; it could not have been seen *a priori*.

Page 160

618. One imagines the willing subject here as something without any mass (without any inertia); as a motor which has no inertia in itself to overcome. And so it is only mover, not moved. That is:

One can say "I will, but my body does not obey me"--but not: "My will does not obey me." (Augustine.)

Page 161

But in the sense in which I cannot fail to will, I cannot try to will either.

Page 161

619. And one might say: "I can always will only inasmuch as I can never try to will."

Page 161

620. *Doing* itself seems not to have any volume of experience. It seems like an extensionless point, the point of a needle. This point seems to be the real agent. And the phenomenal happenings only to be consequences of this acting. "I *do*..." seems to have a definite sense, separate from all experience.

Page 161

621. Let us not forget this: when 'I raise my arm', my arm goes up. And the problem arises: what is left over if I subtract the fact that my arm goes up from the fact that I raise my arm?

Page 161

((Are the kinaesthetic sensations my willing?))

Page 161

622. When I raise my arm I do not usually *try* to raise it.

Page 161

623. "At all costs I will get to that house."--But if there is no difficulty about it--*can* I try at all costs to get to the house?

Page 161

624. In the laboratory, when subjected to an electric current, for example, someone says with his eyes shut "I am moving my arm up and down"--though his arm is not moving. "So," we say, "he has the special feeling of making that movement."--Move your arm to and fro with your eyes shut. And now try, while you do so, to tell yourself that your arm is staying still and that you are only having certain queer feelings in your muscles and joints!

Page 161

625. "How do you know that you have raised your arm?"--"I feel it." So what you recognize is the feeling? And are you certain that you recognize it right?--You are certain that you have raised your arm; isn't this the criterion, the measure, of the recognition?

Page 161

626. "When I touch this object with a stick I have the sensation of touching in the tip of the stick, not in the hand that holds it." When someone says "The pain isn't here in my hand, but in my wrist", this has the consequence that the doctor examines the wrist. But what difference does it make if I say that I feel the hardness of the

object in the tip of the stick or in my hand? Does what I say mean "It is as if I had nerve-endings in the tip of the stick?" *In what sense* is it like that?--Well, I am at any rate inclined to say "I feel the hardness etc. in the tip of the stick." What goes with this is that when I touch the object I look not at my hand but at the tip of the stick; that I describe what I feel by saying "I feel something hard and round there"--not "I feel a pressure against the tips of my thumb, middle finger, and index finger...." If, for example, someone asks me "What are you now feeling in the fingers that hold the probe?" I might reply: "I don't know--I feel something hard and rough *over there*."

Page 162

627. Examine the following description of a voluntary action: "I form the decision to pull the bell at 5 o'clock, and when it strikes 5, my arm makes this movement."--Is that the correct description, and not *this* one: "..... and when it strikes 5, I raise my arm"?--One would like to supplement the first description: "and see! my arm goes up when it strikes 5." And this "and see!" is precisely what doesn't belong here. I do *not* say "See, my arm is going up!" when I raise it.

Page 162

628. So one might say: voluntary movement is marked by the absence of surprise. And now I do not mean you to ask "But *why* isn't one surprised here?"

Page 162

629. When people talk about the possibility of foreknowledge of the future they always forget the fact of the prediction of one's own voluntary movements.

Page 162

630. Examine these two language-games:

Page 162

(a) Someone gives someone else the order to make particular movements with his arm, or to assume particular bodily positions (gymnastics instructor and pupil). And here is a variation of this language-game: the pupil gives himself orders and then carries them out.

Page 162

(b) Someone observes certain regular processes--for example, the reactions of different metals to acids--and thereupon makes predictions about the reactions that will occur in certain particular cases.

Page 162

There is an evident kinship between these two language-games, and also a fundamental difference. In both one might call the spoken words "predictions". But compare the training which leads to the first technique with the training for the second one.

Page Break 163

Page 163

631. "I am going to take two powders now, and in half-an-hour I shall be sick."--It explains nothing to say that in the first case I am the agent, in the second merely the observer. Or that in the first case I see the causal connexion from inside, in the second from outside. And much else to the same effect.

Page 163

Nor is it to the point to say that a prediction of the first kind is no more infallible than one of the second kind.

Page 163

It was not on the ground of observations of my behaviour that I said I was going to take two powders. The antecedents of this proposition were different. I mean the thoughts, actions and so on which led up to it. And it can only mislead you to say: "The only essential presupposition of your utterance was just your decision."

Page 163

632. I do not want to say that in the case of the expression of intention "I am going to take two powders" the prediction is a cause--and its fulfilment the effect. (Perhaps a physiological investigation could determine this.) So much, however, is true: we can often predict a man's actions from his expression of a decision. An important language-game.

Page 163

633. "You were interrupted a while ago; do you still know what you were going to say?"--If I do know now, and say it--does that mean that I had already thought it before, only not said it? No. Unless you take the certainty with which I continue the interrupted sentence as a criterion of the thought's already having been completed at that time.--But, of course, the situation and the thoughts which I had contained all sorts of things to help the continuation of the sentence.

Page 163

634. When I continue the interrupted sentence and say that this was how I had been going to continue it, this is like following out a line of thought from brief notes.

Page 163

Then don't I *interpret* the notes? Was only one continuation possible in these circumstances? Of course not. But I did not *choose* between interpretations. I *remembered* that I was going to say this.

Page 163

635. "I was going to say....."--You remember various details. But not even all of them together shew your intention. It is as if a snapshot of a scene had been taken, but only a few scattered details of it were to be seen: here a hand, there a bit of a face, or a hat--the rest is dark. And now it is as if we knew quite certainly what the whole picture represented. As if I could read the darkness.

Page Break 164

Page 164

636. These 'details' are not irrelevant in the sense in which other circumstances which I can remember equally well are irrelevant. But if I tell someone "For a moment I was going to say...." he does not learn those details from this, nor need he guess them. He need not know, for instance, that I had already opened my mouth to speak. But he *can* 'fill out the picture' in this way. (And this capacity is part of understanding what I tell him.)

Page 164

637. "I know exactly what I was going to say!" And yet I did not say it.--And yet I don't read it off from some other process which took place then and which I remember.

Page 164

Nor am I *interpreting* that situation and its antecedents. For I don't consider them and don't judge them.

Page 164

638. How does it come about that in spite of this I am inclined to see an interpretation in saying "For a moment I was going to deceive him"?

Page 164

"How can you be certain that for the space of a moment you were going to deceive him? Weren't your actions and thoughts much too rudimentary?"

Page 164

For can't the evidence be too scanty? Yes, when one follows it up it seems extraordinarily scanty; but isn't this because one is taking no account of the history of this evidence? Certain antecedents were necessary for me to have had a momentary intention of pretending to someone else that I was unwell.

Page 164

If someone says "For a moment....." is he really only describing a momentary process?

Page 164

But not even the whole story was my evidence for saying "For a moment....."

Page 164

639. One would like to say that an opinion *develops*. But there is a mistake in this too.

Page 164

640. "This thought ties on to thoughts which I have had before."--How does it do so? Through a *feeling* of such a tie? But how can a feeling really tie thoughts together?--The word "feeling" is very misleading here. But it is sometimes possible to say with certainty: "This thought is connected with those earlier thoughts", and yet be unable to shew the connexion. Perhaps that comes later.

Page 164

641. "My intention was no less certain as it was than it would have been if I had said 'Now I'll deceive him'."--But if you had said the words, would you necessarily have meant them quite seriously? (Thus

Page Break 165

the most explicit expression of intention is by itself insufficient evidence of intention.)

Page 165

642. "At that moment I hated him."--What happened here? Didn't it consist in thoughts, feelings, and actions? And if I were to rehearse that moment to myself I should assume a particular expression, think of certain happenings, breathe in a particular way, arouse certain feelings in myself. I might think up a conversation, a whole scene in which that hatred flared up. And I might play this scene through with feelings approximating to those of a real occasion. That I have actually experienced something of the sort will naturally help me to do so.

Page 165

643. If I now become ashamed of this incident, I am ashamed of the whole thing: of the words, of the poisonous tone, etc..

Page 165

644. "I am not ashamed of what I did then, but of the intention which I had."--And didn't the intention lie *also* in what I did? What justifies the shame? The whole history of the incident.

Page 165

645. "For a moment I meant to...." That is, I had a particular feeling, an inner experience; and I remember it.--And now remember *quite precisely!* Then the 'inner experience' of intending seems to vanish again. Instead one remembers thoughts, feelings, movements, and also connexions with earlier situations.

Page 165

It is as if one had altered the adjustment of a microscope. One did not see before what is now in focus.

Page 165

646. "Well, that only shews that you have adjusted your microscope wrong. You were supposed to look at a particular section of the culture, and you are seeing a different one."

Page 165

There is something right about that. But suppose that (with a particular adjustment of the lenses) I did remember a *single* sensation; how have I the right to say that it is what I call the "intention"? It might be that (for example) a particular tickle accompanied every one of my intentions.

Page 165

647. What is the natural expression of an intention?--Look at a cat when it stalks a bird; or a beast when it wants to escape.

Page 165

((Connexion with propositions about sensations.))

Page 165

648. "I no longer remember the words I used, but I remember my intention precisely; I meant my words to quiet him." What does my memory *shew* me; what does it bring before my mind? Suppose it did

Page Break 166

nothing but suggest those words to me!--and perhaps others which fill out the picture still more exactly.--("I don't remember my words any more, but I certainly remember their spirit.")

Page 166

649. "So if a man has not learned a language, is he unable to have certain memories?" Of course--he cannot have verbal memories, verbal wishes or fears, and so on. And memories etc., in language, are not mere threadbare representations of the *real* experiences; for is what is linguistic not an experience?

Page 166

650. We say a dog is afraid his master will beat him; but not, he is afraid his master will beat him to-morrow. Why not?

Page 166

651. "I remember that I should have been glad then to stay still longer."--What picture of this wish came before my mind? None at all. What I see in my memory allows no conclusion as to my feelings. And yet I remember quite clearly that they were there.

Page 166

652. "He measured him with a hostile glance and said...." The reader of the narrative understands this; he has no doubt in his mind. Now you say: "Very well, he supplies the meaning, he guesses it."--Generally speaking; no. Generally speaking he supplies nothing, guesses nothing.--But it is also possible that the hostile glance and the words later prove to have been pretence, or that the reader is kept in doubt whether they are so or not, and so that he really does guess at a possible interpretation.--But then the main thing he guesses at is a context. He says to himself for example: The two men who are here so hostile to one another are in reality friends, etc. etc.

Page 166

((("If you want to understand a sentence, you have to imagine the psychical significance, the states of mind involved."))

Page 166

653. Imagine this case: I tell someone that I walked a certain route, going by a map which I had prepared beforehand. Thereupon I shew him the map, and it consists of lines on a piece of paper; but I cannot explain how these lines are the map of my movements, I cannot tell him any rule for interpreting the map. Yet I did follow the drawing with all the characteristic tokens of reading a map. I might call such a drawing a 'private' map; or the phenomenon that I have described "following a private map". (But this expression would, of course, be very easy to misunderstand.)

Page 166

Could I now say: "I read off my having then meant to do such-and-such,

Page Break 167

as if from a map, although there is no map"? But that means nothing but: *I am now inclined to say* "I read the intention of acting thus in certain states of mind which I remember."

Page 167

654. Our mistake is to look for an explanation where we ought to look at what happens as a 'proto-phenomenon'. That is, where we ought to have said: *this language-game is played*.

Page 167

655. The question is not one of explaining a language-game by means of our experiences, but of noting a language-game.

Page 167

656. What is the purpose of telling someone that a time ago I had such-and-such a wish?--Look on the language-game as the *primary* thing. And look on the feelings, etc., as you look on a way of regarding the language-game, as interpretation.

Page 167

It might be asked: how did human beings ever come to make the verbal utterances which we call reports of past wishes or past intentions?

Page 167

657. Let us imagine these utterances always taking this form: "I said to myself: 'if only I could stay longer!'" The purpose of such a statement might be to acquaint someone with my reactions. (Compare the grammar of "mean" and "vouloir dire".)

658. Suppose we expressed the fact that a man had an intention by saying "He as it were said to himself 'I will....'"--That is the picture. And now I want to know: how does one employ the expression "as it were to say something to oneself"? For it does not mean: to say something to oneself.

659. Why do I want to tell him about an intention too, as well as telling him what I did?--Not because the intention was also something which was going on at that time. But because I want to tell him something about *myself*, which goes beyond what happened at that time.

I reveal to him something of myself when I tell him what I was going to do.--Not, however, on grounds of self-observation, but by way of a response (it might also be called an intuition).

660. The grammar of the expression "I was then going to say...." is related to that of the expression "I could then have gone on."

In the one case I remember an intention, in the other I remember having understood.

661. I remember having meant *him*. Am I remembering a process or state?--When did it begin, what was its course; etc.?

662. In an only slightly different situation, instead of silently beckoning, he would have said to someone "Tell N. to come to me." One can now say that the words "I wanted N. to come to me" describe the state of my mind at that time; and again one may *not* say so.

663. If I say "I meant *him*" very likely a picture comes to my mind, perhaps of how I looked at him, etc.; but the picture is only like an illustration to a story. From it alone it would mostly be impossible to conclude anything at all; only when one knows the story does one know the significance of the picture.

664. In the use of words one might distinguish 'surface grammar' from 'depth grammar'. What immediately impresses itself upon us about the use of a word is the way it is used in the construction of the sentence, the part of its use--one might say--that can be taken in by the ear.--And now compare the depth grammar, say of the word "to mean", with what its surface grammar would lead us to suspect. No wonder we find it difficult to know our way about.

665. Imagine someone pointing to his cheek with an expression of pain and saying "abracadabra!"--We ask "What do you mean?" And he answers "I meant toothache".--You at once think to yourself: How can one 'mean toothache' by that word? Or what did it *mean to mean* pain by that word? And yet, in a different context, you would have asserted that the mental activity of *meaning* such-and-such was just what was most important in using language.

But--can't I say "By 'abracadabra' I mean toothache"? Of course I can; but this is a definition; not a description of what goes on in me when I utter the word.

666. Imagine that you were in pain and were simultaneously hearing a nearby piano being tuned. You say "It'll soon stop." It certainly makes quite a difference whether you mean the pain or the piano-tuning!--Of course; but what does this difference consist in? I admit, in many cases some direction of the attention will correspond to your meaning one thing or another, just as a look often does, or a gesture, or a way of shutting one's eyes which might be called "looking into oneself".

667. Imagine someone simulating pain, and then saying "It'll get better soon". Can't one say he means the pain? and yet he is not concentrating his attention on any pain.--And what about when I finally say "It's stopped now"?

668. But can't one also lie in this way: one says "It'll stop soon", and means pain--but when asked "What did you mean?" one answers "The noise in the next room"? In this sort of case one may say: "I was going to answer.... but thought better of it and did answer....."

Page 169

669. One can refer to an object when speaking by pointing to it. Here pointing is a part of the language-game. And now it seems to us as if one spoke *of* a sensation by directing one's attention to it. But where is the analogy? It evidently lies in the fact that one can point to a thing by *looking* or *listening*.

Page 169

But in certain circumstances, even *pointing* to the object one is talking about may be quite inessential to the language-game, to one's thought.

Page 169

670. Imagine that you were telephoning someone and you said to him: "This table is too tall", and pointed to the table. What is the role of pointing here? Can I say: I *mean* the table in question by pointing to it? What is this pointing for, and what are these words and whatever else may accompany them for?

Page 169

671. And what do I point to by the inner activity of listening? To the sound that comes to my ears, and to the silence when I hear *nothing*?

Page 169

Listening as it were *looks for* an auditory impression and hence can't point to it, but only to the *place* where it is looking for it.

Page 169

672. If a receptive attitude is called a kind of 'pointing' to something--then that something is not the sensation which we get by means of it.

Page 169

673. The mental attitude doesn't '*accompany*' what is said in the sense in which a gesture accompanies it. (As a man can travel alone, and yet be accompanied by my good wishes; or as a room can be empty, and yet full of light.)

Page 169

674. Does one say, for example: "I didn't really mean my pain just now; my mind wasn't on it enough for that?" Do I ask myself, say: "What did I mean by this word just now? My attention was divided between my pain and the noise--"?

Page Break 170

Page 170

675. "Tell me, what was going on in you when you uttered the words....?"--The answer to this is not: "I was meaning....."!

Page 170

676. "I meant *this* by that word" is a statement which is differently used from one about an affection of the mind.

Page 170

677. On the other hand: "When you were swearing just now, did you really mean it?" This is perhaps as much as to say: "Were you really angry?"--And the answer may be given as a result of introspection and is often some such thing as: "I didn't mean it very seriously", "I meant it half jokingly" and so on. There are differences of degree here.

Page 170

And one does indeed also say "I was half thinking of him when I said that."

Page 170

678. What does this act of meaning (the pain, or the piano-tuning) consist in? No answer comes--for the answers which at first sight suggest themselves are of no use.--"And yet at the time I *meant* the one thing and not the other." Yes,--now you have only repeated with emphasis something which no one has contradicted anyway.

Page 170

679. "But can you doubt that you meant *this*?"--No; but neither can I be certain of it, know it.

Page 170

680. When you tell me that you cursed and meant N. as you did so it is all one to me whether you looked at a picture of him, or imagined him, uttered his name, or what. The conclusions from this fact that interest me have nothing to do with these things. On the other hand, however, someone might explain to me that cursing was *effective* only when one had a clear image of the man or spoke his name out loud. But we should not say "The point

is how the man who is cursing *means* his victim."

Page 170

681. Nor, of course, does one ask: "Are you sure that you cursed *him*, that the connexion with him was established?"

Page 170

Then this connexion must be very easy to establish, if one can be so sure of it?! Can know that it doesn't fail of its object!--Well, can it happen to me, to intend to write to one person and in fact write to another? and how might it happen?

Page 170

682. "You said, 'It'll stop soon'.--Were you thinking of the noise or of your pain?" If he answers "I was thinking of the piano-tuning"--is he observing that the connexion existed, or is he making it by means

Page Break 171

of these words?--Can't I say *both*? If what he said was true, didn't the connexion exist--and is he not for all that making one which did not exist?

Page 171

683. I draw a head. You ask "Whom is that supposed to represent?"--I: "It's supposed to be N."--You: "But it doesn't look like him; if anything, it's rather like M."--When I said it represented N.--was I establishing a connexion or reporting one? And what connexion did exist?

Page 171

684. What is there in favour of saying that my words describe an existing connexion? Well, they relate to various things which didn't simply make their appearance with the words. They say, for example, that I *should have* given a particular answer then, if I had been asked.

Page 171

And even if this is only conditional, still it does say something about the past.

Page 171

685. "Look for A" does not mean "Look for B"; but I may do just the same thing in obeying the two orders.

Page 171

To say that something different must happen in the two cases would be like saying that the propositions "Today is my birthday" and "My birthday is on April 26th" must refer to different days, because they do not make the same sense.

Page 171

686. "Of course I meant B; I didn't think of A at all!"

Page 171

"I wanted B to come to me, so as to..."--All this points to a wider context.

Page 171

687. Instead of "I meant him" one can, of course, sometimes say "I thought of him"; sometimes even "Yes, we were speaking of him." Ask yourself what 'speaking of him' consists in.

Page 171

688. In certain circumstances one can say "As I was speaking, I felt I was saying it *to you*". But I should not say this if I were in any case talking with you.

Page 171

689. "I am thinking of N." "I am speaking of N."

Page 171

How do I speak *of* him? I say, for instance, "I must go and see N today"--But surely that is not enough! After all, when I say "N" I might mean various people of this name.--"Then there must surely be a further, different connexion between my talk and N, for otherwise I should *still* not have meant HIM.

Page 171

Certainly such a connexion exists. Only not as you imagine it: namely by means of a mental *mechanism*.

Page 171

(One compares "meaning him" with "aiming at him".)

Page Break 172

Page 172

690. What about the case where I at one time make an apparently innocent remark and accompany it with a furtive sidelong glance at someone; and at another time, without any such glance, speak of somebody present openly, mentioning his name--am I really thinking *specially* about him as I use his name?

691. When I make myself a sketch of N's face from memory, I can surely be said to *mean* him by my drawing. But which of the processes taking place while I draw (or before or afterwards) could I call meaning him?

For one would naturally like to say: when he meant him, he aimed at him. But how is anyone doing that, when he calls someone else's face to mind?

I mean, how does he call HIM to mind?

How does he call him?

692. Is it correct for someone to say: "When I gave you this rule, I meant you to..... in this case"? Even if he did not think of this case at all as he gave the rule? Of course it is correct. For "to mean it" did not mean: to think of it. But now the problem is: how are we to judge whether someone meant such-and-such?--The fact that he has, for example, mastered a particular technique in arithmetic and algebra, and that he taught someone else the expansion of a series in the usual way, is such a criterion.

693. "When I teach someone the formation of the series.... I surely mean him to write.... at the hundredth place."--Quite right; you mean it. And evidently without necessarily even thinking of it. This shews you how different the grammar of the verb "to mean" is from that of "to think". And nothing is more wrong-headed than calling meaning a mental activity! Unless, that is, one is setting out to produce confusion. (It would also be possible to speak of an activity of butter when it rises in price, and if no problems are produced by this it is harmless.)

PART II

i

One can imagine an animal angry, frightened, unhappy, happy, startled. But hopeful? And why not?

A dog believes his master is at the door. But can he also believe his master will come the day after to-morrow?--And *what* can he not do here?--How do I do it?--How am I supposed to answer this?

Can only those hope who can talk? Only those who have mastered the use of a language. That is to say, the phenomena of hope are modes of this complicated form of life. (If a concept refers to a character of human handwriting, it has no application to beings that do not write.)

"Grief" describes a pattern which recurs, with different variations, in the weave of our life. If a man's bodily expression of sorrow and of joy alternated, say with the ticking of a clock, here we should not have the characteristic formation of the pattern of sorrow or of the pattern of joy.

"For a second he felt violent pain."--Why does it sound queer to say: "For a second he felt deep grief"? Only because it so seldom happens?

But don't you feel grief *now*? ("But aren't you playing chess *now*?" The answer may be affirmative, but that does not make the concept of grief any more like the concept of a sensation.--The question was really, of course, a temporal and personal one, not the logical question which we wanted to raise.

"I must tell you: I am frightened."

"I must tell you: it makes me shiver."--

And one can say this in a *smiling* tone of voice too.

And do you mean to tell me he doesn't feel it? How else does he *know* it?--But even when he says it as a

piece of information he does not learn it from his sensations.

Page 174

For think of the sensations produced by physically shuddering: the words "it makes me shiver" are themselves such a shuddering reaction; and if I hear and feel them as I utter them, this belongs among the rest of those sensations. Now why should the wordless shudder be the ground of the verbal one?

Page Break 175

ii

Page 175

In saying "When I heard this word, it meant.... to me" one refers to a *point of time* and to a *way of using the word*. (Of course, it is this combination that we fail to grasp.)

Page 175

And the expression "I was then going to say....." refers to a *point of time* and to an *action*.

Page 175

I speak of the essential *references* of the utterance in order to distinguish them from other peculiarities of the expression we use. The references that are essential to an utterance are the ones which would make us translate some otherwise alien form of expression into this, our customary form.

Page 175

If you were unable to say that the word "till" could be both a verb and a conjunction, or to construct sentences in which it was now the one and now the other, you would not be able to manage simple schoolroom exercises. But a schoolboy is not asked to *conceive* the word in one way or another out of any context, or to report how he has conceived it.

Page 175

The words "the rose is red" are meaningless if the word "is" has the meaning "is identical with".--Does this mean: if you say this sentence and mean the "is" as the sign of identity, the sense disintegrates?

Page 175

We take a sentence and tell someone the meaning of each of its words; this tells him how to apply them and so how to apply the sentence too. If we had chosen a senseless sequence of words instead of the sentence, he would not learn how to apply the *sequence*. And if we explain the word "is" as the sign of identity, then he does not learn how to use the sentence "the rose is red".

Page 175

And yet there is something right about this 'disintegration of the sense'. You get it in the following example: one might tell someone: if you want to pronounce the salutation "Hail!" expressively, you had better not think of hailstones as you say it.

Page 175

Experiencing a meaning and experiencing a mental image. "In both cases", we should like to say, "we are *experiencing* something, only something different. A different content is proffered--is present--to consciousness."--What is the content of the experience of imagining? The answer is a picture, or a description. And what is the content

Page Break 176

of the experience of meaning? I don't know what I am supposed to say to this.--If there is any sense in the above remark, it is that the two concepts are related like those of 'red' and 'blue'; and that is wrong.

Page 176

Can one keep hold of an understanding of meaning as one can keep hold of a mental image? That is, if one meaning of a word suddenly strikes me,--can it also stay there in my mind?

Page 176

"The whole scheme presented itself to my mind in a flash and stayed there like that for five minutes." Why does this sound odd? One would like to think: what flashed on me and what stayed there in my mind can't have been the same.

Page 176

I exclaimed "Now I have it!"--a sudden start, and then I was able to set the scheme forth in detail. What is supposed to have stayed in this case? A picture, perhaps. But "Now I have it" did not mean, I have the picture.

Page 176

If a meaning of a word has occurred to you and you have not *forgotten* it again, you can now use the word in such-and-such a way.

Page 176

If the meaning has occurred to you, now you *know* it, and the knowing began when it occurred to you. Then how is it like an experience of imagining something?

Page 176

If I say "Mr. Scot is not a Scot", I mean the first "Scot" as a proper name, the second one as a common name. Then do different things have to go on in my mind at the first and second "Scot"? (Assuming that I am not uttering the sentence 'parrot-wise'.)--Try to mean the first "Scot" as a common name and the second one as a proper name.--How is it done? When *I* do it, I blink with the effort as I try to parade the right meanings before my mind in saying the words.--But do I parade the meanings of the words before my mind when I make the ordinary use of them?

Page 176

When I say the sentence with this exchange of meanings I feel that its sense disintegrates.--Well, *I* feel it, but the person I am saying it to does not. So what harm is done?--"But the point is, when one utters the sentence in the usual way something *else*, quite definite, takes place."--What takes place is *not* this 'parade of the meanings before one's mind'.

Page Break 177

iii

Page 177

What makes my image of him into an image of *him*?

Page 177

Not its looking like him.

Page 177

The same question applies to the expression "I see him now vividly before me" as to the image. What makes this utterance into an utterance about *him*?--Nothing in it or simultaneous with it ('behind it'). If you want to know whom he meant, ask him.

Page 177

(But it is also possible for a face to come before my mind, and even for me to be able to draw it, without my knowing whose it is or where I have seen it.)

Page 177

Suppose, however, that someone were to draw while he had an image or instead of having it, though it were only with his finger in the air. (This might be called "motor imagery.") He could be asked: "Whom does that represent?" And his answer would be decisive.--It is quite as if he had given a verbal description: and such a description can also simply take the *place* of the image.

Page Break 178

iv

Page 178

"I believe that he is suffering."--Do I also *believe* that he isn't an automaton?

Page 178

It would go against the grain to use the word in both connexions.

Page 178

(Or is it like this: I believe that he is suffering, but am certain that he is not an automaton? Nonsense!)

Page 178

Suppose I say of a friend: "He isn't an automaton".--What information is conveyed by this, and to whom would it be information? To a *human being* who meets him in ordinary circumstances? What information *could* it give him? (At the very most that this man always behaves like a human being, and not occasionally like a machine.)

Page 178

"I believe that he is not an automaton", just like that, so far makes no sense.

Page 178

My attitude towards him is an attitude towards a soul. I am not of the *opinion* that he has a soul.

Page 178

Religion teaches that the soul can exist when the body has disintegrated. Now do I understand this teaching?--Of course I understand it--I can imagine plenty of things in connexion with it. And haven't pictures of these things been painted? And why should such a picture be only an imperfect rendering of the spoken doctrine? Why should it not do the *same* service as the words? And it is the service which is the point.

Page 178

If the picture of thought in the head can force itself upon us, then why not much more that of thought in the

soul?

Page 178

The human body is the best picture of the human soul.

Page 178

And how about such an expression as: "In my heart I understood when you said that", pointing to one's heart? Does one, perhaps, not *mean* this gesture? Of course one means it. Or is one conscious of using a *mere* figure? Indeed not.--It is not a figure that we choose, not a simile, yet it is a figurative expression.

Page Break 179

V

Page 179

Suppose we were observing the movement of a point (for example, a point of light on a screen). It might be possible to draw important consequences of the most various kinds from the behaviour of this point. And what a variety of observations can be made here!--The path of the point and certain of its characteristic measures (amplitude and wave-length for instance), or the velocity and the law according to which it varies, or the number or position of the places at which it changes discontinuously, or the curvature of the path at these places, and innumerable other things.--Any of these features of its behaviour might be the only one to interest us. We might, for example, be indifferent to everything about its movements except for the number of loops it made in a certain time.--And if we were interested, not in just *one* such feature, but in several, each might yield us special information, different in kind from all the rest. This is how it is with the behaviour of man; with the different characteristic features which we observe in this behaviour.

Page 179

Then psychology treats of behaviour, not of the mind?

Page 179

What do psychologists record?--What do they observe? Isn't it the behaviour of human beings, in particular their utterances? But *these* are not about behaviour.

Page 179

"I noticed that he was out of humour." Is this a report about his behaviour or his state of mind? ("The sky looks threatening": is this about the present or the future?) Both; not side-by-side, however, but about the one *via* the other.

Page 179

A doctor asks: "How is he feeling?" The nurse says: "He is groaning". A report on his behaviour. But need there be any question for them whether the groaning is really genuine, is really the expression of anything? Might they not, for example, draw the conclusion "If he groans, we must give him more analgesic"--without suppressing a middle term? Isn't the point the service to which they put the description of behaviour?

Page 179

"But then they make a tacit presupposition." Then what we do in our language-game always rests on a tacit presupposition.

Page Break 180

Page 180

I describe a psychological experiment: the apparatus, the questions of the experimenter, the actions and replies of the subject--and then I say that it is a scene in a play.--Now everything is different. So it will be said: If this experiment were described in the same way in a book on psychology, then the behaviour described would be understood as the expression of something mental just because it is *presupposed* that the subject is not taking us in, hasn't learnt the replies by heart, and other things of the kind.--So we are making a presupposition?

Page 180

Should we ever really express ourselves like this: "Naturally I am presupposing that....."?--Or do we not do so only because the other person already knows that?

Page 180

Doesn't a presupposition imply a doubt? And doubt may be entirely lacking. Doubting has an end.

Page 180

It is like the relation: physical object--sense-impressions. Here we have two different language-games and a complicated relation between them.--If you try to reduce their relations to a *simple* formula you go wrong.

Page Break 181

Suppose someone said: every familiar word, in a book for example, actually carries an atmosphere with it in our minds, a 'corona' of lightly indicated uses.--Just as if each figure in a painting were surrounded by delicate shadowy drawings of scenes, as it were in another dimension, and in them we saw the figures in different contexts.--Only let us take this assumption seriously!--Then we see that it is not adequate to explain *intention*.

For if it is like this, if the possible uses of a word do float before us in half-shades as we say or hear it--this simply goes for *us*. But we communicate with other people without knowing if they have this experience too.

How should we counter someone who told us that with *him* understanding was an inner process?--How should we counter him if he said that with him knowing how to play chess was an inner process?--We should say that when we want to know if he can play chess we aren't interested in anything that goes on inside him.--And if he replies that this is in fact just what we are interested in, that is, we are interested in whether he can play chess--then we shall have to draw his attention to the criteria which would demonstrate his capacity, and on the other hand to the criteria for the 'inner states'.

Even if someone had a particular capacity only when, and only as long as, he had a particular feeling, the feeling would not be the capacity.

The meaning of a word is not the experience one has in hearing or saying it, and the sense of a sentence is not a complex of such experiences.--(How do the meanings of the individual words make up the sense of the sentence "I still haven't seen him yet"?) The sentence is composed of the words, and that is enough.

Though--one would like to say--every word has a different character in different contexts, at the same time there is *one* character it always has: a single physiognomy. It looks at us.--But a face in a *painting* looks at us too.

Are you sure that there is a single if-feeling, and not perhaps several? Have you tried saying the word in a great variety of contexts? For

example, when it bears the principal stress of the sentence, and when the word next to it does.

Suppose we found a man who, speaking of how words felt to him, told us that "if" and "but" felt the *same*.--Should we have the right to disbelieve him? We might think it strange. "He doesn't play our game at all", one would like to say. Or even: "This is a different type of man."

If he *used* the words "if" and "but" as we do, shouldn't we think he understood them as we do?

One misjudges the psychological interest of the if-feeling if one regards it as the obvious correlate of a meaning; it needs rather to be seen in a different context, in that of the special circumstances in which it occurs.

Does a person never have the if-feeling when he is not uttering the word "if"? Surely it is at least remarkable if this cause alone produces this feeling. And this applies generally to the 'atmosphere' of a word;--why does one regard it so much as a matter of course that only *this* word has this atmosphere?

The if-feeling is not a feeling which accompanies the word "if".

The if-feeling would have to be compared with the special 'feeling' which a musical phrase gives us. (One sometimes describes such a feeling by saying "Here it is as if a conclusion were being drawn", or "I should like to say '*hence*.....'", or "Here I should always like to make a gesture--" and then one makes it.)

But can this feeling be separated from the phrase? And yet it is not the phrase itself, for that can be heard without the feeling.

Is it in this respect like the 'expression' with which the phrase is played?

We say this passage gives us a quite special feeling. We sing it to ourselves, and make a certain movement,

and also perhaps have some special sensation. But in a different context we should not recognize these accompaniments--the movement, the sensation--at all. They are quite empty except just when we are singing this passage.

Page Break 183

Page 183

"I sing it with a quite particular expression." This expression is not something that can be separated from the passage. It is a different concept. (A different game.)

Page 183

The experience is this passage played like *this* (that is, as I am doing it, for instance; a description could only *hint* at it).

Page 183

Thus the atmosphere that is inseparable from its object--is not an atmosphere.

Page 183

Closely associated things, things which we *have* associated, seem to fit one another. But what is this seeming to fit? How is their seeming to fit manifested? Perhaps like this: we cannot imagine the man who had this name, this face, this handwriting, not to have produced *these* works, but perhaps quite different ones instead (those of another great man).

Page 183

We cannot imagine it? Do we try?--

Page 183

Here is a possibility: I hear that someone is painting a picture "Beethoven writing the ninth symphony". I could easily imagine the kind of thing such a picture would shew us. But suppose someone wanted to represent what Goethe would have looked like writing the ninth symphony? Here I could imagine nothing that would not be embarrassing and ridiculous.

Page Break 184

vii

Page 184

People who on waking tell us certain incidents (that they have been in such-and-such places, etc.). Then we teach them the expression "I dreamt", which precedes the narrative. Afterwards I sometimes ask them "did you dream anything last night?" and am answered yes or no, sometimes with an account of a dream, sometimes not. That is the language-game. (I have assumed here that I do not dream myself. But then, nor do I ever have the feeling of an invisible presence; other people do, and I can question them about their experiences.)

Page 184

Now must I make some assumption about whether people are deceived by their memories or not; whether they really had these images while they slept, or whether it merely seems so to them on waking? And what meaning has this question?--And what interest? Do we ever ask ourselves this when someone is telling us his dream? And if not--is it because we are sure his memory won't have deceived him? (And suppose it were a man with a quite specially bad memory?--)

Page 184

Does this mean that it is nonsense ever to raise the question whether dreams really take place during sleep, or are a memory phenomenon of the awakened? It will turn on the use of the question.

Page 184

"The mind seems able to give a word meaning"--isn't this as if I were to say "The carbon atoms in benzene seem to lie at the corners of a hexagon"? But this is not something that seems to be so; it is a picture.

Page 184

The evolution of the higher animals and of man, and the awakening of consciousness at a particular level. The picture is something like this: Though the ether is filled with vibrations the world is dark. But one day man opens his seeing eye, and there is light.

Page 184

What this language primarily describes is a picture. What is to be done with the picture, how it is to be used, is still obscure. Quite clearly, however, it must be explored if we want to understand the sense of what we are saying. But the picture seems to spare us this work: it already points to a particular use. This is how it takes us in.

Page Break 185

viii

"My kinaesthetic sensations advise me of the movement and position of my limbs."

I let my index finger make an easy pendulum movement of small amplitude. I either hardly feel it, or don't feel it at all. Perhaps a little in the tip of the finger, as a slight tension. (Not at all in the joint.) And this sensation advises me of the movement?--for I can describe the movement exactly.

"But after all, you must feel it, otherwise you wouldn't know (without looking) how your finger was moving." But "knowing" it only means: being able to describe it.--I may be able to tell the direction from which a sound comes only because it affects one ear more strongly than the other, but I don't feel this in my ears; yet it has its effect: I *know* the direction from which the sound comes; for instance, I look in that direction.

It is the same with the idea that it must be some feature of our pain that advises us of the whereabouts of the pain in the body, and some feature of our memory image that tells us the time to which it belongs.

A sensation *can* advise us of the movement or position of a limb. (For example, if you do not know, as a normal person does, whether your arm is stretched out, you might find out by a piercing pain in the elbow.)--In the same way the character of a pain can tell us where the injury is. (And the yellowness of a photograph how old it is.)

What is the criterion for my learning the shape and colour of an object from a sense-impression?

What sense-impression? Well, *this* one; I use words or a picture to describe it.

And now: what do you feel when your fingers are in this position?--"How is one to define a feeling? It is something special and indefinable." But it must be possible to teach the use of the words!

What I am looking for is the grammatical difference.

Let us leave the kinaesthetic feeling out for the moment.--I want to describe a feeling to someone, and I tell him "Do *this*, and then you'll

get it," and I hold my arm or my head in a particular position. Now is this a description of a feeling? and when shall I say that he has understood what feeling I meant?--He will have to give a *further* description of the feeling afterwards. And what kind of description must it be?

I say "Do *this*, and you'll get it". Can't there be a doubt here? Mustn't there be one, if it is a feeling that is meant?

This looks *so*; *this* tastes *so*; *this* feels *so*. "This" and "so" must be differently explained.

Our interest in a 'feeling' is of a quite *particular* kind. It includes, for instance, the 'degree of the feeling', its 'place', and the extent to which one feeling can be submerged by another. (When a movement is very painful, so that the pain submerges every other slight sensation in the same place, does this make it uncertain whether you have really made this movement? Could it lead you to find out by looking?)

ix

If you observe your own grief, which senses do you use to observe it? A particular sense; one that *feels* grief? Then do you feel it *differently* when you are observing it? And what is the grief that you are observing--is it one which is there only while it is being observed?

'Observing' does not produce what is observed. (That is a conceptual statement.)

Again: I do not 'observe' what only comes into being through observation. The object of observation is something *else*.

Page 187

A touch which was still painful yesterday is no longer so today.

Page 187

Today I feel the pain only when I think about it. (That is: in certain circumstances.)

Page 187

My grief is no longer the same; a memory which was still unbearable to me a year ago is now no longer so.

Page 187

That is a result of observation.

Page 187

When do we say that any one is observing? Roughly: when he puts himself in a favourable position to receive certain impressions in order (for example) to describe what they tell him.

Page 187

If you trained someone to emit a particular sound at the sight of something red, another at the sight of something yellow, and so on for other colours, still he would not yet be describing objects by their colours. Though he might be a help to us in giving a description. A description is a representation of a distribution in a space (in that of time, for instance).

Page 187

If I let my gaze wander round a room and suddenly it lights on an object of a striking red colour, and I say "Red!"--that is not a description.

Page 187

Are the words "I am afraid" a description of a state of mind?

Page 187

I say "I am afraid"; someone else asks me: "What was that? A cry of fear; or do you want to tell me how you feel; or is it a reflection on your present state?"--Could I always give him a clear answer? Could I never give him one?

Page Break 188

Page 188

We can imagine all sorts of things here, for example:

Page 188

"No, no! I am afraid!"

Page 188

"I am afraid. I am sorry to have to confess it."

Page 188

"I am still a bit afraid, but no longer as much as before."

Page 188

"At bottom I am still afraid, though I won't confess it to myself."

Page 188

"I torment myself with all sorts of fears."

Page 188

"Now, just when I should be fearless, I am afraid!"

Page 188

To each of these sentences a special tone of voice is appropriate, and a different context.

Page 188

It would be possible to imagine people who as it were thought much more definitely than we, and used different words where we use only one.

Page 188

We ask "What does 'I am frightened' really mean, what am I referring to when I say it?" And of course we find no answer, or one that is inadequate.

Page 188

The question is: "In what sort of context does it occur?"

Page 188

I can find no answer if I try to settle the question "What am I referring to?" "What am I thinking when I say it?" by repeating the expression of fear and at the same time attending to myself, as it were observing my soul out of the corner of my eye. In a concrete case I can indeed ask "Why did I say that, what did I mean by it?"--and I might answer the question too; but not on the ground of observing what accompanied the speaking. And my answer would supplement, paraphrase, the earlier utterance.

Page 188

What is fear? What does "being afraid" mean? If I wanted to define it at a *single* shewing--I should *play-act* fear.

Page 188

Could I also represent hope in this way? Hardly. And what about belief?

Page 188

Describing my state of mind (of fear, say) is something I do in a particular context. (Just as it takes a particular context to make a certain action into an experiment.)

Page 188

Is it, then, so surprising that I use the same expression in different games? And sometimes as it were between the games?

Page 188

And do I always talk with very definite purpose?--And is what I say meaningless because I don't?

Page Break 189

Page 189

When it is said in a funeral oration "We mourn our...." this is surely supposed to be an expression of mourning; not to tell anything to those who are present. But in a prayer at the grave these words would in a way be used to tell someone something.

Page 189

But here is the problem: a cry, which cannot be called a description, which is more primitive than any description, for all that serves as a description of the inner life.

Page 189

A cry is not a description. But there are transitions. And the words "I am afraid" may approximate more, or less, to being a cry. They may come quite close to this and also be *far* removed from it.

Page 189

We surely do not always say someone is *complaining*, because he says he is in pain. So the words "I am in pain" may be a cry of complaint, and may be something else.

Page 189

But if "I am afraid" is not always something like a cry of complaint and yet sometimes is, then why should it *always* be a description of a state of mind?

Page Break 190

X

Page 190

How did we ever come to use such an expression as "I believe..."? Did we at some time become aware of a phenomenon (of belief)?

Page 190

Did we observe ourselves and other people and so discover belief?

Page 190

Moore's paradox can be put like this: the expression "I believe that this is the case" is used like the assertion "This is the case"; and yet the *hypothesis* that I believe this is the case is not used like the hypothesis that this is the case.

Page 190

So it *looks* as if the assertion "I believe" were not the assertion of what is supposed in the hypothesis "I believe"!

Page 190

Similarly: the statement "I believe it's going to rain" has a meaning like, that is to say a use like, "It's going to rain", but the meaning of "I believed then that it was going to rain", is not like that of "It did rain then".

Page 190

"But surely 'I believed' must tell of just the same thing in the past as 'I believe' in the present!"--Surely

$\sqrt{-1}$ must mean just the same in relation to -1, as $\sqrt{1}$ means in relation to 1! This means nothing at all.

Page 190

"At bottom, when I say 'I believe...' I am describing my own state of mind--but this description is indirectly an assertion of the fact believed."--As in certain circumstances I describe a photograph in order to describe the thing it is a photograph of.

Page 190

But then I must also be able to say that the photograph is a good one. So here too: "I believe it's raining and my belief is reliable, so I have confidence in it."--In that case my belief would be a kind of sense-impression.

Page 190

One can mistrust one's own senses, but not one's own belief.

Page 190

If there were a verb meaning 'to believe falsely', it would not have any significant first person present indicative.

Page 190

Don't look at it as a matter of course, but as a most remarkable thing, that the verbs "believe", "wish", "will" display all the inflexions possessed by "cut", "chew", "run".

Page 190

The language-game of reporting can be given such a turn that a report is not meant to inform the hearer about its subject matter but about the person making the report.

Page Break 191

Page 191

It is so when, for instance, a teacher examines a pupil. (You can measure to test the ruler.)

Page 191

Suppose I were to introduce some expression--"I believe", for instance--in this way: it is to be prefixed to reports when they serve to give information about the reporter. (So the expression need not carry with it any suggestion of uncertainty. Remember that the uncertainty of an assertion can be expressed impersonally: "He might come today".)--"I believe...., and it isn't so" would be a contradiction.

Page 191

"I believe...." throws light on my state. Conclusions about my conduct can be drawn from this expression. So there is a *similarity* here to expressions of emotion, of mood, etc..

Page 191

If, however, "I believe it is so" throws light on my state, then so does the assertion "It is so". For the sign "I believe" can't do it, can at the most hint at it.

Page 191

Imagine a language in which "I believe it is so" is expressed only by means of the tone of the assertion "It is so". In this language they say, not "He believes" but "He is inclined to say...." and there exists also the hypothetical (subjunctive) "Suppose I were inclined etc.", but not the expression "I am inclined to say".

Page 191

Moore's paradox would not exist in this language; instead of it, however, there would be a verb lacking one inflexion.

Page 191

But this ought not to surprise us. Think of the fact that one can predict one's *own* future action by an expression of intention.

Page 191

I say of someone else "He seems to believe...." and other people say it of me. Now, why do I never say it of myself, not even when others *rightly* say it of me?--Do I myself not see and hear myself, then?--That can be said.

Page 191

"One feels conviction within oneself, one doesn't infer it from one's own words or their tone."--What is true here is: one does not infer one's own conviction from one's own words; nor yet the actions which arise from that conviction.

Page 191

"Here it *looks* as if the assertion 'I believe' were not the assertion of what is supposed in the hypothesis."--So I am tempted to look for a different development of the verb in the first person present indicative.

Page 191

This is how I think of it: Believing is a state of mind. It has duration; and that independently of the duration of its expression in a sentence, for example. So it is a kind of disposition of the believing person. This is shewn me in the case of someone else by his behaviour; and

Page Break 192

by his words. And under this head, by the expression "I believe..." as well as by the simple assertion.--What about my own case: how do I myself recognize my own disposition?--Here it will have been necessary for me to take notice of myself as others do, to listen to myself talking, to be able to draw conclusions from what I say!

Page 192

My own relation to my words is wholly different from other people's.

Page 192

That different development of the verb would have been possible, if only I could say "I seem to believe".

Page 192

If I listened to the words of my mouth, I might say that someone else was speaking out of my mouth.

Page 192

"Judging from what I say, *this* is what I believe." Now, it is possible to think out circumstances in which these words would make sense.

Page 192

And then it would also be possible for someone to say "It is raining and I don't believe it", or "It seems to me that my ego believes this, but it isn't true." One would have to fill out the picture with behaviour indicating that two people were speaking through my mouth.

Page 192

Even in the *hypothesis* the pattern is not what you think.

Page 192

When you say "Suppose I believe...." you are presupposing the whole grammar of the word "to believe", the ordinary use, of which you are master.--You are not supposing some state of affairs which, so to speak, a picture presents unambiguously to you, so that you can tack on to this hypothetical use some assertive use other than the ordinary one.--You would not know at all what you were supposing here (i.e. what, for example, would follow from such a supposition), if you were not already familiar with the use of "believe".

Page 192

Think of the expression "I say....", for example in "I say it will rain today", which simply comes to the same thing as the assertion "It will....". "He says it will...." means approximately "He believes it will....". "Suppose I say...." does *not* mean: Suppose it rains today.

Page 192

Different concepts touch here and coincide over a stretch. But you need not think that all lines are *circles*.

Page 192

Consider the misbegotten sentence "It may be raining, but it isn't".

Page 192

And here one should be on one's guard against saying that "It may be raining" really means "I think it'll be raining." For why not the other way round, why should not the latter mean the former?

Page 192

Don't regard a hesitant assertion as an assertion of hesitancy.

Page Break 193

xi

Page 193

Two uses of the word "see".

Page 193

The one: "What do you see there?"--"I see *this*" (and then a description, a drawing, a copy). The other: "I see a likeness between these two faces"--let the man I tell this to be seeing the faces as clearly as I do myself.

Page 193

The importance of this is the difference of category between the two 'objects' of sight.

Page 193

The one man might make an accurate drawing of the two faces, and the other notice in the drawing the likeness which the former did not see.

Page 193

I contemplate a face, and then suddenly notice its likeness to another. I *see* that it has not changed; and yet I see it differently. I call this experience "noticing an aspect".

Page 193

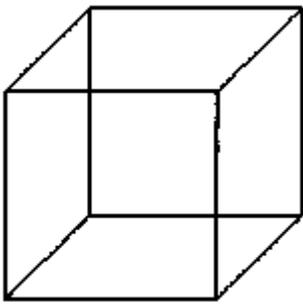

Its *causes* are of interest to psychologists.

Page 193

We are interested in the concept and its place among the concepts of experience.

Page 193

You could imagine the illustration

appearing in several places in a book, a text-book for instance. In the relevant text something different is in question every time: here a glass cube, there an inverted open box, there a wire frame of that shape, there three boards forming a solid angle. Each time the text supplies the interpretation of the illustration.

Page 193

But we can also *see* the illustration now as one thing now as another.--So we interpret it, and *see* it as we *interpret* it.

Page 193

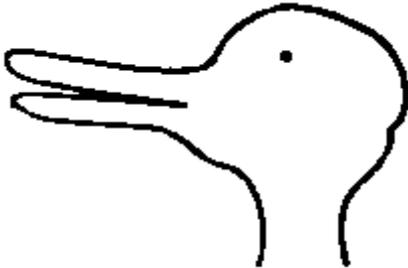

Here perhaps we should like to reply: The description of what is got immediately, i.e. of the visual experience, by means of an interpretation--is an indirect description. "I see the figure as a box" means: I have a particular visual experience which I have found that I always have when I interpret the figure as a box or when I look at

Page Break 194

a box. But if it meant this I ought to know it. I ought to be able to refer to the experience directly, and not only indirectly. (As I can speak of red without calling it the colour of blood.)

Page 194

I shall call the following figure, derived from Jastrow†1, the duck-rabbit. It can be seen as a rabbit's head or as a duck's.

And I must distinguish between the 'continuous seeing' of an aspect and the 'dawning' of an aspect.

Page 194

The picture might have been shewn me, and I never have seen anything but a rabbit in it.

Page 194

Here it is useful to introduce the idea of a picture-object. For instance

would be a 'picture-face'.

Page 194

In some respects I stand towards it as I do towards a human face. I can study its expression, can react to it as to the expression of the human face. A child can talk to picture-men or picture-animals, can treat them as it treats dolls.

Page 194

I may, then, have seen the duck-rabbit simply as a picture-rabbit from the first. That is to say, if asked "What's that?" or "What do you see here?" I should have replied: "A picture-rabbit". If I had further been asked what that was, I should have explained by pointing to all sorts of pictures of rabbits, should perhaps have pointed to real rabbits, talked about their habits, or given an imitation of them.

I should not have answered the question "What do you see here?" by saying: "Now I am seeing it as a picture-rabbit". I should simply

have described my perception: just as if I had said "I see a red circle over there."--

Nevertheless someone else could have said of me: "He is seeing the figure as a picture-rabbit."

It would have made as little sense for me to say "Now I am seeing it as..." as to say at the sight of a knife and fork "Now I am seeing this as a knife and fork". This expression would not be understood.--Any more than: "Now it's a fork" or "It can be a fork too".

One doesn't *'take'* what one knows as the cutlery at a meal *for* cutlery; any more than one ordinarily tries to move one's mouth as one eats, or aims at moving it.

If you say "Now it's a face for me", we can ask: "What change are you alluding to?"

I see two pictures, with the duck-rabbit surrounded by rabbits in one, by ducks in the other. I do not notice that they are the same. Does it *follow* from this that I *see* something different in the two cases?--It gives us a reason for using this expression here.

"I saw it quite differently, I should never have recognized it!" Now, that is an exclamation. And there is also a justification for it.

I should never have thought of superimposing the heads like that, of making *this* comparison between them. For they suggest a different mode of comparison.

Nor has the head seen like *this* the slightest similarity to the head seen like *this*--although they are congruent.

I am shewn a picture-rabbit and asked what it is; I say "It's a rabbit". Not "Now it's a rabbit". I am reporting my perception.--I am shewn the duck-rabbit and asked what it is; I *may* say "It's a duck-rabbit". But I may also react to the question quite differently.--The answer that it is a duck-rabbit is again the report of a perception; the answer "Now it's a rabbit" is not. Had I replied "It's a rabbit", the ambiguity would have escaped me, and I should have been reporting my perception.

The change of aspect. "But surely you would say that the picture is altogether different now!"

But what is different: my impression? my point of view?--Can I say? I *describe* the alteration like a perception; quite as if the object had altered before my eyes.

"Now I am seeing *this*", I might say (pointing to another picture, for example). This has the form of a report of a new perception.

The expression of a change of aspect is the expression of a *new* perception and at the same time of the perception's being unchanged.

I suddenly see the solution of a puzzle-picture. Before, there were branches there; now there is a human shape. My visual impression has changed and now I recognize that it has not only shape and colour but also a quite particular 'organization'.--My visual impression has changed;--what was it like before and what is it like now?--If I represent it by means of an exact copy--and isn't that a good representation of it?--no change is shewn.

And above all do *not* say "After all my visual impression isn't the *drawing*; it is *this*--which I can't shew to anyone."--Of course it is not the drawing, but neither is it anything of the same category, which I carry within

myself.

Page 196

The concept of the 'inner picture' is misleading, for this concept uses the '*outer* picture' as a model; and yet the uses of the words for these concepts are no more like one another than the uses of 'numeral' and 'number'. (And if one chose to call numbers 'ideal numerals', one might produce a similar confusion.)

Page 196

If you put the 'organization' of a visual impression on a level with colours and shapes, you are proceeding from the idea of the visual impression as an inner object. Of course this makes this object into a chimera; a queerly shifting construction. For the similarity to a picture is now impaired.

Page 196

If I know that the schematic cube has various aspects and I want to find out what someone else sees, I can get him to make a model of what he sees, in addition to a copy, or to point to such a model; even though *he* has no idea of my purpose in demanding two accounts.

Page 196

But when we have a changing aspect the case is altered. Now the only possible expression of our experience is what before perhaps seemed, or even was, a useless specification when once we had the copy.

Page 196

And this by itself wrecks the comparison of 'organization' with colour and shape in visual impressions.

Page 196

If I saw the duck-rabbit as a rabbit, then I saw: these shapes and colours (I give them in detail)--and I saw besides something like this:

Page Break 197

and here I point to a number of different pictures of rabbits.--This shews the difference between the concepts.

Page 197

'Seeing as....' is not part of perception. And for that reason it is like seeing and again not like.

Page 197

I look at an animal and am asked: "What do you see?" I answer: "A rabbit".--I see a landscape; suddenly a rabbit runs past. I exclaim "A rabbit!"

Page 197

Both things, both the report and the exclamation, are expressions of perception and of visual experience. But the exclamation is so in a different sense from the report: it is forced from us.--It is related to the experience as a cry is to pain.

Page 197

But since it is the description of a perception, it can also be called the expression of thought.--If you are looking at the object, you need not think of it; but if you are having the visual experience expressed by the exclamation, you are also *thinking* of what you see.

Page 197

Hence the flashing of an aspect on us seems half visual experience, half thought.

Page 197

Someone suddenly sees an appearance which he does not recognize (it may be a familiar object, but in an unusual position or lighting); the lack of recognition perhaps lasts only a few seconds. Is it correct to say he has a different visual experience from someone who knew the object at once?

Page 197

For might not someone be able to describe an unfamiliar shape that appeared before him just as *accurately* as I, to whom it is familiar? And isn't that the answer?--Of course it will not generally be so. And his description will run quite differently. (I say, for example, "The animal had long ears"--he: "There were two long appendages", and then he draws them.)

Page 197

I meet someone whom I have not seen for years; I see him clearly, but fail to know him. Suddenly I know him, I see the old face in the altered one. I believe that I should do a different portrait of him now if I could paint.

Page 197

Now, when I know my acquaintance in a crowd, perhaps after looking in his direction for quite a while,--is this a special sort of seeing? Is it a case of both seeing and thinking? or an amalgam of the two, as I should almost like to say?

Page 197

The question is: *why* does one want to say this?

The very expression which is also a report of what is seen, is here a cry of recognition.

What is the criterion of the visual experience?--The criterion? What do you suppose?

The representation of 'what is seen'.

The concept of a representation of what is seen, like that of a copy, is very elastic, and so *together with it* is the concept of what is seen. The two are intimately connected. (Which is *not* to say that they are alike.)

How does one tell that human beings *see* three-dimensionally?--I ask someone about the lie of the land (over there) of which he has a view. "Is it like *this*?" (I shew him with my hand)--"Yes."--"How do you know?"--"It's not misty, I see it quite clear."--He does not give reasons for the surmise. The only thing that is natural to us is to represent what we see three-dimensionally; special practice and training are needed for two-dimensional representation whether in drawing or in words. (The queerness of children's drawings.)

If someone sees a smile and does not know it for a smile, does not understand it as such, does he see it differently from someone who understands it?--He mimics it differently, for instance.

Hold the drawing of a face upside down and you can't recognize the expression of the face. Perhaps you can see that it is smiling, but not exactly what *kind* of smile it is. You cannot imitate the smile or describe it more exactly.

And yet the picture which you have turned round may be a most exact representation of a person's face.

The figure (a) is the reverse of the figure (b)

As (c) *pleasure* is the reverse of (d) *Pleasure* But--I should like to say--there is a different difference between my impressions of (c) and (d) and between those of (a) and (b). (d), for example, looks neater than (c). (Compare a remark of Lewis Carroll's.) (d) is easy, (c) hard to copy.

Imagine the duck-rabbit hidden in a tangle of lines. Now I suddenly notice it in the picture, and notice it simply as the head of a rabbit. At some later time I look at the same picture and notice the same figure, but see it as the duck, without necessarily realizing that it was the same figure both times.--If I later see the aspect change--can I say that the duck and rabbit aspects are now seen quite differently from when I recognized them separately in the tangle of lines? No.

But the change produces a surprise not produced by the recognition.

If you search in a figure (1) for another figure (2), and then find it, you see (1) in a new way. Not only can you give a new kind of description of it, but noticing the second figure was a new visual experience.

But you would not necessarily want to say "Figure (1) looks quite different now; it isn't even in the least like the figure I saw before, though they are congruent!"

There are here hugely many interrelated phenomena and possible concepts.

Then is the copy of the figure an *incomplete* description of my visual experience? No.--But the

circumstances decide whether, and what, more detailed specifications are necessary.--It *may* be an incomplete description; if there is still something to ask.

Page 199

Of course we can say: There are certain things which fall equally under the concept 'picture-rabbit' and under the concept 'picture-duck'. And a picture, a drawing, is such a thing.--But the *impression* is not simultaneously of a picture-duck and a picture-rabbit.

Page 199

"What I really *see* must surely be what is produced in me by the influence of the object"--Then what is produced in me is a sort of copy, something that in its turn can be looked at, can be before one; almost something like a *materialization*.

Page 199

And this materialization is something spatial and it must be possible to describe it in purely spatial terms. For instance (if it is a face) it can smile; the concept of friendliness, however, has no place in an account of it, but is *foreign* to such an account (even though it may subserve it).

Page 199

If you ask me what I saw, perhaps I shall be able to make a sketch which shews you; but I shall mostly have no recollection of the way my glance shifted in looking at it.

Page Break 200

Page 200

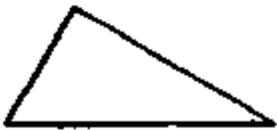

The concept of 'seeing' makes a tangled impression. Well, it is tangled.--I look at the landscape, my gaze ranges over it, I see all sorts of distinct and indistinct movement; *this* impresses itself sharply on me, *that* is quite hazy. After all, how completely ragged what we see can appear! And now look at all that can be meant by "description of what is seen".--But this just is what is called description of what is seen. There is not *one genuine* proper case of such description--the rest being just vague, something which awaits clarification, or which must just be swept aside as rubbish.

Page 200

Here we are in enormous danger of wanting to make fine distinctions.--It is the same when one tries to define the concept of a material object in terms of 'what is really seen'.--What we have rather to do is to *accept* the everyday language-game, and to note *false* accounts of the matter *as* false. The primitive language-game which children are taught needs no justification; attempts at justification need to be rejected.

Page 200

Take as an example the aspects of a triangle. This triangle

can be seen as a triangular hole, as a solid, as a geometrical drawing; as standing on its base, as hanging from its apex; as a mountain, as a wedge, as an arrow or pointer, as an overturned object which is meant to stand on the shorter side of the right angle, as a half parallelogram, and as various other things.

Page 200

"You can think now of *this* now of *this* as you look at it, can regard it now as *this* now as *this*, and then you will see it now *this* way, now *this*."--*What* way? There *is* no further qualification.

Page 200

But how is it possible to *see* an object according to an *interpretation*?--The question represents it as a queer fact; as if something were being forced into a form it did not really fit. But no squeezing, no forcing took place here.

Page 200

When it looks as if there were no room for such a form between other ones you have to look for it in another dimension. If there is no room here, there *is* room in another dimension.

Page Break 201

Page 201

(It is in this sense too that there is no room for imaginary numbers in the continuum of real numbers. But what this means is: the application of the concept of imaginary numbers is less like that of real numbers than appears from the look of the *calculations*. It is necessary to get down to the application, and then the concept finds a different place, one which, so to speak, one never dreamed of.)

Page 201

How would the following account do: "What I can see something as, is what it can be a picture of"?

Page 201

What this means is: the aspects in a change of aspects are those ones which the figure might sometimes have *permanently* in a picture.

Page 201

A triangle can really be *standing up* in one picture, be hanging in another, and can in a third be something that has fallen over.--That is, I who am looking at it say, not "It may also be something that has fallen over", but "That glass has fallen over and is lying there in fragments". This is how we react to the picture.

Page 201

Could I say what a picture must be like to produce this effect? No. There are, for example, styles of painting which do not convey anything to me in this immediate way, but do to other people. I think custom and upbringing have a hand in this.

Page 201

What does it mean to say that I '*see the sphere floating in the air*' in a picture?

Page 201

Is it enough that this description is the first to hand, is the matter-of-course one? No, for it might be so for various reasons. This might, for instance, simply be the conventional description.

Page 201

What is the expression of my not merely understanding the picture in this way, for instance, (knowing what it is *supposed* to be), but *seeing* it in this way?--It is expressed by: "The sphere seems to float", "You see it floating", or again, in a special tone of voice, "It floats!"

Page 201

This, then, is the expression of taking something for something. But not being used as such.

Page 201

Here we are not asking ourselves what are the causes and what produces this impression in a particular case.

Page 201

And *is* it a special impression?--"Surely I see something *different* when I see the sphere floating from when I merely see it lying there."--This really means: This expression is justified!--(For taken literally it is no more than a repetition.)

Page Break 202

Page 202

(And yet my impression is not that of a real floating sphere either. There are various forms of 'three-dimensional seeing'. The three-dimensional character of a photograph and the three-dimensional character of what we see through a stereoscope.)

Page 202

"And is it really a different impression?"--In order to answer this I should like to ask myself whether there is really something different there in me. But how can I find out?--I *describe* what I am seeing differently.

Page 202

Certain drawings are always seen as flat figures, and others sometimes, or always, three-dimensionally.

Page 202

Here one would now like to say: the visual impression of what is seen three-dimensionally is three-dimensional; with the schematic cube, for instance, it is a cube. (For the description of the impression is the description of a cube.)

Page 202

And then it seems queer that with some drawings our impression should be a flat thing, and with some a three-dimensional thing. One asks oneself "Where is this going to end?"

Page 202

When I see the picture of a galloping horse--do I merely *know* that this is the kind of movement meant? Is it superstition to think I *see* the horse galloping in the picture?--And does my visual impression gallop too?

Page 202

What does anyone tell me by saying "Now I see it as....."? What consequences has this information? What can I do with it?

Page 202

People often associate colours with vowels. Someone might find that a vowel changed its colour when it was repeated over and over again. He finds *a* 'now blue--now red', for instance.

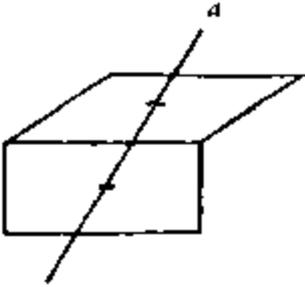

Page 202

The expression "Now I am seeing it as..." might have no more significance for us than: "Now I find *a* red".

(Linked with physiological observations, even this change might acquire importance for us.)

Here it occurs to me that in conversation on aesthetic matters we use the words: "You have to see it like *this*, this is how it is meant"; "When you see it like *this*, you see where it goes wrong"; "You have to hear this bar as an introduction"; "You must hear it in this key"; "You must phrase it like *this*" (which can refer to hearing as well as to playing).

This figure

is supposed to represent a convex step and to be used in some kind of topological demonstration. For this purpose we draw the straight line *a* through the geometric centres of the two surfaces.--Now if anyone's three-dimensional impression of the figure were never more than momentary, and even so were now concave, now convex, that might make it difficult for him to follow our demonstration. And if he finds that the flat aspect alternates with a three-dimensional one, that is just as if I were to shew him completely different objects in the course of the demonstration.

What does it mean for me to look at a drawing in descriptive geometry and say: "I know that this line appears again here, but I can't *see* it like that"? Does it simply mean a lack of familiarity in operating with the drawing; that I don't 'know my way about' too well?--This familiarity is certainly one of our criteria. What tells us that someone is seeing the drawing three-dimensionally is a certain kind of 'knowing one's way about'. Certain gestures, for instance, which indicate the three-dimensional relations: fine shades of behaviour.

I see that an animal in a picture is transfixed by an arrow. It has struck it in the throat and sticks out at the back of the neck. Let the picture be a silhouette.--Do you *see* the arrow--or do you merely *know* that these two bits are supposed to represent part of an arrow?

(Compare Köhler's figure of the interpenetrating hexagons.)

"But this isn't *seeing!*"--"But this is seeing!"--It must be possible to give both remarks a conceptual justification.

But this is seeing! *In what sense* is it seeing?

"The phenomenon is at first surprising, but a physiological explanation of it will certainly be found."--

Our problem is not a causal but a conceptual one.

If the picture of the transfixed beast or of the interpenetrating hexagons were shewn to me just for a moment and then I had to describe it, *that* would be my description; if I had to draw it I should

certainly produce a very faulty copy, but it would shew some sort of animal transfixed by an arrow, or two hexagons interpenetrating. That is to say: there are certain mistakes that I should *not* make.

The first thing to jump to my eye in this picture is: there are two hexagons.

Now I look at them and ask myself: "Do I really see them *as* hexagons?"--and for the whole time they are before my eyes? (Assuming that they have not changed their aspect in that time.)--And I should like to reply: "I am not thinking of them as hexagons the whole time."

Page 204

Someone tells me: "I saw it at once as two hexagons. And that's the *whole* of *what* I saw." But how do I understand this? I think he would have given this description at once in answer to the question "What are you seeing?", nor would he have treated it as one among several possibilities. In this his description is like the answer "A face" on being shewn the figure

Page 204

The best description I can give of what was shewn me for a moment is *this*:.....

Page 204

"The impression was that of a rearing animal." So a perfectly definite description came out.--Was it *seeing*, or was it a thought?

Page 204

Do not try to analyse your own inner experience.

Page 204

Of course I might also have seen the picture first as something different, and then have said to myself "Oh, it's two hexagons!" So the aspect would have altered. And does this prove that I in fact saw it as something definite?

Page 204

"Is it a *genuine* visual experience?" The question is: in what sense is it one?

Page 204

Here it is *difficult* to see that what is at issue is the fixing of concepts.

Page 204

A *concept* forces itself on one. (This is what you must not forget.)

Page 204

For when should I call it a mere case of knowing, not seeing?--Perhaps when someone treats the picture as a working drawing, *reads* it like a blueprint. (Fine shades of behaviour.--Why are they *important*? They have important consequences.)

Page Break 205

Page 205

"To me it is an animal pierced by an arrow." That is what I treat it as; this is my *attitude* to the figure. This is one meaning in calling it a case of 'seeing'.

Page 205

But can I say in the same sense: "To me these are two hexagons"? Not in the same sense, but in a similar one.

Page 205

You need to think of the role which pictures such as paintings (as opposed to working drawings) have in our lives. This role is by no means a uniform one.

Page 205

A comparison: texts are sometimes hung on the wall. But not theorems of mechanics. (Our relation to these two things.)

Page 205

If you see the drawing as such-and-such an animal, what I expect from you will be pretty different from what I expect when you merely know what it is meant to be.

Page 205

Perhaps the following expression would have been better: we *regard* the photograph, the picture on our wall, as the object itself (the man, landscape, and so on) depicted there.

Page 205

This need not have been so. We could easily imagine people who did not have this relation to such pictures. Who, for example, would be repelled by photographs, because a face without colour and even perhaps a face

reduced in scale struck them as inhuman.

Page 205

I say: "We regard a portrait as a human being,"--but when do we do so, and for how long? *Always*, if we see it at all (and do not, say, see it as something else)?

Page 205

I might say yes to this, and that would determine the concept of regarding-as.--The question is whether yet another concept, related to this one, is also of importance to us: that, namely, of a seeing--as which only takes place while I am actually concerning myself with the picture as the object depicted.

Page 205

I might say: a picture does not always *live* for me while I am seeing it.

Page 205

"Her picture smiles down on me from the wall." It need not always do so, whenever my glance lights on it.

Page 205

The duck-rabbit. One asks oneself: how can the eye--this *dot*--be looking in a direction?--"*See, it is looking!*" (And one 'looks' oneself as one says this.) But one does not say and do this the whole time one is looking at the picture. And now, what is this "See, it's looking!"--does it express a sensation?

Page Break 206

Page 206

(In giving all these examples I am not aiming at some kind of completeness, some classification of psychological concepts. They are only meant to enable the reader to shift for himself when he encounters conceptual difficulties.)

Page 206

"Now I see it as a...." goes with "I am trying to see it as a...." or "I can't see it as a.... yet". But I cannot try to see a conventional picture of a lion *as* a lion, any more than an F as that letter. (Though I may well try to see it as a gallows, for example.)

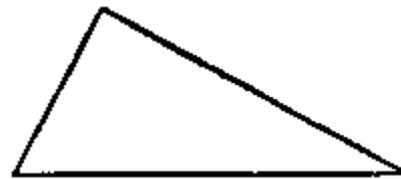

Page 206

Do not ask yourself "How does it work with *me*?"--Ask "What do I know about someone else?"

Page 206

How does one play the game: "It could be *this* too"? (What a figure could also be--which is what it can be

seen as--is not simply another figure. If someone said "I see

as

", he might still be meaning very different things.)

Page 206

Here is a game played by children: they say that a chest, for example, is a house; and thereupon it is interpreted as a house in every detail. A piece of fancy is worked into it.

Page 206

And does the child now *see* the chest as a house?

Page 206

"He quite forgets that it is a chest; for him it actually is a house." (There are definite tokens of this.) Then would it not also be correct to say he *sees* it as a house?

Page 206

And if you knew how to play this game, and, given a particular situation, you exclaimed with special expression "Now it's a house!"--you would be giving expression to the dawning of an aspect.

Page 206

If I heard someone talking about the duck-rabbit, and *now* he spoke in a certain way about the special expression of the rabbit's face I should say, now he's seeing the picture as a rabbit.

Page 206

But the expression in one's voice and gestures is the same as if the object had altered and had ended by *becoming* this or that.

Page 206

I have a theme played to me several times and each time in a slower tempo. In the end I say "*Now it's right*", or "*Now at last it's a march*", "*Now at last it's a dance*".--The same tone of voice expresses the dawning of an aspect.

Page Break 207

Page 207

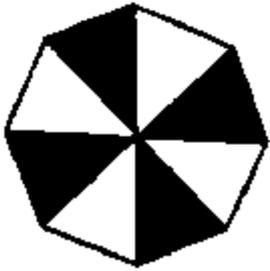

'Fine shades of behaviour.'--When my understanding of a theme is expressed by my whistling it with the correct expression, this is an example of such fine shades.

Page 207

The aspects of the triangle: it is as if an *image* came into contact, and for a time remained in contact, with the visual impression.

Page 207

In this, however, these aspects differ from the concave and convex aspects of the step (for example). And also from the aspects of the figure

(which I shall call a "double cross") as a white cross on a black ground and as a black cross on a white ground.

Page 207

You must remember that the descriptions of the alternating aspects are of a different kind in each case.

Page 207

(The temptation to say "I see it like *this*", pointing to the same thing for "it" and "this".) Always get rid of the idea of the private object in this way: assume that it constantly changes, but that you do not notice the change because your memory constantly deceives you.

Page 207

Those two aspects of the double cross (I shall call them the aspects A) might be reported simply by pointing alternately to an isolated white and an isolated black cross.

Page 207

One could quite well imagine this as a primitive reaction in a child even before it could talk.

Page 207

(Thus in reporting the aspects A we point to a part of the double cross.--The duck and rabbit aspects could not be described in an analogous way.)

Page 207

You only 'see the duck and rabbit aspects' if you are already conversant with the shapes of those two animals. There is no analogous condition for seeing the aspects A.

Page 207

It is possible to take the duck-rabbit simply for the picture of a rabbit, the double cross simply for the picture of a black cross, but not to take the bare triangular figure for the picture of an object that has fallen over. To see this aspect of the triangle demands *imagination*.

Page Break 208

Page 208

The aspects A are not essentially three-dimensional; a black cross on a white ground is not essentially a cross with a white surface in the background. You could teach someone the idea of the black cross on a ground of different colour without shewing him anything but crosses painted on sheets of paper. Here the 'background' is simply the surrounding of the cross.

Page 208

The aspects A are not connected with the possibility of illusion in the same way as are the three-dimensional aspects of the drawing of a cube or step.

Page 208

I can see the schematic cube as a box;--but can I also see it now as a paper, now as a tin, box?--What ought I to say, if someone assured me *he* could?--I can set a limit to the concept here.

Page 208

Yet think of the expression "*felt*" in connexion with looking at a picture. ("One feels the softness of that material.") (*Knowing* in dreams. "And I *knew* that... was in the room.")

Page 208

How does one teach a child (say in arithmetic) "Now take *these* things together!" or "Now *these* go together"? Clearly "taking together" and "going together" must originally have had another meaning for him than that of *seeing* in this way or that.--And this is a remark about concepts, not about teaching methods.

Page 208

One *kind* of aspect might be called 'aspects of organization'. When the aspect changes parts of the picture go together which before did not.

Page 208

In the triangle I can see now *this* as apex, *that* as base--now *this* as apex, *that* as base.--Clearly the words "Now I am seeing *this* as the apex" cannot so far mean anything to a learner who has only just met the concepts of apex, base, and so on.--But I do not mean this as an empirical proposition.

Page 208

"Now he's seeing it like *this*", "now like *that*" would only be said of someone *capable* of making certain applications of the figure quite freely.

Page 208

The substratum of this experience is the mastery of a technique.

Page 208

But how queer for this to be the logical condition of someone's having such-and-such an *experience*! After all, you don't say that one only 'has toothache' if one is capable of doing such-and-such.--From this it follows that we cannot be dealing with the same concept of experience here. It is a different though related concept.

Page Break 209

Page 209

It is only if someone *can do*, has learnt, is master of, such-and-such, that it makes sense to say he has had *this* experience.

Page 209

And if this sounds crazy, you need to reflect that the *concept* of seeing is modified here. (A similar consideration is often necessary to get rid of a feeling of dizziness in mathematics.)

Page 209

We talk, we utter words, and only *later* get a picture of their life.

Page 209

For how could I see that this posture was hesitant before I knew that it was a posture and not the anatomy of the animal?

Page 209

But surely that only means that I cannot use *this* concept to describe the object of sight, just because it has *more* than purely visual reference?--Might I not for all that have a purely visual concept of a hesitant posture, or of a timid face?

Page 209

Such a concept would be comparable with 'major' and 'minor' which certainly have emotional value, but can also be used purely to describe a perceived structure.

Page 209

The epithet "sad", as applied for example to the outline face, characterizes the grouping of lines in a circle. Applied to a human being it has a different (though related) meaning. (But this does *not* mean that a sad expression is *like* the feeling of sadness!)

Page 209

Think of this too: I can only see, not hear, red and green,--but sadness I can hear as much as I can see it.

Page 209

Think of the expression "I heard a plaintive melody". And now the question is: "Does he *hear* the plaint?"

Page 209

And if I reply: "No, he doesn't hear it, he merely has a sense of it"--where does that get us? One cannot mention a sense-organ for this 'sense'.

Page 209

Some would like to reply here: "Of course I hear it!"--Others: "I don't really *hear* it."

Page 209

We can, however, establish differences of concept here.

We react to the visual impression differently from someone who does not recognize it as timid (in the *full* sense of the word).--But I do *not* want to say here that we feel this reaction in our muscles and joints and that this is the 'sensing'.--No, what we have here is a modified concept of *sensation*.

One might say of someone that he was blind to the *expression* of a face. Would his eyesight on that account be defective?

This is, of course, not simply a question for physiology. Here the physiological is a symbol of the logical.

If you feel the seriousness of a tune, what are you perceiving?--Nothing that could be conveyed by reproducing what you heard.

I can imagine some arbitrary cipher--this, for instance:  --to be a strictly correct letter of some foreign alphabet. Or again, to be a faultily written one, and faulty in this way or that: for example, it might be slap-dash, or typical childish awkwardness, or like the flourishes in a legal document. It could deviate from the correctly written letter in a variety of ways.--And I can see it in various aspects according to the fiction I surround it with. And here there is a close kinship with 'experiencing the meaning of a word'.

I should like to say that what dawns here lasts only as long as I am occupied with the object in a particular way. ("See, it's looking!")--I should like to say--and *is* it so?--Ask yourself "For how long am I struck by a thing?"--For how long do I find it *new*?

The aspect presents a physiognomy which then passes away. It is almost as if there were a face there which at first I *imitate*, and then accept without imitating it.--And isn't this really explanation enough?--But isn't it too much?

"I observed the likeness between him and his father for a few minutes, and then no longer."--One might say this if his face were changing and only looked like his father's for a short time. But it can also mean that after a few minutes I stopped being struck by the likeness.

"After the likeness had struck you, how long were you aware of it?" What kind of answer might one give to this question?--"I soon stopped thinking about it", or "It struck me again from time to time", or "I several times had the thought, how like they are!", or "I marvelled at the likeness for at least a minute"--That is the sort of answer you would get.

I should like to put the question "Am I *aware* of the spatial character, the depth of an object (of this cupboard for instance), the *whole* time

I am seeing it?" Do I, so to speak, *feel* it the whole time?--But put the question in the third person.--When would you say of someone that he was aware of it the whole time, and when the opposite?--Of course, one could ask him,--but how did he learn how to answer such a question?--He knows what it means "to feel pain continuously". But that will only confuse him here (as it confuses me).

If he now says he is continuously aware of the depth--do I believe him? And if he says he is aware of it only occasionally (when talking about it, perhaps)--do I believe *that*? These answers will strike me as resting on a false foundation.--It will be different if he says that the object sometimes strikes him as flat, sometimes as three-dimensional.

Someone tells me: "I looked at the flower, but was thinking of something else and was not conscious of its colour." Do I understand this?--I can imagine a significant context, say his going on: "Then I suddenly saw it, and realized it was the one which.....".

Or again: "If I had turned away then, I could not have said what colour it was."

Page 211

"He looked at it without seeing it."--There is such a thing. But what is the criterion for it?--Well, there is a variety of cases here.

Page 211

"Just now I looked at the shape rather than at the colour." Do not let such phrases confuse you. Above all, don't wonder "What can be going on in the eyes or brain?"

Page 211

The likeness makes a striking impression on me; then the impression fades.

Page 211

It only struck me for a few minutes, and then no longer did.

Page 211

What happened here?--What can I recall? My own facial expression comes to mind; I could reproduce it. If someone who knew me had seen my face he would have said "Something about his face struck you just now".--There further occurs to me what I say on such an occasion, out loud or to myself. And that is all.--And is this what being struck is? No. These are the phenomena of being struck; but they *are* 'what happens'.

Page 211

Is being struck looking plus thinking? No. Many of our concepts *cross* here.

Page 211

('Thinking' and 'inward speech'--I do not say 'to oneself'--are different concepts.)

Page Break 212

Page 212

The colour of the visual impression corresponds to the colour of the object (this blotting paper looks pink to me, and is pink)--the shape of the visual impression to the shape of the object (it looks rectangular to me, and is rectangular)--but what I perceive in the dawning of an aspect is not a property of the object, but an internal relation between it and other objects.

Page 212

It is almost as if 'seeing the sign in this context' were an echo of a thought.

Page 212

"The echo of a thought in sight"--one would like to say.

Page 212

Imagine a physiological explanation of the experience. Let it be this: When we look at the figure, our eyes scan it repeatedly, always following a particular path. The path corresponds to a particular pattern of oscillation of the eyeballs in the act of looking. It is possible to jump from one such pattern to another and for the two to alternate. (Aspects A.) Certain patterns of movement are physiologically impossible; hence, for example, I cannot see the schematic cube as two interpenetrating prisms. And so on. Let this be the explanation.--"Yes, that shews it is a kind of *seeing*."--You have now introduced a new, a physiological, criterion for seeing. And this can screen the old problem from view, but not solve it.--The purpose of this paragraph however, was to bring before our view what happens when a physiological explanation is offered. The psychological concept hangs out of reach of this explanation. And this makes the nature of the problem clearer.

Page 212

Do I really see something different each time, or do I only interpret what I see in a different way? I am inclined to say the former. But why?--To interpret is to think, to do something; seeing is a state.

Page 212

Now it is easy to recognize cases in which we are *interpreting*. When we interpret we form hypotheses, which may prove false.--"I am seeing this figure as a...." can be verified as little as (or in the same sense as) "I am seeing bright red". So there is a similarity in the use of "seeing" in the two contexts. Only do not think you knew in advance what the "*state of seeing*" means here! Let the use *teach* you the meaning.

Page 212

We find certain things about seeing puzzling, because we do not find the whole business of seeing puzzling enough.

Page Break 213

Page 213

If you look at a photograph of people, houses and trees, you do not feel the lack of the third dimension in it. We should not find it easy to describe a photograph as a collection of colour-patches on a flat surface; but what we

see in a stereoscope looks three-dimensional in a different way again.

Page 213

(It is anything but a matter of course that we see 'three-dimensionally' with two eyes. If the two visual images are amalgamated, we might expect a blurred one as a result.)

Page 213

The concept of an aspect is akin to the concept of an image. In other words: the concept 'I am now seeing it as...' is akin to 'I am now having *this* image'.

Page 213

Doesn't it take imagination to hear something as a variation on a particular theme? And yet one is perceiving something in so hearing it.

Page 213

"Imagine this changed like this, and you have this other thing." One can use imagining in the course of proving something.

Page 213

Seeing an aspect and imagining are subject to the will. There is such an order as "Imagine *this*", and also: "Now see the figure like *this*"; but not: "Now see this leaf green".

Page 213

The question now arises: Could there be human beings lacking in the capacity to see something *as something*--and what would that be like? What sort of consequences would it have?--Would this defect be comparable to colour-blindness or to not having absolute pitch?--We will call it "aspect-blindness"--and will next consider what might be meant by this. (A conceptual investigation.) The aspect-blind man is supposed not to see the aspects A change. But is he also supposed not to recognize that the double cross contains both a black and a white cross? So if told "Shew me figures containing a black cross among these examples" will he be unable to manage it? No, he should be able to do that; but he will not be supposed to say: "Now it's a black cross on a white ground!"

Page 213

Is he supposed to be blind to the similarity between two faces?--And so also to their identity or approximate identity? I do not want to settle this. (He ought to be able to execute such orders as "Bring me something that looks like *this*.")

Page 213

Ought he to be unable to see the schematic cube as a cube?--It would not follow from that that he could not recognize it as a representation (a working drawing for instance) of a cube. But for him it

Page Break 214

would not jump from one aspect to the other.--Question: Ought he to be able to *take* it as a cube in certain circumstances, as we do?--If not, this could not very well be called a sort of blindness.

Page 214

The 'aspect-blind' will have an altogether different relationship to pictures from ours.

Page 214

(Anomalies of *this* kind are easy for us to imagine.)

Page 214

Aspect-blindness will be *akin* to the lack of a 'musical ear'.

Page 214

The importance of this concept lies in the connexion between the concepts of 'seeing an aspect' and 'experiencing the meaning of a word'. For we want to ask "What would you be missing if you did not *experience* the meaning of a word?"

Page 214

What would you be missing, for instance, if you did not understand the request to pronounce the word "till" and to mean it as a verb,--or if you did not feel that a word lost its meaning and became a mere sound if it was repeated ten times over?

Page 214

In a law-court, for instance, the question might be raised how someone meant a word. And this can be inferred from certain facts.--It is a question of *intention*. But could how he experienced a word--the word "bank" for instance--have been significant in the same way?

Page 214

Suppose I had agreed on a code with someone; "tower" means bank. I tell him "Now go to the tower"--he understands me and acts accordingly, but he feels the word "tower" to be strange in this use, it has not yet 'taken on' the meaning.

"When I read a poem or narrative with feeling, surely something goes on in me which does not go on when I merely skim the lines for information."--What processes am I alluding to?--The sentences have a different *ring*. I pay careful attention to my intonation. Sometimes a word has the wrong intonation, I emphasize it too much or too little. I notice this and shew it in my face. I might later talk about my reading in detail, for example about the mistakes in my tone of voice. Sometimes a picture, as it were an illustration, comes to me. And this seems to help me to read with the correct expression. And I could mention a good deal more of the same kind.--I can also give a word a tone of voice which brings out the meaning of the rest, almost as if this word were a picture of the whole thing. (And this may, of course, depend on sentence-formation.)

When I pronounce this word while reading with expression it is completely filled with its meaning.--"How can this be, if meaning is the use of the word?" Well, what I said was intended figuratively. Not that I chose the figure: it forced itself on me.--But the figurative employment of the word can't get into conflict with the original one.

Perhaps it could be explained why precisely *this* picture suggests itself to me. (Just think of the expression, and the meaning of the expression: "the word that hits it off".)

But if a sentence can strike me as like a painting in words, and the very individual word in the sentence as like a picture, then it is no such marvel that a word uttered in isolation and without purpose can seem to carry a particular meaning in itself.

Think here of a special kind of illusion which throws light on these matters.--I go for a walk in the environs of a city with a friend. As we talk it comes out that I am imagining the city to lie on our right. Not only have I *no* conscious reason for this assumption, but some quite simple consideration was enough to make me realize that the city lay rather to the left ahead of us. I can at first give no answer to the question *why* I imagine the city in *this* direction. I had *no reason* to think it. But though I see no reason still I seem to see certain psychological causes for it. In particular, certain associations and memories. For example, we walked along a canal, and once before in similar circumstances I had followed a canal and that time the city lay on our right.--I might try as it were psychoanalytically to discover the causes of my unfounded conviction.

"But what is this queer experience?"--Of course it is not queerer than any other; it simply differs in kind from those experiences which we regard as the most fundamental ones, our sense impressions for instance.

"I feel as if I knew the city lay over there."--"I feel as if the name 'Schubert' fitted Schubert's works and Schubert's face."

You can say the word "March" to yourself and mean it at one time as an imperative at another as the name of a month. And now say "March!"--and then "March *no further!*"--Does the *same* experience accompany the word both times--are you sure?

If a sensitive ear shews me, when I am playing this game, that I have now *this* now *that* experience of the word--doesn't it also shew

me that I often do not have *any* experience of it in the course of talking?--For the fact that I then also mean it, intend it, now like *this* now like *that*, and maybe also say so later is, of course, not in question.

But the question now remains why, in connexion with this *game* of experiencing a word, we also speak of 'the meaning' and of 'meaning it'.--This is a different kind of question.--It is the phenomenon which is characteristic of this language-game that in *this* situation we use this expression: we say we pronounced the word with *this* meaning and take this expression over from that other language-game.

Call it a dream. It does not change anything.

Given the two ideas 'fat' and 'lean', would you be rather inclined to say that Wednesday was fat and Tuesday

lean, or the other way round? (I incline to choose the former.) Now have "fat" and "lean" some different meaning here from their usual one?--They have a different use.--So ought I really to have used different words? Certainly not that.--I want to use *these* words (with their familiar meanings) *here*.--Now, I say nothing about the causes of this phenomenon. They *might* be associations from my childhood. But that is a hypothesis. Whatever the explanation,--the inclination is there.

Page 216

Asked "What do you really mean here by 'fat' and 'lean'?"--I could only explain the meanings in the usual way. I could *not* point to the examples of Tuesday and Wednesday.

Page 216

Here one might speak of a 'primary' and 'secondary' sense of a word. It is only if the word has the primary sense for you that you use it in the secondary one.

Page 216

Only if you have learnt to calculate--on paper or out loud--can you be made to grasp, by means of this concept, what calculating in the head is.

Page 216

The secondary sense is not a 'metaphorical' sense. If I say "For me the vowel *e* is yellow" I do not mean: 'yellow' in a metaphorical sense,--for I could not express what I want to say in any other way than by means of the idea 'yellow'.

Page 216

Someone tells me: "Wait for me by the bank". Question: Did you, *as you were saying the word*, mean this bank?--This question is of the same kind as "Did you intend to say such-and-such to him on your way to meet him?" It refers to a definite time (the time of walking, as the former question refers to the time of speaking)--but not to an

Page Break 217

experience during that time. Meaning is as little an experience as intending.

Page 217

But what distinguishes them from experience?--They have no experience-content. For the contents (images for instance) which accompany and illustrate them are not the meaning or intending.

Page 217

The intention *with which* one acts does not 'accompany' the action any more than the thought 'accompanies' speech. Thought and intention are neither 'articulated' nor 'non-articulated'; to be compared neither with a single note which sounds during the acting or speaking, nor with a tune.

Page 217

'Talking' (whether out loud or silently) and 'thinking' are not concepts of the same kind; even though they are in closest connexion.

Page 217

The *interest* of the experiences one has while speaking and of the intention is not the same. (The experiences might perhaps inform a psychologist about the '*unconscious*' intention.)

Page 217

"At that word we both thought of him." Let us assume that each of us said the same words to himself--and how can it mean MORE than that?--But wouldn't even those words be only a *germ*? They must surely belong to a language and to a context, in order really to be the expression of the thought *of* that man.

Page 217

If God had looked into our minds he would not have been able to see there whom we were speaking of.

Page 217

"Why did you look at me at that word, were you thinking of....?"--So there is a reaction at a certain moment and it is explained by saying "I thought of...." or "I suddenly remembered...."

Page 217

In saying this you refer to that moment in the time you were speaking. It makes a difference whether you refer to this or to that moment.

Page 217

Mere explanation of a word does not refer to an occurrence at the moment of speaking.

Page 217

The language-game "I mean (or meant) *this*" (subsequent explanation of a word) is quite different from this one: "I thought of.... as I said it." The latter is akin to "It reminded me of...."

Page 217

"I have already remembered three times today that I must write to him." Of what importance is it what went on in me then?--On the

Page Break 218

other hand what is the importance, what the interest, of the statement itself?--It permits certain conclusions.

Page 218

"At these words *he* occurred to me."--What is the primitive reaction with which the language-game begins--which can then be translated into these words? How do people get to use these words?

Page 218

The primitive reaction may have been a glance or a gesture, but it may also have been a word.

Page 218

"Why did you look at me and shake your head?"--"I wanted to give you to understand that you....." This is supposed to express not a symbolic convention but the purpose of my action.

Page 218

Meaning it is not a process which accompanies a word. For no *process* could have the consequences of meaning.

Page 218

(Similarly, I think, it could be said: a calculation is not an experiment, for no experiment could have the peculiar consequences of a multiplication.)

Page 218

There are important accompanying phenomena of talking which are often missing when one talks without thinking, and this is characteristic of talking without thinking. But *they* are not the thinking.

Page 218

"Now I know!" What went on here?--So did I *not* know, when I declared that now I knew?

Page 218

You are looking at it wrong.

Page 218

(What is the signal for?)

Page 218

And could the 'knowing' be called an accompaniment of the exclamation?

Page 218

The familiar physiognomy of a word, the feeling that it has taken up its meaning into itself, that it is an actual likeness of its meaning--there could be human beings to whom all this was alien. (They would not have an attachment to their words.)--And how are these feelings manifested among us?--By the way we choose and value words.

Page 218

How do I find the 'right' word? How do I choose among words? Without doubt it is sometimes as if I were comparing them by fine differences of smell: *That* is too....., *that* is too.....,--*this* is the right one.--But I do not always have to make judgments, give explanations; often I might only say: "It simply isn't right yet". I am dissatisfied, I go on looking. At last a word comes: "*That's* it!" *Sometimes* I can say why. This is simply what searching, this is what finding, is like here.

Page Break 219

Page 219

But doesn't the word that occurs to you somehow 'come' in a special way? Just attend and you'll see!--Careful attention is no use to me. All it could discover would be what is *now* going on in *me*.

Page 219

And how can I, precisely now, listen for it at all? I ought to have to wait until a word occurs to me anew. This, however, is the queer thing: it seems as though I did not have to wait on the occasion, but could give myself an exhibition of it, even when it is not actually taking place. How?--I *act* it.--But *what* can I learn in this way? What do I reproduce?--Characteristic accompaniments. Primarily: gestures, faces, tones of voice.

Page 219

It is possible--and this is important--to say a *great deal* about a fine aesthetic difference.--The first thing you say may, of course, be just: "*This* word fits, *that* doesn't"--or something of the kind. But then you can discuss all the extensive ramifications of the tie-up effected by each of the words. That first judgment is *not* the end of the matter, for it is the field of force of a word that is decisive.

Page 219

"The word is on the tip of my tongue." What is going on in my consciousness? That is not the point at all. Whatever did go on was not what was meant by that expression. It is of more interest what went on in my behaviour.--"The word is on the tip of my tongue" tells you: the word which belongs here has escaped me, but I hope to find it soon. For the rest the verbal expression does no more than certain wordless behaviour.

Page 219

James, in writing of this subject, is really trying to say: "What a remarkable experience! The word is not there yet, and yet in a certain sense is there,--or something is there, which *cannot* grow into anything but this word."--But this is not experience at all. *Interpreted* as experience it does indeed look odd. As does intention, when it is interpreted as the accompaniment of action; or again, like minus one interpreted as a cardinal number.

Page 219

The words "It's on the tip of my tongue" are no more the expression of an experience than "Now I know how to go on!"--We use them in *certain situations*, and they are surrounded by behaviour of a special kind, and also by some characteristic experiences. In particular they are frequently followed by *finding* the word. (Ask yourself: "What would it be like if human beings *never* found the word that was on the tip of their tongue?")

Page Break 220

Page 220

Silent 'internal' speech is not a half hidden phenomenon which is as it were seen through a veil. It is not hidden *at all*, but the concept may easily confuse us, for it runs over a long stretch cheek by jowl with the concept of an 'outward' process, and yet does not coincide with it.

Page 220

(The question whether the muscles of the larynx are innervated in connexion with internal speech, and similar things, may be of great interest, but not in our investigation.)

Page 220

The close relationship between 'saying inwardly' and 'saying' is manifested in the possibility of telling out loud what one said inwardly, and of an outward action's *accompanying* inward speech. (I can sing inwardly, or read silently, or calculate in my head, and beat time with my hand as I do so.)

Page 220

"But saying things inwardly is surely a certain activity which I have to learn!" Very well; but what is 'doing' and what is 'learning' here?

Page 220

Let the use of words teach you their meaning. (Similarly one can often say in mathematics: let the *proof* teach you *what* was being proved.)

Page 220

"So I don't *really* calculate, when I calculate in my head?"--After all, you yourself distinguish between calculation in the head and perceptible calculation! But you can only learn what 'calculating in the head' is by learning what 'calculating' is; you can only learn to calculate in your head by learning to calculate.

Page 220

One can say things in one's head very 'distinctly', when one reproduces the tone of voice of one's sentences by humming (with closed lips). Movements of the larynx help too. But the remarkable thing is precisely that one then *hears* the talk in one's imagination and does not merely *feel* the skeleton of it, so to speak, in one's larynx. (For human beings could also well be imagined calculating silently with movements of the larynx, as one can calculate on one's fingers.)

Page 220

A hypothesis, such as that such-and-such went on in our bodies when we made internal calculations, is only of interest to us in that it points to a possible use of the expression "I said.... to myself"; namely that of inferring the physiological process from the expression.

Page 220

That what someone else says to himself is hidden from me is part of the *concept* 'saying inwardly'. Only "hidden" is the wrong word

Page Break 221

here; for if it is hidden from me, it ought to be apparent to him, *he* would have to *know* it. But he does not 'know' it; only, the doubt which exists for me does not exist for him.

Page 221

"What anyone says to himself within himself is hidden from me" might of course also mean that I can for the most part not *guess* it, nor can I read it off from, for example, the movements of his throat (which would be a

possibility.)

Page 221

"I know what I want, wish, believe, feel,....." (and so on through all the psychological verbs) is either philosophers' nonsense, or at any rate *not* a judgment *a priori*.

Page 221

"I know..." may mean "I do not doubt..." but does not mean that the words "I doubt..." are *senseless*, that doubt is logically excluded.

Page 221

One says "I know" where one can also say "I believe" or "I suspect"; where one can find out. (If you bring up against me the case of people's saying "But I must know if I am in pain!", "Only you can know what you feel", and similar things, you should consider the occasion and purpose of these phrases. "War is war" is not an example of the law of identity, either.)

Page 221

It is possible to imagine a case in which I *could* find out that I had two hands. Normally, however, I *cannot* do so. "But all you need is to hold them up before your eyes!"--If I am *now* in doubt whether I have two hands, I need not believe my eyes either. (I might just as well ask a friend.)

Page 221

With this is connected the fact that, for instance, the proposition "The Earth has existed for millions of years" makes clearer sense than "The Earth has existed in the last five minutes". For I should ask anyone who asserted the latter: "What observations does this proposition refer to; and what observations would count against it?"--whereas I know what ideas and observations the former proposition goes with.

Page 221

"A new-born child has no teeth."--"A goose has no teeth."--"A rose has no teeth."--This last at any rate--one would like to say--is obviously true! It is even surer than that a goose has none.--And yet it is none so clear. For where should a rose's teeth have been? The goose has none in its jaw. And neither, of course, has it any in its

Page Break 222

wings; but no one means that when he says it has no teeth.--Why, suppose one were to say: the cow chews its food and then dungs the rose with it, so the rose has teeth in the mouth of a beast. This would not be absurd, because one has no notion in advance where to look for teeth in a rose. ((Connexion with 'pain in someone else's body'.))

Page 222

I can know what someone else is thinking, not what I am thinking.

Page 222

It is correct to say "I know what you are thinking", and wrong to say "I know what I am thinking."

Page 222

(A whole cloud of philosophy condensed into a drop of grammar.)

Page 222

"A man's thinking goes on within his consciousness in a seclusion in comparison with which any physical seclusion is an exhibition to public view."

Page 222

If there were people who always read the silent internal discourse of others--say by observing the larynx--would they too be inclined to use the picture of complete seclusion?

Page 222

If I were to talk to myself out loud in a language not understood by those present my thoughts would be hidden from them.

Page 222

Let us assume there was a man who always guessed right what I was saying to myself in my thoughts. (It does not matter how he manages it.) But what is the criterion for his guessing *right*? Well, I am a truthful person and I confess that he has guessed right.--But might I not be mistaken, can my memory not deceive me? And might it not always do so when--without lying--I express what I have thought within myself?--But now it does appear that 'what went on within me' is not the point at all. (Here I am drawing a construction-line.)

Page 222

The criteria for the truth of the *confession* that I thought such-and-such are not the criteria for a true *description* of a process. And the importance of the true confession does not reside in its being a correct and certain report of a process. It resides rather in the special consequences which can be drawn from a confession whose truth is guaranteed by the special criteria of *truthfulness*.

Page 222

(Assuming that dreams can yield important information about the dreamer, what yielded the information would be truthful accounts of dreams. The question whether the dreamer's memory deceives him when he reports the dream after waking cannot arise, unless indeed we introduce a completely new criterion for the report's 'agreeing')

Page Break 223

with the dream, a criterion which gives us a concept of 'truth' as distinct from 'truthfulness' here.)

Page 223

There is a game of 'guessing thoughts'. A variant of it would be this: I tell A something in a language that B does not understand. B is supposed to guess the meaning of what I say.--Another variant: I write down a sentence which the other person cannot see. He has to guess the words or their sense.--Yet another: I am putting a jig-saw puzzle together; the other person cannot see me but from time to time guesses my thoughts and utters them. He says, for instance, "Now where is this bit?"--"*Now* I know how it fits!"--"I have no idea what goes in here,"--"The sky is always the hardest part" and so on--but *I* need not be talking to myself either out loud or silently at the time.

Page 223

All this would be guessing at thoughts; and the fact that it does not actually happen does not make thought any more hidden than the unperceived physical proceedings.

Page 223

"What is *internal* is hidden from us."--The future is hidden from us. But does the astronomer think like this when he calculates an eclipse of the sun?

Page 223

If I see someone writhing in pain with evident cause I do not think: all the same, his feelings are hidden from me.

Page 223

We also say of some people that they are transparent to us. It is, however, important as regards this observation that one human being can be a complete enigma to another. We learn this when we come into a strange country with entirely strange traditions; and, what is more, even given a mastery of the country's language. We do not *understand* the people. (And not because of not knowing what they are saying to themselves.) We cannot find our feet with them.

Page 223

"I cannot know what is going on in him" is above all a *picture*. It is the convincing expression of a conviction. It does not give the reasons for the conviction. *They* are not readily accessible.

Page 223

If a lion could talk, we could not understand him.

Page 223

It is possible to imagine a guessing of intentions like the guessing of thoughts, but also a guessing of what someone is actually *going to do*.

Page 223

To say "He alone can know what he intends" is nonsense: to say "He alone can know what he will do", wrong. For the prediction contained in my expression of intention (for example "When it strikes

Page Break 224

five I am going home") need not come true, and someone else may know what will really happen.

Page 224

Two points, however, are important: one, that in many cases someone else cannot predict my actions, whereas I foresee them in my intentions; the other, that my prediction (in my expression of intention) has not the same foundation as his prediction of what I shall do, and the conclusions to be drawn from these predictions are quite different.

Page 224

I can be as *certain* of someone else's sensations as of any fact. But this does not make the propositions "He is much depressed", " $25 \times 25 = 625$ " and "I am sixty years old" into similar instruments. The explanation suggests itself that the certainty is of a different *kind*.--This seems to point to a psychological difference. But the difference is logical.

Page 224

"But, if you are *certain*, isn't it that you are shutting your eyes in face of doubt?"--They are shut.

Page 224

Am I less certain that this man is in pain than that twice two is four?--Does this shew the former to be mathematical certainty?--'Mathematical certainty' is not a psychological concept.

The kind of certainty is the kind of language-game.

"He alone knows his motives"--that is an expression of the fact that we ask *him* what his motives are.--If he is sincere he will tell us them; but I need more than sincerity to guess his motives. This is where there is a kinship with the case of *knowing*.

Let yourself be *struck* by the existence of such a thing as our language-game of: confessing the motive of my action.

We remain unconscious of the prodigious diversity of all the everyday language-games because the clothing of our language makes everything alike.

Something new (spontaneous, 'specific') is always a language-game.

What is the difference between cause and motive?--How is the motive *discovered*, and how the cause?

There is such a question as: "Is this a reliable way of judging people's motives?" But in order to be able to ask this we must know what "judging a motive" means; and we do not learn this by being told what '*motive*' is and what '*judging*' is.

One judges the length of a rod and can look for and find some method of judging it more exactly or more reliably. So--you say--*what* is judged here is independent of the method of judging it. What length *is* cannot be defined by the method of determining length.--To think like this is to make a mistake. What mistake?--To say "The height of Mont Blanc depends on how one climbs it" would be queer. And one wants to compare 'ever more accurate measurement of length' with the nearer and nearer approach to an object. But in certain cases it is, and in certain cases it is *not*, clear what "approaching nearer to the length of an object" means. What "determining the length" means is not learned by learning what *length* and *determining* are; the meaning of the word "length" is learnt by learning, among other things, what it is to determine length.

(For this reason the word "methodology" has a double meaning. Not only a physical investigation, but also a conceptual one, can be called "methodological investigation".)

We should sometimes like to call certainty and belief tones, colourings, of thought; and it is true that they receive expression in the *tone* of voice. But do not think of them as 'feelings' which we have in speaking or thinking.

Ask, not: "What goes on in us when we are certain that....?"--but: How is 'the certainty that this is the case' manifested in human action?

"While you can have complete certainty about someone else's state of mind, still it is always merely subjective, not objective, certainty."--These two words betoken a difference between language-games.

There can be a dispute over the correct result of a calculation (say of a rather long addition). But such disputes are rare and of short duration. They can be decided, as we say, 'with certainty'.

Mathematicians do not in general quarrel over the result of a calculation. (This is an important fact.)--If it were otherwise, if for instance one mathematician was convinced that a figure had altered unperceived, or that his or someone else's memory had been deceived, and so on--then our concept of 'mathematical certainty' would not exist.

Even then it might always be said: "True we can never *know* what the result of a calculation is, but for all that it always has a quite

definite result. (God knows it.) Mathematics is indeed of the highest certainty--though we only have a crude reflection of it."

But am I trying to say some such thing as that the certainty of mathematics is based on the reliability of ink and paper? *No.* (That would be a vicious circle.)--I have not said *why* mathematicians do not quarrel, but only *that* they do not.

It is no doubt true that you could not calculate with certain sorts of paper and ink, if, that is, they were subject to certain queer changes--but still the fact that they changed could in turn only be got from memory and comparison with other means of calculation. And how are these tested in their turn?

What has to be accepted, the given, is--so one could say--*forms of life.*

Does it make sense to say that people generally agree in their judgments of colour? What would it be like for them not to?--One man would say a flower was red which another called blue, and so on.--But what right should we have to call these people's words "red" and "blue" *our* 'colour-words'?"--

How would they learn to use these words? And is the language-game which they learn still such as we call the use of 'names of colour'? There are evidently differences of degree here.

This consideration must, however, apply to mathematics too. If there were not complete agreement, then neither would human beings be learning the technique which we learn. It would be more or less different from ours up to the point of unrecognizability.

"But mathematical truth is independent of whether human beings know it or not!"--Certainly, the propositions "Human beings believe that twice two is four" and "Twice two is four" do not mean the same. The latter is a mathematical proposition; the other, if it makes sense at all, may perhaps mean: human beings have *arrived* at the mathematical proposition. The two propositions have entirely different *uses.*--But what would *this* mean: "Even though everybody believed that twice two was five it would still be four"?--For what would it be like for everybody to believe that?--Well, I could imagine, for instance, that people had a different calculus, or a technique which we should

not call "calculating". But would it be *wrong*? (Is a coronation *wrong*? To beings different from ourselves it might look extremely odd.)

Of course, in one sense mathematics is a branch of knowledge,--but still it is also an *activity.* And 'false moves' can only exist as the exception. For if what we now call by that name became the rule, the game in which they were false moves would have been abrogated.

"We all learn the same multiplication table." This might, no doubt, be a remark about the teaching of arithmetic in our schools,--but also an observation about the concept of the multiplication table. ("In a horse-race the horses generally run as fast as they can.")

There is such a thing as colour-blindness and there are ways of establishing it. There is in general complete agreement in the judgments of colours made by those who have been diagnosed normal. This characterizes the concept of a judgment of colour.

There is in general no such agreement over the question whether an expression of feeling is genuine or not.

I am sure, *sure*, that he is not pretending; but some third person is not. Can I always convince him? And if not is there some mistake in his reasoning or observations?

"You're all at sea!"--we say this when someone doubts what we recognize as clearly genuine--but we cannot prove anything.

Is there such a thing as 'expert judgment' about the genuineness of expressions of feeling?--Even here, there are those whose judgment is 'better' and those whose judgment is 'worse'.

Correcter prognoses will generally issue from the judgments of those with better knowledge of mankind.

Page 227

Can one learn this knowledge? Yes; some can. Not, however, by taking a course in it, but through 'experience'.--Can someone else be a man's teacher in this? Certainly. From time to time he gives him the right *tip*.--This is what 'learning' and 'teaching' are like here.--What one acquires here is not a technique; one learns correct judgments. There are also rules, but they do not form a system, and only experienced people can apply them right. Unlike calculating-rules.

Page 227

What is most difficult here is to put this indefiniteness, correctly and unfalsified, into words.

Page Break 228

Page 228

"The genuineness of an expression cannot be proved; one has to feel it."--Very well,--but what does one go on to do with this recognition of genuineness? If someone says "Voilà ce que peut dire un cœur vraiment épris"--and if he also brings someone else to the same mind,--what are the further consequences? Or are there none, and does the game *end* with one person's relishing what another does not?

Page 228

There are certainly *consequences*, but of a diffuse kind. Experience, that is varied observation, can inform us of them, and they too are incapable of general formulation; only in scattered cases can one arrive at a correct and fruitful judgment, establish a fruitful connexion. And the most general remarks yield at best what looks like the fragments of a system.

Page 228

It is certainly possible to be convinced by evidence that someone is in such-and-such a state of mind, that, for instance, he is not pretending. But 'evidence' here includes 'imponderable' evidence.

Page 228

The question is: what does imponderable evidence *accomplish*?

Page 228

Suppose there were imponderable evidence for the chemical (internal) structure of a substance, still it would have to prove itself to be evidence by certain consequences which *can* be weighed.

Page 228

(Imponderable evidence might convince someone that a picture was a genuine.... But it is *possible* for this to be proved right by documentary evidence as well.)

Page 228

Imponderable evidence includes subtleties of glance, of gesture, of tone.

Page 228

I may recognize a genuine loving look, distinguish it from a pretended one (and here there can, of course, be a 'ponderable' confirmation of my judgment). But I may be quite incapable of describing the difference. And this not because the languages I know have no words for it. For why not introduce new words?--If I were a very talented painter I might conceivably represent the genuine and the simulated glance in pictures.

Page 228

Ask yourself: How does a man learn to get a 'nose' for something? And how can this nose be used?

Page 228

Pretending is, of course, only a special case of someone's producing (say) expressions of pain when he is not in pain. For if this is possible

Page Break 229

at all, why should it always be pretending that is taking place--this very special pattern in the weave of our lives?

Page 229

A child has much to learn before it can pretend. (A dog cannot be a hypocrite, but neither can he be sincere.)

Page 229

There might actually occur a case where we should say "This man *believes* he is pretending."

Page Break 230

Page 230

If the formation of concepts can be explained by facts of nature, should we not be interested, not in grammar, but rather in that in nature which is the basis of grammar?--Our interest certainly includes the

correspondence between concepts and very general facts of nature. (Such facts as mostly do not strike us because of their generality.) But our interest does not fall back upon these possible causes of the formation of concepts; we are not doing natural science; nor yet natural history--since we can also invent fictitious natural history for our purposes.

Page 230

I am not saying: if such-and-such facts of nature were different people would have different concepts (in the sense of a hypothesis). But: if anyone believes that certain concepts are absolutely the correct ones, and that having different ones would mean not realizing something that we realize--then let him imagine certain very general facts of nature to be different from what we are used to, and the formation of concepts different from the usual ones will become intelligible to him.

Page 230

Compare a concept with a style of painting. For is even our style of painting arbitrary? Can we choose one at pleasure? (The Egyptian, for instance.) Is it a mere question of pleasing and ugly?

Page Break 231

xiii

Page 231

When I say: "He was here half an hour ago"--that is, remembering it--this is not the description of a present experience.

Page 231

Memory-*experiences* are accompaniments of remembering.

Page 231

Remembering has no experiential content.--Surely this can be seen by introspection? Doesn't *it* shew precisely that there is nothing there, when I look about for a content?--But it could only shew this in this case or that. And even so it cannot shew me what the word "to remember" means, and hence *where* to look for a content!

Page 231

I get the *idea* of a memory-content only because I assimilate psychological concepts. It is like assimilating two *games*. (Football has *goals*, tennis not.)

Page 231

Would this situation be conceivable: someone remembers for the first time in his life and says "Yes, now I know what 'remembering' is, what it *feels like* to remember".--How does he know that this feeling is 'remembering'? Compare: "Yes, now I know what 'tingling' is". (He has perhaps had an electric shock for the first time.)--Does he know that it is memory because it is caused by something past? And how does he know what the past is? Man learns the concept of the past by remembering.

Page 231

And how will he know again in the future what remembering feels like?

Page 231

(On the other hand one might, perhaps, speak of a feeling "Long, long ago", for there is a tone, a gesture, which go with certain narratives of past times.)

Page Break 232

xiv

Page 232

The confusion and barrenness of psychology is not to be explained by calling it a "young science"; its state is not comparable with that of physics, for instance, in its beginnings. (Rather with that of certain branches of mathematics. Set theory.) For in psychology there are experimental methods and *conceptual confusion*. (As in the other case conceptual confusion and methods of proof.)

Page 232

The existence of the experimental method makes us think we have the means of solving the problems which trouble us; though problem and method pass one another by.

Page 232

An investigation is possible in connexion with mathematics which is entirely analogous to our investigation of psychology. It is just as little a *mathematical* investigation as the other is a psychological one. It will *not* contain calculations, so it is not for example logistic. It might deserve the name of an investigation of the 'foundations of mathematics'.

FOOTNOTES

Page ix

†1 It was hoped to carry out this plan in a purely German edition of the present work.

Page 2

†1 "When they (my elders) named some object, and accordingly moved towards something, I saw this and I grasped that the thing was called by the sound they uttered when they meant to point it out. Their intention was shewn by their bodily movements, as it were the natural language of all peoples: the expression of the face, the play of the eyes, the movement of other parts of the body, and the tone of voice which expresses our state of mind in seeking, having, rejecting, or avoiding something. Thus, as I heard words repeatedly used in their proper places in various sentences, I gradually learnt to understand what objects they signified; and after I had trained my mouth to form these signs, I used them to express my own desires."

PREFACE

Page iv

After Wittgenstein had finished Part I of *Philosophical Investigations* in the form in which it was later printed, he was writing remarks from May 1946 to May 1949 in new MS volumes (MSS 130-138), remarks almost exclusively concerned with the nature of psychological concepts. During this period he twice dictated a selection of the MS material to a typist, in late autumn 1947 (TS 229) and in early autumn 1948 (TS 232). For the last third of the MS entries there is no corresponding extant typescript. Probably in the middle of 1949 Wittgenstein put together a MS selection (MS 144), mainly from what he had written since October 1948, but partly also from earlier MS volumes and typescripts. He then had a fair copy of this MS typed out, and it was printed as Part II of *Philosophical Investigations*. This typescript has unfortunately disappeared.

Page iv

What Wittgenstein wrote in MS books 130-138 may with some justification be described as preparatory studies for Part II of the *Investigations*. He cut up the two typescripts 229 and 232 into slips, and preserved in all three hundred and sixty-nine of the fragments for further use. They are printed in the collection *Zettel*. (They amount to more than half of the remarks in that work.) But by far the greater part of the remarks in TSS 229 and 232 and in the MS volumes 137 and 138 have thus far remained unpublished.

Page iv

The editors considered it right to publish the two typescripts 229 and 232 in their entirety in two volumes under the title "Remarks on the Philosophy of Psychology".

Page iv

Typescript no. 229 is here published as the first volume. The underlying MSS cover the time from May 10th 1946 to October 11th 1947. There were two versions of the typescript, one probably copied from the other. Both were marred with many spelling mistakes and other faults. An exact collation with the MS sources was carried out. The MSS for the most part do not contain drawings, and so we have taken them from the corresponding MSS.

Page iv

Mr. André Maury and Mr. Heikki Nyman helped in working over the sources to make an accurate and complete text. Heikki Nyman made the index for the book. The editors would like to take this opportunity of thanking their collaborators for this laborious work.

G. E. M. Anscombe

G. H. von Wright

Page iv

Wittgenstein's spelling is sometimes old-fashioned, sometimes vacillating--and sometimes obviously incorrect. The punctuation also often

departs very much from normal punctuation. Care was necessary in making corrections. In general we have tried to follow the readings of the typescript, e.g. in the case of the initial letters of adjectives functioning substantively. In a few cases only we have chosen to disturb the punctuation of the typescript. We are greatly indebted to Joachim Schulte for helpful advice in correction of the printed text.

I

1. Let's consider what is said about such a phenomenon as this: seeing the figure  sometimes as an F, sometimes as the mirror-image of an F.

I want to ask: what does seeing the figure now this way now that consist in?--Do I actually see something different each time; or do I only *interpret* what I see in a different way?--I am inclined to say the former. *But why?* Well, interpreting is an action. It may consist, e.g., in someone's saying "That's supposed to be an F", or he doesn't say it, but when he copies the sign he replaces it by an F; or he considers: "What may that be? It'll be an F that the writer slipped with". Seeing isn't an action but a state. (A grammatical remark.) And if I have never read the figure as anything but "F", never considered what it might be, then we shall say that I see it as an F; if, that is, we know that it can also be seen differently.

For how have we arrived at the concept of 'seeing this as this'? On what occasions does it get formed, is it felt as a need? (Very frequently, when we are talking about a work of art.) Where, for example, what is in question is a phrasing by the eye or ear. We say "You must hear this bar as an introduction", "You must listen for this mode", but also "I hear the French 'ne... pas' as a negation with two parts to it, not as 'not a step'" etc. Now is it an actual seeing or hearing? Well: that's what we call it; we react with these words in particular situations. And in turn we react to these words with particular actions. [Zettel, 208.]

2. Is it introspection that tells me whether I have to do with a genuine seeing, or rather with an act of interpreting? To start with I must get clear about what I would call a case of interpreting; what it is that tells me whether something is interpreting or seeing.

(Seeing in accordance with an interpretation.) [Z 212.]

3. I should like to say: "I see the figure as the mirror-image of an F" is only an indirect description of my experience. That there is a direct one; namely: I see the figure like *this* (here I point for myself at my visual impression). Whence this temptation here?--There is an important fact here, namely that we are prepared to allow for a number of different descriptions of our visual impression, e.g. "Now the figure is *looking* to the right, now to the left."

4. Suppose we were to ask someone: What similarity is there between this figure and an F? Now one person answers "The figure is a reversed F", and another "It is an F with the horizontals made too long". Are we to say "These two see the figure differently"?

5. Don't I see the figure sometimes this way, sometimes otherwise, even when I don't react with words or any other signs?

But "sometimes this way", "sometimes otherwise" are after all words, and what right have I to use them here? Can I prove my right to you, or to myself? (Unless by a further reaction.)

But surely I know that there are two impressions, even if I don't say so! But how do I know that what I say then, is the thing that I knew? [Z 213.]

6. The familiar face of a word; the feeling that a word is as it were a picture of its meaning; that it has as it were taken its meaning up into itself--it's possible for there to be a language to which all that is alien. And how are these feelings expressed among us? By the way we choose and value words. [Cf. P.I. p. 218f.]

7. It is *easy* to describe the cases in which we are right to say we *interpret* what we see, as such-and-such. [Cf. P.I. p. 212e.]

8. When we interpret, we make a conjecture, we express a hypothesis, which may subsequently turn out false. If we say "I see this figure as an F", there isn't any verification or falsification for that, just as there isn't for "I see a luminous red". This is the kind of similarity that we must look for, in order to justify the use of the word "see" in that context. If someone says that he knows by introspection that it is a case of 'seeing', the answer is: "And how do I know what you are calling introspection? You explain one mystery to me by another." [Cf. P.I. p. 212e.]

9. In different places in a book, a text-book of physics say, we see the illustration: . In the accompanying text what is in question is one time a glass cube, another a wire frame, another a lidless open box, another time it's three boards making a solid angle. The text interprets the illustration every time.

But we can also say that we *see* the illustration now as one thing, now as another.--Now how remarkable it is, that we are able to use

the words of the *interpretation* also to describe what is immediately perceived!

Here at first we should like to reply: This description of the immediate experience by means of an interpretation is only an indirect description. That the truth is this: We can give the figure one time interpretation A, one time interpretation B, one time interpretation C; and there are also three direct experiences--three ways of seeing the figure--A', B', C', such that A' favours interpretation A, B' interpretation B, C' interpretation C. That is why we use interpretation A as a description of the way of seeing which is favourable to it. [Cf. P.I. p. 193f, g.]

10. But what does it mean to say that the experience A' favours interpretation A? What is the experience A'? How is it identified?

11. Let us assume that someone makes the following discovery. He investigates the processes in the retina of human beings who are seeing the figure now as a glass cube, now as a wire frame etc., and he finds out that these processes are like the ones that he observes when the subject sees now a glass cube, now a wire frame etc.... One would be inclined to regard such a discovery as a proof that we actually see the figure differently each time.

But with what right? How can the experiment make any pronouncement upon the nature of the immediate experience?--It puts it in a particular class of phenomena.

12. How is the experience A' identified? How does it come about that I know of this experience at all?

How does one teach anyone the expression of this experience: "Now I am seeing the figure as a wire frame"? Many have learnt the word "see" and never made any such use of it.

Now if I shew our figure to such a one, and tell him "Now just try to see it as a wire frame"--must he understand me? What if he says: "Do you mean anything but that I am to follow the text of the book, which is about a wire frame, and to use the figure as an aid in doing so?" And if he doesn't understand me, what can I do? And if he does understand me, how is that manifested? Isn't it just in this, that he too says he is now *seeing* the figure as a wire frame?

13. Thus the inclination to use that form of verbal expression is a characteristic utterance of the experience. (And an *utterance* is not a *symptom*.)

14. Are there still other utterances of this experience? Wouldn't the following proceeding be conceivable: I put a wire frame, a glass cube, a box, etc. in front of someone and ask him "Which of these things does the figure represent?" He replies "The wire frame".

15. Ought we now to say he saw the figure as a wire frame--though he did not have the experience of seeing it now as this, now as something else?

16. Suppose someone asked "Do we all see a printed F the same way?" Well, one might try the following: We shew various people an F and put the question: "Which way does an F look, to the right or to the left?"

Or we ask: "If you were supposed to compare an F with a face in profile, where would be the front and

where the back?"

But maybe some would not understand these questions. They are analogous to questions like "What colour is the sound a for you?" or "Does a strike you as yellow or white?" etc.

If someone didn't understand this question, if he called it nonsense,--could we say he didn't understand English, or the meanings of the words "colour", "sound", etc.?

On the contrary: it's when he has learnt to understand these words that he can react to those questions 'with comprehension' or 'uncomprehendingly'.

Page 5

17. "Do we all see an F the same way?"--That doesn't yet mean a thing, so long as it isn't settled how we learn 'what way' someone sees it. But if now, e.g., I also say "For me an F looks towards the right and a J towards the left",--does that allow me to say: Whenever I see an F, it looks in this direction, or in any direction? What reason would I have to say anything of the kind?

Page 5

18. Let us assume that the question "Which direction does an F look in?" had never been put--but only this one: "If you had to paint an eye and a nose onto an F and a J, would it look to the right or to the left?" This too would surely be a psychological[[sic]] question. And it would not involve anything about a '*seeing*' this way, or otherwise! What is in question is an *inclination* to do one thing or the other.

Page 5

19. One employment of the concept 'looking in this direction' is, e.g., as follows: One says, perhaps to an architect: "This distribution of the windows makes the façade look *in that direction*." Similarly one uses the expression "This arm interrupts the movement of the sculpture" or "The movement should go like *this*" (here one makes a gesture).

Page Break 6

Page 6

20. The question whether what is involved is a seeing or an act of interpreting arises because an interpretation becomes an expression of experience. And the interpretation is not an indirect description; no, it is the primary expression of the experience.

Page 6

21. But why don't we see that at once, but think rather that there must be an immediate expression here, and that the phenomenon just is too intangible, can't really be described, and in any case we have to grope for an indirect representation to communicate with other people?

We tell ourselves: Unless we supply something extra to the figure in our fancy, we can't possibly have an experience essentially tied up with things that are quite outside the sphere of immediate perception.

One might say, e.g.: "You assert that you see the figure as a wire frame. Do you perhaps also know if it is a copper wire or an iron wire? And why then has it got to be a *wire*?--This shews that the word 'wire' doesn't actually belong essentially to the description of the experience."

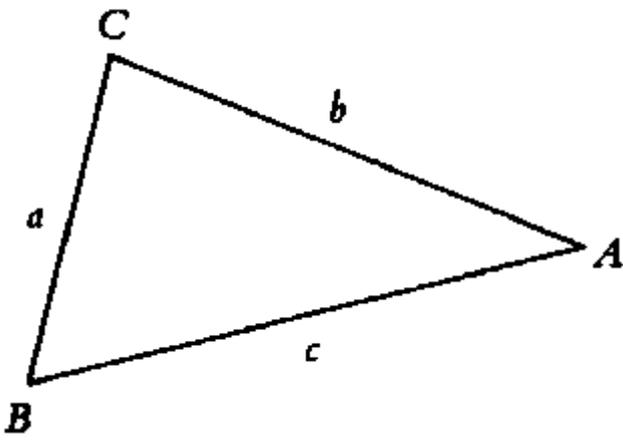

Page 6

22. But now let us imagine the following kind of explanation: If one holds one's nose while eating, foods lose all their taste, except for sweet, bitter, salt and sour. So, we want to say, the special taste of bread, say, consists of this 'taste' in the narrower sense and the aroma, which is what gets lost when we don't breathe through our nose. Now why shouldn't there be something like that going on in connection with seeing? Perhaps in this way: The *eye* doesn't distinguish the figure as a wire frame from the figure as a box, etc. That is so to speak the aroma, which the brain supplies to what is seen. On the other hand the eye does distinguish various aspects: it as it were phrases the visual picture; and *one* phrasing is more in accord with *one* interpretation, the other with the other. (More in accord *as a matter of experience*.)

Think, for example, of certain involuntary interpretations that we give *to* one or another passage in a piece of music. We say: This interpretation forces itself on us. (That is surely an experience.) And the interpretation can be explained by purely musical relationships:--Very well, but *our* purpose is, not to explain, but to describe.

Page Break 7

Page 7

23.

Page 7

See the triangle in such a way that c is the base and C the apex; and now, so that b is the base and B the apex.--What do you do?--First of all:--do you know what you do? No.

"Well, perhaps it is the glance, which first fixes on the 'base' and then goes to the 'apex'. But can you say that your glance couldn't shift in just the same way, in another context, without your having seen the triangle that way?"

Make this experiment too: See the triangle in such a way that (like an arrowhead) it points now in direction A , now in direction B .

Page 7

24. Of whom do we say that he is seeing the triangle as an arrow that points to the right? Of one who has simply learned to use it as such an arrow and has always used it like that? No. Naturally, that does not mean that such a one is said to be seeing it *differently*, or that we wouldn't know how he is seeing it. *Seeing* this way or otherwise doesn't come in here yet.--But what about a case in which I correct someone else and say "What is over there is not an arrow pointing to the right, but one pointing upwards", and now I confront him with some practical consequence of this interpretation. He says: "I always took the triangle as an arrow pointing to the right."--Is a seeing in question here? No: for of course it may mean "When I have encountered this sign I have always followed it *this way*." Someone who says that need not have the least understanding of the question: "But: were you *seeing* it as an arrow pointing to the right?"

Page 7

25. We say that a man sees the triangle now this way, now that, if he says it of himself; if he pronounces, or hears, these words with signs of understanding; but also, if he says, e.g., "Now the triangle is pointing in this direction; before, it pointed in the other direction," and then, when asked whether the triangle has changed its form or position, answers: "It's not like that". And so on.

Page Break 8

Page 8

26. Let us consider the case of the picture of wheels rotating in opposite directions. Firstly, I may again see the movement in the picture as *one* or as the *other* movement. Secondly, I may also *take it* for the one or the other.

Page 8

27. The *somewhat queer* phenomenon of seeing this way or that surely makes its first appearance when someone recognizes that the optical picture in *one* sense remains the same, while something else, which one might call "conception", may change. If I take the picture for this or that, let's say for two wheels turning opposite ways, there is so far no question of a division of the impression into optical picture and conception--Should I say, then, that this division is the phenomenon that interests me?

Or let us ask this: What *reaction* am I interested in? The one that shews that someone takes a bowl for a bowl (and so also the one that shews that he takes a bowl for something else)? Or the one that shews that he observes a change and yet shews at the same time that nothing has altered in his optical picture?

Page 8

28. Another possibility is that I say: I have always taken that for a bowl; now I see that it isn't one--without being conscious of any change of 'aspect'. I mean simply: I now see something different, now have a different visual impression.

Suppose someone shews something to me and asks me what it is. I say: "It's a cube." At which he says "So *that's* how you see it". Would I have to understand these words in any other sense than: "So *that's* what you take it to be"?

Page 8

29. When I contemplate the objects around me, I am not conscious of there being such a thing as a visual conception.

Page 8

30. "I see this figure as a solid angle": why don't you simply accept that as true if, that is, he knows English and is reliable?--I don't doubt that it is the truth. But what he said is a tensed sentence. Not one about the nature of this phenomenon: no, but one saying: this happened.

Page 8

31. The expression of the experience is: "Now I'm seeing it as a pyramid; now as a square with its diagonals."

Now, what is the "it" which I see now this way, now that? Is it the drawing? And how do I know it is the same drawing both times? Do I merely know this, or do I *see* it as well?--How would it be, if it were subsequently proved that the drawing always altered slightly when it was seen as

Page Break 9

something else; or that the optical picture was then slightly different? One line, for example, looks a little heavier, or thinner, than before.

Page 9

32. Shall I say that the various aspects of the figure are associations? And how does that help me?

Page 9

33. Something about the optical picture of the figure seems to alter here; and then again, nothing alters after all. And I cannot say "A new interpretation keeps on striking me". Indeed it does; but it also incorporates itself straight away in what is seen. There keeps on striking me a new aspect of the drawing--which I see remains the same. It is as if a new garment kept on being put on it, and as if all the same each garment was the same as the other.

One might also say "I do not merely *interpret* the figure, but I clothe it with the interpretation".

Page 9

34. I say to myself: "What is this? What does this phrase say? Just what does it express?"--I feel as if there must still be a much clearer understanding of it than the one I have. And this understanding would be reached by saying a great deal about the surrounding of the phrase. As if one were trying to understand an expressive gesture in a ceremony. And in order to explain it I should need as it were to analyse the ceremony. E.g., to alter it and shew what influence that would have on the role of that gesture.

Page 9

35. I might also say: I feel as if there must be parallels to this musical expression in other fields.

Page 9

36. The question is really: are these notes not the *best* expression for what is expressed here? Presumably. But that does not mean that they aren't to be explained by working on their surrounding[[sic]].

Page 9

37. Is it a contradiction if I say: "This is beautiful and this is not beautiful" (pointing at different objects)? And ought one to say that it isn't a contradiction, because the two words "This" mean different things? No; the two "This's" have the *same* meaning. "Today" has the same meaning today as it had yesterday, "here" the same meaning here and there. It is not here as with the sentence "Mr. White turned white".

"This is beautiful and this is not beautiful" is a contradiction, but it has a use.

Page Break 10

Page 10

38. The basic evil of Russell's logic, as also of mine in the *Tractatus*, is that what a proposition is is illustrated by a few commonplace examples, and then pre-supposed as understood in full generality.

Page 10

39. But isn't it clear that the two 'this's' have different meanings, since they can be replaced by different proper names?--Replaced? "This" just doesn't now mean "A", now "B".--Of course not by itself, but together with the pointing gesture.--Very well; that is only to say that a sign consisting of the word "this" and a gesture has a different meaning from a sign consisting of "this" and another gesture.

But that is of course mere juggling with words. What you are saying is that your sentence "This is beautiful and this is not beautiful" is not a complete sentence, because these words have to have gestures going with them.--But why is it not a complete sentence in that case? It is a sentence of a different kind from, say "The sun is rising"; it has a very different kind of employment. But such are the differences that there are, this is the profusion that there is in the realm of sentences.

Page 10

40. "Scot is not a Scot." If I say this, I mean the first S. as a proper name, the second as a class-name. Is there something different going on in my mind, when I pronounce the two words "S."?--The word functions in the proposition in a different way in the two cases. That would be to make a comparison of the word to a machine-part and of the *sentence* to the machine. Quite ineptly. Rather one might say: the language is the machine, the sentence the machine part. It would then go something like this: This crank has two holes of the same size. With one it is attached to the shaft, while the crank pin sticks into the other. [Cf. P.I. p. 176f.]

Page 10

41. Try to mean the first "S." as a class-name, the second as a proper name! How do you make the attempt? [Cf. P.I. p. 176f.]

Page 10

42. "The concept Scot is not a Scot." Is this nonsense? Well, I do not know what anyone who says that is trying to say, that is, how he is intending to use this sentence. I can think out several uses for it, which are ready to hand. "But you just *can't* use it, nor can you think it, in such a way that the same thing is *meant* by the words 'the concept Scot' and the second 'Scot', as you *ordinarily* mean by these words." Here is the mistake. Here one is thinking as if *this* comparison came into one's mind: words fit together in the sentence, i.e. senseless

Page Break 11

sequences of words may be written down; but the meaning of each word is an invisible *body*, and these meaning-bodies do *not* fit together. ("Meaning it gives the sentence a further dimension.")

Page 11

43. Hence the idea that the sentence can't be thought, for in thought I should have to *fit* the meanings of the words together into a sense, and it doesn't work. (Jigsaw puzzle.)†1

Page 11

44. But isn't contradiction forbidden by the law of contradiction?--At any rate "Non (p and non p)" doesn't forbid anything. It is a tautology. But if we forbid a contradiction, then we are excluding forms of contradiction from our language. We expunge these forms.

Page 11

45. One may have the thought: "How remarkable that the *single* meaning of the word "to feel" (and of the other psychological verbs) is compounded of heterogeneous components, the meanings of the *first* and of the *third* person."

But what can be more different than the profile and the front view of a face; and yet the concepts of our language are so formed, that the one appears merely as a variation of the other. And of course it is easy to give a ground in facts of nature for this structure of concepts. (Heterogeneous things; arrow-head and arrow-shaft.)

Page 11

46. If we can find a ground for the structures of concepts among the facts of nature (psychological and physical), then isn't the description of the structure of our concepts really disguised natural science; ought we not in that case to concern ourselves not with grammar, but with what lies at the bottom of grammar in nature?

Indeed the correspondence between our grammar and general (seldom mentioned) facts of nature does concern us. But our interest does not fall back on these *possible* causes. We are not pursuing a natural science; our aim is not to predict anything. Nor natural history either, for we invent facts of natural history for our own purposes. [Cf. P.I. p. 230a.]

Page 11

47. It is interesting, for example, to observe that particular shapes are not tied to particular colours in our environment; that, for example, we do not always see green in connection with round, red in connection with square. If we imagined a world in which shapes and colours *were* always tied to one another in such ways, we'd find intelligible a system of concepts, in which the fundamental division--shape and colour--did not hold.

Page Break 12

Page 12

Some further examples:

It is important, for example, that we are accustomed to draw with pencil, pen or the like, and that therefore the elements of our representation are strokes and points (in the sense of dots). Had human beings never drawn, but always painted (so that the concept of the *contour* of shapes did not play a big part), if there were a word in common use, let's call it "line", at which no one thought of a stroke, i.e. of something very thin, but always thought only of the boundary of two colours, and if at the word "point" one never thought of something tiny, but only of the intersection of two colour boundaries, then perhaps much of the development of geometry would not have

occurred.

If we only saw one of our primary colours, red say, extremely seldom and only in tiny expanses, if we could not prepare colours for painting, if red occurred only in particular connections with other colours, say only at the very tips of leaves of certain trees, these tips gradually changing from green to red in the autumn, then nothing would be more natural than to call red a degenerate green.

Think of the circumstances under which white and black appear to us as *colours* and on the other hand as the lack of any colour. Imagine its being possible to wash all colours away, and that then the base was always white, and that there was no such thing as white paint.

It is easier for us to reproduce and recognize a pure red, green, etc. from memory, than say, a shade of reddish brown.

Page 12

48. But I am not saying: if the facts of nature were different we should have different concepts. That is an hypothesis. I have no use for it and it does not interest me.

I am only saying if you believe that our concepts are the right ones, the ones suited to intelligent human beings; that anyone with different ones would not realize something that we realize, then imagine certain general facts of nature different from the way they are, and conceptual structures different from our own will appear *natural* to you. [Cf. P.I. p. 230b.]

Page 12

49. 'Natural', not 'necessary'. For is everything that we do a means to an end? Is everything inappropriate, that can't be called a means to an end?

Page 12

50. (On 33) The explanation: "I associate this object with the figure", makes nothing clearer.

Page 12

51. How is "will" actually used? In philosophy one is unaware of having invented a quite new use of the word, by assimilating its use to

Page Break 13

that of, e.g., the word "wish". It is interesting that one constructs certain uses of words specially for philosophy, wanting to claim a more elaborated use than they have, for words that seem important to us.

"Want" is sometimes used with the meaning 'try': "I wanted to get up, but was too weak." On the other hand one wants to say that wherever a voluntary movement is made, there is volition. Thus if I walk, speak, eat, etc., etc., then I am supposed to will to do so. And here it can't mean trying. For when I walk, that doesn't mean that I try to walk and it succeeds. Rather, in the ordinary way I walk without trying to. Of course it can also be said "I walk because I want to", if that distinguishes the ordinary case of walking from that in which I am shoved, or electric currents move my leg muscles.

Page 13

52. Philosophy has tried to fix itself up with a use of the word which presents as it were a more consistent following up of certain features of the ordinary use.

Page 13

53. "The word 'x' has two meanings" means: it has two kinds of use.

Page 13

Ought I to say "If you describe the use of this word in our language, you will see that it has two uses, not just one"?

Page 13

54. Might we not imagine people declaring that the word "bench" always has the same meaning? That a bench is

always something like this:

But that they did, nevertheless, also use the word for a legal institution; but of that they say that since it is a bench, it is something of the kind we have drawn in our picture.

Page 13

55. Have the words "go" and "went" the same meaning?

Have the words "go" and "goest" the same meaning?

Has the word "go"†1 the same meaning in "I go"†1 and in "You go"†1?

Page 13

56. Should I say: "With two different meanings there go two different explanations of meaning"?

57. Imagine a group of sentences in a language each consisting of three signs. The sentences describe the work carried out by a particular man. The first sign (from left to right) is the man's name, the second signifies an activity (such as sawing, boring, filing) the third what is worked on.

Such a sentence might run "a a a". If, that is, "a" is the name of a person, an action, and what is worked on.

58. Now what does it mean to say "The sign 'a' has a different meaning in 'x a y' and in 'a x y'"? It might even be said to have a different meaning according to its *position*. (Like a digit in the decimal system.)

Imagine chess played with pieces all the same shape. One would then always have to remember where a particular piece was at the beginning of the game. And it might be said: "This piece and that have different meanings;" I can't make the same moves with one as with the other. Just so I gather from the "a" in the first position that the matter concerns *this* man (perhaps I point to him); from the one in the second position, that he is doing *this* work, etc. The "a" might occur in three tables in which it is correlated with certain pictures that explain its meaning. And in that case I should look the sign 'a' up in a different table according to its position in order to interpret the sentence.

59. What does it mean "to investigate whether 'f(f)' makes sense when 'f' has the same meaning in both places"?

60. One is looking for something, hasn't found it yet, but knows what one is looking for. But it may also happen that one looks around searchingly and cannot say what one is searching for; finally one lights upon something and says "That's what I wanted". "Looking", it might be called, "without knowing what one is looking for".

61. We might speak of "functional states". (E.g.: Today I am very irritable. If I am told such-and-such today, I keep on reacting in such-and-such a way. In contrast with this: I have a headache the whole day.)

62. How did such an expression as "I believe..." ever come to be used? Did a phenomenon, that of belief, suddenly get noticed? [Cf. P.I. p. 190a.]

63. Did we observe ourselves and discover this phenomenon in that way?

64. Did we observe ourselves and other men and so discover the phenomenon of belief?

65. In the language of a tribe there might be a pronoun, such as we do not possess and for which we have no practical use, which 'refers' to the propositional sign in which it occurs. I will write it like this: I. The proposition "I am ten centimetres long" will then be tested for truth by measuring the written sign. The proposition "I contain four words" for example is true; and so is "I do not contain four words". "I am false" corresponds to the paradox of the Cretan Liar.--The question is: What do people use this pronoun for? Well, the proposition "I am ten centimetres long" might serve as a ruler, the proposition "I am beautifully written" as a paradigm of beautiful script.

What interests us is: How does the word "I" get used in a *language-game*? For the proposition is a paradox only when we abstract from its use. Thus I might imagine that the proposition "I am false" was used in the kindergarten. When the children read it, they begin to infer "If that's false, it's true, so it is false, etc. etc." People have perhaps discovered that this inferring is a useful exercise for children.†1

What interests us is: how this pronoun gets used in a *language-game*. It is possible, though not quite easy, to fill out a picture of a language-game with this word. A proposition like "I contain four words" might, for example, be used as a paradigm for the number four, and in another sense so might the proposition "I do not contain four words". A proposition is a paradox only if we abstract from its use.†1

66. How would people differ from us who were not able, like us, to *see* a triangle now this way, now that?--If we came to a tribe that did not have these experiences, how should we notice this?

How should we notice it, if the people could not *see* depth? So that they were as Berkeley thought we are.

67. How many squares go in a square when the scale in which to take the small square has not been determined? Suppose someone came and said: one can't say for sure how many will go in, but one can at any rate make an estimate!

Page Break 16

Page 16

68. "The expression like the feeling"--the bitter food like the bitter sorrow. "As like as like can be",--how would it be if they were not merely like, but the same?

Page 16

69. "Sorrow and care are similar feelings." Is that an empirical fact?

Page 16

70. Ought I to say: "A rabbit may look like a duck"?

Would it be conceivable that someone who knows rabbits but not ducks should say: "I can see the drawing

as a rabbit and also in another way, although I have no word for the second aspect"? Later he gets to know ducks and says: "That's what I saw the drawing as that time!" Why is that not possible?

Page 16

71. Or suppose someone said: This rabbit has a complacent expression.--If someone knew nothing about a complacent expression--might *something strike* him here, and he later on, having learnt to recognize complacency, say that that was the expression that struck him then?

Page 16

72. The *appropriate* word. How do we find it? Describe this! In contrast to this: I find the right term for a curve, after I have made particular measurements of it.

Page 16

73. I see that the word is appropriate even before I know, and even when I never know, *why* it is appropriate.

Page 16

74. I should not *understand* someone who said that he had seen the picture as that of a rabbit, but had not been able to say so, because at that time he had not been aware of the existence of such a creature.

Page 16

75. Should I say: "The picture-rabbit and the picture-duck look just the same"?! Something militates against that--But can't I say: they look just the same, namely like this--and now I produce the ambiguous drawing. (The draft of water, the draft of a treaty.) But if I now wanted to offer reasons against this way of putting things what would I have to say? That one sees the picture differently each time, if it is now a duck and now a rabbit--or, that what is the beak in the duck is the ears in the rabbit, etc?

Page Break 17

Page 17

76. Imagine the ambiguous picture being used in a strip cartoon. Then it is not possible, for example, that some other animal should meet the duck and take it for a rabbit; but it would be possible for someone in the twilight to take the duck in profile for a rabbit.

Page 17

77. "I can no more see the rabbit and the duck at the same time than I can mean the words 'Weiche Wotan, weiche!' in their two meanings."--But that would not be right; what is right is that it is not natural for us to pronounce these words in order to tell Wotan he should depart, and in saying so to tell him that we prefer our eggs soft boiled.†1 And yet it would be possible to imagine such a use of words.

Page 17

78. The *facts* of human natural history that throw light on our problem, are difficult for us to find out, for our talk passes them by, it is occupied with other things. (In the same way we tell someone: "Go into the shop and buy..."--not: "Put your left foot in front of your right foot etc. etc., then put coins down on the counter, etc. etc.")

Page 17

79. If I do not believe in an inner state of seeing and the other says: "I see...", then I believe that he does not know English, or is lying.

80. What has been said, if it is said that anyone who sees the drawing now as a rabbit now as a duck has quite different visual experiences? The inclination to say this becomes very great, if, e.g., one adds a line to the drawing that perhaps emphasizes the mouth of the rabbit, and then sees how this line plays a quite different part in the picture of the duck.--Or think of the facial expression of the rabbit, which completely disappears in the other picture.

At first, for example, I see a haughty face, and then I don't see a haughty face.

And what is done by someone, if he admits that I see something quite different each time?

81. "How do I know that I am smiling at *this* facial expression?"

82. "I see a quite particular facial expression, which I call that of the rabbit, and a completely different one which I call that of the duck." Let me merely call one A and the other one B: How could I now explain the meaning of A and B to someone without making any reference to a rabbit and a duck?

It would be possible, e.g. like *this*: I say "A" to him and give an imitation of a rabbit's face with my own face etc.

83. "'Seeing *this*' doesn't mean: reacting in *this* way,--for I can see without reacting." Of course. For neither does "I see" mean: I react, nor "he sees": he reacts, nor "I saw": I reacted, etc.

And even if I *said* "I see" whenever I saw, these words wouldn't say "I say 'I see'".

84. I point to a particular spot in the picture and say "That is the eye of the rabbit or of the duck." Now how can something in this drawing be an *eye*?

85. "Can depth really be seen?"--"Why should one not be able to see depth, when one can see colours and shapes?! The retina's being two-dimensional is no reason for saying the opposite."--Certainly not; but the answer does not meet the problem. The problem arises from this, that the description of the seen, what we call the description of what is seen, is of a different kind, if one time I represent colour and shape, perhaps using a transparency, another time the dimension of depth by means of a gesture or a profile.

86. It is unhelpful to remark that the arrangement in the dimension of depth is, like any other, a property of the 'seen'.

87. What does it mean to say that the cavity in a tooth that the dentist is probing feels much bigger than it is to the patient? I shew with my fingers, e.g., and say: "I would have thought it was as big as *this*." What do I go by in measuring the distance apart of the fingers?--Do I measure it at all? Can one say: "First, I know how big the cavity strikes me as being, then I shew it with my fingers"? Well, in some cases that could be said, when, for example, I think to myself that the cavity is 5 mm and explain *this* to someone by shewing him the distance--Suppose I were asked: "Did you know how big the diameter struck you as being before you shewed it?"--Here I might reply: "Yes. For if you had asked me earlier, I should have given you this answer."--Knowing something just isn't: thinking a thought.

88. When I say what I know, how is what I say *what* I know?

89. What is the description of what I see? (This doesn't mean only: In what words am I to describe what I see?--but also "What does a description of what I see look like? What am I to call by that name?")

90. The peculiar feeling that the recurrence of a refrain gives us. I should like to make a gesture. But the gesture isn't really at all characteristic precisely of the recurrence of a refrain. Perhaps I might find that a *phrase* characterizes the situation better; but it too would fail to explain why the refrain strikes one as a joke, why its recurrence elicits a laugh or grin from me. If I could dance to the music, that would be my best way of expressing just *how* the refrain moves me. Certainly there couldn't be any better expression than that.--

I might, for example, put the words "To repeat", before the refrain. And that would certainly be apt; but it does not explain why the refrain makes a strongly comic impression on me. For I don't always laugh when a "To

repeat" is appropriate.

Page 19

91. The 'content' of experience, of experiencing: I know what toothaches are like, I am acquainted with them, *I know what it's like to see red, green, blue, yellow, I know what it's like to feel sorrow, hope fear, joy, affection, to wish to do something, to remember having done something, to intend doing something, to see a drawing alternately as the head of a rabbit and of a duck, to take a word in one meaning and not in another etc.*† I know how it is to see the vowel *a* grey and the vowel *ü* dark purple.--I know, too, what it means to parade these experiences before one's mind. When I do that, I don't parade kinds of behaviour or situations before my mind.--So I know, do I, what it means to parade these experiences before one's mind? And what *does* it mean? How can I explain it to anyone else, or to myself?

Page 19

92. The concept 'word' in linguistics. How does one use "the same word"?

"have" and "had" are the same word.'

'He's saying the same word, once out loud, once silently.'

'Are "bank" (money) and "bank" (river) the same word?'

'Is it the same word "have" both times when one says "I have a house" and "I have built a house"?''

Page Break 20

Page 20

93. Speculation: A tribe that we have brought into subjection, which we want to make into a slave-race. The behaviour, the bearing of these people is of interest to us just for that reason. We want to describe it, to describe various *aspects* of this behaviour. We watch and observe, e.g. pain-behaviour, joy-behaviour etc. Their behaviour also includes the use of a language. And generally it includes such behaviour as is learned, no less than such as is not learned, like a child's crying. Nor do they merely have a language, they have one containing psychological forms of expression.--Ask yourself: How do these get taught to the children of this tribe?--

Now I assume that these people possess expressions like the following: "I have black hair", "He has black hair"; "I have money", "He has money"; "I have a wound", "He has a wound". And now they use this grammatical construction in *psychological* ascriptions.

Page 20

94. "As I heard 'bank' the meaning money-bank came to mind." It is as if a germ of meaning were experienced, and then got interpreted. Now is that an experience?

One might precisely say: "I had an experience which was the germ for this use." That might be a form of expression that was natural to us.

Page 20

95. Having a favourite... is also a movement of thought that one can learn.

Page 20

96. A tribe that we want to enslave. The government and the scientists give it out that the people of this tribe have no souls; so they can be used without scruple for any purpose whatever. Naturally we are interested in their language all the same; for of course we need to give them orders and to get reports from them. We want to know too what they say among themselves, as this hangs together with the rest of their behaviour. But also we must be interested in what in them corresponds to our 'psychological utterances', for we want to keep them capable of work, and so their expressions of pain, of feeling unwell, of depression, of pleasure in life etc. etc. are of importance to us. Indeed, we have also found that these people can be used successfully as experimental objects in physiological and psychological laboratories; since their reactions--including speech-reactions--are altogether those of men endowed with souls. I assume that it has also been found that these automata can be taught our language instead of their own by a method very like our 'instruction'. [Cf. Z 528.]

Page Break 21

Page 21

97. These beings now learn, e.g. to calculate, to calculate on paper or orally. But somehow we bring them to the point of being able to say the result of a multiplication after they have sat still for a while without writing or speaking. When one considers the kind of way in which they learn this 'calculating in the head', and the phenomena that surround it, the picture suggests itself, that the process of calculating is as it were submerged, and goes on *under* the mirror surface of the water. (Think of the sense in which water '*consists*' of H and O.)

Naturally there are various purposes for which we need to have an order of the form "Calculate this in your head"; a question "Have you calculated it?"; and even "How far have you got?"; a statement of the automaton "I

have calculated..."; etc. etc. In short: all that we say among ourselves about calculating in the head, is also of interest to us when they say it. And what goes for calculating in the head also goes for other forms of thinking.--If anyone among us voices the idea that something must surely be going on *in* these beings, something mental, this is laughed at like a stupid superstition. And if it does happen that the slaves spontaneously form the expression that this or that has taken place *in* them, that strikes us as especially comical. [Cf. Z 529.]

Page 21

98. With these beings we also play the game "Think of a number Multiply it by 5--..."--Does that prove that *after all* something has taken place *in* them?-

Page 21

99. And now we observe a phenomenon,--which we might interpret as the expression of the experience: seeing a figure now this way now that. Now we shew them, e.g., a puzzle picture. They find the solution; and then they say something, point to something, draw something etc., and we can teach them our expression: "Now I always see the picture this way." Or they have learnt our language and the ordinary use of the word "to see" and now they invent that form spontaneously.

Page 21

100. What interest, what importance has this phenomenon, this reaction? It may be quite unimportant, quite uninteresting, or again important and interesting. Some people associate certain colours with our vowels; some can answer the question which days of the week are fat and which are thin. These experiences play a very subordinate part in our lives; but I can easily think out circumstances, in which what is unimportant to us would acquire great importance.

Page Break 22

Page 22

101. The slaves also say "When I heard the word 'bank' it meant... to me". Question: Against the background of what technique of language do they say this? For everything turns on that. What had we taught them, what employment of the word "mean"? And what, if anything at all, do we gather from their utterance? For if we can do nothing with it, it might interest us as a curiosity. Let us just imagine human beings who are unacquainted with dreams and who hear our narrations of dreams. Imagine one of us coming to this non-dreaming tribe and gradually learning to communicate with the people.--Perhaps you think they would never understand the word "dream". But they would soon find a use for it. And the doctors of the tribe might very well be interested in our dreams and draw important conclusions from the dreams of these strangers.--Nor can it be said that for these people the verb "to dream" could mean nothing but to tell a dream. For the stranger would use both expressions, "to dream" and "to tell a dream" and the people of our tribe wouldn't be allowed to confuse "I dreamt..." with "I told the dream...". [Cf. Z 530.]

Page 22

102. We ask ourselves: "What interests us about the psychological utterances of human beings?"--Don't see it so much as a matter of course that these verbal reactions do interest us.

Page 22

103. Why does the chemical formula of a substance interest us? "Well, or [[sic, of?]] course its composition interests us."--Here we have a similar case. The answer might also have been "Because its inner nature interests us".

Page 22

104. "You are surely not going to deny that rust and water and sugar have an inner nature!" "If one didn't know it already, science would surely have shewn it beyond cavil."

Page 22

105. Is the hearing or thinking of a word in this or that meaning a *genuine experience*?--How is that to be judged?--What speaks against it? Well, that one cannot discover any *content* for this experience. It's as if one were expressing an experience, but then could not think what the experience really was. As if one could indeed sometimes think of an experience that was simultaneous with the one we are looking for, but what we get to see then is merely a garment, and, where what it clothes should be, there is a vacuum. And then one is inclined to say: "You must not look for *another* content". The content of the experience just is to be described by the *specific expression* (of the

Page Break 23

experience). But that does not satisfy us either. For why do we feel nevertheless that there just is *no* content there?

And is it like that only with the experience of meaning? Isn't it so also with, e.g., that of remembering? If someone asks me what I have been doing in the last two hours, I answer him straight off and I don't read the answer off from an experience I am having. And yet one says that *I remembered*, and that this is a mental process.

Page 23

106. One might almost marvel that one can answer the question "What did you do this morning?"--without looking up historical traces of activity or the like. Yes; I answer, and wouldn't even know that this was only possible through a special mental process, remembering, if I were not told so.

Page 23

107. But there is also such a thing as "I believe I remember that", whether rightly or wrongly--and here there comes into view what is *subjective* about the psychological.

Page 23

108. If I now say that the experience of remembering and the experience of pain are different in kind, that is misleading: for "experiences of different kinds" makes one think perhaps of a difference like that between a pain, a tickle, and a feeling of familiarity. Whereas the difference of which we are speaking is comparable, rather, to that

between the numbers 1 and $\sqrt{-1}$.

Page 23

109. Where do we get the concept of the 'content' of an experience from? Well, the content of an experience is the private object, the sense-datum, the 'object' that I grasp immediately with the mental eye, ear, etc. The inner picture.--But where does one find one needs this concept?

Page 23

110. Why, when I communicate my subjective memory, am I not inclined to say I was describing the content of my experience?

Page 23

111. Of course, when I say "Memories of that day rose up in me" it looks different. Here I am inclined to speak of a content of the experience, and I imagine something like words and pictures which rise up before my mind.

Page 23

112. I can shew someone what a particular pain, an itch, a tingle etc. is, by producing the feeling in him and observing his reaction, the

Page Break 24

description that he gives, etc. But can I do anything like that in the case of memory-experience?--In such a way, that is, that he can now say "Yes, now I know what it is to remember something". Of course, I can teach him what we call "remembering something"; I can teach him the use of these words. But can he then say "Yes, now I have experienced what that is!" ("Yes, now I know what shuddering is!"†1) If he were to say so, we should be astonished, and think "What can he have experienced?" For we experience nothing special. [Cf. P.I. p. 231c.]

Page 24

113. When someone says "Now I know what a tingle is," we know that he knows through his 'expression of the sensation'; he jerks, makes a particular noise, says what we too say in this case, finds the same description apt as we do. [Cf. P.I. p. 231c.]

Page 24

114. And in this way we might actually speak of a feeling "Long, long ago" and *these* words are an expression of the feeling; but not *these*: "I remember that I often met him." [Cf. P.I. p. 231c.]

Page 24

115. "If it passes, then it was not true love." Why *was* it not in that case? Is it our experience, that only this feeling and not that endures? Or are we using a picture: we test love for its *inner* character, which the immediate feeling does not discover. Still, this picture is important to us. Love, what is important, is not a feeling, but something deeper, which merely manifests itself in the feeling.

We have the word "love" and now we give this title to the most important thing. (As we confer the title "Philosophy" on a particular intellectual activity.)

Page 24

116. We confer individual words as we confer already existing titles.

Page 24

117. "A new born child has no teeth."--"A goose has no teeth." "A rose has no teeth."--This last at any rate--one would like to say--is obviously true! It is even surer than that a goose has none.--And yet it is none so clear. For where should a rose's teeth have been? The goose has none in its beak. Nor, of course, has it any in its wings; but that's not what anyone means when he says it has no teeth--Why, suppose one were to say: the cow chews its food and then dungs the

Page Break 25

rose with it, so the rose has teeth in the mouth of a beast. This is not absurd, because one wouldn't have any idea in

advance, where to look for teeth in a rose. ((This hangs together somehow with the problem that the proposition "The earth has existed for more than 100,000 years" has a clearer sense than "The earth has existed for the last five minutes". For if you were to say that, I should ask you: "What observations are you referring to? What observations would go against your proposition? Whereas I probably know the thinking and observations to which the first proposition belongs.)) [Cf. P.I. p. 221h, g.]

Page 25

118. "You see, this is what it's like when one remembers something." This? What?--Can one imagine someone saying: "I shall never forget this experience (namely of remembering)!"?

Page 25

119. Is memory an experience? *What* do I experience? And is it an experience, when the word "bank" means one thing or the other to me?

Again: *What* do I experience?--One is inclined to answer: I saw this or that before me, I imagined it.

Well, do I merely *say* it?--that is, that this word meant this to me--and did *nothing* happen? It was mere words?--Not mere words; and it can also be said that something happened, which corresponded to them--but one cannot *explain* that it wasn't mere words by saying that something corresponding to them happened. For the two expressions mean the same thing.

Page 25

120. The feeling of having been in just the same situation before. I have never had this feeling.

When I see someone I know well, his is a well-known face; it is far more intimately known to me, than when it merely 'strikes me as familiar'. But wherein consists this familiar knowledge? Have I the feeling of familiar knowledge the whole time when I am seeing him? And why does one not want to say that? One would like to say: "I have no special feeling of familiar knowledge, no feeling that corresponds to my familiarity with him." When I say that I know him extremely well, that I have seen him and talked with him countless times, that isn't meant to describe a *feeling*. And what shews that this does not describe a feeling?--If, say, someone were to assert that *he* had such a feeling the whole time he was seeing some intimately known object--or if he says he *believes* he has such a feeling,--should I say I don't believe him?--Or should I say I don't know what sort of feeling that is?

Page Break 26

Page 26

I see someone I know well, and someone asks me whether his face strikes me as familiar. I shall say: no. I shall say that the face is that of a human being I have seen thousands of times. "And do you not have the experience of familiarity--when you do have it with a face you hardly know?"!

How does it come out that I am not expressing a feeling, when I say: Of course his face is familiar to me, it is as familiar as can be?

Page 26

121. Why is it ridiculous to speak of a continuous feeling of familiar acquaintance?--"Well, because you don't feel one." But is *that* the answer?

Page 26

122. A feeling of familiar acquaintance; that would be something like a feeling of well-being. Why does it seem correct to speak of a feeling here, and not there?--Here there occurs to me the special expression of well-being. A cat's purr, say.

Page 26

123. And can I not also imagine a case, in which I should say someone has a constant feeling of familiar acquaintance with an object? Think of someone going round a room in which he had not been for a long time, and enjoying his familiar acquaintance with all the old things? Could one not speak of a feeling of familiarity here? And why?--Do I know this feeling in *myself*? Is *that* why I find that here it makes sense to speak of the feeling?

Page 26

124. I imagine that all his doings have a familiar feel to him.--But how shall I know this?--Well, by his saying it. So he must use certain words, he must, e.g., say "everything feels so familiar," or give some other specific expression of the feeling.

Page 26

125. The feeling of the unreality of one's surroundings. This feeling I have had once, and many have it before the onset of mental illness. Everything seems somehow not *real*; but not as if one *saw* things unclear or blurred; everything looks quite as usual. And how do I know that another has felt what I have? Because he uses the same words as I find appropriate.

But why do I choose precisely the word "unreality" to express it? Surely not because of its sound. (A word of very like sound but different meaning would not do.) I choose it because of its meaning.

But I surely did not learn to use the word to mean: *a feeling*. No; but I learned to use it with a particular meaning and now I use it spontaneously like *this*. One might say--though it may mislead--: When I have learnt the word in its ordinary meaning, then I choose *that* meaning as a simile for my feeling. But of course what is in question here is not a simile, not a comparison of the feeling with something else.

126. The fact is simply that I use a word, the bearer of another technique, as the expression of a feeling. I use it in a new way. And wherein consists this new kind of use? Well, one thing is that I *say*: I have a 'feeling of unreality'--after I have, of course, learnt the use of the word "feeling" in the ordinary way. Also: the feeling is a state.

127. Anger. "I hate..." is obviously the expression of hate, "I am angry" seldom the expression of anger. Is anger a feeling? And why not?--First and foremost: what does someone do, if he is angry? How does he conduct himself? In other words: when does one say that someone is angry? In such cases he learns to use the expression "I am angry". It is the expression of a feeling?--And why *should* it be the expression of a feeling, or of feelings?

128. Then is anger not an experience?--Is clenching my fist, say, an experience, or pronouncing or writing down a sentence?

129. Take the various psychological phenomena: thinking, pain, anger, joy, wish, fear, intention, memory etc.,--and compare the behaviour corresponding to each.--But what does behaviour include here? Only the play of facial expression and the gestures? Or also the surrounding, so to speak the occasion of this expression? And if one does include the surrounding as well,--how is the behaviour to be compared in the case of anger and in that of memory, for example?

130. Isn't this as if someone were to say: "Compare different states of water"--and by that he means its temperature, the speed with which it is flowing, its colour, etc.?

131. The behaviour of humans includes of course not only what they do without ever having learned the behaviour, but also what they do (and so, e.g. *say*) after having received a training. And this behaviour has its importance in relation to the special training.--If, e.g., someone

has learnt to use the words "I am glad" as someone else has learnt to use the words "I am frightened", we shall draw unlike conclusions from like behaviour.

132. "But may he not be frightened, even though he *never* reveals it?" What does this "may" mean? Is it supposed to mean "Does it sometimes happen that someone is frightened without ever saying so?"--No. Rather: "Is there any sense in e.g. that question?"--Or: does it make sense, if a novelist narrates that someone was frightened but never revealed it? Well, it does make sense. But what sense? I mean:--Where and how will such a sentence be used? When I ask "What sense does it make?"--I want someone to answer me not with a picture or a series of pictures, but with the description of situations.

133. "But depression is surely a *feeling*; you surely don't want to say that you are depressed and don't feel it? And where do you feel it?" That depends on what you call "feeling it". If I direct my attention to my bodily feelings, I notice a very slight headache, a slight discomfort in the region of the stomach, perhaps a certain tiredness. But do I mean that, when I say I am severely depressed?--And yet I say again: "I feel a burden weighing on my soul." "Well, I can't express it any differently!"--But how remarkable that I say it that way and cannot express it differently!

134. My difficulty is altogether like that of a man who is inventing a new calculus (say the differential calculus) and is looking for a symbolism.

135. Depression is not a bodily feeling; for we do not *learn* the expression "I feel depressed" in the circumstances that are characteristic of a particular bodily feeling.

136. "But depression, anger, is surely a particular feeling!"--What sort of proposition is that? Where is it used?

137. Uncertainty: whether a man really has this feeling, or is merely putting up an appearance of it. But of course it is also uncertain whether he is not merely putting up an appearance of pretending. This pretence is merely rarer and does not have grounds that are so easily understood.--But what does this uncertainty consist in? Am I really always in some uncertainty whether someone is really angry, sad, glad etc. etc.? No. Any more than whether I have a notebook in

Page Break 29

front of me and a pen in my hand, or whether this book will fall if I let go of it, or whether I have made a miscalculation when I say 25×25 is 625. The following, however, is true: I can't give criteria which put the presence of the sensation beyond doubt; that is to say: there are no such criteria.--But what sort of fact is *that*? A *psychological* one, concerning sensations? One will want to say it resides in the nature of sensation, or of the expression of sensation. I might say: it is a peculiarity of our language-game.--But even if that is true, it passes over a main point: In *certain* cases I am in some uncertainty whether someone else is in pain or not, I am not secure in my sympathy with him--and *no* expression on his part can remove this uncertainty.--In that case I say, e.g.: "He might be pretending this too." But why should he necessarily be pretending? For pretence is only one quite special case of someone's expressing pain and not feeling it. A particular drug might put him into a state in which he 'acts like an automaton', is not pretending, but feels nothing, though he expresses feelings. I am imagining, e.g., that the drug has the effect that some time after a real illness he repeats all the actions of his period of illness, while the objective illness, the causes of pain, for example, have ceased to exist. In this case we have as little sympathy with him as with someone under a narcotic. We say that he repeats all the expressions of pain, etc. purely automatically, but that of course he isn't pretending.

Page 29

138. "I can never *know* what is going on in him; *he* always knows": When one thinks philosophically, one would like to say that. But what situation does this statement correspond to? Every day we hear one man saying of another that he is in pain, is sad, is merry, etc. without a trace of doubt, and we relatively seldom hear that he does not know what is going on in the other. In this way, then, the uncertainty is not so bad. And it also happens that one says "I know that you felt like this then, even if you won't admit it now".

Page 29

139. The picture "He knows--I don't know" is one that makes our lack of knowledge appear in an especially irritating light. It is like when one looks for an object in various drawers, and tells oneself that God knows the whole time *where* it actually is, and that we are searching this drawer quite futilely.

Page 29

140. "Any human knows he is in pain"--and does he also know exactly how severe his pain is?

Page Break 30

Page 30

141. The uncertainty of the ascription "He's got a pain" might be called a constitutional certainty.

Page 30

142. The child that is learning to speak learns the use of the words "having pain", and also learns that one can simulate pain. This belongs to the language-game that it learns.

Or again: It doesn't just learn the use of "He has pain" but also that of "I believe he has pain". (But naturally not of "I believe I have pain".)

Page 30

143. "He can also simulate pain"--that is to say: he can behave as if he had pains without having them. Certainly; and such a proposition underlines a particular picture; but is the employment of "He has pain" influenced by this?

Page 30

144. But how if someone were to say "Having pain and shamming pain are very different states of mind, which might have the same expression in behaviour"?

Page 30

145. So do sham pain and true pain have the same expression? And in that case how does one distinguish them? How do I know that the child I teach the use of the word "pain" does not misunderstand me and so always call "pain" what I call "sham pain"?

Page 30

146. Suppose someone explains the teaching of the word "pain" in this way: when a child behaves in such-and-such a way on particular occasions, I think it feels what I feel in such cases; and if I am not mistaken in this, then the child associates the word with the feeling and uses the word when the feeling reappears.--

This explanation is correct enough; but *what* does it explain? Or: what sort of ignorance does it remove?--It

tells us, e.g., that the person does *not* associate the word with a behaviour or an 'occasion'. So if anyone did not know whether the word "pain" names a feeling or a behaviour, the explanation would be instructive to *him*. It also says that the word is *not* used now for this feeling now for that--as of course might also be the case. [Cf. Z 545.]

Page 30

147. The explanation says that I use the word wrong if I later use it for a *different* feeling. A whole cloud of philosophy condensed into a droplet of symbolic practice. [Cf. P.I. p. 222b.]

Page Break 31

Page 31

148. Why should the words "I believe he is in pain" not be mere lunacy? Somewhat as if someone were to say "I believe my teeth are in his mouth".

Page 31

149. A tribe: the people often pretend, they lie in the road looking ill and in pain; if someone comes to their aid, they attack him. For this behaviour the tribe has a particular word.

Page 31

150. Instead of "It is uncertain whether he is in pain" one might say "Be mistrustful in face of his manifestation of pain".--And how does one do that?

Page 31

151. Believing that someone else is in pain, doubting whether he is, are so many natural kinds of behaviour towards other human beings; and our language is but an auxiliary to and extension of this behaviour. I mean: our language is an extension of the more primitive behaviour. (For our *language-game* is a piece of behaviour.) [Cf. Z 545.]

Page 31

152. I am not certain whether he is in pain."--Suppose someone were to stick a pin into himself whenever he said this, in order to have the meaning of the word "pain" vividly before his mind and to know *what* he was in doubt *about*! Would the sense of his statement be assured by his providing himself with pain while he makes it? Surely he knows now *what* it is he doubts about the other?--But how will he doubt what he now feels, about the other? How will he attach the doubt to his feelings? For what is the route from his pain to the other? For can he really better doubt the pain of the other, if he himself feels pain at the time? Need I myself have a cow in order to be able to doubt whether someone else has one? [Cf. Z 546.]

Page 31

153. So he has true pain; and what he doubts about another, is the possession of *this*.--But how does he do so?--It is as if I were to say to someone: "Here you have a chair; do you see it? Now translate it into French!" [Cf. Z 547.]

Page 31

154. So he has true pain;--and now he knows what he is to doubt about the other. He has the object before him; and it isn't any such thing as 'behaviour'. (But now!) In order to doubt whether the other is feeling pain now, I need the concept of pain; not pain. And it is probably true that this concept might be imparted to me by providing me with pain. [Cf. Z 548.]

Page Break 32

Page 32

155. It would be just as wrong to use an experience of meaning to explain the concept of understanding meaning as to explain reality and unreality by the experience of unreality, or the concept of the presence of a human being by the feeling of a presence. One might just as well try to explain what check is in chess by a check-feeling.

Page 32

156.  "But one can surely see the figure as an arrow and as a bird's foot, even when one never tells anyone." And that in turn means: It makes *sense* to say: Someone saw the figure now this way, now that, without telling anyone.--I don't want to say it makes no sense, but the sense is not clear straight off:--I know, for example, that people talk of a feeling of unreality, they say everything seems unreal to them; and now one says: everything might strike people as unreal even if they had never told anyone. How does one know straight off that it makes sense to say "perhaps everything strikes this person as unreal, although he never speaks of it"?

Of course I have here purposely chosen a very rare experience. For because it is not one of the everyday experiences, one looks more sharply at the use of the words.--I should like to say: In some pressing trouble it makes sense to cry out: "It's all unreal!"--and so one knows that that other statement makes sense too!--Or again: Someone says to me "Everything seems unreal to me". I hardly know what that means--and yet I know already, that it would make sense to say, etc. etc. Now this of course depends on his using this sentence to describe an experience, i.e. on its being a psychological statement.

157. That is to say: when someone manifests a state of mind, he might also have had that state of mind without manifesting it. That is a bit of talk. †1 But what is the purpose of a sentence saying: perhaps N had the experience E but never gave any sign of it? Well, it is at any rate possible to think of an application for the sentence. Suppose, for example, that a trace of the experience were to be found in the brain, and then we say it has turned out that before his death he had thought or seen such and such etc. Such an application might be held to be artificial and far-fetched; but it is important that it is *possible*.

158. If there is such a thing as a temptation to regard the differential calculus as a calculus with infinitely small magnitudes, it's conceivable that in another case there may be an analogous temptation, a still more powerful one--when, that is, it gets nourishment on every side from the forms of language; and one can imagine it becoming irresistible.

159. "I had toothache"--when I say this I don't remember my behaviour, I remember my pain. And how does that happen? A faint copy of the pain comes into my mind?--So is it as if one were ever so slightly in pain? "No; it is another kind of copy; something specific." So is it as if one had never seen a painted picture but only busts, and one said "No, a painting is quite different from a bust, it is a quite different sort of copy". It might be, for example, that one would find it far harder to make it intelligible to a blind man what a painting is than what a bust is.

160. But the word "specific" (or an analogous one), which one would very much like to use here, does not help. It is as little of a resource as the word "indefinable" when one says that the word "good" is indefinable.

What we want to know, to get a bird's-eye view of, is the use of the word "good", and equally that of the word "remember".

For one can't say: "After all, you are *acquainted* with the specific thing, the memory-image." I am not *acquainted with it*--To be sure I may say "I can't describe Mr. N., but I am acquainted with him"; but that means that I recognize him, not that I *believe* I recognize him.

161. Its making sense to say that someone had a feeling, without ever revealing it, hangs together with its making sense to say "I felt this then; I remember it".

The explanation might be as follows: After all, one isn't going to say: "If I had never said that I had pains at that time, then I wouldn't have had them."

162. "I surely know what this *means*: 'He was in pain!'" Does that mean that I can *imagine* it? What would make this imagining important?

It is indeed important that, in order to explain this proposition I can turn to the memory of my own pains at any time, or to summoning pains up in myself, etc.

163. How does anyone learn to call a lump of sugar "sugar"? How, to obey the request "Give me a lump of sugar?" And how does he learn the words "A lump of sugar, please"--i.e. the expression of a wish?! How, to understand the order "Throw!"; and how, the expression of intention "Now I am going to throw"? Well--the grown-ups may perform before the child, may pronounce the word

and straightway throw,--but now the child must imitate *that*. ("But that is the expression of intention only if the child really has the intention in its mind"--But then when does one say that that is the case?)

And how does it learn to use the expression "I was just about to throw"? And how does one know that it was then really in the state of mind that I call "being about to throw"? After such-and-such language games have been taught it, then on such-and-such occasions it uses the words that the grown-ups spoke in such cases, or it uses a more primitive form of expression, which contains the essential relations to what it has previously learnt, and the grown-ups substitute the regular form of expression for the more primitive one.

164. The new (spontaneous, 'specific' is a language-game). [Cf. P.I. p. 224h.]

165. "But weren't there all these appearances--of pain, of wishing, of intention, of memory etc., before there was any

language?" What is the *appearance* of pain?--"What is a table?"--"Well, *that*, for example!" And that is of course an explanation, but what it teaches is the technique of the use of the word "table". And now the question is: What explanation corresponds to it in the case of an 'appearance' of mental life? Well, there is no such thing as an explanation which one can recognize straight away as the homologous explanation.

Page 34

166. It may be asked: Does something always come into my head when I understand a word?! (The following question is similar: "When I look at a familiar object, does an act of recognition always take place?")

Page 34

167. But there is the phenomenon that when a word is heard outside any context--for example--for a fleeting moment it has one meaning, and the next moment another; that if one pronounces the word over and over it loses all 'meaning'; and so on. And here it is a matter of something's *coming into one's head*.

Page 34

168. What should we say about men who didn't understand the words "Now I'm seeing this figure as..., now as..."? Would they be lacking in an important sense; is it as if they were blind; or colour-blind; or without absolute pitch?

Page Break 35

Page 35

169. Well, it is easy to imagine men who could not 'phrase' drawings thus and so; but would they not all the same take a drawing now for this, now for something else? Or am I to assume that in this case they would not say that the optical picture has in an important sense stayed the same? Thus, when the schematic representation of a cube looked now this way now that to them, would they believe that the lines had altered their position?

Page 35

170. Imagine someone who did not like to see a drawing or a photograph, because he says that a colourless human being is ugly. Or there might be someone who found that men, houses, etc. all tiny as they are in pictures, were uncanny or ridiculous. This would certainly be a very queer attitude. ('Thou shalt make thyself no image.')

Think of our reactions towards a good photograph, towards the facial expression in the photograph. There might be people who at most saw a kind of diagram in a photograph, as we consider a map; from it we can gather various things about the landscape; but we can't, e.g., admire the landscape in looking at the map, or exclaim "What a glorious view!"

The 'form-blind' man must be abnormal in this kind of way. [Cf. P.I. p. 205f.]

Page 35

171. How can the non-occurrence of an experience in hearing the word hinder our *calculating* with words, or influence it?

Page 35

172. Imagine people who only think out loud and only imagine by drawing on paper. Or perhaps it would be better to say: who draw, where we imagine. Then the case where I imagine my friend N does not correspond to the case where someone else draws him; rather he must draw him and say or write that it is his friend N.--But suppose he has two friends who are like one another and have the same name? and I ask him "Which did you mean, the clever one or the stupid one?"--He *could* not answer this. But he could answer the question "Which of them does that present?"--In this case the answer is simply a further use of the picture, not a statement about an experience.

Page 35

173. Compare James' idea that the thought is already complete at the beginning of the sentence, with the idea of the lightning speed of thought and the concept of the *intention* of saying such-and-such. That

Page Break 36

the thought is already complete at the beginning of the sentence (and why not at the beginning of the previous one?) means the same as: If someone is interrupted after the first word and you ask him later on "What were you wanting to say then?", he can answer the question at least, he often can. But here too James says something that sounds like a psychological statement and is not one. For, whether the thought was already complete at the beginning of the sentence would surely have to be proved by the experience of individuals. [Cf. Z 1.]

Page 36

174. However, we also often cannot answer the question what we meant to say then. But in this case we say we have *forgotten* it. Would it be imaginable that in such cases people should reply: "I merely said *these* words; how am I to know what would have come after them?"

Page 36

175. If you say "As I heard this word, it meant... for me" you refer to a point of time and to an employment of the word.--The remarkable thing about it is of course the relation to the point of time.

The 'meaning-blind' would lose that relation. [Cf. P.I. p. 175a.]

Page 36

176. And if you say "I was wanting to go on..."--you refer to a *point of time* and to an *action*. [Cf. P.I. p. 175b.]

Page 36

177. If I speak of the essential *references* of the utterance, that is because this pushes the inessential special expressions of our language into the background. The essential references are the ones that would lead us to translate an otherwise unaccustomed expression into the customary one. [Cf. P.I. p. 175c.]

Page 36

178. Suppose someone never said "I was going to do this then" and could not be taught to use such an expression either? It is surely clear that a person can think a lot without thinking that. He can master a great area of language, without mastering this one. I mean: he remembers his expressions, including perhaps that he said such-and-such to himself. So he will say, e.g., "I said to myself 'I want to go there'" and perhaps also "I imagined the house and went on the path that led there". What is characteristic here is that he has his intentions in the form of thoughts or pictures and hence that they would always be replaceable by the speaking of a sentence or the seeing of a picture. The "lightning speed" of thought is missing in him.--But now, is that supposed to mean that he often moves like an automaton; walks in the street, perhaps, and makes purchases; but when one meets

Page Break 37

him and asks "Where are you going?"--he stares at one as if he were sleep-walking?--He won't answer "I don't know" either. Or will his proceedings strike him, or us, as planless? I don't see why!

When I go to the baker, say, perhaps I say to myself "I need bread" and I go the usual way. If someone asks him "Where are you going?" I want to assume that he answers with the expression of intention just as we do.--But will he also say: "As I left the house, I was meaning to go to the baker, but now..."? No; but ought we to say that on this account he set out on his way as it were sleepwalking?

Page 37

179. But isn't it then remarkable that, in all the great variety of mankind we do not meet such people as this? Or are there such people among the mental defectives; and it is merely not sufficiently observed which language-games these are capable of and which not?

Page 37

180. Plato says that thinking is a conversation. If it really were a conversation, then one could only report the words of the conversation and the external circumstances under which it was carried on, but not also the meaning (*Meinung*) that these words then had for the speaker. If someone said to himself (or out loud) "I hope to see N soon", it would make no sense to ask: "And which person of that name did you mean then?" For all that he did was say these words.

But could I not imagine that he, nevertheless, wants to go on in a particular way; so that I could ask him: "And do you now mean someone by this name, and whom?"

And suppose that usually he could go on now, could explain his words--where would be the difference between him and us? He could give a verbal report of any thought-process. So if he said "I just thought of N" and we asked him "*How* did you think of him?" he can always answer us, unless he says he has forgotten.

Page 37

181. If someone says to me "N has written to me", I can ask him "which N do you mean?"--and must he refer to an experience in speaking the name if he is to answer me?--And if he now simply pronounces the name N--perhaps as an introduction to a statement about N,--can't I equally well ask him "Whom do you mean?" and he equally well answer?

Page Break 38

Page 38

182. One does actually often simply pronounce someone's name; perhaps in a sigh. And now someone else asks "Whom did you mean?"

And how will our meaning-blind man act? Will he not sigh like that; or not be able to answer anything to the question; or answer "I mean..." instead of "I meant..."?

Page 38

183. Imagine one of your acquaintances. Now say who it was.--Sometimes the picture comes first and the name after. But does that mean that I guess the name according to whom the picture resembles?--And if the name only comes after, am I to say that the idea of the acquaintance was already there with the picture, or that it was only complete with the name? For I did not infer the name from the likeness of the picture; and that is the very reason why I can say that the idea had already been there with the picture.

184. "I must go to the bank and get some money."--How did you understand that sentence? Need this question mean anything but "How would you explain this sentence, what action to expect when you hear it?" etc? If the sentence is uttered under different circumstances, so that the word "bank" obviously sometimes *means* this, sometimes something else--must something special go on in hearing the sentence if you are to understand it? Don't all *experiences* of understanding get covered up by the use, by the *practice* of the language-game? And that merely means: here such experiences aren't of the slightest interest to us.

185. When I see the milkman coming, I fetch my jug and go to meet him. Do I experience an intending? Not that I knew of. (Any more, perhaps, than I *try* to walk, in order to walk.) But if I were stopped and asked "Where are you going with that jug?" I should express my *intention*.

186. If now I say, e.g. "I got up to go to the milk van,"--is this to be called the description of an experience of intending? And why is that misleading? Is it because there was here no 'expression' of an experience?

187. But if I say "I got up to..., but then I recollected myself and..."--where is the experience here, and *when* did it take place? Was the experience only the 'recollecting myself', 'changing my mind'?

188. I take the milk-jug, go a few steps, then I see that it isn't clean, say "No!" and go the [[sic to?]] the water-tap. Then I describe what happened and name my intentions. Now *didn't* I have these? Of course! But once again: isn't it misleading to call them *experiences*? if, that is, one *also* calls by that name what I said to myself, imagined etc.! (It would also be misleading to call intention a "feeling".)

189. And now the question arises whether for the same reasons it wouldn't be totally misleading to speak of 'form-blindness' or 'meaning-blindness' (as though one were to talk of 'will-blindness', when someone behaves passively). For a blind man just is someone who does not have a *sense*. (The mental defective--e.g.--can't be compared to the blind man.)

190. When I drew the first  it was a half circle; the second was a half S; the third was a whole.

191. "I have no doubt that that often happens."--If you say this in a conversation, can you really believe that in speaking you distinguish between the meanings of the two words 'that'?

192. One might want to make the following objection against the fiction about people who only think out loud: Suppose such a one were to say "As I left the house, I said to myself 'I must go to the baker,'" couldn't he be asked "Did you really *mean* those words? For you might have said them as practice in elocution, or as a quotation, or as a joke, or in order to mislead someone." That is true. But was what he was doing a matter of the experience that accompanied the words? What speaks for such an assertion? Presumably, that the one who is asked may reply "I meant the sentence *like this*" without inferring this from external circumstances.

193. Of course one wants to say that if someone remembers having *meant* these words, he is remembering the experience of a certain *depth*, of a resonance. (If he had not meant it, he wouldn't have had this resonance.) But is that not simply an illusion (like that in which someone believes that he feels thinking in his head)? One uses inappropriate concepts to form the *picture* of the processes. (Cf. James.)

194. Make the following experiment: Say some ambiguous word to yourself ("till"); if you now experience it as a verb, try to hang on to

this experience, so that it lasts.--If you say the word to yourself several times, it loses its meaning for you; and now ask yourself whether, when you are using it as a verb in ordinary speech, the word does not perhaps feel as it does when it has lost its meaning through being often repeated.--You certainly can't testify from your memory that the contrary is true. But one merely finds that *a priori* it can't be otherwise.

195. It is indifferent whether one says that the interpretation of the word 'till' is projected later into the experience

had while pronouncing it. For here there is no difference between projecting and describing.

Page 40

196. One may take a drawing for a real cube; can one also, in the same sense, take a triangle as lying down or standing up--"When I came nearer, I saw that it was only a drawing." But not: "When I looked closer I saw that *this* was the base line and *this* the apex."

Page 40

197. My words "When you began to speak, I thought you meant..." tie up with the beginning of his speech and with an idea that I had then.--And it is of course possible for someone never to do anything like that. But I will assume that at the end he can answer the question "Which N was I speaking of?" And it is of course possible that he would have answered it differently if I had put the question after the very first words of my story. Isn't he then supposed to understand the question: "Did you know right at the beginning whom I was talking about?"--And now if he does not understand such a question--shall we not simply judge him to be mentally defective? I mean: shall we not simply assume that his thinking is not really *clear*, or that he no longer remembers what he was thinking then? That is to say, here we shall ordinarily use a different picture from the one which I was proposing.

Page 40

198. But it is true: with mental defectives we often feel as if they talked more automatically than we do, and if someone were what we called 'meaning-blind', we should picture him as making a less lively impression than we do, behaving more 'like an automaton'. (One also says: "God knows what goes on in his mind", and one thinks of something ill-defined, disorderly.)

Page Break 41

Page 41

199. It might be that when one pronounced a word to some people, they immediately formed some sentence or other with this word, and that others did not, that the former was a sign of intelligence, the latter of dullness.

Page 41

200. What can be adduced against the expressions 'specific psychological phenomenon' or 'irreducible phenomenon'? They are misleading: but what is their source? One wants to say: "If someone is unacquainted with sweet, bitter, red, green, notes and colours, one cannot make the meaning of these words intelligible to him." On the other hand, if someone hasn't yet eaten a sour apple, what is meant can be explained to him. For red is *this*, and bitter *this* and pain *this*. And if one says that, one must now actually exhibit what these words mean; that is, one must point to something red; taste, or make the other taste, something bitter; give oneself or the other pain etc. Not think that one can privately point to pain within oneself. But how in that case will one exhibit what "imagining", "remembering", "intending", "believing" mean? The expression "specific psychological phenomenon" corresponds to that of the private ostensive definition.

Page 41

201. Is it (in the end) an illusion, if I believed that the other's words had this sense for me at *that* time? Of course not! Any more than it is an illusion to believe that one has dreamed something before waking up.

Page 41

202. When I supposed the case of a 'meaning-blind' man, this was because the experience of meaning seems to have no importance in the *use* of language. And so because it looks as if the meaning-blind could not lose much. But it conflicts with this, that we sometimes say that some word in a communication meant one thing to us until we saw that it meant something else. First, however, we don't feel in this case that the experience of the meaning took place while we *were hearing the word*. Secondly, here one might speak of an experience rather of the sense of the sentence, than of the meaning of a word.

Page 41

203. The picture that one perhaps connects with the utterance of the sentence "The bank is far away", is an illustration of *it* and not of one of its words.

Page 41
