204. If someone insists that when he hears and understands an order, a piece of information etc., he mostly does not experience anything at all, at least not anything that determines the sense for him--might this

Page Break 42

man not say nevertheless in some form or other that he had taken the first words of the sentence like *this* and later altered the way he took them?--But what would he say that *for*? It might explain a particular reaction on his part. He heard, e.g., that N was dead and believed that this meant his friend N; then he realizes that it is not so. At first he looks upset; then relieved.--And it is easy to see what kind of interest such an explanation may have.

Page 42

205. What am I to say now--that the meaning-blind man is not in a position to react like that? Or that he merely does not assert that he *then* experienced the meaning--and so, that he merely does not use a particular picture?

Page 42

206. Is the meaning-blind man then one who does *not* say: "The whole course of thought was before my mind in a flash"? But is that to say that he can't say "Now I've got it!"--

Page 42

207. "In that place there was no tree, no shrub"--how does this sentence function? Well, "tree" stands for a thing that looks like *this*. Of course, that's what a tree looks like; but is the idea of a word's going proxy for a thing really so easy to understand? If I am planning a garden, I can have a peg go proxy for a tree here. Where the peg stands now, the tree will be set later.--But still, one might say that the word "tree" in a sentence goes proxy there for the picture of a tree (and of course even a tree can be used as that). For in a picture-language one might put the picture in the place of the word "tree", and the word "tree" will in any case be connected with the picture by means of the ostensive definition. In that case, then, it is the ostensive definition that determines what the word '*goes proxy for*'. And now

apply this, e.g. to the word "pain".--But does not the sign " " in a map go proxy for a house? Surely only in so far as a house too might serve as a *sign*! But the sign surely does not go proxy for the house for which it stands.--"Well, it *corresponds* to it."--So when I walk with the map in my hand and come to this house, I point to the place on the map and say "*That's* the house". "The sign goes proxy for the house" would mean: "Because I can't place the house itself on the map, I put this sign instead of it." But what would the house itself be doing on the map anyway? Proxy is something provisional but if the sign *corresponds* to the house, there is nothing provisional here; for it isn't going to be replaced by the house when we get to the house.

Page Break 43

And as the sign never will be replaced by its bearer, one might ask: How can a house be replaced by an ink line?

No: the peg is a substitute for the tree; the picture may be a substitute for the person, when one would rather see him but must be content with the picture; but the sign on the map is not a substitute for the object that it means.

Page 43

208. While I write, do I feel anything in my hand or in my wrist? Not generally. But still, wouldn't it feel different, if my hand were anaesthetized? Yes. And is that now a proof that I *nevertheless* do feel something when I move my hand in the normal way? No, I believe not.

Page 43

209. "I give you my full confidence." If someone who is saying this pauses after the word "you", perhaps I am able to continue; the situation yields what he wants to say. But if to my surprise he now goes on: "a gold watch" and I say "I was prepared for something else"--does that mean: while he was saying the first words I experienced something that may be called that way of taking the words?? I believe that this can't be said.

Page 43

210. Imagine this conversation: He: "I give you--." "I know. But in this case, all the same, you do *not* trust me."--I interrupted him because I knew what he was going to say. But did I necessarily fill out the continuation in thought? When I see a sketch, do I fill it out in my imagination?

Page 43

211. "I found myself going..."
saying..." etc.†1

This description does not *always* apply when I say something, take a path etc.

Page 43

212. Introspection can never lead to a definition. It can only lead to a psychological statement about the introspector. If, e.g., someone says: "I believe that when I hear a word that I understand I always feel something that I don't feel when I don't understand the word"--that is a statement about his peculiar experiences. Someone else perhaps feels something quite different; and if both of them *make correct use of* the word "understand" the essence of understanding lies in this use, and not in what they may say about what they experience.

Page Break 44

Page 44

213. What must the man be called, who cannot understand the concept 'God', cannot see how a reasonable man may use this word seriously? Are we to say he suffers from some *blindness*?

Page 44

214. One suddenly understands, suddenly repeats a word that the other has said. He tells me "It is seven o'clock"; at first I don't react; suddenly I cry out: "Seven o'clock! Then I'm already too late..." What he said had only just reached

my consciousness. But now, what happened, when I repeated the words "Seven o'clock!?" I can give no answer to this that would be of any interest. Only, to repeat, I had just grasped what he had said, and so on; and that gets us no further. Of course the talk (the idea) of a 'specific process' is based on this "Only, to repeat". (The absent minded man who at the order "Right about turn!" turns left about....)

Page 44

215. Does something happen when I understand this word, intend this or that?--Does nothing happen?--That is not the point; but rather: why should what happens within you interest me? (His soul may boil or freeze, turn red or blue: what do I care?)

Page 44

216. A mental defective will certainly *not* say: "When you began to speak, I thought you meant...."--Now it will be asked: Is that because he always understands right at once? Or because he never corrects himself? Or does the same go on in him as in me, and he merely can't express it?

Page 44

217. "When you began to speak, I thought you were going to.... That was why I made the movement... too." So one explains what one did by means of the thoughts that one had at the time. Now do I really think this explanation out only after the event? Didn't I really make this movement because I thought...?--What sort of question is that? Of course the "because" does not relate to a cause.

Page 44

218. "I am going to explain to you why I stood up; it was because I thought you meant...."--Yes, now I understand it!--But wherein lies the importance of this understanding? Well, for example: If the explanation had been another one, I should have had to react differently with words or actions. To that extent his thought is like an action, or a process in his body. The report about this thought is like one about such processes.--What interest have the words "At first I thought you meant..."? Often none. It may be said to disclose his

Page Break 45

world of thoughts. But what purpose does *that* serve? Why isn't this disclosure empty talk, or mere fantasy?

Page 45

219. One might (of course) call the report of such a conception the report of a *tendency*. (James.) But here the experience of a tendency must not be seen under the aspect of an experience which isn't quite complete! As if experiences yielded a coloured picture, and certain colours were laid on in full strength, others merely indicated, i.e. put on much more faintly.

In itself, however, a faint colour is not a hint at a stronger one.

Page 45

220. An event leaves a trace in the memory: one sometimes imagines this as if it consisted in the event's having left a trace, an impression, a consequence, in the nervous system. As if one could say: even the nerves have a memory. But then when someone remembered an event, he would have to *infer* it from this impression, this trace. Whatever the event does leave behind in the organism, it isn't the memory.

The organism compared with a dictaphone spool; the impression, the trace, is the alteration in the spool that the voice leaves behind. Can one say that the dictaphone (or the spool) is remembering what was spoken all over again, when it reproduces what it took?

Page 45

221. The feeling of dependence. How can one *feel* dependent? How can one *feel* 'It doesn't depend on me'? But what a queer expression of a feeling this is anyway!

But if, e.g., every morning one had difficulty in making certain movements at first, in raising one's arm and the like, and had to wait till the paralysis passed off, and that that sometimes took a long time, and sometimes happened quickly, and one could not foresee it or adopt any means of speeding it up--wouldn't that be the very thing to give us a consciousness of dependence? Isn't it the failure of the regular, or the vivid imagination of its failing, that lies at the bottom of this consciousness?

It is the consciousness: "It didn't have to go like that!" When I get up from a chair, I don't ordinarily tell myself "So I can get up". I say it after an illness, perhaps. But someone who did habitually say that to himself, or who said afterwards: "So it worked this time"--of him one might say he had a peculiar attitude to life.

Page Break 46

Page 46

222. Why does one say "He knows what he means"? How does one know that he *knows* it?

If he knows it, but I don't *know* what he means--what would it be like, if I did know it? And suppose I knew it and he didn't? How would someone have to behave for us to say: "He *knows* what the other is experiencing"?

But must there be a case that we should describe in that way if we were consistent? It *isn't* clear that any appearance must be described by the words "A has pains in the body of B".

That is to say: one can indeed say: "Wouldn't that be a consequent application of this expression?" but I may or may not be inclined to call it consequent.

Page 46

223. Remember especially the expression in a dream narrative: "And I knew that..." One might think: 'It's surely remarkable that one can dream that one knew.' One also says: "and in the dream I knew that..."

Page 46

224. Not all that I do, do I do with some intention. (I whistle as I go along etc. etc.) But if I were now to stand up and go out of the house, and then come back inside, and to the question "Why did you do that?" I answered: "For no particular reason" or "I just did" this would be found queer, and someone who often did this with nothing particular in mind would deviate very much from the norm. Would he have to be what is called "feeble minded"?

Page 46

225. Imagine someone of whom one would say: he can never remember an intention except by remembering the expression of an intention.

What we normally do 'with a definite intention' someone might do without any, but it might nevertheless prove useful. And perhaps in such a case we should say that he acted with *unconscious* intention. E.g., he suddenly climbs on a chair and then gets down again. To the question "Why"? he has no answer; but then he reports having noticed this and that from the chair, and that it seems as if he climbed up in order to observe this.

Might a 'meaning-blind' person not behave likewise?

Page 46

226. "When I said 'He is an ass' I was speaking of..." What sort of connexion have these sounds with this man?--Asked, "Whom do you mean?" I shall mention his name, describe him, shew his photograph etc. Is there a further connexion here? One that held

Page Break 47

particularly at the time of the utterance? During the whole time of uttering the sentence, though, or only while I said "he"? No answer!

Page 47

227. The experience during those words--I should like to say--grows naturally towards this explanation.

Page 47

228. But it is surely like this: I shall sometimes say "He is an ass", in conversation perhaps; and if I were asked "Would you have experienced anything different during these words if we had been speaking of N instead of M?" I shall have to grant that this need not be the case. On the other hand it sometimes seems to me as if I had an experience, while pronouncing the words, that pertains unambiguously to *him*.

The experiences while speaking seems to be connected intimately with *him*.

Page 47

229. "Of course I was thinking of him: I saw him before me!"--but I didn't *recognize* him from my picture of him.

Page 47

230. I suddenly say "He is an ass". A: "Whom did you mean?" I: "N." A: "Did you think of him while you were saying the sentence, or only when you gave the explanation?"--I might now reply that my words had been the terminus of a rather long course of thought. I had already been thinking of N the whole time. And could I now say: the words themselves were not tied up with him through any special experience, but the whole course of thought was? Thus I might easily have meant someone else by those words, and who *was* their reference was a matter of what preceded them.

In order, however, to be able to say that I was speaking of him, meant him, thought of him, must I really be able to remember an experience that unconditionally ties up with him? So might it not perhaps always strike one as if *nothing* had happened while my words were going on, that could only point to him? So I am imagining that I am always *conscious* that my images are ambiguous. At the same time however--this is what I am assuming--I still say "I meant...". But is this not a contradictory assumption? No: for that really is how things are. I say "I meant...": *that* is how I go on.

Page 47

231. I was speaking to my neighbours about their doctor; as I did so a picture of this man came into my mind--but I had never seen him, merely knew his name, and perhaps formed a picture of him from the

Page Break 48

name. How can this picture characterize my speaking of *him*? And yet this is how it struck me, till I recalled that I

don't know at all what the man looks like. So his picture represents him for me not a whit better than does his name.

Page 48

232. If I compare the coming of the *meaning* into one's mind to a dream, then our talk is ordinarily dreamless.

The 'meaning-blind' man would then be one who would always talk dreamlessly.

Page 48

233. And one really can ask: What do his dreams matter to me? Why need I be interested in what he dreams and whether he dreams while he speaks to me or hears me?--Naturally that does not mean that these dreams can never interest me. But why should they be the most important thing in linguistic traffic?

Page 48

234. The use of the word 'dream' here is useful, but only if one sees that it still conceals an error within itself.

Page 48

235. "I thought the whole time that you were talking about...."--Only how *was* it?--Surely not otherwise, than if he really had been speaking of that man. My later realization that I understood him wrong does not alter anything about what happened as I was understanding the words.--

If, then, the sentence "At that point I believed that you meant..." is the report of a 'dream', that means that I *always* 'dream' when I understand a sentence.

Page 48

236. We also say "I assumed you were talking about..." and that sounds still less like the report of an experience.

Page 48

237. "I thought you were speaking of... and wondered at your saying... of him."--This wondering in turn is in like case: Here too we again have the feeling as if it took the pronouncing of this thought to fill out the rudimentary experience.

Page 48

238. Well, it is surely true! For sometimes, when I say "I thought..." I can report that I *did* say these words to myself out loud or silently; or that I used, not these but other words, of which the present ones reproduce the *gist*. *This does surely sometimes happen!* In contrast with this, however, is the case in which my present expression is not the *reproduction* of anything. For it is a 'reproduction' only if there are rules of projection making it one.

Page Break 49

Page 49

239. Someone who was unable to say: the word "till" may be a verb and a conjunction, or to frame sentences in which it is the one or the other--such a one could not master simple school exercises. But what a school child is not required to do is to take the word outside any context in this way and that, or to report how he has taken it. [Cf. P.I. p. 175b.]

Page 49

240. I should like to say: conversation, the application and further interpretation of words flows on and only in this current does a word have its meaning. "He has left."--"Why?" What did you mean as you pronounced the word "Why"? What did you *think* of?

Page 49

241. "I thought you were meaning *him*"--Now, that does not mean the same as "I think you meant him". Don't let the comparison with another use of the past tense confuse you.

Page 49

242. We play this game: There are pictures here and words are pronounced and we have to point to the picture corresponding to the word. Among the words there are also ambiguous ones. At the word... only one meaning occurs to me and I point to a picture, later only another one and I point to another picture. Will the meaning-blind man be able to do this? Of course.--But how about *this*? A word is mentioned, one of its meanings occurs to me. I do not say it, but look for the picture. Before I have found it, I am struck by a further meaning of the word; I say: "A second meaning has just occurred to me." And then I explain: "First *this* meaning occurred to me, and afterwards that one." Can the meaning-blind do *that*?--Can't he say he knows the meaning of the word but isn't saying it? Or can't he say that it has just *occurred* to him but that he isn't saying it?--It strikes me that he can say both. But in that case surely also: "As you said the word, *this* meaning occurred to me." And now why not "When I said that word I meant it at first in *this* meaning."?

Page 49

243. It's as if the word that I understand had a definite slight aroma that corresponds to my understanding of it. As if two familiar words were distinguished for me not merely by their sound or their appearance, but by an atmosphere as well, even when I don't *imagine* anything in connexion with them.--But remember how the names of famous poets and composers seem to have taken up a peculiar meaning into themselves. So that one can say: the names

"Beethoven" and "Mozart" don't merely sound different; no, they are also accompanied by a different *character*. But if you had to describe this

Page Break 50

character more closely--would you point to their portraits, or to their music?

And now the meaning-blind man again: He would not feel that the names, when heard or seen, were distinguished by an imponderable Something. And what would he have lost by this?--And yet, when he hears a name, first *one* bearer of it, and then other, may occur to him.--

Page 50

244. I said, the words "Now I can do it!" don't express an *experience*. Any more than these: "Now I am going to raise my arm."--But why don't they express any experience, any feeling--Well, how are they used? Both, e.g., are preliminary to an action. The fact that a statement makes reference to a point of time, at which time, however, nothing that it means, nothing of which it speaks, happens in the outer world, does not shew us that it spoke of an experience.

Page 50

245. Think of children putting up their hands in class when they know the answer to a question. Must one of them have said the answer silently to himself, for putting up his hand to make sense? *What* must have gone on in him for this?--Nothing. But it is important that he ordinarily *gives* an answer when he has put up his hand; and that is the criterion for his *understanding* putting up one's hand. [Cf. Z 136a.]

Page 50

246. "The words 'the rose is red' are senseless if the word 'is' has the meaning of 'is the same as'." We have the idea that if someone tried to pronounce the words "the rose is red" with these meanings for the words, he could not but get stuck in thinking it. (As also, that one cannot think a contradiction, because so to speak the thought collapses for one.)

One would like to say: "You can't mean these words like this and still connect a sense with the whole." [Cf. P.I. p. 175c.]

Page 50

247. Could one say that a meaning-blind man would reveal himself in this: One can have no success in saying to such a man: "You must hear this word as..., then you will say the sentence properly." That is the direction one gives someone in playing a piece of music. "Play this as if it were the answer"--and one perhaps adds a gesture.

But how does anyone translate this gesture into playing? If he understands me, he now plays it more as I want him to.

But could you not give just such a direction but using the words "louder", "softer", "quicker", "slower"? No: I could not. For even if he *does* now play this note louder, that one more softly, I don't even

Page Break 51

realize it. In the same way I can also tell him "Make a crafty face", and I would know if he had made one, without being able to describe the geometrical alterations of the face beforehand, or afterwards.

Page 51

248. When one asks "Is experiencing meaning analogous to experiencing a mental image?", one means: isn't the difference simply that of a different *content*? Now, what is the content of the experience of imagining? "It is *this*"--but here I must point to a picture or a description.--"In both of these cases one has an experience" (one would like to say)--"Only it's different. A different content is presented to consciousness--stands before it." And this is of course a very misleading picture. For it is the illustration of a turn of speech and it explains nothing. One might as well try to explain the chemical symbolism of a formula by drawing pictures in which the elements were represented as people who stretch out their hands to one another. (Illustrations of the alchemists.) [Cf. P.I. p. 175e.]

Page 51

249. If someone says he has had an image of a shining gold ball, we shall understand him; but not if he says that the ball was hollow. But in a dream a man might see a ball and *know* it was hollow.

Page 51

250. The direction: "Wie aus weiter Ferne"†1 in Schumann. Must everyone understand such a direction? Everyone, for example, who would understand the direction "Not too quick"? Isn't the capacity that is supposed to be absent in the meaning-blind one of this kind?

Page 51

251. Can one keep hold of the understanding of a meaning, as one can keep hold of a mental image? So if a meaning of the word suddenly strikes me--can it also stand still before my mind? [Cf. P.I. p. 176b.]

Page 51

252. "The whole plan came before my mind in a flash and stayed still like that for one minute." Here one would like to think that what stayed still can't be the same as what flashed upon one. (As one can't extend a diphthong.) [Cf. P.I. p. 176c.]

Page 51

253. For if it happened that I said "Now I have it!" (i.e. a sudden start), of course one can't talk about this as staying still.

Page Break 52

Page 52

254. "Yes, I know the word. It's on the tip of my tongue.--"Here the idea forces itself on one, of the gap which James speaks of, which only this word will fit into, and so on.--One is somehow as it were already experiencing the word, although it is not yet there.--One experiences a *growing* word.--And I might of course also say that I experienced a growing meaning, or growing explanation of meaning.--Only it is queer that we don't want to say that there was something there, which then grew up into this explanation. For when you 'put your hand up' you say you already know it.--Very well; but you might also say "Now I can say it", and whether this *ability* grows into a *saying* is something you don't know. And what if it were now said "The saying is the fruit of this ability, if it grew out of this ability"?

Page 52

255. When I *was going* to say it, *was able* to say it, I had not yet *said* it.

Page 52

256. Of course there is something wrong too about the explanation that the meaning or its explanation has grown out of a certain germ. In fact we do not perceive such a growth; or at any rate only in very rare cases. And this explanation springs from the tendency to explain instead of merely describing.

Page 52

257. Mere description is so difficult because one believes that one needs to fill out the facts in order to understand them. It is as if one saw a screen with scattered colour-patches, and said: the way they are here, they are unintelligible; they only make sense when one completes them into a shape.--Whereas I want to say: Here *is* the whole. (If you complete it, you falsify it.)

Page 52

258. Of course the *meaning* occurred to me *then!* Not at the time when I reported it, nor in the interval.

This just is what one calls it: This just is the way we use the words "The meaning occurred to me" ("in this so-called twentieth century"†1).

Page 52

259. "The meaning is surely not something that one can experience!"--Why not?--The meaning isn't a sense-impression. But what are sense-impressions? Something like a smell, a taste, a pain, a noise etc. But what is 'something like' all these things? What is common to them? This question cannot of course be answered by immersing oneself in these sense-impressions. But one might ask this: "In what

Page Break 53

circumstances shall we say that someone has a kind of sense-impression that we lack?"--We say for example of beasts, that they have an organ with which they perceive such-and-such, and such a sense-organ need not be similar to ours.

Page 53

260. Could a kind of sense perception be imagined, through which we grasped the form of a solid body, the *whole* form, not just what can be seen from a certain point of view? Such a person would, e.g., be able to model a body in clay without walking round it or touching it.

Page 53

261. Is it the multiplicity of the possible explanations of a meaning that lies at the bottom of our not experiencing a meaning 'in the same sense' as a visual image?

Page 53

262. What makes my image of him into an image of *him*?--What makes this portrait into *his* portrait? The intention of the painter? And does that mean: his state of mind?--And what makes a photograph into a picture of *him*? The intention of the photographer? And suppose a painter had the intention of drawing N from memory, but, guided by forces in his unconscious, draws an excellent picture of M.--Would we now call it a bad picture of N? And imagine people trained in the drawing of likenesses who draw the person sitting in front of them 'mechanically'. (Human

reading-machines.)

And now--what makes my image of him into an image of *him*? Nothing of what holds for a portrait holds for the image. The *question* makes a mistake. [Cf. P.I. p. 177.]

Page 53

263. If the meaning has struck you, and you have not *forgotten* it again, you can now use the word in this way.

If the meaning has occurred to you, you *know* it now, and its occurring to you was simply the beginning of knowing. Here there is no analogy with the experiencing of a mental image. [Cf. P.I. p. 176e.]

Page 53

264. How is it, though, that when pointing to a particular figure I tell myself that I should like to call *this* such-and-such ('x')? I may even say the ostensive definition "'x' means this" out loud to myself. But I must surely also understand it myself! So I must *know* how, according to what technique, I think of using the sign "x".--If someone asks me, say, "Do you know *how* you are going to use the word?" I shall answer: yes.

Page Break 54

Page 54

265. How about religion's teaching that the soul can exist when the body has disintegrated? Do I understand what it teaches? Of course I understand it--I can imagine a lot here. (Pictures of these things have been painted too. And why should such a picture be only the incomplete reproduction of the spoken thought? Why should it not perform the *same* service as what we say? And this service is the point.) [Cf. P.I. p. 178.]

Page 54

266. But you aren't a pragmatist? No. For I am not saying that a proposition is true if it is useful.

The usefulness, i.e. the use, gives the proposition its special sense, the language-game gives it.

And in so far as a rule is often given in such a way that it proves useful, and mathematical propositions are essentially akin to rules, usefulness is reflected in mathematical truths.

Page 54

267. The expression of soul in a face. One really needs to remember that a face with a soulful expression can be *painted*, in order to believe that it is merely shapes and colours that make this impression. It isn't to be believed, that it is merely the *eyes*--eyeball, lids, eyelashes etc.--of a human being, that one can be lost in the gaze of, into which one can look with astonishment and delight. And yet human eyes just do affect one like this. "From which you may see...."

Page 54

268. Do I *believe* in a soul in someone else, when I look into his eyes with astonishment and delight?

Page 54

269. The proposition "if p, then q", as, e.g. "if he comes, he will bring something", is not the same as " $p \supset q$ ". For the proposition "if p then q" can go into the subjunctive, but the proposition " $p \supset q$ " cannot.--If someone replies to the proposition "If he comes,..." with "that's not true", he doesn't mean to say "He will come and not bring anything" but rather: "He *may* come and not bring anything."

From " $p \supset q$ " there does not follow: "if p then q"; for I can very well assert the former (I know, e.g. that $\sim p \cdot \sim q$ is the case) and deny the second proposition.

Page 54

270. Am I now to say that the proposition "If... then..." is either true, or false, or undecided? (So the law of excluded middle is not valid?)

Page Break 55

Page 55

271. Another answer to the statement "If he comes, he will bring something" is: "Not necessarily."--Also: "That doesn't follow."--One may also say "There isn't that connexion."--Russell said that when one says "If... then..." one ordinarily means not material but formal implication; but that is not correct either. "If... then..." can't be reproduced in expressions belonging to Russellian logic.

Page 55

272. One may, however, very well say that the proposition "If... then..." is either true, or false, or undecided.--But on what occasion will one say this? I think: as an introduction to a further exposition. One treats the matter under these three headings. I divide the field of possibilities into three parts.

It will perhaps now be said: a *proposition* divides it into *two* parts. But why? Unless that is part of the definition of a proposition. Why shouldn't I also call something a proposition that makes a three-fold division?

Page 55

273. Now take a twofold division. I say: "Either he comes, or not. If he comes, then..., if he doesn't come, then..."

May I not apply this treatment to the proposition "If... gets into contact with... there will be an explosion"? If someone has asserted this--may I not reply "Either you are right about that or not: if it is as you say, then...; if not, then..."?

Page 55

274. The law of excluded middle does not say, as its form suggests: There are only these two possibilities, Yes and No, and no third one. But rather: "Yes" and "No" divide the field of possibilities into two parts.--And that of course need not be so. ("Have you stopped beating your wife?")

Page 55

275. 'Wish is a stance of the mind, the soul, in relation to an object.' 'Wish is a state of mind that relates to an object.' In order to make this more intelligible, one thinks perhaps of yearning, and of the object of our yearning's being before our eyes and that we look at it longingly. If it is not there in front of us, perhaps its picture goes proxy for it, and if there is no picture there, then an image. And so the wish is a stance of the soul towards an image. But one really always thinks of the stance of the body towards an object. The stance of the soul to the image is just what one might represent in a picture: the man's soul, as

Page Break 56

it leans with gestures of longing towards the picture (an actual picture) of an object.

Page 56

276. And in this way of course one might also represent someone in whose bearing there is no kind of expression of the wish, but whose soul has this longing.

Page 56

277. "The sentence 'If only he would come' may be laden with our longing."--What was it laden with there? It is as if a weight were loaded on to it from our spirit. I should indeed like to say all of that. And doesn't it matter, that I want to say that?

Page 56

278. Doesn't it matter that I want to say that? Isn't it important? Is it not important that for me hope lives in the *breast*? Isn't this a picture of one or another important bit of human behaviour? Why does a human being believe a thought comes into his head? Or, more correctly, he does not *believe* it; he lives it. For he clutches at his head; he shuts his eyes in order to be alone with himself in his head. He tilts his head back and makes a movement as a sign that nothing should disturb the process in the head.--Now are these not important kinds of behaviour?

Page 56

279. And if the picture of the thought in the head can force itself upon us, why not much more that of thought in the soul? [Cf. P.I. p. 178f.]

Page 56

280. What better picture of believing could there be, than the human being who, with the expression of belief, says "I believe..."?

Page 56

281. The human being is the best picture of the human soul. [Cf. P.I. p. 178g.]

Page 56

282. It is, of course, important that a man wanting an apple can easily be represented in a picture of desire without putting words of desire into his mouth--but that the conviction that something is thus and so cannot be so represented.

Important, because it shews the difference, the essential difference, between psychological phenomena; and the kind of way this difference is to be described.

Page 56

283. Why did I say "essential difference"? Is it a difference like that between carbon, gravitation, the velocity of light and ultra-violet rays? All of which are 'objects' treated of by natural science.--

Page Break 57

Page 57

284. Suppose we are talking of the phenomena we get in connection with human speech. We might be interested in: the speed of talk, the change of intonation, the gestures, the length or shortness of sentences etc. etc.--Now when one says of a human being that he has a mental life: he thinks, wishes, fears, believes, doubts, has images, is sad, merry etc.--is that analogous to: he eats, drinks, speaks, writes, runs,--or analogous to: he moves now fast, now slow, now towards a goal, now without any goal, now continuously, now in jerks?

Page 57

285. Think of what may be called the character of a line, and of all that must be called a description of its character.

What a lot of things one may ask, if one is interested in the character of a line!

Page 57

286. Imagine we were observing the movement of a dot, say a black dot on a white paper surface. Important conclusions of every conceivable kind might be drawn from the character of the movements. But what a host of different things we might observe!--Whether the dot moves uniformly or non-uniformly; whether its velocity alters periodically; whether it alters continuously or in jerks; whether the dot describes a closed line; how close this gets to being a circle; whether the dot describes the line of a wave and what its amplitude and wave length are; and innumerable other things. And any of these might be the one thing that interested us. We might, e.g., be indifferent to everything about this movement except the number of angles of the path in a definite time. And that means that if what interests us is not just a single characteristic, but rather many, then any one of them may yield us special information quite different from all the rest. And that's how it is with the behaviour of human beings, with the various characteristics of this behaviour, which we observe. [Cf. P.I. p. 179a.]

Page 57

287. So does psychology deal with behaviour (*say*), not with human states of mind? If someone does a psychological experiment--what will he report?--What the subject says, what he does, what has happened, to him in the past and how he has reacted to it.--And not: what the subject thinks, what he sees, feels, believes, experiences?--If you describe a painting, do you describe the arrangement of paint strokes on the canvas--and *not* what someone looking at it *sees*?

But now how about this: The observer in the experiment will sometimes say: "The subject said 'I feel...'", and I had the impression

Page Break 58

that this was true."--Or he says: "The subject seemed tired." Is that a statement about his behaviour? One would perhaps like to say: Of course, what else should it be?--It may also be reported: "The subject said 'I am tired'"--but the cash value of these words will depend on whether they are plausible, whether they were repeating what someone else said, whether they were a translation from French, etc.

Now think of this: I recount: "He made a dejected impression." I am asked: "What was it that made this impression on you?" I say: "I don't know."--Can it now be said that I described his behaviour? Well, can one not say I have described his face if I say "His face changed to sadness"? Even though I cannot say what spatial alterations in the face made this impression?

It will perhaps be replied: "If you had looked closer, you would have been able to describe the characteristic changes of colour and position." But who says that I or anyone could do this? [Cf. P.I. p. 179b.]

Page 58

288. Once more: When I report "He was put out", am I reporting a behaviour or a state of mind? (When I say "The sky looks threatening", am I talking about the present or the future?) Both. But not side by side; rather one in one sense, the other in another. But what does that mean? (Is this not mythology? No.) [Cf. P.I. p. 179c.]

Page 58

289. It is here quite as it is with talk of physical objects and sense-impressions. We have *two* language-games, and their mutual relations are complicated. If one tries to describe these relations in a simple fashion, one goes wrong. [Cf. P.I. p. 180c.]

Page 58

290. Suppose I describe a psychological experiment: the apparatus, the questions of the experimenter, the answers and actions of the subject. And then I say: all that is a scene in such-and-such a play. Now all is altered. So it will be said: If this experiment were described in the same way in a book on psychology, in that case the description of the behaviour of the subject would be understood as expression of the state of mind, because one *presupposes* that the subject is speaking the truth, is not pulling our legs, has not learnt the answers by heart.--So we make an assumption? [Cf. P.I. p. 180a.]

Page Break 59

Page 59

291. The nurse says to the doctor "He's groaning"--one time she means to say "He is in severe pain"; another "He's groaning--although there's nothing wrong"; another "He's groaning; I don't know whether he is in pain or is merely making this noise."

We form a presupposition?--We *use* the statement differently each time.

Page 59

292. "Of course the psychologist reports the words, the behaviour, of the subject, but surely only as signs of mental processes."--That is correct. If the words and the behaviour are, for example, learned by heart, they do not interest

the psychologist. And yet the expression "as signs of mental processes" is misleading, because we are accustomed to speak of the colour of the face as a sign of fever. And now each bad analogy gets explained by another bad one, so that in the end only weariness releases us from these ineptitudes.

Page 59

293. Imagine someone saying: any familiar word already has an aura, a 'corona' of faintly indicated uses surrounding it. Much as if the principal figures in a painting were surrounded with faint, misty pictures of proceedings in which these figures play a part.--Now, let's just take this assumption seriously!--Then it comes out that it's inadequate to explain *intention*.

For if it is like this, that the possibilities of employment of an expression come before our minds in half shades as we hear it or say it--if it is like this, then that holds for us. But we communicate with others, without ever having asked them whether they have these experiences too. [Cf. P.I. p. 181a.]

Page 59

294. And what about the continuous coming to be and passing away in the domain of our consciousness? Well, how is it: is that experienced, or can it not be imagined otherwise at all? Here is an unclarity.

Page 59

295. I know my way about in a room: that is, without needing a moment's reflection, I can find the door, open and shut it, use any piece of furniture, I don't have to look for the table, the books, the chest of drawers or think what can be done with them. That I know my way around will come out in the freedom with which I move about in the room. It will also be manifested in an absence of astonishment or doubt. Now what answer am I to make to the question: whether this knowing-one's-way-around-in-this-room is a state of mind?

Page Break 60

Page 60

296. The question "What's a thermometer for?" I am in a position to answer *at once*, without any difficulty, with a long string of sentences. And equally I can meet the request: "Explain the application of the word 'book'."

Page 60

297. Knowing one's way about can be called an experience, and again, also, not.

Page 60

298. The employment of certain words for the sake of the rhythm of a sentence. This might be *far* more important to us that it actually is.

Page 60

299. "What kind of experience is...?" One won't ask "What's it like when YOU have it?"--for this might be answered by one person this way, by another that. One won't ask them for a description of the experience, but will rather look to see how and on what occasions people mention the experience, speak of it, *without* trying to describe it.

Page 60

300. I say the word "tree", then I say a nonsense-word. They feel different. To what extent?--Two objects are shewn me: One is a book, the other a thing unknown to me with a peculiar shape. I say: they not merely look different, but I also have a different feeling on looking at them. The first thing I 'understand', the other I don't understand. "Yes, but it is not only the difference between familiarity and strangeness." Well, is there not also a difference between kinds of familiarity and strangeness? A stranger walks into my room, but it is a human being, so much I see at once. Some swathed thing walks into my room. I don't know if it is man or beast. I see an unfamiliar object on my table, an ordinary pebble, but I never saw it before on my table. I see a stone on the path; I am not astonished, although I do not remember having seen just that stone before. I see on my table a queer-shaped object whose function is unknown to me and am *not* surprised: it was always there, I never knew *what* it was and was never interested to know, it is thoroughly familiar to me.

Page 60

301. "Didn't you understand the word 'tree' when you heard it?--In that case something did go on in you!"--And what?--I *understood* it.--Only the question is: Am I to say about understanding, that it went on in me? Something goes against this; and that can only mean that by means of this expression we put understanding together with other

Page Break 61

phenomena and elide a difference which we want to emphasize. But what difference?--Well, in what cases do we *not* resist saying: something went on in us as we heard the word?

Page 61

302. What would we need to say to someone who told us that in *his* case understanding was an inner process?--What retort should we make to him, if he said that with him being able to play chess was an inner process?--Some such thing as, that we aren't interested in anything that goes on in him when we want to know

whether he can play chess. And if he now replies that we *are* interested in what goes on in him after all, namely: in whether he can play chess--then we could contradict him by reminding him of the *criteria* which would prove his capacity to us. [Cf. P.I. p. 181b.]

Page 61

303. In order to know your way about an environment, you do not merely need to be acquainted with the right path from one district to another; you need also to know where you'd get to if you took this wrong turning. This shews how similar our considerations are to travelling in a landscape with a view to constructing a map. And it is not impossible that such a map will sometime get constructed for the regions that we are moving in.

Page 61

304. Suppose you do have a peculiar experience when you understand, how can *you* know that it is the one we call "understanding"?--Well, how do you know, then, that the experience that you have is the one we call "pain"?--That is different--I know that, because my spontaneous behaviour in certain situations is what is called the expression of pain.

Page 61

305. When one learns to use the word "pain", that does not happen through guessing which of the inner processes connected with falling down etc. this word is used for.

For in that case this problem might arise as well: on account of *which* of my sensations do I cry out when I damage myself?

And here I imagine one's pointing inside and asking himself: "Is it *this* sensation, or *this* one?"

Page 61

306. "It doesn't matter whether I have attached the *right* name to the sensation--I just have attached *a* name to it!"--But now, how does one attach a name to something, e.g. to a sensation? Can one *within oneself* attach a name to a sensation? What happens here; and what is the result of this action? ((Cf. Remark on attaching a name-tag to

Page Break 62

something.†1)) if one shuts a door in one's mind, is it then shut? And what are the consequences? That, in one's mind, now no one can get in?

Page 62

307. "How do *you* know, then, that the experience which you have is the one that we call 'pain'?" The experience that I have? Which experience? How do I specify it: for myself, and for another?

Page 62

308. Suppose we could learn what it is that people call a sensation, say a 'pain', and then someone taught us to *express* this sensation. What kind of connexion with the sensation would this activity need to have, for us to be able to call it the 'expression' of that sensation?

Page 62

309. Suppose someone knew, guessed, that a child had sensations but no expression of any kind for them. And now he wanted to teach the child to express the sensations. How must he connect an action with a sensation, so that it becomes the expression of the sensation?

Page 62

310. Can he teach the child: "Look, this is how one expresses something--*this*, for example, is an expression of *this*--and now you express your pain!"

Page 62

311. "Understand" just is not used like a word for a sensation.

Page 62

312. The confusing picture is this: that we observe a substance--its changes, states, motions; like someone observing the changes and motions in a blast furnace. Whereas we observe and compare the attitudes and behaviour of human beings.

Page 62

313. Primitive pain-behaviour is a sensation-behaviour; it gets replaced by a linguistic expression. "The word 'pain' is the name of a sensation" is equivalent to "I've got a pain' is an expression of sensation".

Page 62

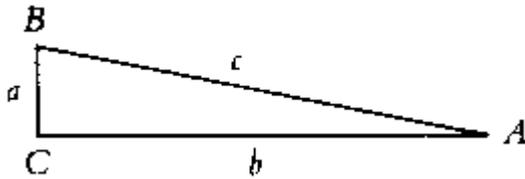

314. Forms of behaviour may be incommensurable. And the word "behaviour", as I am using it, is altogether misleading, for it includes in its meaning the external circumstances--of the behaviour in a narrower sense.

Page Break 63

Page 63

Can I then speak of one behaviour of anger, for example, and of another of hope? (It is easy to imagine an orang-utan angry--but hopeful? And why is it like this?) [Cf. P.I. p. 174a.]

Page 63

315.

Page 63

If someone tells me: "Now I am seeing *this* point as the apex of the triangle" I understand him. But what do I do with this understanding? Well, I can, e.g., say to him "Does the triangle strike you now as if it had fallen over, as if it normally stood on the base line *a*? Or does it now appear to you as a mountain with *B* as its peak? Or as a wedge? Or as an 'inclined plane'? Or as a cone?"

You may now ask "What does it *consist* in: to see the figure like *this*?"--and you may, so to speak, form hypotheses about what goes on here. E.g., eye movements, or images, with which one supplements the seen--one imagines a body, say, that slides down the inclined plane--etc. All this *may* happen but need not; and when someone tells me he sees the triangle as a wedge etc. he is *not* telling me how his eyes have been moving etc.--No, the question is not *what happens here*, it is: how one may use that statement. E.g. what my understanding of the information does for me.

One application would be this: One may tell someone: "Look at the triangle as a wedge, and then you won't wonder at... any more." And at this perhaps he says "Yes, like that it strikes me as more natural".--So I have removed some disquiet with my explanation; or helped him to do an exercise more quickly.

Page 63

316. Seeing the resemblance of one face to another, the analogy of one mathematical form with another, a human form in the lines of a puzzle picture, a three-dimensional shape in a schematic drawing, hearing or pronouncing "pas" in "ne... pas" with the meaning "step"--all these phenomena are somehow similar, and yet again very different. (A visual perception, an auditory perception, an olfactory perception, a perception of movement.)

Page Break 64

Page 64

317. In all these cases one may be said to experience a *comparison*. For the expression of the experience is that we are inclined towards a comparison. Inclined to make a paraphrase.

It is an experience whose expression is a comparison. But why an 'experience'? Well, our expression is an experience-expression. Because we say "I see it as...", "I hear it as..."? No; though this form of expression hangs together with that. But it is *justified*, because the language-game makes the expression into expression of an experience.

Page 64

318. An experience that is manifested in a comparison.--In order, e.g., to hear "Je ne sais pas" in that conscious way one has to be acquainted with other expressions like "not a thing".†1

The expression of the experience by means of the comparison precisely is *the* expression of it, the immediate expression. It is the very phenomenon that we observe and that interests us.

Page 64

319. If now someone couldn't hear "pas" like this, couldn't experience it; if he didn't understand what we mean by speaking of 'hearing as'--would he also fail to understand us when we explain that even in the negation "pas" did once mean the same as "step", and if we said it was analogous to the word "bit", "thing", "bißchen" etc? But what is the insight into, by which someone perceives that the use of the word... is *analogous* to that of the word...?

Page 64

320. Well, what do I shew someone such an analogy for? What do I expect from doing so? What effect has it?--It surely has the appearance of an explanation. It is *one* kind of explanation. For one does say: "Yes, now I understand the use of this word." But one also says: "I know what you mean, but I can't *hear* it as that."

Page 64

321. "Just as we still... at the present day, so these people...."

We are able to look at *this* custom in the light of *that* one. This may serve, e.g. as a heuristic principle.

Page 64

322. While any *word*--*one* would like to say--may have a different character in different contexts, all the same there is one character--a face--that it always has. It looks at us.--For one might actually think that each word was a little

face; the written sign might be a face. And one might also imagine that the whole proposition was a kind of group-picture, so that the gaze of the faces all together produced a relationship among them and so the whole made a *significant group*. But what constitutes the experience of a group's being significant?

Page Break 65

And would it be necessary, if one is to use the proposition, that one feel it as significant in this way? [Cf. P.I. p. 181d.]

Page 65

323. For is it even certain that anyone who understands our language would be inclined to say that each word has a *face*? And--the most important thing what general tendency in us is this inclination part of?

Page 65

324. First of all it is clear that the tendency to regard the word as something intimate, full of soul, is not always there, or not always in the same measure. But the opposite of being full of soul is being mechanical. If you want to act like a robot--how does your behaviour deviate from our ordinary behaviour? By the fact that our ordinary movements cannot even approximately be described by means of geometrical concepts.

Page 65

325. Would one also get an impression of a group-picture from sentences written in telegraphic style?

Page 65

326. A convict has a number for a name. No one would say of it what Goethe says about people's names.

Page 65

327. One has the idea that the sense of a sentence is composed of the meanings of its individual words. (The group-picture.) How is, e.g. the sense "I still haven't seen him yet", composed of the meanings of the words?

Page 65

328. Even the word "state" has a face, for at any rate "the State" has a *different* face. It feels different; and so "state" would also have to feel somehow or other!--But *must* "state" feel different from "State"? Suppose someone were to assure me that to him *these* two words felt just the same? He says, e.g. I feel the connective and the verb "still" differently all right, but not "State" and "state". Would we have the right to disbelieve him?

What looked like a quite matter-of-course expression, which is tied up with the understanding of the words, appears here in the light of a purely personal expression of feeling. No different from someone's saying that for him the vowels a and e are the same colour. Can I now say to this man: "You aren't playing our game"?

Page 65

329. If you have fine perceptions, will you assume that you feel the two words "still" differently in all contexts? No. One expects that only when one pronounces them experimentally.

Page Break 66

Page 66

330. Imagine human beings who calculate with 'extremely complicated' numerals. These, however, get represented as figures that arise when one writes our numerals one on top of the other. They write π , for example, up to the fifth

decimal place like this:

Anyone who watched them would find it difficult to guess what they were up to. And they might themselves not be able to explain. For this numerical sign may alter its appearance (for us) up to the point of unrecognizability when it is written in a somewhat different script. And what the people were doing would appear to us as purely intuitive. [Cf. Z. 699.]

Page 66

331. Thus I am saying: one makes a false estimate of the psychological interest of the if-feeling if one looks at it as the matter-of-course correlate of the meaning of the word; it must rather be seen in a different context, in the context of the special circumstances under which it occurs. [Cf. P.I. p. 182c.]

Page 66

332. Say "It is hard to still one's fears" and pronounce the fifth word with the feeling of a connective! In the course of ordinary conversation, practise pronouncing a word which has two meanings with the inappropriate feeling. (If it is not connected with a wrong tone of voice, it doesn't impede communication.)

Page 66

333. Now say to yourself: the connective "still" is really the same as the verb "still" just as "away" = "a-way" and "despite" (noun) = "despite" (preposition) and pronounce the sentence "Bad as things are, still they might be worse",

with "still" in the meaning of the verb!

Page 66

334. Are you even sure that there is a *single* if-feeling? and not perhaps several? Have you tried to pronounce the word in very different contexts? (When, e.g., it bears the main emphasis of the sentence, and when the word next to it does.) [Cf. P.I. p. 181e.]

Page 66

335. Does anyone ever have the if-feeling when he is not pronouncing the word "if"? It would surely be at any rate remarkable, if only *this* cause was supposed to call up the sensation. Did James ever ask himself whether, and where, one has it otherwise?--And that's how it is with the 'atmosphere' of a word:--why does one regard it as so

Page Break 67

much a matter of course that only *this* word has *this* atmosphere? [Cf. P.I. p. 182d.]

Page 67

336. Goethe's signature intimates something Goethian to me. To that extent it is like a face, for I might say the same of his face.

It is like a *mirroring*. Does this phenomenon belong with this other one: "I have been in this situation before"?

Or do I *identify* the signature with the person in that, e.g. I love to look at the signature of a beloved human being, or I frame the signature of someone I admire and put it on my desk? (Magic that is done with pictures, hair etc.)

Page 67

337. The atmosphere is *inseparable* from the thing.--So it is not an atmosphere.

What are inwardly associated *got* associated, they seem to fit one another. But how do they seem to do that? What is the expression of their seeming to fit? Is it like this: we can't imagine that the man who was called this, looked like this, had this signature, produced, not *these* works, but maybe quite different ones (those of another great man)?

Page 67

We can't imagine that? Do we try? [Cf. P.I. p. 183c.]

Page 67

338. It might be like *this*: Imagine a painter wanting to sketch a picture "Beethoven writing the ninth symphony". I could easily imagine what one might see in such a picture. But suppose someone wanted to depict how Goethe would have looked writing the ninth symphony? Here I should not know how to imagine anything that would not be extremely incongruous and ridiculous. [Cf. P.I. p. 183d.]

Page 67

339. Look at a long familiar piece of furniture in its old place in your room. You would like to say: "It is part of an organism." Or "Take it outside, and it's no longer at all the same as it was", and similar things. And naturally one isn't thinking of any *causal* dependence of one part on the rest. Rather it's like *this*: I could give this thing a name and say that it is shifted from its place, has a stain, is dusty; but if I tried taking it *quite* out of its present context, I should say that it had ceased to exist and another had got into its place.

One might even feel like this: "Everything is part and parcel of everything else" (internal and external relations). Displace a piece and it is no longer what it was. Only in this surrounding is this table this table. Everything is part of everything. Here we have the inseparable atmosphere. And what is anyone saying, who says this? What sort of method of representation is he proposing? Isn't it that

Page Break 68

of the painted picture? If, for example, the table has moved, you paint a new picture of the table *with* its surrounding.

Page 68

340. "A quite particular expression"--it is part of this that if one makes the slightest alteration in the face, the expression changes at once.

Page 68

341. His name seems to fit his works.--*How* does it *seem* to fit? Well, I express myself in some such way.--But is that *all*?--It is as if the name together with these works, formed a solid whole. If we see the name, the works come to mind, and if we think of the works, so does the name. We utter the name with reverence.

The name turns into a gesture; into an architectonic form.

Page 68

342. If anyone didn't understand this, we should want to designate him as, say, 'prosaic'. And is that what the

'meaning-blind' would be?

Page 68

343. Any other arrangement would strike us as incorrect. Through custom these forms become a paradigm; they acquire so to speak the force of law. ("The power of custom"?)

Page 68

344. Anyone who cannot understand and learn to use the words "to *see* the sign as an arrow"--that's whom I call "meaning-blind".

It will make no sense to tell him "You must try to *see* it as an arrow" and one won't be able to help him in *that way*.

Page 68

345. But what about such an expression as *this*: "As you said it, in my heart I understood it"? At the same time one points to one's heart. And doesn't one *mean* this gesture?! Of course one means it. Or is one conscious of only using a picture? Certainly not! [Cf. P.I. p. 178h.]

Page 68

346. When the child learns to talk, when does it develop the "feeling of meaning"? Are people interested in this, when they teach it to talk and observe its progress in talking?

Page 68

347. Again, observing an animal, e.g. an ape that investigates an object and tears it to pieces, one may say: "You see that something is going on in him." How remarkable that is! But not more remarkable than that we say: love, conviction, are in our hearts!

Page Break 69

Page 69

348. When and how does a human being begin to manifest feelings of meaning? In what games will it be revealed?

Page 69

349. Isn't the inclination to think of a meaning-body like the inclination to think of a seat of thought?--*Must* everyone be inclined to say he thinks in his head? This expression is taught him as a child. ("Doing sums in one's head.") But at any rate the *inclination* develops from this (or the expression developed from it). In any case--the inclination is then present. And so is the inclination to speak of a meaning-body (or the like) *how ever* it arose.

Page 69

350. Do we also speak of a '*feeling*' of thinking in the head? Wouldn't this be like the 'feeling of meaning'?

Again: Suppose someone who wouldn't have this feeling. Is he unable to think?

Indeed, someone who does philosophy or psychology will perhaps say "*I feel that I think in my head*". But what that means he won't be able to say. For he will not be able to say *what* kind of feeling that is; but merely to use the expression that he '*feels*'; as if he were saying "*I feel this stitch here*". Thus he is unaware that it remains to be investigated what his expression "I feel" means here, that is to say: what consequences we are permitted to draw from this utterance. Whether we may draw the same ones as we would from the utterance "I feel a stitch here".

Page 69

351. For one might also say "*I feel the rise in prices in my head*". And is that *nonsense*? But under what heading in psychology should we put this feeling? It doesn't belong under 'sensation'--unless someone were to say "When I feel this pain in my head, there is always a rise in prices".

Page 69

352. Might not someone say: "I have a feeling of a place when I think. I may, for example, think the thought... now in my head, now in my heart."--And would that shew that a thought has a place? I mean: would it describe the experience of thinking more closely? Wouldn't it rather describe a *new* experience?

"I should like to say: 'I thought in my head'."

Page 69

353. One can obey the order "Think of nothing at all", "make your mind a blank".

Page 69

354. Just as we have learnt the phrase "in the head" in connexion with thinking, so too we have learnt "the word has this ('one')

Page Break 70

meaning" and all the phrases that are akin to it. And also the form of expression: "these two words only sound the same, but otherwise they have nothing to do with each other" and many similar ones. And the experience of meaning really follows these turns of speech exactly. (Though they might have a completely different form--the French "*vouloir dire*" for example.)

355. So is the experience of meaning a mere fancy? Well, even if it is a fancy, that does not make the experience of this fancy any *less* interesting.

356. Incidentally, it is striking that the word "association" plays so small a part in my considerations. I believe that this word is used in an extremely vague, blurred kind of way, and for quite dissimilar phenomena.

357. *Much* can be said about a fine aesthetic difference--this is very important. That is to say, the first utterance is of course merely "*This* word fits, *this* one does not" or the like; but then there may be discussion of all the widely ramified connexions made by each of these words. That is to say, it is *not* all over once that first judgment has been made; rather what it depends on is the *field* of each word. [Cf. P.I. p. 219b.]

358. Why should the experience of meaning be important? He says the word, says he said it now in this meaning; then, in that one. I say the same. This obviously has nothing to do with the ordinary and important use of the expression "*That's* what I meant by this word". So what is the remarkable thing? That we say something of that sort? Naturally that is of interest. But the interest here does not depend on the concept of the 'meaning' of a word, but on the range of similar psychological phenomena which in general have nothing to do with word-meaning.

359. Someone says, perhaps in a language lesson, "Let us talk about the word 'still'". I ask: "Do you mean the noun, the adjective, or the verb?"--He: "I mean the noun." Need he, or I, have had an experience of meaning here? No. Though it is likely that images have come into our minds during this exchange. They will, e.g., play the same part as scribbling while one speaks. If someone were accustomed to scribble on paper during a conversation, he would perhaps one time draw a still, another time a lake, another time the word "Still!"

And if the talk were of a still and he were to draw a lake, this might distract him from the conversation; but if he draws pipes, then he'd be staying with the thing.

360. To what extent can doodling be compared to the play of images?--Imagine human beings who, from childhood up, make drawings on all occasions where we should say they are imagining something. If one puts a pencil in their hand then they draw at high speed.

But doesn't the ordinary human being do something quite similar? He doesn't draw indeed, but he 'describes his image', i.e., instead of drawing, he *speaks*. Or again, he uses gestures in order to represent, e.g. someone whom he is imagining. Must I assume that he *reads off* this description, these gestures, from something? What is there to be said for this?--Well, perhaps he *says* "I see him before me!" and then he represents him. But if, instead of this expression, I had taught him to say "Now I know what he looks like" or "Now I can say what he looks like" or "Now I'll tell you what he looks like"--then the dangerous picture would be eliminated. (Tennis without a ball.)

361. In order to climb into the depths one does not need to travel very far; no, for that you do not need to abandon your immediate and accustomed environment.

362. How do I find the 'right' word? How do I choose among words? It is indeed as if I compared words according to fine discriminations of taste. *This* is too... *this* too...--that's the right one.

But I don't need always to judge, to explain, why this or that isn't the right word. It simply *isn't right* yet. I go on searching, am not satisfied. *This* is just what it looks like to search, and *this* is what it looks like, to find. [Cf. P.I. p. 218h.]

363. "*I am developing what there is in it.*" How do I know that this was *in* it?--That's not how it is. Nor can one ask "How do I know that this is what I actually dreamt?" It is there in it because I *say* it is. Or better: because I am inclined to say... And what sort of queer experience is that: being inclined to say...? Not an experience at all.

364. If, however, I had died before I could develop all this--in that case would it *not* have been contained within my experience?--The

answer "No" to this question is wrong; the answer "Yes" must be wrong too.

"No" would mean: If someone does not tell a dream, it is false to say he had it. It would be incorrect to say: "I don't know whether he had a dream; he said nothing about it."

"Yes" would mean: He may well have had a dream even when he doesn't report it. But that isn't supposed to be a *psychological* statement! A logical one, then.

Page 72

365. May someone not dream and yet not tell anyone? Certainly: for he may dream *and* tell someone.

Page 72

366. We read in a story that someone had a dream and did not tell it to anyone. We don't ask how the author could learn it.--Don't we *understand* it, when Strachey makes surmises about what Queen Victoria may have seen in her mind's eye just before her death? Of course--but didn't people also *understand* the question how many souls there was room for on the point of a needle? That is to say: the question whether one understands this does not help us here; we must ask *what* we can do with such a sentence.--*That* we use the sentence is clear; *how* we use it is the question.

Page 72

367. *That* we use the sentence doesn't yet tell us anything, because we know the enormous variety of use. Thus we see the problem in *How*.

Page 72

368. Once more: people narrate something to us after waking up; we thereupon teach them the expression "I dreamt..." followed by the narrative. I then sometimes ask them: "Did you dream anything last night?" and sometimes get an affirmative, sometimes a negative answer, sometimes a dream narrative, sometimes none. That is the language-game. (I have assumed now that I myself do not dream. But neither do I have the feeling of an invisible presence and other people do have it, and I can ask them about their experiences.)

Now must I make an assumption in this case about whether these people's memory has deceived them or not; whether they *actually* saw these pictures before them during their sleep or whether it's merely that that's how it seems to them after waking up? And what is the sense of this question?--And what interest has it?! Do we ever ask ourselves that, when someone tells us a dream and if not,--is it because we are sure that his memory won't have deceived him? (And

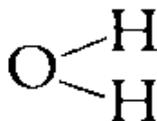

Page Break 73

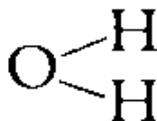

suppose he was a man with a quite specially bad memory!) [CF. P.I. p. 184a.]

Page 73

369. And does that mean that it is *nonsense* ever to raise the question whether the *dream* really when on in the night, or whether the dream is a memory-phenomenon of the awakened? That depends on *what* we intend, i.e. *what* use we are making of this question. For if we form the picture of dreaming, that a picture comes before the mind of the sleeper (as it would be represented in a painting) then naturally it makes sense to ask this question. One is asking: Is it like *this*, or like *this*--and to each "this" there corresponds a different picture. [Cf. P.I. p. 184b.]

Page 73

370. (Suppose someone were to ask: Is the structure of water  or H-O-H? Does it make sense?--If you give it a sense, it does make sense.)

Page 73

371. Back to the language-game of telling dreams: Someone says to me one day: "What I dreamt last night I will tell no one." Now does that make sense? Why not? Am I supposed to say, after what I have said about the origin of the language-game, that it makes no sense--as the original phenomenon just was the dream *narrative*? Absolutely not!

Page 73

372. To us, a railway station, with all its equipment, telegraph poles and telegraph wires, means an extensively ramified system of traffic. But on Mars there is to be found this structure with all its whys and wherefores, even with a bit of railway track, and there it means nothing of the kind.

Page 73

373. "The mind seems able to give the word meaning"--isn't this as if I were to say: "The carbon atoms in benzene seem to lie at the corners of a hexagon."? But that is not something that seems to be so: it is a *picture*. [Cf. P.I. p. 184c.]

Page 73

374. Of course I don't want to give a *definition* of the word "dream"; but still I want to do something like it: to describe the use of the word. My question then runs roughly like this: If I were to come to a strange tribe with a

language I didn't know, and the people had an expression corresponding to our "I dream", "He dreams" etc.--how should I find out that this was so; *how* should I know which

Page Break 74

expressions of their language I am to translate into these expressions of ours?

For finding *this* out is like finding out which of their words I am to translate into our word "table".

Here of course I don't ask "What do they call *THIS*?" while I point at something. Although I might ask even that, and might point to a symbolic representation of a dream or a dreamer.

Page 74

375. There is also this to say: the child does not absolutely have to learn the use of the word "to dream" by first merely reporting an occurrence on waking up, and our then teaching it the words "I dreamt". For it is also possible that the child hears the grown-up say he has dreamt and now says the same thing of itself and tells a dream. I am *not* saying: the child *guesses* what the grown-up means. Suffice it that one day it uses the word, and uses it under the circumstances under which we use it.

Page 74

376. So the proper question is not: "How does he learn the use of the word?" but rather "How does it come out that he does use it as we do?"

Page 74

377. "Black is the beauty of the brightest day"†1--Can one say "Well, it *seems* as if it were black?" Have we then an hallucination of something black?--So what makes these words *apt*?--"We understand them." We say, e.g. "Yes, I know exactly what that's like!" and now we can describe our feelings and our behaviour.

Page 74

378. "When you are talking about dreaming, about thinking, about sensation,--don't all these things seem to lose the mysteriousness which seems to be their essential characteristic?" Why should dreaming be more mysterious than the table? Why should they not both be equally mysterious?

Page 74

379. "The phenomenon of seeing  as an arrow or otherwise is surely a true visual phenomenon; even though it is not so tangible as that of form and colour." How should it not be a visual phenomenon?!--Does anyone that speaks of it ever doubt that it is (except when he is doing philosophy or psychology)? Don't we ask a

Page Break 75

man about it and tell him of it, like any other visual phenomenon? I mean: Do we talk of it more hesitantly, with the suspicion that what we say may have no clear sense? Certainly not. But there are differences in it, all the same. The ones that we indicate when we say "more intangible."

Only it is like this: If I put two substances in front of someone, I may say: Feel this one here. Don't you find that it feels softer?" And if he answers yes, I say, e.g. "Yes, I feel that too. So there is a difference between them." (I.e.: I have not merely fancied it.)--But it is *otherwise* with psychological phenomena. When I say "This is more intangible than that"--as, that is, a tenseless proposition--this does not rest upon a consensus of judgements, *not* upon our all feeling that too (when we '*contemplate*' the experience).

Page 75

380. Don't put the phenomenon in the wrong drawer. *There* it looks ghostly, intangible, uncanny. Looking at it rightly, we no more think of its intangibility than we do of time's intangibility when we hear: "It's time for dinner." (Disquiet from an ill-fitting classification.)

Page 75

381. "This coffee has *no taste at all*." "This face has *no expression at all*."--The opposite of this is "It has a quite particular expression" (though I could not say what). A *strong* expression I could easily connect with a story for example. Or with looking for a story. When we speak of the enigmatic smile of the Mona Lisa, that may well mean that we ask ourselves: In what situation, in what story, might one smile like that? And so it would be conceivable for someone to find a solution; he tells a story and we say to ourselves "Yes, *that* is the expression which *this* character would have assumed here".

Page 75

382. Remembering a particular kinaesthetic sensation--remembering the visual image of a movement.--Make the same movement with the right and left thumb, and judge whether the kinaesthetic sensations are the same.--Have you a memory-image of the K-sensation in walking?--If you are tired, or suffering pain, muscular pain or a burning skin--are the sensations in moving a limb the same as in a different condition? But are you then sometimes in doubt

whether you now really have raised your leg, because the feeling is so totally different? Do you actually feel the movement in the joint?

Page Break 76

Page 76

383. You sometimes hear someone saying "I am imagining his bearing quite vividly"; or "his voice". But do you ever hear "I am imagining the K.-sensation in connexion with this movement of the hand"?! And *why* not?

Does one imagine it and merely not say so?

Page 76

384. What are we to answer if someone counters us: "If you guide someone's hand in a movement, by doing so you *are* shewing him a particular K.-sensation, which he then reproduces if he now repeats the movement when ordered to"? And can one say that obviously he may be guided in this way by the visual image of the movement--but not by a K.-image?

Page 76

385. How important is it that there is such a thing as a pictorial representation of the visual movement and nothing corresponding to it for the 'kinaesthetic movement'?

Make a movement that looks like *this*--"Make a movement that produces *this* noise". "Make a movement that produces *this* K.-sensation." Copying the K.-sensation correctly would in this case mean repeating the movement correctly according to the *appearance to the eye*.

Page 76

386. Imagine the movement's being *very* painful, so that the pain drowns out any other slight sensation. [Cf. P.I. p. 186d.]

Page 76

387. Make a movement with your fingers (such as you make in piano playing, say); repeat it, but with a lighter touch. Do you remember which of the two feelings you had yesterday in connexion with the first movement?

We say perhaps: "No, yesterday this movement looked rather different"--but do we also say "The movement is not quite the same--I did not have exactly this K.-sensation"?

Page 76

388. For of course we have feelings of movement and we *can* also reproduce them. Especially when we repeat a movement under the same circumstances after only a brief pause. One also localizes the sensations, but hardly ever in the joints, mostly in the skin. (Blow your cheeks out. Where do you *do* it, and where do you feel it?)

Page 76

389. The growth of analysis might be compared with the growth of a seed. And in this case to say "It was all already contained in

Page Break 77

the sensation" or "it grew out of it as from a seed" come to the same thing. Now how much is there (true) in this, that one sometimes reproduces an arm movement (say) according to a visual picture, but not according to a kinaesthetic picture?

Page 77

390. Does one actually sometimes go by a visual image in bending one's arm? I can only say: If I did not *see* that my arm has moved after being convinced I had moved it with my face turned away, I should become confused and should presumably trust my *eyes*. Seeing can at any rate tell me whether I have carried out my intended movement exactly, e.g. have reached the position that I wanted to reach; the *feeling* wasn't able to do that. I feel that I am moving all right, and I can also judge roughly *how* by the feeling--but I simply *know* what movement I have made, although you couldn't speak of any *sense-datum* of the movement, of any immediate inner picture of the movement. And when I say "I simply *know*..." "knowing" here means something like "being able to say" and is not in turn, say, some kind of inner picture.

Page 77

391. "In order to be able to say the feeling tells me where my arm now is, or how far I am moving it, one would need to have correlated feelings and movements. It should be possible to say: 'When I have the feeling... then in my experience my arm is over *there*'. Or: you would need to have a criterion of identity of the feelings *besides* that of the movement you've made." But even if this condition makes sense at all, is it fulfilled for *seeing*? Well, one can represent a visual picture by drawing. But as for giving someone, or oneself, the feeling that is characteristic of the arm's being bent at an angle of 30°, I mean without bending the arm--that one can't do.

Bend your arm a little. What do you feel?--A tension or suchlike here and there, and principally the rubbing of my sleeve.--Do it again. Was the feeling the same? *Roughly*. Roughly in the same places. Does *this* feeling always

accompany this movement, can you say so? No. And yet I find there is still something about this argument that doesn't fit.

Page 77

392. Imagine that certain movements produced notes and now it was said that we recognize how far the arm has moved from the note that strikes. That would surely be possible. (Playing a scale on the piano.) But what sort of presuppositions must be satisfied for it to be so? It would not be enough, e.g. that notes accompany the movements; nor that they are often like for like movements. Nor would it suffice to

Page Break 78

say: the note just *must* have a single identical quality for identical movements, as it is the only sense datum in which we can recognize the amplitude of the movement.

Page 78

393. But isn't there such a thing as a kind of private ostensive definition for feelings of movement and the like? E.g. I crook a finger and note the sensation. Now someone says to me: "I am going to produce certain sensations in your finger in such and such a way, without its moving; you tell me when it is *that* one that you have now in crooking your finger." Mightn't I now, for my own private use, call this sensation "S", use my memory as criterion of identity and then say "Yes, that's S again" etc.

Page 78

394. It would then also be conceivable that I should recognize the sensation and that it should occur *without* being accompanied by the conviction of the movement's having taken place--without the sense of movement.

Page 78

395. I can certainly, e.g., raise my knee several times in succession and say I have had the same sensation every time: Not as if I *always* had this sensation when I raise my knee, nor as if I can recognize the movement in the sensation, but merely: In this series of knee-movements I three times had the same sensation, produced by the movement.

Being the same here of course means the same thing as seeming the same.

Page 78

396. "I had the same sensation three times": that describes a process in my private world. But how does someone else know what I mean? What I call "same" in such a case? He relies upon it that I am using the word here in the same way as usual? But what in this case is the use that is *analogous* to the usual one? No, this difficulty is not a piece of over-refinement; he *really* does not know, cannot know, which objects are the same in this case.

Page 78

397. The example of the motor roller with the motor in the cylinder is actually far better and deeper than I have explained. For when someone shewed me the construction I saw at once that it could not function, since one could roll the cylinder from outside even when the 'motor' was not running; but *this* I did not see, that it was a rigid construction and not a machine at all. And here there is a close

Page Break 79

analogy with the private ostensive definition. For here too there is, so to speak, a direct and an indirect way of gaining insight into the impossibility. [See Z 248.]

Page 79

398. I named this sensation of movement "S". Now, for others it is the sensation I had when I made this movement. But for me? Does "S" now mean something else?--Well, for me it means *this* sensation.--But which is this? for I pointed to my sensation a minute ago, how can I now point to *it* again?

Page 79

399. But suppose the case where someone made a series of arm-movements and said: "The sensation that I now have in my leg, I call 'S₁,'" and so on. Later, on various occasions, he says "Now I have S₃". And so on. Such utterances might be important, if we observe certain physiological correlates, for example, and in this way are able to draw conclusions from his utterances.

Page 79

400. If it is true that we do not estimate the kind and magnitude of the movement of a limb by the *feeling* -- how would a human being differ from us, with whom that *was* the case? Well, *this* could quite easily be imagined: that someone felt pain-sensations varying in strength or kind with difference of movements. Thus he would say, e.g. "I feel this pricking when I bend my arm through an angle of about 90°"

Page 79

401. Imagine someone who by means of a dowsing rod, and going by the tug which it gives, can determine the depth of a water course. He learned this in the following way: He walked over water courses of various depths and *noted* the tug. (This might perhaps have been established with a spring balance.) He associated the tug with the

depth and now draws conclusions from the tug to the depth. This might happen in such a way that he states the tug--say in pounds--and makes a transition to the depth, perhaps using a table. However, it may also be the case that he knows no other measure of the tug than the depth of the water-course. After a certain amount of practice he can give the depth right. If one exerts a tug on the rod, say by using weights, he will say "That tugs like a water-course of such and such a depth".

Page 79

402. However, it might be that, while he was able to give the depth of a water course *right* by means of the tug of the rod, yet he was not

Page Break 80

able to give a correct estimate of the tug of the rod. I mean this as follows: It might be that water gives an equal tug at different depths in different circumstances; and this dowser now says, e.g.: "This water-course is deeper than the former one, it tugs more weakly"--and he is right: the water-course actually does lie deeper, but the tug measured by the spring balance was the same and he had not noted *it* correctly.--Am I to say in such a case: he judges the depth by the tug?

Page 80

403. He will perhaps say: "This tug is that of a water-course at depth..." while he as it were studies this tug--as one hefts a weight in one's hand. But perhaps he says: "I can't judge the tug--the water is at the depth...." In this (latter) case one will not say he judges the depth by the tug. (At least not 'consciously'.)

Page 80

404. Suppose now someone were to say he judged how far he has bent his arm by the strength of a sensation of pressure in the elbow. That surely means: When it reaches a certain strength he knows from that that the arm is bent to *this* degree. Or what else should it mean, that he judges the degree of the bending by the sensation of pressure?

Page 80

405. I want to say: How does anyone know that he judges something by *this* feeling--Does it suffice if he directs his attention to the feeling in making his estimate?

Page 80

406. If you say that for this someone must be able to say: "When the pressure is as strong as *this*, my arm is bent 90°"--then the 'this' must be capable of being specified. Otherwise that someone judges the bending by the strength of the sensations of pressure would at most mean that one *cannot* judge the bending when one has *no* sensation of pressure (or only an uncommonly weak one). (And so, e.g. when one is anaesthetized.)

Page 80

407. Thus there is a variety of cases. Someone may *say* he judges the bending by the sensation of pressure or pain, and may in doing this so to speak hearken to this sensation; but for the rest be quite unable to give the degree of the sensation in any form.--Or there may be two independent specifications: of the degree of the sensation and of the degree of bending.

Page 80

408. "When I feel the pressure as hard as *this*, then...." Doesn't that make sense? Someone might even say he had a whole scale of

Page Break 81

sensations of pressure. I can well imagine that. Only that would no more be an *actual* scale than the picture of a thermometer is a thermometer. Although in many respects it has a great similarity to a thermometer.

Page 81

409. I give the rules of a game. Quite in accordance with these rules, the other makes a move whose possibility I had not foreseen, and which spoils the game, at least as I meant it. I must now say: "I gave bad rules," I must change or perhaps add to my rules.

So did I in this way already have a picture of the game? In a certain sense: yes.

I might, for example, not have foreseen that a quadratic equation need not have real numbers as a solution.

The rule, then, leads me to something of which I say: "I had not expected this picture; I always pictured the solution like *this*...." [Cf. Z 293.]

Page 81

410. How would it be if one said: "Not every system of rules determines a calculus." One would give dividing through by 0 as an example. For let us imagine an arithmetic in which it was allowed and in consequence it could be proved that any number was equal to any other.

Page 81

411. When children play at trains--ought I to say that a child who is imitating a steam engine is seen by another as a

steam engine? He is *taken as* a steam engine in the game.

Suppose I had shown a grown-up the shape  and asked "What does that remind you of?" and he had replied "A steam engine"--does that mean that he *saw* it as a steam engine?

For I take it as the typical game of "seeing something as something", when someone says "Now I see it as this, now as that". When, that is, he is acquainted with different aspects, and that *independently* of his making any application of what he sees.

So I should like to say this: I do not see any application of the picture as a sign that the picture is *seen* this way or that.

Page 81

412. Would a child understand what it means to see the table 'as a table'? It learns: "This is a table, that's a bench" etc., and it completely masters a language game without any hint of there being an aspect involved in the business.

Page Break 82

Page 82

413. "Yes, it's just that the child doesn't analyse what it does." Once more: what is in question here is not an analysis of what happens. Only an analysis--and this word is very misleading--of our concepts. And our concepts are more complicated than those of the child; in so far, that is, as our words have a more complicated employment than its words do.

Page 82

414. "I surely see it like *this*, even if I don't express it." That would mean that what I see doesn't alter when I express it. If one were to ask "Has the body this weight only so long as it is being weighed?"--that would mean "Does the weight change when we put it on the weighing machine?" And naturally that is not at all the thing that we should like to ask.

Page 82

415. Only through the phenomenon of change of aspect does the aspect seem to be detached from the rest of the seeing. It is as if, after the experience of change of aspect, one could say "So there was an aspect there!"

Page 82

416. When one scrapes a coating off a thing one can say "So there was a coating there".--But if the *colour* of a body changes--can I say "So it had a colour!" as if this had only just struck me?

Can one say: I only became aware that the thing had a colour, when its colour changed?

Page 82

417. Do not think that it is something *queer* for you to see a picture on the wall three-dimensionally. It is--I should like to say--as ordinary as it seems. (And I might say this about a lot of things.)

Page 82

418. Imagine that the things that surround us--table, books, chairs etc.--underwent abrupt periodic colour changes; their shapes remain the same. Might one say here that this was how we first became conscious of colour and shape as special constituents of our visual experience?

Page 82

419. When I compare wild flowers and garden flowers, this may make me conscious of the difference of *character*; but that is not to say that I must already earlier on have perceived their character as well as the flowers themselves, or that I must after all have perceived them as having some character or other.

Page 82

420. Must I know that I see with two eyes? Certainly not. Do I perhaps have two visual impressions in ordinary seeing, so that I notice that my three-dimensional visual impression is compounded of

Page Break 83

two visual pictures? Certainly not.--So I can't separate threedimensionality from seeing.

Page 83

421. If I ask someone "Which direction would you say an 'F' looks in and which a 'J'?" and he answers that for him an F always looks to the right, a J to the left--of course that does not mean that whenever he looks at an F he always has a sensation of direction. This becomes clearer if one puts the question like *this*: "Where would you paint an eye and a nose onto an F?"--But if it were now said: "So it looks in this direction for you only as long as you are thinking this or saying it"--isn't that as if one were to ask "Would you paint the nose there on an F, only at the time that you are actually painting it?"

Page 83

422. Do I always see a face '*as a face*'? I have books here in front of me: Do I see them the whole time '*as books*'? I

mean: Do I see them the whole time as books, if I don't precisely see them as anything else? Or do I often, or ordinarily, see only colours and shapes, without any special aspect? (Obviously not!) We tell someone: "If *that* is the base then *that* is the apex and *that* the altitude." Or he has to answer the question: "What is the altitude of the triangle, when *this* is the base?" But we don't insist on his *seeing* the triangle in this or that way.--One may well sometimes say: "Imagine it turned round" (or the like) and one might also say "See it turned round", and this remark might help; in the way, that is, in which some drawn lines completing the picture might help if they suggested this aspect.

Page 83

423. Can I, e.g., say: I see the chair as *object*, as *unit*? In the same way as I say I see now the black cross on a white ground, and now the white cross on a black ground?

If someone asks me "What have you there in front of you?" I shall of course answer "A chair"; so I shall treat it as a unit. But can one now say I *see it as a unit*?

And can I see the cross-figure *without* seeing it *this way or that*?

Page 83

424. When I ask someone "What do you see in front of you" and he says "What I have in front of me looks *like this*" and now he draws the cross-figure--*must* he have seen it in some aspect or other? Has he not seen it, if he can only describe it by drawing?

Page 83

425. Can a child inform you that it sees three-dimensionally?

And imagine its saying to you "I see everything flat"--what would that tell you? It might see everything flat and know through intuition that it *isn't* flat, and behave correspondingly!

Page Break 84

Page 84

426. If the child takes this picture for such-and-such and now I conclude: "So it sees the picture in this way"--what sort of conclusion am I drawing? What does this conclusion say to me? It would perhaps be said that I was inferring the kind of sense-datum or visual picture the child had: as if the conclusion ran: "So the picture in its mind is *like this*"; and now one would have to give (say) a plastic representation of it.

Page 84

427. Then is it like *this*: "I have always read the sign ' Σ ' as a sigma; now someone tells me it could also be an M turned round, and now I can see it like that too: so I have always *seen it as* a sigma before"? That would mean that I have not merely seen the figure Σ and read it like *this*, but I have also *seen it as this*!

Page 84

428. "But how could I know that I should have reacted like this if you had asked me?"--How? There is no How. But there are indications that I am right in saying it.

Page 84

429. I want to describe what I see; for this purpose I prepare a transparency. But now I am further asked "Is *this* in front and *this* behind?" So, by means of words or a model, I describe what I see in front and what behind. And then I am further asked "And do you see *this* point as the apex of the triangle?" and now I must answer this as well.--But must I have an answer to it?--Assume, though it is not true, that the direction of one's glance determines the aspect. And in one case my gaze is continuously directed on to the same point in the picture, in another it moves in a regular fashion according to a simple law, in a third it wanders randomly back and forth over the object. If we now replaced a description of the aspect by that of the direction of glance, would it not be a description to say that the direction of glance was random, or indeterminate? And that might be just the ordinary case.--To the question "Did you see this point as the apex of the triangle?", then, the answer might be "I can't mention any particular aspect" or perhaps "At any rate I didn't see it like *this*".

Page 84

430. What, however, did the hypothesis of the importance of the direction of glance do for us?--It offered us a picture of definite multiplicity.

Page 84

431. But such a theory is really the construction of a psychological model of a psychological phenomenon. And hence of a physiological model.

Page Break 85

Page 85

The theory really says "It could be like this:...." And the usefulness of the theory is that it illustrates a concept.

It may illustrate it better and worse; more, and less, appropriately. The theory is thus so to speak a notation for this kind of psychological phenomenon.

Page 85

432. Thus if we 'leave explanation'--if we say that after all we don't mind about the *explanation*--what is left over is a grammatical stipulation. It concerns the use of the statement "I am now seeing a particular facial expression in the picture".

Page 85

433. Doesn't the theme point to something outside itself? Oh, yes! But that means:--The impression that it makes on me hangs together with things in its surroundings--e.g. with the existence of our language and its intonation; but that means: with the whole field of our language-games.

When I say, e.g.: It is as if a conclusion were being drawn here, or as if here something were being confirmed, or, as if this were the answer to what went before,--in this way my understanding presupposes familiarity with conclusions, confirmations, answers. [Cf. Z 175; *Culture and Value*, pp. 51-52.]

Page 85

434. A theme has a facial expression just as much as a face does. [*Vermischte Bemerkungen*, 2nd ed. p. 101; *Culture and Value*, p. 52.]

Page 85

435. "The repetition is *necessary*." To what extent is it necessary? Well, sing it, and you will see that it takes the repetition to give it its great strength.--Doesn't it seem to us as if there had to be a text for the theme existing in reality, and the theme would approximate to it, would correspond to it, only if this part was repeated? Or am I to utter the stupidity "It sounds finer with the repetition"? And surely there just is no paradigm there outside the theme. And yet after all there *is* a paradigm outside the theme: namely the rhythm of our language, of our thinking and feeling. And the theme is also in its turn a *new* bit of our language, it is incorporated in it; we learn a new *gesture*. [Cf. C. & V., p. 52.]

Page 85

436. The theme and the language are in reciprocal action. [Cf. C. & V., p. 52.]

Page 85

437. "A whole world of pain lies in these words." How *can* it lie in them?--It hangs together with them. The words are like an acorn from which an *oak-tree* can grow.

But where is the law laid down, according to which the tree grows

Page Break 86

out of the acorn? Well, experience has incorporated the picture into our thought. [Cf. C. & V., p. 52.]

Page 86

438. "Where do you feel grief?"--In my mind.--And if I had to give a place here, I should point in the region of the stomach. For love, to the breast and for a flash of thought, to the head.

Page 86

439. "Where do feel your grief?" In my mind.--Only what does that mean?--What kind of consequences do we infer from this place-assignment? One is, that we do *not* speak of a physical place of grief. But *all the same* we do point to our body, as if the grief were in it. Is that because we feel a physical discomfort? I do not know the cause. But why should I assume it is a bodily discomfort? [Cf. Z 497.]

Page 86

440. Think of the following question: Can one imagine a pain, with, say, the quality of rheumatic pain, but *without* locality? Can one *imagine* it?

When you begin to think this over, you see how much you would like to change the knowledge of the place of pain into a characteristic of what is *felt*, into a characteristic of the sense-datum, of the private object that is there before my mind. [Cf. Z 498.]

Page 86

441. I say that to the grief-stricken the whole world looks grey. But what was before my mind would in that case not be grief, but a grey world: as it were the cause of grief.

Page 86

442. Seeing something as difference of colour--and on the other hand as shadow, the colour being the same. I ask "Have you perceived the colour of the table in front of you, which you've been looking at the whole time?" He says "Yes". But he would have described the colour of the table as "brown" and has not noticed that the green curtains are reflected in its shining surface. Now has he not had the green sense-impression?

"Is the wall in front of you uniformly yellow?" "Yes." But it is partly in shadow and looks almost grey.

Now what did he see, when he looked at the wall? Am I to say, a uniformly yellow surface, which admittedly

is irregularly shadowed? Or: yellow and grey patches?

Page 86

443. It is a remarkable fact that we are hardly ever conscious of the unclarity of the periphery of the visual field. If people, e.g., talk about the visual field, they mostly do not think of that; and when one speaks

Page Break 87

of a representation of the visual impression by means of a picture, one sees no difficulty in this. This is very important.

Page 87

444. "What I perceive is *THIS*--" and now follows a form of *DESCRIPTION*. One might also explain this in this way: Let us imagine a direct transfer of the experience.--But now, what is our criterion for the experience's really having been transferred? "Well he simply has the same as I have"--But how does *he* 'have' it? [Cf. Z 433.]

Page 87

445. Think of the variety of physical experiments. We measure, e.g. temperature; but only within a certain general technique is *this* experiment a measuring of temperature.--So if we were interested in the multiplicity of (physical) measurements, I mean kinds of measurement, we'd be interested in the same way in the multiplicity of methods, of concepts.

Page 87

446. How can you *look at* your grief? By being grief-stricken? By not letting anything distract you from your grief? So are you observing the feeling by *having* it? And if you are holding every distraction at a distance, does that mean you are observing *this* condition? or the other one, in which you were *before* the observation? So do you observe your own observing?

Page 87

447. Suppose someone were to ask "What are all the things measured in physics?" Now one might retail them: lengths, times, brightness of light, weights etc.

But might one not say: You learn more if you ask "How is measuring done?" instead of "What is measured?"

If one does *this*, if one measures like *this*, then one is measuring temperature--if one does *that*, measures like *that*: the strength of a current.

Page 87

448. But doesn't grief consist of all sorts of feelings? Is it not a congeries of feelings? Then would one say it consists of feelings A, B, C, etc.--like granite out of feldspar, mica and quartz?--So do I say of someone who has the feelings... that he is grief-stricken? And how do I know that he has them? Does he tell us?

Page 87

449. But grief is a mental experience. One says that one experiences grief, joy, disappointment. And then these experiences seem to be really composite and distributed over the whole body.

Page Break 88

Page 88

The gasp of joy, laughter, jubilation, the thoughts of happiness--is not the experience of all this: joy? Do I know, then, that he is joyful because he tells me he feels his laughter, feels and hears his jubilation etc.--or because he laughs and is jubilant? Do I say "I am happy" because I feel all that?

Page 88

450. The words "I am happy" are a bit of the behaviour of joy.

Page 88

451. And how does it come about that--as James says--I have a feeling of joy if I merely make a joyful face; a feeling of sadness, if I make a sad one? That, therefore, I can produce these feelings by imitating their expression? Does that shew that muscular sensations are sadness, or part of sadness?

Page 88

452. Suppose someone were to say: "Raise your arm, and you will feel that you are raising your arm." Is that an empirical proposition? And is it one if it is said: "Make a sad face, and you will feel sad"?

Or was that meant to say: "Feel that you are making a sorrowful face, and you will feel sorrow"? and is that a pleonasm?

Page 88

453. Suppose I say: "Yes, it's true: if I adopt a more friendly expression, I feel better at once."--Is that because the feelings in the face are pleasanter? or because adopting this expression has consequences? (One says "Chin up!")

Page 88

454. Does one say: "Now I feel much better: the feeling in my facial muscles and round about the corners of my

mouth is good"? And why does that sound laughable, except, say, when one had, felt pain in these parts before?

Page 88

455. Is my feeling at the corners of the mouth compared with his--in the same way as my mood is compared with this?

How, for example, do I compare my sensations of pressure with his? How do I *learn* to compare them? How do I compare our kinaesthetic sensations, how do I correlate them with one another? And how the feelings of sorrow, joy etc.?

Page 88

456. Now granted--although it is extremely doubtful--that the muscular feeling of a smile is a constituent part of feeling glad;--where are the other components? Well, in the breast and belly etc.!--

Page Break 89

But do you really feel them, or do you merely conclude that they *must* be there? Are you really conscious of these localized feelings?--And if not--why are they supposed to be there at all? Why are you supposed to mean *them*, when you say you feel happy?

Page 89

457. Something that could only be established through an act of *looking*--that's at any rate not what you meant.

For "sorrow", "joy" etc. just are not used like that.

Page 89

458. Why does it sound so queer to say "He felt deep grief for one second"? Because it so seldom happens? Then what if we were to imagine people who often have this experience[[sic]]? Or such as often for hours together alternate between second-long feelings of deep grief and inner joy? [Cf. P.I. p. 174c.]

Page 89

459. "Don't you feel grief *now*..."--is that not as if one were to ask "Aren't you playing chess *now*?" Really, though, the question was a personal and temporal one, not a philosophical question. [Cf. p. 174d.]

Page 89

460. "'I'm hoping...'--the description of my state of mind": That sounds as if I looked into my mind and described it (as one describes a landscape). If now I say: "I keep on hoping that he will yet come to me"--is that a piece of hoping behaviour? Isn't it as little a piece of hoping behaviour as the words "At that time I was hoping he would come"? So should I not say that there are two kinds of present of "hope"? One, as it were the exclamation, the other the report?

Page 89

461. But now when I say to someone "I very much hope that he will come to our gathering"--does he ask me: "What was that, a report or an exclamation?" -Does he fail to understand me, if he doesn't know that? And yet it is one thing to say "I hope he'll come" and another to say: "I don't lose hope that he will come."

Or think of this expression "I hope and pray that he may come".

Page 89

462. "I hope he'll come"--one might say--is sometimes equivalent in meaning to "He'll be coming!" said in a hopeful voice. But this exclamation need not have any perfect tense. Couldn't a language be imagined in which, while there was an equivalent of this expression

Page Break 90

of hope, still there were not the remaining forms of the verb? In which the people quoted themselves when they did want to speak of past hope--saying, e.g. "I said: 'He'll surely come!'"

Page 90

463. It might be said: An assertion says something about the state of mind, given that I can make inferences from it about the state of mind. (That sounds more stupid than it is.) If *that's* how it is, then the expression of a wish "Give me that apple" says something about my state of mine. And is this proposition then a description of this state? That one won't want to say. ("Off with his head!")†1

Page 90

464. If I call out "Help!" is that a description of my state of mind? And is it *not* the expression of a wish? Is it not as much that as any other cry is?

Page 90

465. I say to myself "I still keep on and on hoping, although..." and in saying it I as it were shake my head over myself. That means something quite other than simply "I hope...!" (The difference in English between "I am hoping" and "I hope".)

Page 90

466. And what is observed by observing your own hope? What would you *report*? Various things. "I hope every

day.... I imagined.... Every day I said to myself.... I sighed.... Every day I took this route in the hope...."

Page 90

467. The word "observe" is badly applied here. I try to remember this and that.

Page 90

468. If someone remembers his hope, on the whole he is not therefore remembering his behaviour, nor even necessarily his thoughts. He says--he knows--that at that time he hoped.

Page 90

469. The sentence "I want some wine to drink" has roughly the same sense as "Wine over here!" No one will call *that* a description; but I can gather from it that the one who says it is keen to drink wine, that at any moment he may take action if his wish is refused--and this will be called a conclusion as to his state of mind.

Page 90

470. Is "I believe..." a description of my mental state?--Well, what is such a description? "I am sad", for example, "I am in a good mood", perhaps "I am in pain".

Page Break 91

Page 91

471. It would be asking for trouble to take Moore's paradox for something that can only occur in the mental sphere.

Page 91

472. I want to say first of all that with the assertion "Its going to rain" one expresses belief in that just as one expresses the wish to have wine with the words "Wine over here!" One might also put it like this: "I believe p" means roughly the same as "p" and it ought not to mislead us that the verb "believe" and the pronoun "I" come in the first proposition. We merely see clearly from this that the grammar of "I believe", is very different from that of "I write".

But when I say this, I don't mean that there may not also be big similarities here; and I am not saying what *kind* of differences there are. ((Real and imaginary unit.))

For remember that what is in question here are similarities and differences of concepts, not phenomena.

Page 91

473. One may say the following queer thing: "I believe it's going to rain" means something like: "It's going to rain", but "I believed then that it was going to rain" doesn't mean anything like "It rained then".

But now, what does it mean to say that the first sentence has roughly the same sense as the second? Does it mean that both produce the same thought in my mind (the same *feeling*?)--[Cf. P.I. p. 190d.]

Page 91

474. "I want to think *thus* and not *thus*." And however queer it sounds '*thus*' and '*this*' aren't sharply distinct from one another.

Page 91

475. The way you use the word "God" shews, not *whom* you mean, but what you mean. [V.B. p. 99; C. & V., p. 50.]

Page 91

476. "But surely 'I believed' must mean just *that*, for the past, which 'I believe' means for the present!" $\sqrt{-1}$

must mean just the same for -1, as $\sqrt{1}$ does for 1. That means nothing at all. [Cf. P.I. p. 190d.]

Page 91

477. What does it mean to say that "I believe p" says roughly the same as "p"? We react in roughly the same way when anyone says the first and when he says the second; if I said the first, and someone didn't understand the words "I believe", I should repeat the sentence in the second form and so on. As I'd also explain the words "I wish you'd go away" by means of the words "Go away".

Page Break 92

Page 92

478. Moore's Paradox may be expressed like *this*: "I believe p" says roughly the same as " \vdash p"; but "Suppose I believe that p..." does not say roughly the same as "Suppose p...".

Can one understand the supposition that I wish for something before understanding the expression of a wish?--The child learns first to express a wish, and only later to make the supposition that it wished for such-and-such.

Page 92

479. "Suppose I have a pain..."--that is not an expression of pain and so it is not a piece of pain-behaviour.

The child who learns the word "pain" as a cry, and who then learns to tell of a past pain--one fine day this

child may declare: "If I have a pain, the doctors[[sic]] comes." Now has the meaning of the word "pain" changed in this process of learning the word? It has altered its employment; but one must guard carefully against interpreting this change as a change of object corresponding to the word.

Page 92

480. Imagine "I believe..." represented in a painting. How might I imagine this? The picture would perhaps shew *me* with some picture or other inside my head. The point is not what symbolism it employs. The picture of *what* I believe, e.g. that it is raining, will come into it. My mind will perhaps lay hold of this picture, hold on to it and so on.--And now let us suppose that this picture got used as the assertion "Its raining". Well, so far there is nothing odd about that. Am I now to say that there is a lot that is *redundant* about the picture? That I should not like to say.

Page 92

481. "Basically, with these words I describe my own state of mind--but *here* this description is indirectly an assertion of the state of affairs that is believed."--As, in certain circumstances I describe a photograph in order to describe what the photograph is a shot of. [Cf. P.I. p. 190e.]

Page 92

482. But if this analogy held good, then I should further have to be able to say that this photograph (the impression on my mind) is trustworthy. So I should have to be able to say: "I believe that it's raining, and my belief is trustworthy, so I trust it." As if my belief were a kind of sense-impression. [Cf. P.I. p. 190e.]

Page 92

483. Do you say, e.g. "I believe it, and as I am reliable, it will presumably be so"? That would be like saying: "I believe it--therefore I believe it."

Page Break 93

Page 93

484. Just as one may use the same procedure, now to measure the length of the table, now to check the yardstick, now to test the measurer's accuracy in making measurements, in the same way an assertion may serve one as information as to its content, or about the character or the state of mind of the asserter.

Page 93

485. One might very well say: "He's coming, but I still can't believe it!"--"He's coming! I can't believe it!"

Page 93

486. Imagine an announcer in a railway station, who announces a train according to schedule, but--perhaps groundlessly--is convinced that it won't arrive. He might announce: "Train No.... will arrive at... o'clock. Personally I don't believe it."

Page 93

487. How would it be, if a soldier produced military communiqués which were justified on grounds of observation; but he adds that he believes they are incorrect.--Let us ask ourselves, not what may be going on in the mind of one who speaks in this way, but rather whether others can do anything with this report, and what they can do.

Page 93

488. The communiqué is a language-game with these words. It would produce confusion if we were to say: the words of the communiqué--the proposition communicated--have a definite sense, and the giving of it, the 'assertion' supplies something additional. As if the sentence, spoken by a gramophone, belonged to pure logic; as if here it had the pure logical sense; as if here we had before us the object which logicians get hold of and consider--while the sentence as asserted, communicated, is what it is in *business*. As one may say: the botanist considers a rose *as a plant*, not as an ornament for a dress or room or as a delicate attention. The sentence, I want to say, has no sense outside the language-game. This hangs together with its not being a kind of *name*. As though one might say "I believe..."--*that's* how it is" pointing (as it were inwardly) at what gives the sentence its meaning.

Page 93

489. Is it a tautology to give the communiqué: "The cavalry will arrive immediately, and I believe it"?

Page 93

490. The paradox is this: the *supposition* may be expressed as follows: "Suppose *this* went on inside me and *that* outside"--but the *assertion*

Page Break 94

that *this* is going on *inside* me asserts: this is going on outside me. As *suppositions* the two propositions about the inside and the outside are quite independent, but not as assertions.

Page 94

491. Does this lie in the nature of the concept "believe"? Certainly.

Page 94

492. Suppose someone said "I wish--but I don't want my wish to be fulfilled". (Lessing: "If God in his right hand...."†1) Can one then ask God to give the wish, and *not* to fulfil it?

Page 94

493. So it looks as if the assertion "I believe..." were not the assertion of what the supposition "I believe" supposes! [Cf. P.I. p. 190c.]

Page 94

494. Don't see it as a matter of course, but as something very worthy of note, that the verbs "believe", "hope", "wish", "intend" and so on, exhibit all the grammatical forms that are also possessed by "eat", "talk", "cut". [Cf. P.I. p. 190h.]

Page 94

495. Imagine I were the hybrid being that might pronounce "I don't believe it is raining; and it is raining".--But what purpose do these words now serve? What employment am I imagining being given to them?

"He's coming. I personally don't believe it, but don't let that mislead you." "He's coming, rely upon it. I don't believe it, but don't let that mislead you." This sounds as if two persons were speaking out of me; or as if one court within me gave the other person the information that so and so was coming, and this court wished that the person should take appropriate action--while another court in a certain sense reported my own attitude. It is as if one were to say "I know that this is the wrong procedure, but I know that that's what I shall do".

"He's coming, but I don't believe it" may, then, occur in a language-game. Or better: It is possible to think out a language-game in which these words would not strike us as absurd.

Page Break 95

Page 95

496. A voltmeter might *pronounce* the voltage by means of a gramophone record instead of by dial and pointer. When one presses a button (asks the question) the instrument says, e.g. "The voltage amounts to...". Could it make sense to have the voltmeter say: "I believe the voltage amounts to..."? One can imagine such a case.

Am I now to say that the instrument is stating something about itself--or about the voltage? Am I to say that the instrument *always* states something about itself! And if, e.g., on repetition it may give a higher reading for the voltage: am I to say that it had *believed* the voltage was...?

Page 95

497. Or let us put it like this: Am I to say a voltmeter says something about itself, or about the voltage? May I not say both? Each, that is, under different circumstances?

Page 95

498. Have "Help!" and "I need help" different senses; is it merely a crudity in our conception that we regard them as equivalent? Does it always mean something to say "Strictly speaking, what I meant was not 'Help!' but 'I need help'"?

The worst enemy of our understanding is here the idea, the picture, of a 'sense' of what we say, in our mind.

Page 95

499. The assertion "He will come" makes no allusion to the maker of the assertion. But neither does it allude to the words of the assertion, whereas "'He will come' is a true proposition" does allude to the words and has the same sense as the proposition that does not do so.

Page 95

500. Might one speak of the sense of the words "that he will come"? For these words are precisely the Fregean 'assumption'. Well, couldn't I explain to someone what this verbal expression means? Yes I can, by explaining to him, or shewing him, how it is employed.

Page 95

501. The difficulty becomes insurmountable if you think the sentence "I believe..." states something about the state of my mind. If it were so, then Moore's Paradox would have to be reproducible if, instead of saying something about the state of one's own mind, one were making some statement about the state of one's own brain. But the point is that no assertion about the state of my (or anyone's) brain is equivalent to the assertion which I believe--for example, "He will come".

Page Break 96

Page 96

502. But now, we do nevertheless take the assertion "He believes p" as a statement about his *state*; from this indeed there results his way of going on in given circumstances. Then is there no *first person present* corresponding to such an ascription? But then, may I not ascribe a state to myself now in which such-and-such linguistic and other reactions are probable? It is like this, at any rate, when I say "I'm very irritable at present". Similarly I might also say

"I believe any bad news very readily at present".

Page 96

503. Now would a proposition ascribing to myself--or to my brain such a condition that I reply "Yes" to the question "Will he come?" and also exhibit such-an-such other reactions--would such a proposition amount to the assertion "He will come"?

Here one might ask "How do you imagine I have been instructed about this state of mind?--By experience, say? Do I then want to predict from experience that I will now always answer such a question like *this*, etc.?" If that's how it is, and I make the statement "I believe he will come" in this sense, and I add "and he isn't going to come", then that is a contradiction only to the same extent as "I'm incapable of pronouncing any word with four syllables"; or "I can't speak a word of English".

If this latter is a kind of contradiction; still the assumption "Suppose I couldn't speak a word of English" is not.

Page 96

504. That he believes such-and-such, *we* gather from observation of his person, but *he* does not make the statement "I believe..." on grounds of observation of himself. And *that* is why "I believe p" may be equivalent to the assertion of "p". And the question "Is it so?" to "I'd like to know if it is so."

Page 96

505. "This face has a quite particular character"--really means: *much* could be said about it. When does one say this? What justifies one in it? Is it a particular experience? Does one already know what one will say: has one already said it silently? Isn't it a situation like: "Now I know how to go on!"

Page 96

506. We all know the process of sudden change of aspect;--but what if someone asked: "Does A have the aspect *a* continuously before his eyes--when, that is, no change of aspect has taken place?" May not

Page Break 97

the *aspect* become, so to speak, *fresher*, or *more indefinite*?--And how queer it is that I *ask* this!

Page 97

507. There is such a thing as the flaring up of an aspect. In the same way as one may play something with more intense and with less intense expression. With stronger emphasis of the rhythm and the structure, or less strong.

Page 97

508. Seeing, hearing *this* as a variant of *that*. Here there is the moment at which I *think* of B at the sight of A, where this seeing is, so to speak, acute, and then again the time in which it is chronic.

Page 97

509. *Not* to explain, but to *accept* the psychological phenomenon--that is what is difficult.

Page 97

510. "F" as a variation of different figures.

If I imagine that the paradigm, as a variant on which I see the object, is somehow present in my mind as I see, then it might after all be present now more clearly, now less, and it might disappear altogether.

Page 97

511. Imagine two people: one has learnt "F" like this in his youth: "  "--the other, as we do: "  ". If now both read the word "Figure",--must I say, have I reason to say, that they each see the "F" differently? Obviously not. And yet might it not still happen, that the one, on hearing how the other learned to write and read this letter, says: "I've never seen it like *that*, but always like *this*"?

And further, there will probably be situations in which I shall explain what one of these people does or says like *this*: "The thing is, he regards this letter as a variant of..."

Page 97

512. *This* is certain, that one may say: "I've never seen this in that way before." Here there is no doubt about the "never".--But if you say "I have *always* seen this like that", this "always" is not equally certain. And there is of course nothing at all remarkable about this, if instead of "seen" one says "taken".

Page 97

513. Suppose you knew that the sign  was a combination of a  with a  .--This recalls the dream phenomenon, which, in

Page Break 98

telling a dream, one describes with the words: "and I knew that...". And it also has some similarity to what is called

"hallucination".

Page 98

514. It is as if when I see the written character there were a paradigm, a pattern, present in my mind. But what sort of pattern?? What does it look like? Surely at any rate not like the character itself!--Well, like the character seen in *this* way then? But seen in *what* way? What notation can I use for the aspect? Well, what notation do we use; how do we communicate about it? I say, for example: "The sign, as I see it, looks to the right." I might positively speak of a kind of visual centre of gravity,--might say: The centre of gravity of the sign F is *here*. Can I explain what I mean by this? No.--But I can compare this reaction of mine with other people's reactions.

Page 98

515. Am I continually conscious that the edges of my visual field are blurred? Ought I to say: "Hardly ever", or "never"?

Page 98

516. In a different thought-space--one would like to say--the thing looks different.

Page 98

517. In music a variation on a theme could be imagined, which, phrased a bit differently, say, can be conceived as a completely different kind of variation of the theme. (In rhythm there are such ambiguities.) Indeed what I mean is probably to be found absolutely always, when a repetition makes the theme appear in a quite different light.

Page 98

518. No aspect that is not (also) conception.

Page 98

519. Suppose someone said to me: "Something has changed about the *picture* now--I can't put it in any other

way--although the shape is the same as before. I can only say: before, it was a kind of , now it's a kind of ." If he were to say *that*, might I not all the same be suspicious and doubt that he had always, uninterruptedly, *seen* the figure in that way, and not merely never conceived it otherwise?

Page 98

520. Imagine that a child, when it has learnt the letter "R", were to say to us "I always see it as an 'R'". What could that tell us??--For that matter, even if it were to say "I always see it as a 'P' with a skew support" that would only tell us: the child conceives it so, that's how it explains the letter to itself, and such like. Only if it were to speak of a change of the aspect should we say: now it is that phenomenon....

Page Break 99

Page 99

521. If someone says "I always see it *this* way", he must say how. Suppose he did this by tracing the lines of the figure in a definite order or in a particular rhythm. That would be something *like* his telling us "I always follow the figure with my eyes in *this* way". And here it might of course be that his memory deceives him.

Page 99

522. If he says "I see the figure (now) like *this*" and follows it in a definite way this need not be so much a description as, so to speak, the seeing itself. But if he says "I *have* always seen it like that" this means that he has never seen it *differently*, and here he may be deceiving himself.

Page 99

523. No, I didn't have the paradigm continuously before my mind--but when I describe the change of aspect, I use the paradigms in describing it.

Page 99

524. "I've always seen it *this* way"--here one really means to say: "I have always conceived it *this* way, and *this* change of aspect has never taken place."

Page 99

525. "I've never seen it *this* way, always *that*." Only this doesn't make a proposition by itself. It lacks a field.

Page 99

526. "I have always seen it with *this* face." But you still have to say *what* face. And as soon as you add *that*, it's no longer as if you had *always* done it.

"I have always seen this letter as having a peevish face." Here one can ask: "Are you sure it was *always*?" That is to say: did the peevishness *always* strike you?

Page 99

527. And what about something's 'striking' one? Does that take place in a moment, or does it last?

Page 99

528. "When I look at him, I always see his father's face." Always?--But surely not just *momentarily*! This aspect may endure.

529. Imagine its being said: "Now I always see it in *this* context."-

530. Absolute and relative pitch: Here is something similar: I hear the transition from one note to the other. But after a short time I can no longer recognize a note as the higher or lower of those two. And it

doesn't even have to make sense to speak of any such "recognition"; when, that is, there is no criterion for correct recognition.

531. It is almost as if the '*seeing* of the sign in *this* context' were an echo of a thought. [Cf. P.I. p. 212b.]

532. To say of a real face, or of a face in a painting: "I've *always* seen it as a face" would be queer; but not "It has always been a face for me, and I have never seen it *as something else*".

533. If, e.g., for once I see the  as a T with an additional stroke, it is as if the *grouping* changed. But if I am asked: "So formerly you always saw this figure with the grouping of an ?" I could not say it was so.

534. If someone says: "I am talking of a visual phenomenon, in which the visual picture, that is its organization, does change, although shapes and colours remain the same"--then I may answer him: "I know what you are talking about: *I too should like to say* what you say."--So I am not saying "Yes, the phenomenon we are both talking about is actually a change of organization..." but rather "Yes, this talk of the change of organization etc. is an expression of the experience which I mean too".

535. "The organization of the visual image changes."--"Yes, that's what I'd like to say too."

This is analogous to the case of someone saying "Everything around me strikes me as unreal"--and someone else replies: "Yes, I know this phenomenon. That's just how I'd put it myself."

536. "The organization of the visual image changes" has not the same kind of application as: "The organization of this company is changing." *Here* I can describe *how it is*, if the organization of our company changes.

537. "It never occurred to me that one can see the figure *this* way": does it follow that it did occur to me, or that I knew, that one could see it the way I always have seen it?

538. I hear a note--so don't I hear how loud it is?--Is it correct to say: if I hear the note, I must be conscious of its degree of loudness? It's different if its strength alters.

539. At first sight it would appear to be like *this*: Someone notices that one can see an  also as a T with a little appendix; he says "Now I see it as a T etc., now as an F". From this it seems to follow that he sees it the second time as he *always* saw it before his discovery.--And so, that if it makes sense to say "Now I see it as an F again", it also made sense to say, before the change of aspect, "I always see the letter  as an F".

540. If I had always heard a sentence in one and the same intonation (and often heard it) would it be right to say that I must, of course, have been conscious of the intonation? If that just means that I have heard it in this intonation and also pronounce it accordingly--then I am conscious of the intonation. But I need not know that there is such a thing as an 'intonation'; the intonation need never have *struck* me, I need never have *hearkened to it*.

The concept intonation may be quite unknown to me. The '*separation*' of intonation from sentence need not have been effected for me.

I have not learned any language-game with the word "intonation"!

541. For when a child learns its letters, it doesn't learn to see them *this* way and not otherwise. Am I to say, now,

that at the change of aspect the man realizes that he has always seen a letter, say an R, in the same way?--Well, it *might* be so, but it isn't so. No, *that's not what we say*. Rather, when someone says something like: for him the letter... has always had such-and-such a face, he would admit that in many cases he has not 'thought' of a face when he saw the letter.

Page 101

542. Am I now to say: a 'kind of seeing' is associated with a letter for us? Certainly not; unless it means something like: a face gets associated with a letter.

Page 101

543. Think of the concept "style of handwriting" one may say "That's an interesting style that the letter... is written in"--but does everyone who has learnt how to write a letter of the alphabet understand what "style" means? I mean: Can someone understand the style

Page Break 102

of the letter S who doesn't know at all that there is such a thing as different styles for a letter?--Or am I merely playing with words here?

You just must not have too narrow a concept of 'experiencing'.

Ask yourself, e.g.: The man who has never had other examples before him--can *he* perceive a pronunciation as *vulgar*?

Page 102

544. "I find this handwriting unattractive." If someone has only just learnt to read and write, can he find a handwriting 'unattractive'?--It may perhaps in some sense put him off. It makes sense to say that someone finds a handwriting unattractive, only if he is already capable of forming all sorts of thoughts about a handwriting.

Page 102

545. Would it be imaginable, given two identical bits of a piece of music, to have directions placed above them, bidding us hear it like *this* the first time, and like *this* the second, without this exerting any influence on the performance? The piece would perhaps be written for a chiming clock and the two bits would be meant to be played equally loud and in the same tempo--only *taken* differently each time.

And, even if a composer has never yet written such a direction, might not a critic write it? Would not such a direction be comparable to a title to Programme music ("Dance of the Peasants")?

Page 102

546. Only of course, if I say to someone "Hear it like *this*", he must now be able to say: "Yes, now I understand it; now it really makes sense!" (Something must click.)

Page 102

547. What concept have we of sameness, of identity? You are familiar with the uses of the word "same" when what is in question is same colours, same sounds, same shapes, same lengths, same feelings, and now you decide whether this case and that should be included in this family or not.

Page 102

548. What is it that is repulsive in the idea that we study the use of a word, point to mistakes in the description of this use and so on? First and foremost one asks oneself: How could *that* be so important to us? It depends on whether what one calls a 'wrong description' is a description that does not accord with established usage--or one which does not accord with the practice of the person giving the description. Only in the second case does a philosophical conflict arise.

Page Break 103

Page 103

549. Less repulsive is the idea that we form *a wrong picture* for ourselves, say of thinking. For here one says to oneself: at least we have to do with thinking, not with the word "thinking".

So we form a wrong picture of thinking.--But *of what* do we form a wrong picture; how do I know, e.g., that you are forming a wrong picture of *that*, of which I too am forming a wrong picture?

Let us suppose that our picture of thinking was a human being, leaning his head on his hand while he talks to himself. Our question is not "Is that a correct picture?" but "How is this picture employed as a picture of thinking?"

Say, not: "We have formed a wrong picture of thinking"--but: "We don't know our way about in the use of our picture, or of our pictures." And hence we don't know our way about in the use of our word.

Page 103

550. Very well,--but this word is surely interesting to us only insofar as it actually possesses for us a quite particular use, and so already relates to a particular phenomenon!--That's true. And that means: our concern is not with improving grammatical conventions.--But what does it mean to say "We all know what phenomenon the word

'thinking' refers" to? Doesn't it simply mean: we can all play the language-game with the word "think"? Only it produces unclarity to call thinking a 'phenomenon', and further unclarity to say "we form a wrong picture of this phenomenon". (One might really rather say "a wrong concept".)

Page 103

551. If we are dealing with the use of the word "five", then we are dealing in a certain sense with what "corresponds" to the word; only *this* way of speaking is primitive, it presupposes a primitive conception of the use of a word.

Page 103

552. A 'language game': We get someone to choose an aroma according to a drawing, e.g. the aroma of coffee. We

say to him "Coffee smells like this: " and now we tell him to bring the liquid that smells like that--Now I will assume that he would actually bring the right one. So I would have a means of imparting orders to a human being by *graphical* means. ((Connexion with the nature of a rule, a technique, of mathematics,--that of the real numbers for example.)) This also hangs together with this: ("The mother hen 'calls' the chickens to her").

Page Break 104

Page 104

553. "One can't describe the aroma of coffee." But couldn't one imagine being able to do so? And *what* does one have to imagine for this?

If someone says: "One can't describe the aroma," one may ask him: "What *means* of description do you want to use? What *elements*?"

Page 104

554. We are not *prepared* for the task of describing the use of the word "think", for example. (And why should we have been? What use is such a description?)

And the naïve conception that one forms of it does not correspond to the reality at all. We expect a smooth regular contour and get to see a ragged one. Here one might really say that we had formed a wrong picture. It is like this: suppose there were a substantive, let's say "giant", used to express all that we say by means of the word "big". The picture that would come to our minds in connexion with the word "giant" would be that of a giant. And now suppose that our queer employment of the word "big", with this picture before our eyes, had to be described. [Cf. Z 111.]

Page 104

555. Macaulay says that the art of fiction is an "imitative art", and naturally gets straight away into the greatest difficulties with this concept. He wants to give a description: but any picture that suggests itself to him is inappropriate, however right it seems at first sight; and however queer it seems that one should be unable to describe what one so exactly understands.

Here one tells oneself: "It *must* be like this!--even if I cannot immediately get rid of all the objections."

Page 104

556. It is very easy to imagine someone knowing his way about a city quite accurately, i.e. he finds the shortest way from one part of the city to another quite surely--and yet that he should be perfectly incapable of drawing a map of the city. That, as soon as he tries, he only produces something completely wrong. (Our concept of 'instinct'.) [Z, 121.]

Page 104

557. Above all, someone attempting the description lacks any system. The systems that occur to him are inadequate, and he seems suddenly to find himself in a wilderness instead of in the well laid out garden that he knew so well.

Rules occur to him, no doubt, but the reality shews nothing but exceptions.

Page Break 105

Page 105

558. And the rules of the foreground make it impossible for us to recognize the rules in the background. For when we keep the background together with the foreground, we see only jarring exceptions, in other words *irregularity*.

Page 105

559. Do we say that *anyone* who talks sense is thinking? E.g. the builder in language-game (2)?†1 Might we not imagine the building and the calling out of the words etc. in a surrounding in which we should not connect them up with any thinking?

For "thinking" is *akin* to "considering". [Cf. Z, 98.]

Page 105

560. "Carrying out a multiplication mechanically" (whether on paper or in the head): that is something we do say-but

"considering something mechanically": for us, that contains a contradiction.

Page 105

561. The expression, the behaviour, of considering. Of what do we say: It is considering something? Of a human being, sometimes of a beast. (Not of a tree or a stone.) *One* sign of considering is hesitating in what you do (Köhler). (Not just *any* hesitation.)

Page 105

562. Think of the 'considering' in 'trying'. In 'investigating'; in the expression of astonishment; of failure and of success.

Page 105

563. What a lot of things a man must do in order for us to say he *thinks*!

Page 105

564. He cannot *know* whether I am thinking, but I know it. What do I know? That what I am doing now is *thinking*? And what do I compare it with in order to know that? And may I not be mistaken about it? So all that is left is: I know that I am doing what I am doing.

Page 105

565. But it surely makes sense to say. "He does not know what I thought, for I did not tell him!"

Is a thought also 'private' in the case where I utter it out loud in talking to myself, if no one hears me?

"My thoughts are known to myself alone."

But what that means is, roughly: "I *can* describe them, can express them *if* I want to."

Page Break 106

566. "Only I know my thoughts."--How do you know that? Experience did not teach you it.--What do you tell us by saying so? You must be expressing yourself badly.

"Not so! I am now thinking something to myself; tell me what it is!" So was it after all an empirical proposition? No; for, if I were to tell you what you are thinking to yourself, I would only be *guessing* it. How is it to be decided whether I have guessed right? By your word, and by certain circumstances: So I am comparing this language-game with *another* one, in which the means of deciding (verification) look different.

Page 106

567. "Here I cannot...."--Well, where *can* I? In another game. (Here--that is in tennis--I cannot shoot the ball into goal.)

Page 106

568. But isn't there a connexion between the grammatical 'privacy' of thoughts and the fact that we generally cannot guess the thoughts of someone else before he utters them? But there is such a thing as guessing thoughts in the sense that someone says to me: "I know what you have just thought" (or "What you just thought of") and I have to admit that he has guessed my thoughts right. But in fact this happens very seldom. I often sit without talking for several minutes in my class, and thoughts go through my head; but surely none of my audience could guess what I have been thinking to myself. Yet it would also be possible that someone should guess them and write them down just as if I had uttered them out loud. And if he shewed me what he had written, I should have to say "Yes, I thought just that to myself."--And here, e.g., this question would be undecidable: whether I am not making a mistake; whether I really thought that, or, influenced by his writing, I am firmly *imagining* myself to have thought precisely that.

And the word "undecidable" belongs to the description of the language-game.

Page 106

569. And wouldn't *this* too be conceivable: I tell someone "You have just thought... to yourself"--He denies it. But I stick to my assertion, and in the end he says: "I believe you are right; I must have thought that to myself; my memory must be deceiving me."

And now imagine this being a quite ordinary episode!

Page 106

570. "Thoughts and feelings are private" means roughly the same as "There is pretending", or "One can hide one's thoughts and feelings; can even lie and dissimulate". And the question is, what is the import of this "There is..." and "One can".

Page Break 107

Page 107

571. Under what circumstances, on what occasions, then, does one say: "Only I know my thoughts"?--When one might also have said: "I am not going to tell you my thoughts" or "I am keeping my thoughts secret", or "You people

could not guess my thoughts".

Page 107

572. Of what does one say that one is *acquainted* with it? and to what extent am I acquainted with my thoughts?

Don't we say that one is acquainted with what one can give a correct description of? And can one say that of one's own thoughts?

If someone wants to call the words the "description" of the thought instead of the "expression" of the thought, let him ask himself how anyone learns to describe a table and how he learns to describe his own thoughts. And that only means: let him look and see how one judges the description of a table as right or wrong, and how the description of thoughts: so let him keep in view these language-games in all their situations.

Page 107

573. "But the fact is that a human being knows only his *own* thoughts." ("But the fact is that only I know of my own thinking.")

"And I don't either," one might say.

Page 107

574. "Nature has given it to man to be able to think in secret." Imagine its being said; "Nature has given it to man to be able to talk audibly, but also to be able to talk inaudibly, within his mind." So, that means, he can do the same thing in two ways. (As if he could digest visibly and also digest invisibly.) Only with speaking within one's mind the speaking is hidden better than any process within one's body can possibly be.--But how would it be if I were to speak, and everyone else were deaf? Wouldn't my speaking be equally well hidden?

Page 107

"It all goes on in the deepest secrecy of the mind."

Page 107

575. If someone *says* to me what he has thought--has he really said: what he *thought*? Would not the actual mental event have to remain undescribed?--Was *it* not the secret thing,--of which I give another a mere picture in speech?

Page 107

576. If I *say* what I *think* to someone,--do I know my thought here better than my words represent it? Is it as if I were acquainted with a *body* and shewed the other a mere photograph?

Page Break 108

Page 108

577. "Man has the gift of speaking with himself in total seclusion; in a seclusion far more complete than that of a hermit." How do I know that N. has this gift?--Because he says so and is trustworthy?--

Page 108

And yet we do say: "I'd like to know what he is thinking to himself now," quite as we might say: "I'd like to know what he's writing in his notebook now." Indeed, one might say *that* and so to speak see it as obvious that he is thinking to himself what he enters in his notebook.

Page 108

578. If there were people who could *regularly* read a man's thoughts say by observation of his larynx--would they too be inclined to speak of the total solitude of the spirit within itself?--Or: Would they too be inclined to use *that picture* of 'total seclusion'?

Page 108

579. "I'd like to know what he's thinking of." But now ask yourself this--apparently irrelevant--question: "Why does what is going on in him, in his mind, interest me at all, supposing that something is going on?" (The devil take what's going on inside him!)

Page 108

580. In philosophy, the comparison of thinking to a process that goes on in secret is a misleading one.

As misleading as, e.g., the comparison of searching for the appropriate expression to the efforts of someone who is trying to make an exact copy of a line that only he can see.

Page 108

581. What confuses us is that knowing the thoughts of another from one angle is logically impossible, and from another it is psychologically and physiologically impossible.

Page 108

582. Is it right to say: these two 'impossibilities' connect up with each other in such a way that the psychological impossibility (here) supplies us with the picture that (then) becomes for us the mark of the concept 'thinking'?

Page 108

583. One cannot say: writing in one's notebook or speaking in monologue is *'like'* silent thinking; but for certain purposes the one process can *replace* the other (e.g. calculating in the head can replace calculating on paper).

584. Might there be people who always mutter to themselves as they think, so that their thinking is accessible to others?--"Yes, but we still could not know whether they don't think silently to themselves as

well."--But then might it not be that it was just as senseless to suppose this as to suppose that these people's hairs were thinking, or a stone was thinking? That is to say: if this were so, need it so much as occur to us that someone thought, that he had thoughts, hidden in his mind?

585. "I don't know what you are thinking to yourself. Say what you are thinking."--That means something like "Talk!"

586. Then is it misleading to speak of man's soul, or of his spirit? So little misleading, that it is quite intelligible if I say "My soul is tired, not just my mind". But don't you at least say that everything that can be expressed by means of the word "soul", can also be expressed somehow by means of words for the corporeal? I do not say that. But if it were so--what would it amount to? For the words, and also what we point to in explaining them, are nothing but instruments, and everything depends on their use.

587. Our knowledge of different languages prevents us from really taking seriously the philosophies laid down in the forms of each of them. But at the same time we are blind to our own strong prejudices for, as against, certain forms of expression; to the fact that just this piling up of several languages results in a special picture. That, so to speak, it is not optional for us which form we cover up with which.

588. You must remember the possibility of a language-game of 'continuing a series of figures', in which no rule, no expression of a rule is ever given, but the learning is done *only* by means of examples. So that the idea that each step can be justified by a somewhat--a kind of model--in our mind would be entirely alien to these people. [Cf. Z 295.]

589. Example of the names that have meaning only when accompanied by their bearers, i.e. that is the only way they are used. So they serve merely to avoid continual pointing. The example that always comes to my mind is the designation of lines, points, angles by A, B, C... a, b... etc., in geometrical figures.

590. In reading: seeing the picture of the word: "I saw the word fleetingly"--that is a special experience, it cannot be portrayed on film.

591. Imagine a mental illness, in which one can use and understand names only in the presence of their bearers. [Cf. Z 714.]

592. There could be a use made of signs, of such a kind that the signs became useless (that one perhaps destroyed them) as soon as the bearers ceased to exist.

In this language-game the name would have to have the object as it were on a lead; and when the object ceases to exist, one can throw away the name which has worked in connexion with it. [Cf. Z 715.]

593. "I intend to go there": is the state of mind being *described* or *voiced*?--If one imagines a model of the mind, then the sentence might be a description of the model in its present state. The human being looks at his mind and says:... Is it a good model or a bad one?--How should that be decided? The question is: How would it be *employed* as a sign?

594. "I intend..." *might* be used as an assertion: "I am doing something that is in accordance with this intention", e.g.: I am packing for the journey, getting myself ready for the journey in this way or that, by means of considerations or actions. One *might* use a verb in that way. Perhaps corresponding to the expression: "I am acting with the intent...."

595. Description of my state of mind: the alternation of fear and hope, e.g. "In the morning I was full of hope, and then...". Anyone would call that a description. But it is characteristic of it, that this description could run parallel to a description of my behaviour.

596. Compare the expression of fear and hope with that of 'belief' that such-and-such will happen.--That is why hope and fear are counted among the emotions; belief (or believing, however, is not.

Page 110

597. If I say: "The intention to do it grew stronger every hour," this will be called a description. But in that case so surely will *this* as well: "I intended the whole time...."

Page Break 111

Page 111

Now compare: "The whole time, I believed in the law of gravity" with "The whole time, I believed I heard a low whisper." In the first case "believe" is used similarly to "know". (*Had* anyone asked me, I *would have* said...) In the second case we have activity, surmising, listening, doubt etc. And even if "believe" does not *designate* these activities, still they are surely what makes us say that here we are *describing* a state of mind or a mental activity. We may also put it like this: we form a picture of the man who believes the whole time that he is hearing a low rustle. But not of the man who believes in the correctness of the law of gravity.

Page 111

598. I intend (it might be said) doesn't mean: "What I am at, is intending," or "I am engaged in intending" (as one says, I am engaged in reading the newspaper). On the other hand: "I am engaged in planning my journey" etc.

We have not, but might have, a single verb (and perhaps it actually exists in some little-known language) which expresses: "to act and think with such-and-such an intention."

Page 111

599. "I intend..." is *never* a description, but in certain circumstances a description can be derived from it.

Page 111

600. Talking to oneself. "What happens here?" Wrong question! It's not just that one can't say what happens--one can't say either that one doesn't know what happens, and one can't even say that one only knows this and that about it! But even this is wrong to say: It just is a specific process, which can't be described except in just these words. The concepts 'description' and 'report'. One says: Someone reported that he had said to himself... How far is that comparable to the 'report' that he had, e.g. said...? Let us make ourselves realize that *describing* is a very special *language-game*.--We have to dig around this hard substratum of our concepts.

Page 111

601. Concepts *may* mitigate or aggravate a mischief; favour it, or hamper it. [V.B., p. 108; C. & V., p. 55.]

Page 111

602. Quite right: one can't imagine any explanation of "red" or of "colour". Not, however, because what is experienced is something specific, but rather because the language-game is so.

Page 111

603. "One can't explain what *red* is to anyone." But suppose one could--is it in that case not what we call "red"?

Page Break 112

Page 112

Let us imagine men who express an intermediate colour, between red and yellow, e.g., by means of a kind of binary decimal fraction like this: R,LLRL and the like, where, e.g., yellow stands to the right, and red to the left.--Already in their nursery schools these people learn how to describe shades of colour in this way: they learn how to choose colours according to such descriptions, and they learn to mix them etc. They would stand to us roughly in the relation of people with absolute pitch to people in whom this is wanting. *They can do* what we can't. [Cf. Z 368.]

Page 112

604. And here we feel like saying: "Now, is that even imaginable? The *behaviour*, to be sure! But the inner process, the colour experience, as well?" And it is difficult to see what one should say to such a question. If we had not yet encountered people with absolute pitch, would the existence of such people strike us as very probable? [Cf. Z 369.]

Page 112

605. If someone were to say "Red is composite"--we should not be able to guess what he was alluding to, what he will be trying to do with this sentence. But if he says: "This chair is composite" although we may not know what kind of composition he is speaking of, still we can at once think of more than one sense for his assertion.

Now what kind of fact is this, that I am drawing attention to here?

Page 112

At any rate it is an *important* fact.--We are not familiar with any technique, to which that sentence might be alluding. [Cf. Z. 338.]

Page 112

606. Here we describe a language-game that we *cannot learn*. [Z 339.]

Page 112

607. "In that case something quite different must be going on in him, something that we are not acquainted with."--This *shows us* what we go by in determining whether something different from or the same as what goes on in us is going on 'in someone else'. This shows us *what we go by* in judging of inner processes. [Cf. Z 340.]

Page 112

608. "Red is not composite!" And what is red?--Here we should like simply to point to something red; and we forget that if that statement is to make sense we must be given more than the ostensive definition. We don't yet understand at all what is the sense of a sentence of the form "X is not composite", if X is replaced by a word having the use of our colour words.

Page Break 113

Page 113

609. It is a fact: "Red" does not get explained to anyone by means of words without reference to a sample of the colour. Shouldn't that be important?

Page 113

610. "How could one explain red to someone, since it is after all a particular sense-impression, known only to him who has it (or has had it)--and explaining can only mean: *producing* it in the other person."--

Page 113

611. "Someone who has absolute pitch must have a different experience of notes from what I have." And must everyone who has absolute pitch have the same experience? And if not, then why must it be a different one from mine?

Page 113

612. Imagine that, in order to explain 'red' to someone, we shew him a reddish dark brown, and say: "This colour consists of yellow (we shew pure yellow) black (se[[sic]] shew it), and one more colour which is called 'red'." Thereupon let him be competent to pick pure red out of a number of colour samples.

Page 113

613. And note this: one doesn't point to red, but to something red. That is of course to say: the concept 'red' is not determined by pointing, and now it is possible not only to interpret "red" as, e.g. the name of a shape, but also as a concept-word that comes *much closer* to a colour word than that.

Page 113

614. The *employment* of a word is not: to *designate* something.

Page 113

615. Can you imagine what a red-green colour-blind man sees? Can you paint a picture of the room as he sees it? [Cf. Z 341.]

Page 113

616. "If someone saw everything only black, white and grey, he would have to be *given* something, in order to know what red, green etc. are." And what would he have to be given? Well, the colours. And so, e.g. *this* and *this* and *this*. (Imagine, e.g., that coloured patterns had to be introduced into his brain, in addition to merely grey and black ones.) But would that have to happen as a means to the end of future action? Or are these patterns actually involved in this action? Do I want to say; "Something would have to be given him, for it is clear that otherwise he could not..."--or: His seeing behaviour *includes* new components?

Again what would we *call* an "explanation of seeing"? Is one to say: Well, you know what explanation means otherwise; so apply this concept here too? [Cf. Z 342-3.]

Page Break 114

Page 114

617. Can I say: "Look at it! Then you will see that it can't be explained."--Or: "Drink in the colour red, then you will see that it can't be represented by means of anything else!"?--And if the other now agrees with me, does that shew that he has drunk in the same as I?--And what is the significance of our inclination to say this? Red seems to be there, isolated. Why? What is the value of this seeming, of this inclination? [Cf. Z 344.]

Page 114

618. Think of the sentence "Red is not a blended colour," and of its function.

For the language-game with colours is characterized by what we are able to do, and what we are not able to do. [Cf. Z 345.]

Page 114

619. Red is something specific; but we don't see that when we look at something red. Rather we see the *phenomena*

that we *limit* by means of the language-game with the word "red".

Page 114

620. "Red is something specific," that must be as much as to say: "*That* is something specific" while pointing at something red. But for that to be intelligible, one would already have to mean our *concept* 'red', the use of that sample. [Cf. Z 333.]

Page 114

621. If you wonder at these things, wonder first at something else! Namely, at what is actually accomplished by description and report. If you concentrate your wonderment on this, those other problems will shrink.

Page 114

622. Primary colours. Suppose the colours that we call blends were among other men to play the role of our primary colours; should we say that *their* primary colours were, for example, this orange,--this bluish red, this bluish green, etc.? Then does the proposition "red is a primary colour" come to this: red plays such-and-such a role among us; we react to red, yellow etc. in this and that way?--Mostly one does not think so: that is to say, "Red is a pure colour" is a proposition about the 'essence' of red, time doesn't come into it; one cannot imagine that this colour might not be simple.

Page 114

623. The colour-circle: the equal distances of the primary colours are arbitrary. Indeed, the transitions would perhaps make a more uniform impression on us, if, e.g., the pure blue were nearer to the pure green than to the pure red. It would be very remarkable if the equality of the distances lay in the nature of the things.

Page Break 115

Page 115

624. "There's no such thing as a reddish green" is akin to the propositions that we use as axioms in mathematics. [Cf. Z 346.]

Page 115

625. Men count and calculate: Describe what they do here. Ought this description to include sentences like *this* one: "Now he understood how he had to continue the series"--or: "He is now able to do any arbitrary multiplication"? And is *this* proposition to be counted in: "He saw the whole number-series in his mind's eye"?

Such sentences may occur in the description: but may we not require that their use be explained to us; so that no false or irrelevant images sneak in on us?

Here the question arises, for whom we are giving the description. Of whom do we say, he is able to do any arbitrary multiplications? How does one arrive at this *concept* at all? And for whom, under what circumstances, will this description be important?

Page 115

626. 'Red a degenerate green.' When one sees a leaf turn from green to red, one says that the green is sickly and in the red part is quite degenerate. When one sees the red colour, one always makes a face.

Mightn't red have been explained as the ultimate degeneration of green?

Page 115

627. "One cannot *explain* to anyone what red is!"--How does one arrive at this idea at all; on what occasion does one say this?

Page 115

628. "Colours are something specific. Not to be explained by anything else." How is this instrument used?--Describe the game with colours. The naming of colours, the comparison of colours, the production of colours, the connexion between colour and light and illumination, the connexion of colour with the eye, of notes with the ear, and innumerable other things. Won't what is 'specific' about colours come out in this? How does one shew someone a colour; and how a note?

Page 115

629. When we talk to ourselves in thought: "Something happens; that's for sure." But the usefulness of these words is in reality just as unclear as that of the special psychological propositions that we are trying to explain.

Page Break 116

Page 116

630. Instead of the unanalysable, specific, indefinable: the fact that we act in such-and-such ways, e.g. *punish* certain actions, *establish* the state of affair thus and so, *give* orders, render accounts, describe colours, take an interest in others' feelings. What has to be accepted, the given--it might be said--are facts of living.†1 [Cf. P.I. p. 226d.]

Page 116

631. We judge the motive of an act by what its author tells us, by the report of eyewitnesses, by the preceding

history. That is how we *judge* the motives of a human being. But we do not find it particularly striking that there should be such a thing as the 'judgment of motives'. That this is a quite peculiar language-game--that a table or a stone don't have any motives. That, while there does exist such a question as: "Is that a reliable way of judging a human being's motives?"--still we must already be familiar with what "judgment of motives" means at all. There must already be a technique of which we are thinking' here, in order for us to be able to speak of an alteration of this technique, which we characterize as a more reliable judgment of a motive. [Cf. P.I. p. 224j.]

Page 116

632. One judges the length of a rod, and one can seek and find a method of judging it more exactly, more correctly. So--you say--if *what* we judge here is independent of the method of judging, one can't explain what length is by means of the method of determining length. But anyone who thinks like this is making a mistake. What sort of mistake?--How queer it would be to say: "The height of a Himalayan mountain depends on how one climbs it." "Measuring the height more and more exactly"--one would like to compare this to approaching closer and closer to an object. But it just is not clear in all cases what it means "to approach closer and closer to the length of a rod". And one can't say: "You surely know what the length of a rod is; and you know what 'determining it' means; you therefore know what it means 'to determine the length more and more exactly'".

Under some circumstances it is clear what it means to look for a more exact determination of the length of a rod, and under some circumstances it is not clear and stands in need of a new determination. What "determining the length" means is not learnt by learning what length is and what determining is; rather one learns the meaning of the word "length", among other things, by learning what determining the length is: 'Refining the determination of length' is a

Page Break 117

new technique, which modifies our concept of length. [Cf. P.I. p. 225a.]

Page 117

633. When one describes simple language-games in illustration, let's say, of what we call the 'motive' of an action, then more involved cases keep on being held up before one, in order to shew that our theory doesn't yet correspond to the facts. Whereas more involved cases are just more involved cases. For if what were in question were a theory, it might indeed be said: It's no use looking at these special cases, they offer no explanation of *the* most important cases. On the contrary, the simple language-games play a quite different role. They are poles of a description, not the ground-floor of a theory.

Page 117

634. "How does it come about that it seems to me that this colour-impression that I am having now, is recognized by me as the specific, the unanalysable?"--Ask instead how it comes about that we want to say this. And the answer to *that* is not difficult to find. And isn't it a queer question: why it '*seems*' to us as if... For this very question itself involves a misunderstanding.

Page 117

635. Imagine you were supposed to describe how human beings learn to count (e.g. in the decimal system). You describe what the teacher says and does, and how the pupil behaves in consequence. In what the teacher says and does there occur, e.g., words and gestures that are supposed to encourage the pupil to continue a series; also expressions like "He can count now". Now, ought the description that I give of the process of teaching and learning to contain, besides what the teacher says, my own judgment too, that the pupil can count now, or that the pupil has understood the system of numerals? If I do not put such a judgment into my description--is the description then incomplete? And if I do put it in, am I going beyond mere description?--May I refrain from those judgments and justify myself by saying: "*That is all that happens!*"? [Cf. Z 310.]

Page 117

636. Must I not rather ask: "What does the description do? What purpose does it serve?"--In another context we do indeed know what is a complete and what an incomplete description. Ask yourself: How are these expressions employed: "complete" and "incomplete descriptions"?

Reproducing a speech completely (or incompletely). Does giving the tone of voice, the play of expression, the genuineness or

Page Break 118

ungenuineness of the feeling, the intentions of the speaker, the exertion of speaking--does all this belong to a complete rendering? Whether this or that belongs to the complete description will depend on the purpose of the description, will depend on what the recipient of the description does with it. [Cf. Z 311.]

Page 118

637. The expression "That is all that *happens*" sets a limit to what we call "happening." [Cf. Z 312.]

Page 118

638. My judgment "The pupil can count now" is given for certain purposes. He is thereupon given a job, say. If you say "So this judgment [[sic]] is not part of the description of learning, it is, rather, a prediction"--then I reply "You can take it this way or that". You can say that you are describing the state of the pupil.--

Page 118

639. Imagine red regarded as the summit of all colours. The special role of the triad in our music. Our lack of understanding of the old church modes.

Page 118

640. Under what circumstances would one say, these people conceive all colours as degrees of a *single* property?

Page 118

641. Can you imagine our regarding blue and red as the two outermost poles of deviation from purple? One might then call red a very high, and blue a very low, purple.

Page 118

642. Or imagine a world in which colours almost always occurred in rainbow-like transitions. So that one looks at, say, a green expanse, if it exceptionally does sometimes occur, as a modification of a rainbow.

Page 118

643. Can I say, however, that if *these* were the facts, men would have these concepts? Certainly not. But one can say this: don't think that our concepts are the only possible or reasonable ones: if you imagine quite different facts from those with which we are continually surrounded, then concepts different from ours will appear natural to you. [Cf. P.I. p. 230b.]

Page 118

644. Don't believe that you have the concept of colour within you because, however you look, you look upon a coloured object. (Any more than you have the concept of a negative number because you are in debt.) [Cf. Z 332.]

Page Break 119

Page 119

645. Suppose we were acquainted with a people that had a quite different form of colour attributions from ours: we mostly suppose it an easy thing would then be to teach these people our form of expression. And that, when they are masters of both forms of expression, they will acknowledge the difference between them to be inessential. (The gender of our nouns.†1) Is it so? Must it be so?

Let us imagine that people had two different simple names for two shades of blue, and that colours were *very* different for them, which for us are not so. How would this get manifested? And let us also imagine the reverse: that there is a people for whom red and blue are different only 'in degree', not 'completely different colours'. And what would be the criterion for this?

We say that the same note recurs after every seven notes in the scale. What does it mean to say "We *experience* it as the same"? Is our calling it the same only a linguistic *accident*?

Page 119

646. The feeble-minded are pictured in our imagination as degenerate, essentially incomplete, as it were in rags. Thus as in a state of disorder, rather than more primitive order (which would be a far more fruitful way of looking at them.) [Cf. Z 372.]

Page 119

647. Counting, calculating etc., in a closed system in the way a tune is a closed system. The people count with the aid of the notes of a special tune; at the end of the tune the series of numbers comes to an end.--Am I to say: Of course there are further numbers as well, only these people don't know them? Or am I to say: There is also another way of counting--namely what *we* do--and this these people do not know (do not do).

Page 119

648. The concept of experience: Like that of happening, of process, of state, of something, of fact, of description and of report. Here we think we are standing on the hard bedrock, deeper than any special methods and language-games. But these extremely general terms have an extremely blurred meaning. They relate in practice to innumerable special cases, but that does not make them any *solid*; no, rather it makes them more fluid.

Page 119

649. Calculating in the head is perhaps the one case in which there is a regular use made of imagination in everyday life. That is why it is especially interesting.

Page Break 120

"But I *know* that something went on in me!" And what? Wasn't it, that you calculated in your head?--So after all, calculating in the head is something specific!

Consider first: How does one use the description "He's calculating in his head", "I'm calculating in my head" at all? The difficulty which one comes up against is a vagueness in the criteria for the occurrence of the mental process. Could it be avoided?

650. Can one *imagine* calculating in one's head?

651. One may calculate perceptibly and one may calculate in one's head: could one also do something in one's head, which one can not do perceptibly, for which there is no such thing as a perceptible equivalent?

How would it be if people had a name for calculating in the head, which did not classify it among *activities*, and so *a fortiori* not among those of calculation? They designate it perhaps as a *capacity*. I assume that they use radically different *pictures* from the one we use.

652. But if now someone were to say: "so after all, all that happens is that he *reacts*, behaves, in such-and-such a way,"--then here is a gross misunderstanding. For if someone gave the account: "I in some sense *calculated* the result of the multiplication, without writing etc."--was he talking *nonsense*, or did he make a false report? It is a different employment of language from that of a description of behaviour. But one might indeed ask: Wherein resides the importance of this new employment of language? Wherein resides the importance, e.g. of expression of intention?

653. "How if the pictures that someone had in imagining things had the intensity, clarity, of, e.g. after-images; would these be mental images, or would they be hallucinations--even if he is fully conscious of the unreality of what he sees?" First of all: how do I know that he sees pictures with this clarity? Perhaps he says so. One difference would be this, that his pictures are 'independent' of him. What does that mean? He couldn't use thoughts to dispel them. If, e.g., I imagine the death of my friend, I may tell myself "Don't think about it, think of something else"; but that wouldn't be said to me if I were seeing the event before *[[sic]]* my eyes, e.g. on a film. Then I'd reply to someone who in the assumed case said to me "Don't think about it": "Think about it or not, I'm *seeing* it."

654. Take the use of the English words "this", "that", "these", "those", "will", "shall": it would be difficult to give rules for their

use. But it is possible to *understand* their use, so as to be inclined to say: "If one just has the right feeling for the sense of these words, then one can also apply them." Thus one might ascribe a peculiar meaning even to these words in the English language. Their use gets to be felt as if each had a single physiognomy.

655. Calculating in one's head at the order to do so. Don't let the combination of familiar words prevent you from investigating the language-game right from the bottom.

Remember that one teaches someone to calculate in his head by ordering him to *calculate*! But would it have to be like that? Might it not be that in order to get him to calculate in his head, I mustn't say "Calculate", but rather: "Do something *else*, only get the result" or "Shut your mouth and your eyes and keep still, and you will learn the answer.

I want to say that one need not look at calculating in the head under the aspect of *calculating*, although it has an essential tie-up with calculating.

Nor even under the aspect of 'doing'. For doing is something that one can give someone an *exhibition* of.

656. I want to say: there is no need to interpret reactions different from ours, and hence perhaps favourable to different conceptual structures, as consequences or expressions of (inner) processes which are of a different nature from ours.

There is no need to say: what is in question here are different inner processes.

657. We have, on the one hand his capacity to communicate steps of the calculation without doing any perceptible calculating--on the other, the utterances which he is inclined to make; as for example *this* one: "I did the sum inwardly." The phenomena of the first kind *might* bring us to offer the graphic description: It's as if he calculated somehow and somewhere, and told us steps of this calculation. We may assume what he is inclined to say into our

language as one of its forms of expression; or again we may not. We might, e.g., say to him "You don't calculate 'inside'! You calculate *unreally*." And then *that* is what he says for the future.

Page 121

658. "But I do surely *know* that I *actually* calculate--even if not perceptibly to someone else!" One might take this as a typical expression of someone who was mentally retarded.

Page Break 122

Page 122

659. But if we dispose of the inner process in this way,--is the outer one now all that is left?--the language-game of description of the outer process is *not* all that is left: no, there is also the one whose starting point is the expression. Whatever way our expression may run; whatever the way, e.g., it relates to the 'outward' calculation.

Page 122

660. When a theme, a phrase, suddenly says something to you, you don't have to be able to explain it to yourself. Suddenly *this* gesture too is accessible to you. [Cf. Z 158.]

Page 122

661. Comparison of bodily processes and states, like digestion, breathing etc. with mental ones, like thinking, feeling, wanting, etc. What I want to stress is precisely the incomparability. Rather, I should like to say, the comparable bodily states would be *quickness* of breath, *irregularity* of heart-beat, *soundness* of digestion and the like. And of course all these things could be said to characterize the behaviour of the body.

Page 122

662. Imagine a tribe of people who do not say "he has pains", "we have pains", "the same is going on in him as in me", "these people have the same mental experience" etc.; rather, though there is talk of a mind and of processes in the mind, one says one knows absolutely nothing about whether two people, of whom *we'd* say they were in pain, really have the same or something quite different; and so in this tribe it is said that the people have something unknown; and now there follows in their way of expressing themselves some specification, which comes to the same thing as our "They are having pains". Then these people[[sic]] are likewise not going to say: "When I believe that someone is having pains, I am believing that some particular thing is going on within him" or the like.

But need one look at the matter at all in such a way that the signal of pain and the description of pain-behaviour form a conceptual unit?

I want to ask: "What is the place here of the conceptual and what of the phenomenal?" Must *language* contain an expression of pain? Imagine people with a manual language. Or people who don't speak but only write. Would these have to possess the concept 'pain'?

Page 122

663. But is it easier to imagine people lacking our concept of pain than it is to imagine them not having our concept of a physical body?

Page Break 123

Page 123

664. It is an important fact that we assume it is always possible to teach our language to men who have a different one. That is why we say that their concepts are the same as ours.

Page 123

665. "You start a sentence at whose far end is a verb; you surely aren't going to tell me you began to speak the sentence without an inkling what the verb would be!"--And what does the inkling consist in? And suppose someone really had no inkling of it and yet spoke German fluently! How will one find out whether he had this inkling?

Page 123

666. How far do we investigate the use of words?--Don't we also judge it? Don't we also say that this feature is essential, that one inessential?

Page 123

667. Measuring with a yardstick can be described; how can it be given a foundation?

Is the concept 'pain' an instrument made by man; and what purpose does it serve?

Page 123

668. How can one order someone to mean such and such words like *this*? Apart from ordering him to use them like this.

Page 123

669. Suppose you had to make a decision and the decision was made by pressing one of a number of buttons. The decision that you make in doing this is signaled by a word which is written on the button. It is then, of course, a matter of complete indifference what you experience when you see this word. If the word is, e.g. "fine", you can

mean it as adjective, substantive, or verb, without thereby altering the decision. And equally, when you *pronounce* the word as a decision. At any rate, if someone else is awaiting the decision, it tells him the same thing.

Page 123

670. But how is it when the decision is susceptible of two interpretations, and the one who hears it now gives it *one* of them? He may do this, either through his actions, or, so to speak, in thought. But if the decision did not have to be acted on at once, he might also hear it and for the time being not interpret it *at all*. On the other hand he might give an interpretation in answer to a *question*. This would be a provisional reaction.

Page Break 124

Page 124

671. It is perfectly possible to pronounce words suitably to a particular situation, and hence with such-and-such a meaning, but at the same time to *think* another interpretation. So that for me, unbeknownst to the other, the words have a peculiar meaning.

Page 124

672. If asked, I shall perhaps explain this meaning, without this explanation's having come before my mind earlier. So what had my state of mind, as I spoke the words with the double meaning, to do with the words of the explanation? How far can these words correspond to it? Here there is obviously no such thing as the explanation's fitting the phenomenon.

Page 124

673. One may also mean an expression in one way as one utters it and then at once afterwards, retrospectively, in another.

Page 124

674. It feels to us as if different illustrations attached to the phrase in its two meanings, and as if one can now give an illustration compounded out of the two of them, but then of course it wouldn't be either of the two that accorded with the word or were usual for it.

Naturally, however, that does not mean that whenever one employs the phrase, one of the two illustrations must be present. It only means that *if* we illustrate the word, *one* of the two pictures and not both belong to it.

Page 124

675. 'If you had asked me, *this* is the answer I'd have given you.' That signifies a state; but not an 'accompaniment' of my words.

Page 124

676. Imagine that people had the custom of doodling while they spoke; why should what they produce in this way while talking be less interesting than accompanying processes in their minds, and why should the interest of *these* be of any different kind?

Why does one of these *seem* to give the words their peculiar life?

Page 124

677. According as he meant the word *this* way or *that*, he expressed the one intention or the other. Had the one intention or the other. And one can't say more about the importance of his meaning it than that.

And here again it seems that what went on while he pronounced the individual word ("bank", for example) is of less importance than what went on during, and before, the utterance of the whole

Page Break 125

sentence. As it were, the mood illustrated the whole sentence, not necessarily the single word. And yet, as at the same time we must confess to ourselves, even the illustration does not have to be important. For why should so much depend on it?

And how can it give the sentence a *particular* life, if language doesn't do so? How should it be less ambiguous than the language of words?

Page 125

678. Now this is the decisive point: It is not only from the context that I can judge the meaning; it can be asked about, and in giving the answer one does not derive the meaning from the context.

Page 125

679. Is it just a matter of course that someone who can use language is able to *explain* the words that he understands, the words whose employment he understands? We should, of course, be very much astonished if someone did indeed understand the word "bank", but could give no answer when we asked him "What is a bank?"

Isn't it one thing to understand the sentence "Let's walk in the sun for a while" -and another to know how to explain the word "sun"?--But mustn't one who understands this sentence know, e.g. what the sun looks like? As one who understands the sentence "I haven't any pain" must, e.g., know how one can give oneself pain and how

someone in pain behaves etc.--

Page 125

680. Further; if it is possible for the ambiguous word by frequent repetition to take on *each* 'meaning', why shouldn't some men who pronounce it without any context ordinarily do so without any feeling of a meaning? Or why shouldn't men pronounce a word in this way with a kind of fluctuating meaning, where no context fixes it?

Page 125

681. "But what do you do when you obey the order 'Say... and mean... by it?'--You don't do *something else*. But neither do you do anything specific.

Page 125

682. In any case this isn't a language-game that is very early learnt: pronouncing a word by itself in such and such a meaning. The foundation is obviously that someone says he can pronounce the word... and mean one or the other of its meanings as he does so. That's quite easy when the word has two meanings; but can you also say the word "apple" and mean "table" by it?--Still, I might use a secret language, in which it has this meaning.

Page Break 126

Page 126

683. "Give him this order, and mean... by it." "Tell him this and mean... by it." That would be a remarkable order, which is not ordinarily given. Or I say to someone: "Deliver this message"--and ask him afterwards: "Did you also mean it in such and such a way?"

Page 126

684. But is the past tense form then justified? Yes; for I make a contrast between changing one's mind and its staying the same. I really want to know not merely what he means now, but also what he did mean.--One might perhaps ask: "What *do* you mean? and have you changed your mind?" When the answer to this question is No, then what he says now he also meant before.

I want to say: the criteria for the past happening here are different from what they are for the emergence of a picture.

Page 126

685. Then how am I to describe this psychological phenomenon? Am I to say: one can mean a word in such and such a way upon request? that one fancies one means it this way or that? Am I to say that the word "mean" is being used here in a different sense; that one ought properly to have used a different word? Am I to propose such a word?--Or is just this the phenomenon, that we use the word "mean" here, which we learnt for another purpose?

Page 126

686. Is it a very primitive language-game, in which one says: "At this word.... occurred to me?" [Cf. P.I. p. 218b.]

Page 126

687. Instead of "I mean *this* by the word" one might also say "The word stood for...". And then how can the word have stood for this thing--and not for that, when I pronounced it? And yet *that's* just what it looks like.

So is this as it were an optical illusion? (Such as to make the word seem to *mirror* the object that is correlated with it by the explanation.) And if it is an optical illusion, what do people lose who are unacquainted with this illusion? They can't be losing very much.

Page 126

688. The peculiar experience of meaning is characteristic because we react with an explanation and use the past tense: just as if we were explaining the meaning of a word for practical purposes. [Cf. Z 178.]

Page 126

689. The intention may have altered, and simultaneously with it an experience-content, but the intention was not an experience.

Page Break 127

Page 127

690. One of the principles of observation would surely have to be that I do not *disturb* the phenomenon that I observe by my observation of it. That is to say, my observation must be usable, must be applicable to the cases in which there is no observation.

Page 127

691. So isn't there any peculiar experience corresponding to the jump of: "Now I know!?" No--Imagine one who is always going off with "Now I've got it!" when he hasn't got hold of anything;--what are we to say about him? What experience did he have? It is not the peculiar content of experience at the jump that gives it its peculiar interest, and when someone says that he understood everything in that moment, this is not the description of an experience-content.--But why not?--I want to make a distinction between a statement like "At that moment I saw the

formula clear before me", and one like "At that moment I grasped the method". But not as if I wanted to say--"because one can't grasp a method in a moment". One can, it happens very often.--I want to say: "Now I understand!" is a *signal*, not a description." And *what* is effected by my saying that? Well, it directs attention to the origin of such a signal; there comes into the foreground the question "How does someone learn the words 'Now I understand it!', and how, e.g., the description of a mental image?" For the word "signal" points towards a proceeding that is being signalled. [Cf. P.I. p. 218f.]

Page 127

692. It is of course the indisputability that favours the picture of something's being described here, something that we see and the other does not, and that is near to us and always accessible, but for the other is hidden: hence something that exists *within us* and which we become aware of by looking into ourselves. And psychology is now the theory of this inner thing.

Page 127

693. So if I want to say that our 'utterances', with which psychology has to do, absolutely are not all descriptions of experience-contents, I must say that what are called descriptions of experience-contents are only a small group of these 'indisputable' utterances. But what grammatical features mark off this group?

Page 127

694. An experience-content is what can be produced in a picture, a picture in its subjective meaning, when its purport is: "This I see whatever the object may be that produces the impression." For the experience-content is the private *object*.--But how then can pain form

Page Break 128

such a content?--The sensation of temperature does so rather. And hearing is still closer akin to sight;--but also quite different.

Page 128

695. It positively seems to us as if pain had a body, as if it were a thing, a body with shape and colour. Why? Has it the shape of the part of the body that hurts? One would like, e.g., to say "I could *describe* the pain, if only I had the requisite words and elementary concepts". One feels: all that is lacking is the necessary nomenclature (James.) As if one could even paint the sensation, if only others would understand this language.--And one really can give a spatial and temporal description of pain. [Cf. Z 482.]

Page 128

696. If the expression of pain were only a cry and its strength depended only on the available breath, but not on the damage--should we in that case be inclined to regard pain as something observed?

Page 128

697. Why do you think that someone *else's* pain is similar to his visual sensation?--Or put it like this: why do we group sight, hearing and the sensation of touch together? Because we 'get acquainted with the outer world' through them? Pain certainly could be regarded as a kind of tactile sensation.

Page 128

698. But how about my idea that we don't actually judge the position and movement of our limbs by the feelings that these movements give us? And why should we judge the qualities of the surfaces of bodies in this way, if that cannot be said of our movements?--What is our criterion at all, for saying that our *feeling* tells us this?

Page 128

699. How does one judge whether fatigue (e.g.) is an indefinitely located bodily feeling?

Page 128

700. One would like to say that "I believe" can't *properly* be the present of "I believed". Or: one ought to be able to use a verb in such a way that its past has the sense of "I believed", while its present has a sense different from that of our "I believe". Or again: There ought to be a verb, whose third person in the present tense has the sense "he believes", but whose first person has a sense different from that of "I believe".

But then ought there also to be a verb, whose first person says "I believe", but whose third person does not say what we mean by "he believes"? So the third person would also have to be indisputable?

Page Break 129

Page 129

701. What if someone were to say: "I *know* it won't rain, but I *believe* it will rain."

Page 129

702. What is common to sense-experiences?--The answer that they acquaint us with the outer world is partly wrong and partly right. It is right inasmuch as it is supposed to point to a *logical* criterion. [Cf. Z 477.]

Page 129

703. Could an "I was lying" be imagined, which I inferred from observation of my own behaviour? Only in case someone else cannot make the *confession* "I was lying" either.

Does "I was lying" describe an experience; or again "I made this statement in good faith"?--You need to think of the fact that I don't only infer his good faith from such-and-such behaviour, but I also take his word for it, which he does *not* base on self-observation.

Page 129

704. How is it that I cannot gather that I believe its going to rain from my own statement "It's going to rain"? Can I then draw no interesting conclusions from the fact that I said this? If someone else says it, I conclude perhaps that he will take an umbrella with him. Why not in my own case?

Page 129

Of course there is here the temptation to say: In my own case I don't *need* to draw this conclusion from my words, because I can draw it from my mental state, from my belief itself.

Page 129

705. Why do I never conclude from my words to my probable actions? For the same reason as I don't conclude from my facial expression to my probable behaviour,--for the interesting thing isn't that I don't conclude from my expression of emotion to my emotion, but rather than I don't conclude from that expression to my later behaviour either, as others do, who observe me. [Cf. Z 576.]

Page 129

706. If you philosophize, you often make the wrong, inappropriate, gesture in connexion with a verbal expression. [Cf. Z 450.]

Page 129

707. If someone meets me in the street and asks "Where are you going?" and I reply "I don't know", he supposes that I have no definite *intention*; not, that I don't know whether I shall be able to carry out my intention. (Hebel. †1) [Cf. Z 582.]

Page Break 130

Page 130

708. My super-ego might say of my ego: "It is raining, and the ego believes so," and might go on "So I shall probably take an umbrella with me." And now how does this game go on?

Page 130

709. Consider also the statement: "I shall probably..."--where what follows is a voluntary action, not an involuntary one.

Page 130

710. One says, e.g., "One *feels* conviction, one doesn't infer it from one's own words or tone of voice."

Page 130

But what does it mean to say one *feels* conviction? What is *true* is: one does not make an inference from one's own words to one's own conviction; nor yet to the actions arising from the conviction. [Cf. P.I. p. 191g.]

Page 130

711. At the question "Why don't I infer my probable actions from my talk?" one might say that it is like this: as an official in a ministry I don't infer the ministry's probable decisions from the official *utterances*, since of course I am acquainted with the source, the genesis of these utterances and of the decisions.--This case would be comparable to one in which I carry on conversations with myself, perhaps even in writing, which lead me to my utterances out loud in conversation with other people; and now I say: I shall surely infer my future behaviour, not from these utterances, but from the far more reliable documents of my inner life.

Page 130

712. After all I know that when I am angry, I simply don't need to learn this from my behaviour.--But do I draw a conclusion from my anger to my probable action? One might also put the matter, I think, like this: my relation to my *actions* is not one of observation.

Page 130

713. When I tell someone: "I know that you will do this" then the best means of making this prediction true is to persuade the other into the action.

Page 130

714. If I tell someone "Now you will raise your hand", this prediction may be reason enough for its non-fulfilment; unless it is an order which the other respects.

Page 130

715. "It is raining and I believe it is raining." Turning to the weather, I say that it is raining; then, turning to myself, I

say that I believe it.--

Page Break 131

But what do I do when I turn to myself, what do I observe? Suppose I say: "It's raining, and I believe it will soon stop"--do I turn to myself at the second part of the statement?--Indeed, if I want to find out whether *he* believes that, then I must turn to him, I must observe him. And if I wanted to find out what I believe by observation, I should have to observe my *actions*, just as in the other case I have to observe his.

Now why don't I observe them? Don't they interest me? Apparently they do *not*. I hardly ever ask someone else who has been observing me, whether he has the impression that I believe such and such: that is, in order in this way to make inferences to my future actions. Now why should a really good observer not be able to predict my behaviour from what I say and do better than I would be able to? But perhaps I shall then act as he foresees, only if he makes no prediction of it to me.

Page 131

716. When I say "I remember, I believed...", don't ask yourself "What fact, what process is he remembering?" (that has already been stipulated)--ask rather: "What is the purpose of this language, how is it being used?"

Page 131

717. The sense of sight, of hearing, of touch may fail, so that I am blind, deaf, etc.; but what would correspond to that in the domain of intention?

And how would a man behave without imagination? Or one who is incapable of being sad or cheerful?

Page 131

718. "Hope is directed to the future"--but is there a feeling, identical with hope, but directed to the present or to the past? The same mental movement, so to speak, but with a different object? Ask yourself: what should here be regarded as the criterion of identity of the mental movements? Connected with this: "Is the jump of 'Now I know!' a peculiar, specific jump?"

Page 131

719. Even if I were to admit that I know more of my own belief than of anyone else's I would then surely have to say that what I can know about myself is what I know of someone else though there's much more of it.--So, even if it would be redundant, I'd have to be able to apply a verb to myself, in the way I can apply the word "believe" to other people. What prevents me?

Page Break 132

Page 132

720. The concept of the world of consciousness. We people a space with impressions.

Page 132

721. "The ideal clock would always point to the time 'now'." This also connects up with the language which describes only my impressions of the present moment. Akin is the primal utterance that is only an inarticulate sound. (Driesch.) The ideal name, which the word "this" is.

Page 132

722. I should like to speak of a genealogical tree of psychological concepts. (Is there here a similarity to a genealogical tree of different number concepts?)

Page 132

723. The difficulty of renouncing all theory: One has to regard what appears so obviously incomplete, as something complete.

Page 132

724. Anxiety borrows the pictures of fear. "I have the feeling of impending doom."†1

Page 132

725. But what is the content, the content of consciousness, in anxiety? The question is wrongly framed.

Page 132

726. "A picture (mental image, memory image) of longing." One thinks that one has already done everything by speaking of a 'picture'; for longing just is a content of consciousness, and its picture is something that is (very) like it, even if it is less clear than the original.

And indeed one might very well say of someone who plays longing on the stage of a theatre, that he experiences, [[sic]] or has, a picture of longing: for this is not given as an *explanation* of his proceedings, but as part of a description. [Cf. Z 655.]

Page 132

727. But wouldn't I say that the actor does experience something like real longing? For isn't there something in what James says: that the emotion consists in the bodily feelings, and hence can be at least partially reproduced by

voluntary movements?

Page 132

728. Is it so disagreeable, so sad, to draw down the corners of one's mouth, and so pleasant to pull them up? What is it that is so frightful about fear? The trembling, the quick breathing, the feeling in the facial muscles?--When you say: "This fear, this uncertainty, is frightful!"--might you go on "If only I didn't have this feeling in my stomach!"?

Page Break 133

Page 133

729. The expression "This anxiety is frightful!" is like a groan, a cry. Asked "Why do you cry out?", however--we wouldn't point to the stomach or the chest etc. as in the case of pain; rather, perhaps, at what gives us our fear.

Page 133

730. When anxiety is frightful, and when in anxiety I am conscious of my breathing and of a tension in the muscles of my face--does that mean that I find *these feelings* frightful? Might they not even signify an alleviation? [Cf. Z 499.]

Page 133

731. Compare fear and anxiety with care.

Page 133

732. And what sort of description is *this*: "Ewiges Dustere steigt herunter"†1....

Page 133

One might describe a pain like that; even paint it.

Page 133

733. Isn't the 'content' what one peoples the space of impressions with? What changes, what goes on, in space and time. If, e.g., one talks to oneself, then it would be the imagined sounds (and perhaps the feeling in the larynx or something like that).

Page 133

734. Is lying a particular experience? Well, can I say to someone "Now I am going to lie to you", and then do it? [Cf. Z 189.]

Page 133

735. To what extent am I conscious of lying while I lie? Only inasmuch as I don't first realize it later, but all the same I do know later that I lied. Consciousness of lying is a *capacity*. It is no contradiction of this that there are characteristic feelings of lying [Cf. Z 190.]

Page 133

736. For knowledge is not *translated* into words when it is expressed. The words are not a translation of something else that was there before. [Cf. Z 191.]

Page 133

737. One says "I notice in his tone of voice that he does not believe what he says". Or I suppose it, because he has generally shewn himself unreliable. How can I apply this to *myself*? Can I, e.g., infer from my tone of voice, that I probably shan't act in a way that fits my words? (And yet someone else does make that inference.) Or can I infer it from my previous unreliability? Certainly for preference the latter. But I don't judge the tone of my voice at all as I do that of

Page Break 134

someone else. Mind you, if I could see myself later, say in a talking film, I should perhaps say: "I don't quite trust myself."

Page 134

738. But before all else: I seem to have a substitute for all such conjectures, one that is more certain than they are. After all I *know* that I don't believe what I am saying, and that surely gives me the best of reasons--I should like to say--for assuming that I shall not act accordingly. The point is, I have an *intention* concerning my actions.

Page 134

739. "But I know that I am lying! What need have I to draw conclusions from my tone of voice, etc.?"--But that's not how it is. For the question is: Can I draw the same conclusions e.g. about the future, from that 'knowledge'; can I make the same *application* of it, as of observed signs?

Page 134

740. And then, is the intention always *quite* clear? I say, e.g., "It will happen all right", *half*, because I believe it, *half* because I want to comfort the others.

Page 134

741. *Arrières pensées*. "Mine I know, *conjecture* his". But what *interest*, what importance, have his *arrières pensées* got for me? (Now, weigh the question.) And now the 'knowledge' of my own *arrières pensées* really does play the same part for me, as the conjecture of his does for him.

Page 134

742. 'To judge others by oneself.' Of course there is such a thing. And I sometimes even infer that someone else is in pain because he behaves as I do in this case.

Page 134

743. It might be said: If I tell you my *arrières pensées*, then I communicate to you just what you conjecture when you conjecture these *arrières pensées*. That is: if you conjecture the *arrières pensées* as, so to speak, an active principle, and I give expression to them, you can use my expression immediately in describing that agent. My expression explains exactly what he wants to explain.

Page 134

744. "What should I draw conclusions from my own words to my behaviour for, when in any case I know what I believe?" And what is the manifestation of my knowing what I believe? Is it not manifested precisely in this, that I do not infer my behaviour from my words? That is the fact.

Page Break 135

Page 135

745. Why do I not infer from my tone of voice that I am not really convinced of what I am saying? or the whole of what gets inferred from it?--And if it is answered "Because I know my own *conviction*"--the question is "How does that come out?" Am I now to say: "In the fact that I have no doubt what it is?"

Page 135

746. The *knowledge* of metre. One who *knows* the metre, hears it differently.

Page 135

747. Thoughts can be care-laden, but not toothache-laden.

Page 135

748. I am now whistling a note, but I am also--now--whistling a tune.

Page 135

749. We do not say "I look furious; I only hope I shall commit no violence". But the question is not "How is it that we don't?"

Page 135

750. The psychology of judgment: For judgment too has its psychology.

It is important that one can imagine every judgment beginning with the word "I". "I judge that...."

So is each judgment a judgment about the one who is judging? No, it is not, inasmuch as I don't want the main consequences that are drawn to be ones about *myself*, I want them rather to be about the subject matter of the judgment. If I say "It's raining," I don't in general want to be answered: "So *that's* how it seems to you." "We're talking about the weather," I might say, "not about me."

Page 135

751. "But why is the use of the verb 'believe,' why is its grammar, put together in such a queer way?"

Well, it isn't *queerly* put together. It's only queer if one compares it with, say, the verb "eat".

Page 135

752. "Now what's he likely to do next," I say as I watch him. Do I watch myself and say "what am I likely to do next"?

Page 135

753. Suppose I were moving about a room, and had a screen before my eyes on which I could see myself as an observer would see me. As I move about the room I watch the screen continuously and observe my action.--What would be the difference between these two cases: (a) I shall be influenced by what I see on the screen as I am by my

Page Break 136

normal seeing of my surroundings--(b) I move *involuntarily* and observe myself like a stranger.

But don't I feel my movements?--But isn't this feeling something that *happens* to me, like any other sense-impression?

Page 136

754. Very well: the kindesthetic[[sic]] feeling is a *different*, a peculiar feeling.--But so is smell, so is hearing, etc.--Why does that make such a difference?

The "feeling of innervation"--this expresses what one would like to say: that it is like an *impulse*. A feeling

like an impulse, though? What is an impulse, then? A physical picture. The picture of a push.

Page 136

755. What is the difference between these two things: following a line involuntarily--following a line on purpose?

What is the difference between these two things: tracing a line with care and great attention--and attentively watching how my hand follows a line? [Cf. Z 583.]

Page 136

756. Some differences are easy to give. One resides in foresight of what the hand will do. [Cf. Z 584.]

Page 136

757. Is "I am doing my utmost" the expression of an experience? One difference: One says "Do your utmost". [Cf. Z 581.]

Page 136

758. Does one say: "Give yourself this muscular sensation"? And why not?--"This"?--Which one?--But can't I give myself a particular muscular sensation by moving my arm?--Try it. Move your arm--and ask yourself what feeling you have produced in yourself.

If someone were to tell me: "Bend your arm and produce the characteristic sensation," and I bent my arm, then I'd have to ask him: "Which sensation did you mean? A slight tension in the biceps, or a feeling in the skin on the inside of the elbow joint?" Indeed, if someone ordered me to make a movement I might make it and then describe the sensations that it produces, together with their peculiar place (which would hardly ever be the joint). And I would often have to say that I felt *nothing*. Only one mustn't confound this with the statement that it was as if *there were no sensation* in my arm.

Page 136

759. Are you reading this page voluntarily? And what does the act consist in?--One may read upon request and also stop reading. One may also imagine something on request. E.g. one may recite a poem to

Page Break 137

oneself in the imagination, or do a sum. In this imagining, do you *feel* whether you are imagining something voluntarily or involuntarily?

You can obey an order to summon up thoughts, to call up images--but also, and this is something else, you can obey an order to think of something.

Page 137

760. Images, one might say, are voluntary, after-images involuntary.

Page 137

761. An involuntary movement is, *for example*, one that one can't prevent; or one that one doesn't know of; or one that happens when one purposely relaxes one's muscles in order not to influence the movement.

Page 137

762. When, e.g., I see someone eating, do I ask myself whether he is doing it voluntarily or involuntarily? Perhaps it is said that I assume it is happening voluntarily. What do I assume; that he feels it? And feels it in a particular way?

Page 137

763. How do I know whether the child eats, drinks, walks, etc. voluntarily or involuntarily? Do I ask the child what it feels? No; eating, as anyone does eat, is voluntary.

Page 137

764. If someone were to tell us that with *him* eating was involuntary--what evidence would make one believe this? [Cf. Z 578.]

Page 137

765. When I raise my hand suddenly to shield my eye--is the movement voluntary?--and do I *feel* it differently from a voluntary movement?

Page 137

766. The concept of 'effort'. Do you feel the effort? Of course you feel it. But don't you also *make* it?--What are the signs of effort? With a great effort, I lift a heavy weight. My muscles are tense, my face screwed up, my breath short--but do I do all that; doesn't it merely happen to me? How would it be, if it merely happened to me? How would that case differ from that of willing? Would I talk somehow differently? Would I say: "I don't know what's happening to me: my muscles are tense, my face... etc. etc.?" And if I were to say: "Well, relax your muscles," he would reply "I can't".

But suppose someone were to say to me: "I feel that I *have* to do *whatever* I do," and that at the same time he behaved just like anyone else?

Page Break 138

Page 138

767. Isn't saying that kinaesthetic sensation shews me what movement is made analogous to the opinion that some characteristic of pain shews me its place?

Page 138

768. If someone wanted to represent pain by means of a colour-picture--would he put a local sign into the picture? And why not?

Page 138

769. Is the sensation not the measure of the effort? That is to say, when I say "Now I'm pulling harder", do I notice this by noting the degree of the sensation? And what is there to say against that? One tells someone "Exert yourself more!"--not, so that he shall feel more, but so that he shall achieve more.

Page 138

770. Why does one feel as if one could describe, or paint, a tactile sensation (its content) but not a sensation of motion or position?

Page 138

771. Can you say, e.g., that your sensation of position is weak or strong?

And your sensations when you move a limb may indeed be stronger or weaker (or absent), but that isn't a perception of movement.

Page 138

772. Sensations of movement--these are sensations that are called into being by movement--they may, for example, be pains.

How does one know that it isn't these sensations of movement that tell us what movements we are making? What would be a sign of its being so?

Page 138

773. Isn't it an important fact that the theatre gives us exhibitions of colour and sound, but not of sensations of touch? The use of smells and of sensations of temperature could be imagined, but not of sensations of touch.

Page 138

774. Someone, who is threading a needle with all the appearance of taking care, and tells us that he does it *involuntarily*. How could he justify this statement?

Page 138

775. What one can know, one can be convinced of--and can also conjecture. (Grammatical remark.)

Page 138

776. Voluntary movements are certain movements with their normal *surroundings* of intention, learning, trying, acting. Movements, of

Page Break 139

which it makes sense to say that they are sometimes voluntary, sometimes involuntary, are movements in a special surrounding. [Cf. Z 577.]

Page 139

777. One category of psychological phenomena (facts) would be 'seeds'. But this word may just as easily be the expression of a misunderstanding, like the phrase "experience of tendency" (James). The phrase "move in a board-game", too, does not characterize a *kind of movement*.

Page 139

778. Translating from one language into another is a mathematical task and the translation of a lyrical poem (for example) into a foreign language is quite analogous to a mathematical *problem*. For it is certainly possible to formulate the problem "How is this joke (e.g.) to be translated by a joke in the other language?"--i.e. how is it to be replaced; and the problem may also be solved; but there wasn't a method, a system, belonging to the solution of it. [Cf. Z 698.]

Page 139

779. You know that you are lying; if you are lying, you know it. An inner voice, a feeling, tells me? Might this feeling not deceive me?

Does a voice always tell me? And when does it speak? The whole time?--And how do I know I can trust it?

Page 139

780. A lie has a peculiar surrounding. There is in the first place a motive there. Something occasions it.

Page 139

781. The consciousness of lying is of the category of the consciousness of intention.

Page 139

782. Do not forget: sight, smell, taste etc. are sensations only because these concepts have *something* in

common--as one might take auger, chisel, axe, oxyacetylene torch together, because they have certain functions in common.

Page 139

783. "A pain, a sound, a taste, a smell, has a particular colour." What does that mean? (Quality. Adjective.)

A colour may be *greenish*, or *blueish*--there is such a thing as a blending of colours; and in the same way too a blending of smells, sounds, tastes; qualitative gradations. How does one distinguish qualitative from quantitative gradations, I mean from gradations of 'intensity'?

Still bearable--no longer bearable, these, for example, are degrees of intensity. Suppose someone were to ask: "How can I know that

Page Break 140

what I sense as different degrees of loudness, for example, is not sensed by someone else as different qualities, comparable to different hues?"--Compare the reaction to an alteration in strength with that to an alteration of quality.

Page 140

784. I feel my arm and, oddly, I should like to say: I feel it in a particular position in space: as if, that is, my bodily feeling were distributed in a space in the shape of an arm, so that in order to represent the matter, I would have to represent the arm, say in plaster, in the right position. [Cf. Z 480.]

Page 140

785. Imagine that the point of a pencil were brought into contact with my skin at a certain place; I can say I feel where it is: But do I feel *where* I feel it? "How do you know that the point is now touching your thigh?"--"I feel it." By feeling the contact I know its place; but ought I therefore to speak of a feeling of place? And if there is no such thing as a feeling of place, why must there be a feeling of position?

Page 140

786. It is odd. My lower arm is now lying horizontally and I should like to say I feel that; but not as if I had a feeling that always goes with this position (as one would feel ischaemia or congestion)--rather as if the 'bodily feeling' of the arm were arranged or distributed horizontally, as, e.g., a film of damp or of fine dust on the surface of my arm is distributed like that in space. So it isn't really as if I felt the position of my arm, but rather as if I felt my *arm*, and the feeling had such and such a *position*. But that only means: I simply *know* how it is lying--without knowing it *because....* As I also know where I feel pain--but don't know it *because....* [Cf. Z 481.]

Page 140

787. Consider:--"It isn't true that what I believe is always false. For example, it's raining now, and I believe it."

One might say of him: He speaks like *two* people.

Page 140

788. Why do I have doubts about his intention, but not about mine? To what extent am I indubitably acquainted with my intention? What, so to speak, is the *use* of my *knowing* my intention? That is, what is the use, the function, of the expression of intention? That is, when is something an expression of intention? Well, when the act follows it, when it is a prediction. I make the prediction, the same one as someone else makes from observation of my behaviour, *without* this observation.

Page Break 141

Page 141

789. When dealing with a 'feeling of unreality', we are inclined to say: "All I know is that under certain circumstances human beings often say that they felt everything around them was 'unreal'. Naturally we also know what use of this word the people had learnt, and besides that something about their other utterances. More we do not know."--Why don't we talk in the same way when what is in question is utterances expressive of pleasure, of conviction, of the voluntariness and involuntariness of movements?

Page 141

790. What should I reply to someone who tells me that *he* feels the position and motions of his limbs, that a *feeling* tells *him* their posture and movement? Am I to say he is lying, or that he is making a mistake, or am I to believe him? I should like to ask him *how* a feeling tells him of, for instance, this posture. Or better: how he *knows* that a *feeling* tells him this.

Page 141

791. (One says something *ordinary*,--with the wrong gesture.) [Cf. Z 451.]

Page 141

792. Remember again here the feeling which occurs without justification and to all appearances without any ground, that a particular district must lie in *that* direction. If this feeling weren't for the most part deceptive, one would speak here of a kind of *knowing* by feeling. And the sources of this feeling can only be conjectured, or established by

experience.

Page 141

793. The most important thing here is this: there is a difference; one notices the difference, 'which is a difference of category'--without being able to say what it consists in. That is the case in which one usually says one knows the difference by introspection. [Cf. Z 86.]

Page 141

794. And it sounds too much like an appeal to introspection, if I wanted to say "Test yourself, now--see whether you really determine the position of your limbs by feelings in them."--And it would even be wrong, for then the question is: If someone did that, how would it come out that he did? For suppose after self-examination he were to assure me that it was so, or that it was not so,--how do I know whether I have the right to trust him; I mean, whether he has even understood me right? Or again: how do I test whether I understand him?

Page Break 142

Page 142

795. Someone tells me: "I don't know how I move my fingers, but I know when I am spreading them out by the feeling in the skin between the fingers." Here one would have to ask: Then can't you carry out the order: "Spread out your fingers" straight off with your eyes shut?

Page 142

796. We feel our movements. Yes, we really *feel* them; the sensation is not like a sensation of taste or of temperature, it is, rather, like a sensation of touch: the sensation when skin and muscles are squeezed, pulled, displaced. [Cf. Z 479.]

Page 142

797. How can I use the guidance of my feeling of movement when I make movements? For, how, before the movement has begun, can I select from all the muscles the ones that are going to give me the right feeling of movement? If there is a problem: "How do I know, when I don't see the movement, that, and to what extent, it has taken place?"--why then is there no problem: "How do I know at all how to accomplish, say, a movement I've been ordered to make"? (Russell once made a wrong observation about this.)

Page 142

798. I may, e.g., say that I now know that my finger is bent, but that I have no feeling of any kind in it; at any rate none that I associate peculiarly with this position. Thus if I were to be asked: "Do you feel something, of which you want to say that you wouldn't feel it in the straightened-out position; or is there some feeling missing, which would be present in the other position?"--I should have to answer No.

Page 142

799. "Is pleasure a sensation?" (I. A. Richards.) That means something like: Is pleasure something like a note or a smell?--But is a note then something like a smell? To what extent?

Page 142

800. Someone who asks whether pleasure is a sensation probably does not distinguish between ground and cause, for otherwise it would occur to him that one has pleasure *in something*, which does not mean that this something causes a sensation in us. [Cf. Z 507.]

Page 142

801. But pleasure does at any rate go with a facial expression, and, though we don't see this on ourselves, still we do feel it.

And just try to reflect on something very sad with an expression of radiant joy. [Cf. Z 508.]

Page Break 143

Page 143

802. It is of course possible that the glands of a sad man secrete differently from those of a cheerful one; also, that this secretion is the, or a, cause of sadness. But does it follow from this that sadness is a *sensation* brought about by this secretion? [Cf. Z 509.]

Page 143

803. But here the thought is: "You surely *feel* the sadness--so you must feel it *somewhere*; otherwise it would be a chimera. But if that is what you want to think, just recall the difference between sight and pain. I feel pain in my hand--and colour in my eye? As we here want to employ a schema instead of simply noting what is really common, we make a wrongly simplified picture of our conceptual world. It is as if we were to say that all the plants in the garden had flowers, all had petals--fruits--seeds. [Cf. Z 510.]

Page 143

804. A smell may be extremely pleasant. Is what is pleasant about it only a sensation? In that case the sensation of

pleasantness would accompany the smell. But how would it *relate to the smell*? Of course, the expression of the pleasantness is similar in *kind* to the expression of a sensation, in particular to that of pain. But joy has no place; there are joyful thoughts, but not toothache-ish ones.

But--one would like to say--whether joy is a sensation, or *what* it is, is something one has to notice when one has it!--(And why especially when one has it, and not when one doesn't have it?) Do you also notice the *nature* of one, when you are eating *one* apple, and the *nature* of zero when you are eating none?

Page 143

805. Voluntariness hangs together with intentionalness. And therefore with decision as well. One does not decide on an attack of angina and then have it.

Page 143

806. One brings on a sneeze in oneself or a fit of coughing, but not a voluntary movement. And the will does not bring on sneezing, nor yet walking. [Cf. Z 579.]

Page 143

807. Sensation--that is what one takes to be immediately given and concrete, what one only needs to look at in order to know it; it is that which is really there. (The thing, not its emissary.)

Page 143

808. "I know whether I am talking in accordance with my conviction or contrary to it." So the conviction is what is important. In the background of my utterances. What a *strong* picture. One might paint conviction and speech ("from the depths of his heart"). And yet how little that picture shews!

Page Break 144

Page 144

809. "The smell is marvellous!" Is there any doubt that it is the smell that is marvellous?

So is it a property of the smell?--Why not? It is a property of ten to be divisible by two, and also to be the number of my fingers.

But there might be a language in which people merely shut their eyes and said "Ah, this smell", [[sic '?]] and there is no subject-predicate sentence that is equivalent to the exclamation. That just is a 'specific' reaction. [Cf. Z 551.]

Page 144

810. Is that of which he says he has it, and of which I say I have it, without our inferring this from any observation--is it the same as what we derive from observation of someone else and from the *expression* of his conviction? [Cf. Z 574.]

Page 144

811. Can one say: I *infer* that he will behave as he *intends* to behave? [Cf. Z 575.]

Page 144

812. I make inferences to the consequences of his conviction from the expression of his conviction; but not to the consequences of my conviction from the expression of it.

Page 144

813. Imagine an observer who, as it were automatically, says what he is observing. Of course he hears himself talk, but, so to speak, he takes no notice of that. He sees that the enemy is approaching and reports it, describes it, but like a machine. What would that be like? Well, he does not act according to his observation. Of him, one might say that he speaks what he sees, but that he does not *believe* it. It does not, so to speak, get inside him.

Page 144

814. Why don't I make inferences from my own words to a condition from which words and actions take their rise? In the first place, I do not make inferences from my words to my probable actions.

Page 144

815. Asked: "Are you going to do such-and-such?" I consider *grounds for* and *against*.

Page 144

816. But consider this: After all I sometimes take someone else's word,--so I would surely at least sometimes have to take my own word too, that I have such and such a conviction. But when I report my observation in a quasi-automatic fashion, then this report has nothing at all to do with my conviction. On the other hand I might

Page Break 145

have confidence in myself, or in my observing self, just as another person does. So I might say "I say 'It's raining', so it will presumably be true" Or: "The observer in me says 'Its[[sic]] raining', and I am inclined to believe him."--For isn't this--or something like this--how it is, when a man says that God has spoken to him or through his mouth?

Page 145

817. The *important* insight is that there is a language-game in which I produce information *automatically*, information which can be treated by other people quite as they treat non-automatic information--only here there will be no question of any 'lying'--information which I myself may receive like that of a third person. The 'automatic' statement, report etc. might also be called an 'oracle'.--But of course that means that the oracle must not avail itself of the words "I believe...".

Page 145

818. Where is it said in logic that an assertion cannot be made in a trance?

Page 145

819. "If I look outside, I see that it's raining; if I look within myself, I see that I believe it." And what is one supposed to do with this information?

Page 145

820. "Suppose that it's raining and I don't believe it"--when I assert what is supposed in this supposition,--then, so to speak, my personality splits in two.

"Then my personality splits in two" means: Then I no longer play the ordinary language-game, but some different one.

Page 145

821. "The words 'It's raining' are written in his soul"--this is to mean as much as (i.e. to be replaceable by) "He believes that it is raining". "The words 'It's raining' are written in my soul"--means, say, "I can't get rid of the belief that...", "The idea that... has taken possession of me."

For consider this fact: the words "I believe it is raining" and "It'll be raining" may say *the same: inasmuch*, that is, as in some contexts it makes no difference which of the two sentences we use. (And rid yourself of the idea that one of them is accompanied by a different mental process from the other.) The two sentences may say the same thing, although there is an "I believe..." and "He believes..." etc. that corresponds to the first and not to the second. For a different *concept* is used in the construction of the first. That is: in order to say that perhaps it is raining we do *not* need the concept 'believe', although we may use it for that purpose. The concept of a

Page Break 146

proposition's being 'written on the soul' is now a third concept, which partly coincides with the others in its application, and partly not.

I want to say that in order to construct the assertion "It'll..." there is no need of the 'queer' concept 'believe', although it *may* be used for that purpose.

Page 146

822. Think also of this: 'It'll be raining and it is raining' doesn't mean anything, and no more does "It'll be raining and it isn't". By contrast one can say 'It seems to be raining and it is raining' and also 'It seems to be raining... and it isn't raining'. And 'It seems to be raining' may have the same sense as 'It'll be raining'.

Page 146

823. How do I know that I am in the state of believing:...? Do I look into *myself*? Is it even *any* use to observe myself? Well, I might perhaps ask myself "How much would I bet in this case?"

Page 146

824. Pretence. Simulating pain. It doesn't consist merely in giving expressions of pain when one has no pain. There must be a motive present for the simulation, hence a situation which is not quite simple to describe. Making oneself out sick and weak, in order then to attack those who help one.--"But there is surely an *inner* difference there!" Naturally; only here "inner" is a dangerous metaphor. But the 'proof' that an inner difference is present is the very fact that I can *confess* that I was simulating. I confess an intention. Does it 'follow' from this that the intention was something inner?

Page 146

825. The 'actual infinite' is a 'mere word'. It would be better to say: for the time being this expression merely produces a picture--which so far hangs in the air; you still owe us its application. [Cf. Z 274.]

Page 146

826. An infinitely long row of marbles, an infinitely long rod. Imagine these coming into a kind of fairy-tale. What application, even though a fictitious one, might be made of this concept? Let us ask now, not: can there be such a thing? But: What do we imagine? So give free rein to your imagination! you can have things now just as you choose. You only need to say how you want them. So just make a verbal picture, illustrate it as you choose, by drawings, comparisons, etc. Thus you can--as it were--prepare a blueprint.--And now there remains the question how one can work from it. [Cf. Z 275.]

Page Break 147

827. "But how can the human spirit fly ahead of reality, and even *think* the unverifiable?"--Why should we not *speak* the unverifiable? For we ourselves made it unverifiable.

A false *appearance* is produced? And how can it be so much as *appear* like that? For don't you want to say that this *like that* too isn't even a description? Well then, in that case it is, not a *false* appearance, but one that robs us of our orientation. So that we just ask: How is it possible? [Cf. Z 259.]

828. As soon as the word was spoken, I wished I had not said it.--How did my wish relate to the word that was spoken?

I felt that the word was inappropriate, as soon as I had spoken it. But the *signs* I remember were only like slight indications. Minutiae, from which I might have been able perhaps to *guess* the intention, the wish.

There are occasions of shame--situations--and ashamed behaviour. As there are occasions of expectation and the behaviour of expectancy.

829. When a cat lies in wait by a mouse-hole--do I assume that it is thinking about the mouse?

When a robber waits for his victim--is it part of this, for him to be thinking of that person? *Must* he be considering this and that as he waits? Compare one who is doing such a thing for the first time, with one who has already done it countless times. (Reading.)

830. There might be a verb with the meaning: to formulate one's intention in words or other signs, out loud or in one's thoughts. This verb would not be equivalent in meaning to our 'intend'.

There might be a verb with the meaning: to act according to intention; and this would also not mean the same as "to intend".

Yet another might mean: to brood over an intention; or, to turn it over and over in one's head. [Cf. Z 49.]

831. When I make my coffee, I intend to drink it. If I were making it without this intention--would some accompaniment of my action then have to be *lacking*? Does something go on during the normal doing of a thing, which characterizes it as doing with this intention? But if someone were to ask me whether I intend to drink, and I replied "Yes, of course"--would I be saying something about my present state?

This is how I react in this case; and *that* can be gathered from my reaction.

832. A belief, a wish, a fear, a hope, a fondness; each can be called a state of a man; we can count on this state in our behaviour towards this man, we can infer his reactions from his state.

And if someone says: "All this time I had the belief...", "All my life I have wished..." etc; he is reporting a state, an attitude.--But if he says "I believe he's coming" (or simply "Here he comes") or "I wish you'd come" (or "Please come"), then he is acting, he is speaking, according to that condition, not reporting that it is to be found in him.

But if that were right, then there ought to be a present form of that report, and hence on the one hand the *utterance* "I believe...", and on the other the *report* "I am in the state of belief...". And similarly for wish, intention, fear etc.

833. Someone might relate: "I remember my state in those years exactly; whenever I was asked... I replied...; that was my attitude."

834. There is a *reaction* of loathing, in myself and in others; there are also *feelings of loathing*. And loathing, fear, affection, etc., resemble one another in this; but not hope, belief, etc.

835. Grief incessantly rehearses the sad thoughts. A thought may be sad, loathsome, enchanting etc.; but how does the expression shew that it is this thought, to which we have these reactions? How does one drive a thought away?

836. Ought I to call the whole field of the psychological that of 'experience'? And so all psychological verbs 'verbs of experience'. ('Concepts of experience.') Their characteristic is this, that their third person but not their first person is stated on grounds of observation. That observation is observation of behaviour. A subclass of concepts of experience is formed by the 'concepts of undergoing'. †1

'Undergoings' have duration and a course; they may run on uniformly or non-uniformly. They have intensity. They are not characters of thought. Images are undergoings. A subclass of 'undergoings' are 'impressions'. Impressions have spatial and temporal relations to one another. There are blend-impressions. E.g. blends of smells, colours, sounds. 'Emotions' are 'experiences' but not 'undergoings'. (Examples: sadness, joy, grief, delight.) And one might distinguish between 'directed emotions' and 'undirected emotions'. An emotion has duration; it has no place; it has characteristic 'undergoings' and thoughts; it has a characteristic expression which one would use in *miming* it. Talking under particular circumstances, and whatever else corresponds to that, is thinking. Emotions colour thoughts. One subclass of 'experiences' is the forms of 'conviction'. (Belief, certainty, doubt, etc.) Their expression is an expression of thoughts. They are not 'colourings' of thoughts. The directed emotions might also be called "attitudes". Surprise and fright are attitudes too, and so are admiration and enjoyment.

837. But where does *memory* belong, and where *attention*? One can remember a situation or occurrence *at a moment*. To that extent, then, the concept of memory is like that of instantaneous understanding or decision.

838. My own behaviour is sometimes, but *rarely* the object of my own observation. And this hangs together with the fact that I intend my behaviour. Even if an actor observes the expressions of his own face in a glass, or the musician attends closely to every note in playing, and judges it, this happens after all so that he shall direct his action accordingly. [Cf. Z 591.]

839. What does it mean, e.g. to say that self-observation makes my acting, my movements, uncertain?

I cannot observe myself unobserved. And I do not observe myself for the same purpose as I observe someone else. [Cf. Z 592.]

840. When a child stamps its feet and howls with rage, who would say it was doing this involuntarily? And why? Why is it assumed to be doing this not involuntarily? What are the *tokens* of voluntary action? Are there such tokens? What, then, are the tokens of involuntary movement? They don't happen in obedience to orders, like voluntary actions. There is "Come here!" "Go over there!" "Make this movement with your arm," but not "Have your heart beat faster". [Cf. Z 593.]

841. There is a peculiar combined play of movements, words, facial expressions etc., as of expressions of reluctance, or of readiness, which characterize the voluntary movements of the normal human being. When one calls the child, it doesn't come automatically: there is, for example, the gesture "I don't want to!" There is coming gladly, the decision to come, running away with signs of fright, the effects of being addressed, all the reactions of play, the signs of consideration and its effects. [Cf. Z 594.]

842. A tune went through my head. Was it voluntary, or involuntary? It would be an answer to say: I could also have had it being sung to me inwardly. And how do I know that? Well, because I can ordinarily interrupt myself if I want to.

843. How could I prove to myself that I can move my arm voluntarily? Say by telling myself "Now I'm going to move it" and now it moves? Or shall I say: "Simply by moving it"? But how do I know that I did it, and it didn't move just by accident? Do I in the end feel it after all? And what if my memory of earlier feelings deceived me, and these weren't at all the right feelings to decide the matter?! (And which are the right ones?) And then how does someone else know whether I moved my arm voluntarily? Perhaps I'll tell him: "Tell me to make whatever movement you like, and I'll do it in order to convince you." And what *do* you feel in your arm? "Well the usual feelings." There is nothing unusual about the feelings, the arm is not e.g. without feeling (as if it had 'gone to sleep'). [Cf. Z 595.]

844. A movement of my body, of which I don't know that it is taking place or has taken place, will be called involuntary.--But how is it when I merely *try* to lift a weight, and so there isn't a movement? What would it be like if someone involuntarily strained to lift a weight? Under what circumstances would *this* behaviour be called "involuntary"? [Cf. Z 596.]

845. Can't rest be just as voluntary as motion? Can't abstention from movement be voluntary? What better argument against a feeling of innervation? [Cf. Z 597.]

846. "That glance was not intended" sometimes means: "I didn't know that I gave such a look" or "I didn't mean anything by it".

847. It ought not to strike us as so much a matter of course that memory shews us the past inner, as well as the past outer, process.

848. Imagination is voluntary, memory involuntary, but calling something to mind is voluntary.

849. What a remarkable concept 'trying', 'attempting', is; how much one can 'try to do'! (To remember, to lift a weight, to notice; to think of nothing.) But then one might also say: What a remarkable concept 'doing' is! What are the kinship-relations between 'talking' and 'thinking', between 'talking' and 'talking to oneself'? (Compare the kinship-relations between the kinds of numbers.) [Cf. Z 598.]

850. One makes quite different inferences from involuntary movements and from voluntary ones: this *characterizes* voluntary movement. [Cf. Z 599.]

851. But how do I know that this movement was voluntary? I don't know it, I manifest it. [Cf. Z 600.]

852. "I am tugging as hard as I can." How do I know that? Do my muscular sensations tell me so? The words are a signal; and they have a *function*.

But am I *experiencing* nothing, then? Don't I experience something? something specific? A specific feeling of effort and of inability to do more, of reaching the limit? Of course, but these expressions say no more than "I'm tugging as hard as I can". [Cf. Z 601.]

853. It is important, however, that there are all these paraphrases! That one can describe care with the words "Ewiges Düstere steigt herunter"†1. I have perhaps never sufficiently stressed the importance of this paraphrasing.

Joy is represented by a countenance bathed in light, by rays streaming from it. Naturally that does not mean that joy and light *resemble* one another; but joy *it does not matter why*--is associated with light. To be sure, it might be that this association is taught the child when it learns to talk, that it is no more *natural* than the sound of

the words themselves--enough that it exists. ("Beethoven" and Beethoven's works.) [Cf. Z 517.]

854. Sorrow like the lead-gray sky?! And how can that be found out? By looking at a sorrowing man and at the sky? Or does the sorrowing man say it? And is it then true only for his sorrow, or for the sorrow of *anyone*?

855. But if someone now says that *his* sadness is like a grey cloud--, am I to believe it or not?--One might ask him whether the two are alike *in something*, in a particular respect. (Like, e.g. two faces; or like a sudden strong pain and a flare.) One may give relations--internal relations and connexions--between what one calls "intensities" for different impressions.

856. 'a is between b and c, and is closer to b than to c'--this is a characteristic relation between sensations of the same kind. That is to say, there is, for example, a language-game with the order: "Produce a sensation between *this* one and *this* one, and closer to the first than to the second." And also: "Name two sensations, such that *this* one comes between them." [Cf. Z 360.]

857. And here it is important that with *grey* one will get the answer "black and white", with *purple*, "blue and red", with *pink* "red and white"; but with *olive-green* one will not get "red and green". [Cf. Z 361.]

858. How does one realize that the expression of joy is not the expression of some bodily pain? (An *important*

question.)

Page 152

859. How does one know that the expression of enjoyment is not the expression of a sensation?

Page 152

860. To *pronounce* a figure this or that. Do you always pronounce the figure to be this or that while you see it? Of course: if asked what this figure presents, I should always say "A rabbit"†1; but I am no more continuously conscious of this, than of the fact that there is an actual table here. For if I always pronounce a picture a picture of this object, then I also pronounce any object a thing with this particular use, etc.

Page Break 153

Page 153

861. If someone notices for the first time that the picture is ambiguous, he might react, say with the exclamation: "Ah! a rabbit!" etc.; but still, when he now goes on seeing the picture continuously in one aspect, he won't want to keep on exclaiming "Ah! a...!"

Page 153

862. I want to say that the natural, primitive expression of the experience of an aspect would be such an exclamation; it might also be a lighting up of the eyes. (Something strikes me!)

Page 153

863. When I say I see this figure continuously red, that means that the description, that it is red--the description in words or by means of a picture--is continuously correct, without alteration; hence in contrast to *that* case, in which the picture alters. For the temptation is to describe the aspect with the words "I see it *like this*" *without* pointing to anything. And when one describes a face with its direction of glance as an arrow, one wants to say: "I see this → and not this: ←".

Page 153

864. What corresponds to continuous seeing as →, is that this description, without any variation, is the right one and *that* only means that the aspect did not change.

Page 153

865. Talk of hallucination!†1--What could there be queerer, than that this *dot*, the eye, seems to have a direction!

Page 153

866. When I think about the facial expression of this figure--what do I do, to be thinking about the expression ← and not →?

Page 153

867. When I think about the facial expression of this figure, contemplate it, what do I do to be contemplating the expression ← not →?

And this symbolism, I believe, has everything in it.

Page 153

868. It is as if one saw a picture: one time together with *one* group, and then another time with *another* one. "What does this mean: It is as if one saw...?" It means something like: *that* process might be a representative of the actual one, it would have the right 'multiplicity'.

Page 153

869. It is--contrary to Köhler--precisely a *meaning* that I see.

Page Break 154

Page 154

870. It might be said that one experiences *readiness* for a particular group of thoughts. (The germ of them.)

Page 154

871. It is as if the picture came to *rest* in one position (or another). As if it could in fact fluctuate, and then come to rest with a *particular* accentuation.

One says: "I see it now (or mostly) as *this*." It really feels to us as if the lines were now fitted together into *this* and not the other shape. Or as if they were put into *this* and not the other mould.

And yet all our concern can only be *this*: to describe the actual expression of our experience, which I am merely paraphrasing with all these pictures; to say what is *essential* to this expression.

Page 154

872. Could someone see the figure in *this* way or *this* way, if he could not advance from that to giving explanations, etc.? Thus, could someone see it in such-and-such a way, if he didn't know how animals' heads looked, what an eye

is etc.? And by this of course I don't mean: "Would such a person be competent to do so, would he succeed?" But rather: "Aren't *these concepts* requisite for this?"

Page 154

873. I see the picture of a horse: I know, not merely that it is a horse, but also that the horse is running. Thus I can understand the picture, not just *spatially*, but I also *know* what the horse is now about to do. Imagine someone seeing a picture of a cavalry charge but not knowing that the horses don't stay in their various places!

I am, however, not concerned with an *explanation* of this understanding, say by the assertion that someone who looks at such a picture makes tiny running movements, or feels running innervations. What ground is there for assumptions of this kind, except *this* one: it 'must' be like that?

Page 154

874. But suppose it is said: "One *sees* the painted horse running!" Here, however, I don't just mean to say "I know that this represents a running horse". One is trying to say something *else*. Imagine that someone reacted to such a picture by a movement of his hand and a shout of "Tally ho!". Doesn't that say roughly the same as: he sees the horse running? He might also exclaim "Its[[sic]] running!" and that would not be the observation that it is running, nor yet that it *seems* to be running. Just as one says "See how it runs!"--not in order to inform the other person; rather this is a reaction in which people are in touch with one another.

Page Break 155

Page 155

875. Understanding is like knowing how to go on, and so it is an ability: but "I understand", like "I can go on", is an *utterance*, a *signal*.

Page 155

876. I can experience a word substantivally or adjectivally. Do I know whether everyone, or many, of those with whom I talk, have these experiences? Would it be important for knowing what they mean?

Page 155

877. It hadn't occurred to me that the same contour occurred in both pictures, for in the one picture I took it like *this*, ® in the other like *this* → . Only in the course of consideration did I realize that the contour was the same--Is that a proof that I saw something *different* each time?--It is important that the two aspects are incompatible with one another.

Page 155

878. Is a facial expression something *visual*? I could imagine a picture, where the *expression* was ambiguous. And which perhaps for that reason I should not recognize in a different surrounding. In that case I say something like: "Ah well, the lines are the same; only here they look quite different."

And of course I do really *see* that the → picture and the ← picture are the same! I don't realize it only by making measurements, say!

Page 155

879. I see two different visual objects, you say, which merely have something in common with one another, In saying that you are only laying stress on some analogies at the expense of others. But now this emphasis needs to be grammatically justified.

Page 155

880. How is it possible that the eye, this *dot*, looks in a direction?--"See, it is looking!" (And here one 'looks' oneself.) But one doesn't say and do this continuously while one contemplates the picture. And now what is this "See, it is looking!"--is it the expression of a sensation? [Cf. P.I. p. 205i.]

Page 155

881. I would never have thought of laying the two pictures one on the other like *that*, of comparing them in *that* way. For they suggest a different method of comparison.

The ← picture hasn't even the slightest resemblance to the → picture, one would like to say--although they are congruent.

Page 155

882. "Now I can go on!"--I see that *that* is the front of a head, *that* is a beak--this line is brow-like, this dot is eye-like. But how can the *visual impression* of a line be brow-like? And what makes me say it is

Page Break 156

the visual impression that has this character?--Well, the fact that it isn't a thought, isn't an interpretation, that it has duration like a visual impression.

Page 156

883. Humans have intentions: Let us try to describe this fact! What would such a description be like? *For* whom

would it be a description? Ask yourself this: what purpose is it supposed to serve?

Page 156

884. One can speak to oneself very 'clearly' in the imagination, while at the same time one is reproducing the information of the speech by humming (with closed lips). Movements of the larynx help too. But the remarkable thing about the latter case is that one *hears* the speech in the imagination, and does not merely *feel* as it were its skeleton in the larynx. [Cf. P.I. p. 220e.]

Page 156

885. It is *essential* to 'imaging' that the concepts of sense-perception are used in the expression of it. (The sentence "I hear and don't hear..." might be used as the expression of auditory imagination. A use for the form of contradiction.) A principal mark that distinguishes image from sense-impression and from hallucination is that the one who has the image does not behave as an observer in relation to the image, and so that the image is voluntary.

Page 156

886. Imagine a conversation, one in which one party is yourself, and imagine it in such a way that you yourself are actually speaking in the imagination. What you yourself say, you will then probably feel in your body (in the larynx, in the breast). This, however, only describes and does not define the activity of talking in the imagination.

Page 156

887. The feeling of the uncanny. How is it manifested? The *duration* of such a 'feeling'. What is it like, e.g., for it to be interrupted? Would it be possible, for example, to have it and not have it every other second? Don't its marks include a characteristic kind of course (beginning and ending), distinguishing it from, e.g., a sense perception?

Page 156

888. The way music speaks. Don't forget that even though a poem is framed in the language of information, it is not employed in the language-game of information.

Might one not imagine someone who had never known music, and who came to us and heard someone playing a reflective piece of

Page Break 157

Chopin, being convinced that this was a language and people were merely keeping the sense secret from him?

Verbal language contains a strong musical element. (A sigh, the modulation of tone for a question, for an announcement, for longing; all the countless gestures in the vocal cadences.) [Cf. Z 160, 161.]

Page 157

889. "Don't look for anything behind the phenomena; they themselves are the theory." (Goethe.)

Page 157

890. I observe his face closely. Why? What does it tell me? Whether he is sad or cheerful, e.g., But why am I interested in that? Well, if I get to know his mood, it is like when I have got to know the condition of a body (its temperature, for example); I can draw various kinds of conclusion from this. And that is why I don't observe my own face in the same case. If I observed myself, my face would no longer be a reliable index; and even if it were an index for someone else, still I could not draw any conclusions from it.

Page 157

891. Being ashamed of a thought. Is one ashamed because one has pronounced such-and-such a sentence to oneself in the imagination?

The thing is, language has a multiple root; it has, not a single root, but roots. [Cf. Z 656.]

Page 157

892. "At that moment the thought was before my mind."--And how?--"I had the picture."--So was the picture the thought? No; for if I had merely communicated the picture to someone, he would not have got hold of the thought. [Cf. Z 239.]

Page 157

893. The picture was the key. Or at any rate it *seemed* like the key. [Cf. Z 240.]

Page 157

894. How are visual impressions distinguished from auditory impressions?--Am I to reply "That can't be said; but whoever sees and hears knows that they are *totally* different"? Could it be imagined that for some man *one* particular visual impression was the same as *one* particular auditory impression? so that he could receive this impression both through the eye and through the ear? Would this man point to a picture perhaps and strike a note on the piano and say that *these* two were identical? And would we believe him? And why not? Would we believe him when he said the 'affection of the soul' was the same in the two cases? And if we did believe it, how could we make use of the fact?

Page Break 158

895. The genealogical tree of psychological phenomena: I strive, not for exactness, but for a view of the whole. [Cf. Z 464.]

896. What holds the bundle of 'sense-impressions' together is their mutual relationships. That which is 'red' is also 'sweet' and 'hard' and 'cold' and 'sounds' when one strikes it. In the original language-game with these words it isn't "This looks red", but "This is red" (hard etc.) Our agreement is essential to the language-game. But with "pleasant", "unpleasant", "beautiful", "ugly", it is otherwise.

Pain is in some ways analogous to the other sense-impressions, in some ways different. There is a facial expression, there are exclamations and gestures of pain (as of joy), tokens of rejection, a reception that is characteristic of pain, but none that is characteristic of the sensation red. Bitterness is akin to pain in this.

We could imagine there being a sense impression without any sense organ. Someone might hear, and so he might learn pretty well all the language-games with the words for auditory impressions, without having ears, and without knowing what he hears *with*! For that one hears with the ears comes out relatively very seldom. It *might* be that someone hears as we all do, and it is only later discovered that his *ears* are deaf.

The *content* of experience. One would like to say "I see red *thus*", "I hear the note that you strike *thus*", "I feel pleasure *thus*", "I feel sorrow *thus*", or even "*This* is what one feels when one is sad, *this*, when one is glad", etc. One would like to people a world, analogous to the physical one, with these *thuses* and *thises*. But this makes sense only where there is a picture of *what is experienced*, to which one can point as one makes these statements.

897. If only *one* person had, *once*, made a bodily movement--could the question exist, whether it was voluntary or involuntary?

898. "When I make an effort, I surely *do* something, I surely don't merely have a sensation." And it is so too; for one tells someone "Make an effort!", and he may express the intention: "Now I'm going to make an effort" And when he says "I can't go on!" that does not mean: "I can't endure the feeling--the pain, for example--in my limbs any longer."--On the other hand one *suffers* with effort, as with pain. "I am utterly exhausted"--if someone said that, but moved as briskly as ever, one would not understand him. [Cf. Z 589.]

899. An aspect is subject to the will. If something appears blue to me, I cannot see it red, and it makes no sense to say "See it red"; whereas it does make sense to say "See it as...". And that the aspect is voluntary (at least to a certain extent) seems to be essential to it, as it is essential to imaging that *it* is voluntary. I mean: voluntariness seems to me (but why?) not to be a mere addition; as if one were to say: "This movement can, as a matter of experience, also be brought about in *this* way." That is to say: It is essential that one can say "Now see it like *this*" and "Form an image of...". For this hangs together with the aspect's not 'teaching us something about the external world'. One may teach the words "red" and "blue" by saying "This is red and not blue"; but one can't teach someone the meaning of "figure" and "ground" by pointing to an ambiguous figure. [Cf. P.I. p. 213e.]

900. We do not first become acquainted with images and only later learn to bend them to our will. And of course it is anyway quite wrong to think that we have been directing them, so to speak, with our will. As if the will governed them, as orders may govern men. As if, that is, the will were an influence, a force, or again: a primary action, which then is the cause of the outward perceptible action.

901. Is it right to say: what makes an action voluntary is the psychological phenomena in which it is embedded? (The psychological surrounding.)

Are, e.g., my normal movements in walking "voluntary" in a *non-potential* sense?

902. A child stamps its feet with rage: isn't that voluntary? And do I know anything about its sensations of movement, when it is doing this? *Stamping with rage is voluntary*. Coming when one is called, in the normal surroundings, is voluntary. Involuntary walking, going for a walk, eating, speaking, singing, would be walking, eating, speaking etc. in an abnormal surrounding. E.g. when one is *unconscious*: if for the rest one is behaving like someone in narcosis; or when the movement goes on and one doesn't know anything about it as soon as one shuts one's eyes; or if one can't adjust the movement however much one wants to; etc.

903. No supposition seems to me more natural than that there is no process in the brain correlated with associating

or with thinking; so that it would be impossible to read off thought-processes from

Page Break 160

brain-processes. I mean this: if I talk or write there is, I assume, a system of impulses going out from my brain and correlated with my spoken or written thoughts. But why should the *system* continue further in the direction of the centre? Why should this order not proceed, so to speak, out of chaos? The case would be like the following--certain kinds of plants multiply by seed, so that a seed always produces a plant of the same kind as that from which it was produced--but *nothing* in the seed corresponds to the plant which comes from it; so that it is impossible to infer the properties or structure of the plant from those of the seed that it comes out of--this can only be done from the *history* of the seed. So an organism might come into being even out of something quite amorphous, as it were causelessly; and there is no reason why this should not really hold for our thoughts, and hence for our talking and writing. [Cf. Z 608.]

Page 160
904. It is thus perfectly possible that certain psychological phenomena *cannot* be investigated physiologically, because physiologically nothing corresponds to them. [Cf. Z 609.]

Page 160
905. I saw this man years ago: now I have seen him again, I recognize him, I remember his name. And why does there have to be a cause of this remembering in my nervous system? Why must something or other, whatever it may be, be stored-up there *in any form*? Why *must* a trace have been left behind? Why should there not be a psychological regularity to which *no* physiological regularity corresponds? If this upsets our concepts of causality then it is high time they were upset. [Cf. Z 610.]

Page 160
906. The prejudice in favour of psycho-physical parallalism [[sic]] is also a fruit of the primitive conception of grammar. For when one admits a causality between psychological phenomena, which is not mediated physiologically, one fancies that in doing so one is making an admission of the existence of a soul *alongside* the body, a ghostly mental nature. [Cf. Z 611.]

Page 160
907. Must the verb "I believe" have a past tense form? Well, if instead of "I believe he's coming" we always said "He could be coming" (or the like), but nevertheless said "I believed..."--in this way the verb "I believe" would have *no present*. It is characteristic of the kind of way in which we are apt to regard language, that we believe that there must after all in the last instance be uniformity,

Page Break 161

symmetry: instead of holding on the contrary that it doesn't *have* to exist.

Page 161
908. Imagine the following phenomenon. If I want someone to take note of a text that I recite to him, so that he can repeat it to me later, I have to give him paper and pencil, while I am speaking he makes lines, marks, on the paper; if he has to reproduce the text later he follows those marks with his eyes and recites the text. But I assume that what he has jotted down is not *writing*, it is not connected by rules with the words of the text; yet without these jottings he is unable to reproduce the text; and if anything in it is altered, if part of it is destroyed, he gets stuck in his 'reading' or recites the text uncertainly or carelessly, or cannot find the words at all.--This *can* be imagined!--What I called jottings would not be a *rendering* of the text, not a translation, so to speak, in another symbolism. The text would not be *stored up* in the jottings. And why should it be stored up in our nervous system? [Cf. Z 612.]

Page 161
909. Why should not the initial and terminal states of a system be connected by a natural law, which does not cover the intermediary state? (Only don't think of *agency*). [Cf. Z 613.]

Page 161
910. What is called an alteration in concepts is of course not merely an alteration in what one says, but also in what one does.

Page 161
911. One sees the terminology, but fails to see the technique of applying it.

Page 161
912. One says: "He appears to be in frightful pain" even when one hasn't the faintest doubt, the faintest suspicion that the appearance is deceptive. Now why doesn't one say "I appear to be in frightful pain" for this too must at the very least make *sense*? I might say it at an audition; and equally "I appear to have the intention of..." etc. etc. Everyone will say: "Naturally I don't say that; because I *know* whether I am in pain." It doesn't ordinarily *interest* me to know whether I appear to be in pain; for the conclusions which I draw from this impression in the case of other

people, are ones I don't draw in my own case. I don't say "I'm groaning dreadfully, I must see a doctor", but I may very well say "He's groaning dreadfully, he must...".

Page Break 162

Page 162

913. If this makes no sense: "I know that I am in pain"--and neither does "I feel my pains",--then neither does it make sense to say: "I don't bother about my own groaning because *I know* that I am in pain"--or--"because I *feel* my pains."

So much, however, is true: I don't bother about my groaning. [Cf. Z 538.]

Page 162

914. I infer from observation of his behaviour that he must go to the doctor; but I do *not* make this inference for myself from observation of my behaviour. Or rather: I do that too sometimes, but *not* in analogous cases. [Cf. Z 539.]

Page 162

915. Here it is a help to remember that it is a primitive reaction to take care of, to treat, the place that hurts when someone else is in pain, and not merely when one is so oneself--hence it is a primitive reaction to attend to the pain-behaviour of another, as, also, *not* to attend to one's own pain-behaviour. [Cf. Z 540.]

Page 162

916. What, however, is the word "primitive" meant to say here? Presumably, that the mode of behaviour is *pre-linguistic*: that a language-game is based *on it*: that it is the prototype of a mode of thought and not the result of thought. [Cf. Z 541.]

Page 162

917. It can be called "putting the cart before the horse" to give an explanation like the following: we took care of the other man, because going by analogy with our own case, we believed that he too had the experience of pain.--Instead of saying: Learn from this particular chapter of our behaviour--from this language-game--what are the functions of "analogy" and of "believing" in it. [Cf. Z 542.]

Page 162

918. "How does it come about that I see the tree standing up straight even if I incline my head to one side, and so the retinal image is that of an obliquely standing tree?" Well how does it come about that I speak of the tree as standing up straight even in these circumstances?--"Well, I am conscious of the inclination of my head, and so I supply the requisite correction in the way I take my visual impression."--But doesn't that mean confusing what is primary and what is secondary? Imagine that we knew *nothing at all* of the inner structure of the eye--would this problem make an appearance? We do *not* in truth supply any correction here--that explanation is gratuitous.

Well--but now that the structure of the eye is known--*how does it*

Page Break 163

come about that we act, react, in this way? But must there be a physiological explanation here? Why don't we just leave explaining alone?--But you would never talk like that, if you were examining the behaviour of a machine!--Well, who says that a living creature, an animal body, is a machine in this sense?--[Cf. Z 614.]

Page 163

919. One may note an alteration in a face and describe it by saying that the face assumed a harder expression--and yet not be able to describe the alteration in spatial terms. This is enormously important.--Perhaps someone now says: if you do that, you just aren't describing the alteration of the face, but only the effect on yourself; but then why shouldn't a description using concepts of shape and colour be that too?

Page 163

920. One may also say: "He made *this* face" or "His face altered like *this*", imitating it--and again one can't describe it in any other way. ((There just are many more language-games that are dreamt of in the philosophy of Carnap and others.))

Page 163

921. Consciousness that... may disturb me in my work; knowledge can't.

Page 163

922. How do I know that a dog is hearing something continuously, is having a continuous visual impression, that it feels joy, fear, pain?

What do I know of the 'experience contents' of a dog?

Page 163

923. Are the *colours* really brethren? Are they different only in colour, not also in kind? Are sight, hearing, taste really brethren?

Don't look only for similarities in order to justify a concept, but also for connexions. The father transmits his name to the son even if the latter is quite unlike him.

Page 163

924. Compare a dreadful fright and a sudden violent pain. It is the sensation of pain that is dreadful--but is it the sensation of fright? When someone falls headlong in my presence,--is that merely the cause of an extremely unpleasant sensation in *me*? And how can this question get answered? Does someone who reports the frightful incident complain of the sensation, the catching of breath, etc.? If one

Page Break 164

wants to help someone get over the fright, does one treat the body? Doesn't one much more soothe him about the event, the occasion?

Page 164

925. If someone imitates grief for himself in his study, he will indeed readily be conscious of the tensions on his face. But really grieve, or follow a sorrowful action in a film, and ask yourself if you were conscious of your face. [Cf. Z 503.]

Page 164

926. One tie-up between moods and sense-impressions is that we use the concepts of mood to describe sense-impressions and images. We say of a musical theme, or a landscape, that it is sad, cheerful etc. But naturally it is much more important that we use all the concepts of mood to describe human faces, actions, behaviour. [Cf. Z 505.]

Page 164

927. Consciousness in the face of another. Look into someone else's face and see the consciousness in it, and also a particular *shade* of consciousness. You see on it, in it, joy, indifference, interest, excitement, dullness etc. The light in the face of another.

Do you look within *yourself*, in order to recognize the fury in *his* face? It is there as clearly as in your own breast.

(And what does one want to say? That someone else's face stimulates me to imitate it, and so that I feel small movements and muscular tensions on my own part, and *mean* the sum of these? Nonsense! Nonsense,--for you are making suppositions instead of just describing. If your head is haunted by explanations here, you will neglect to bear in mind the facts which are most important.) [Cf. Z 220.]

Page 164

928. Knowledge, opinion, have no facial expression. There is a tone, a gesture of conviction all right, but only if something is said in this tone, or with this gesture.

Page 164

929. "Consciousness is as clear in his face and behaviour, as in myself." [Cf. Z 221.]

Page 164

930. What would it mean for me to be wrong about his having a mind, having consciousness? And what would it mean to say I was wrong and didn't have any myself? What would it mean to say "I am not conscious"?--But don't I know that there is a consciousness in me?--Do I know it then, and yet the statement that it is so has no purpose?

Page Break 165

Page 165

And how remarkable that one can learn to make oneself understood to others in this matter! [Cf. Z 394.]

Page 165

931. A man can pretend to be unconscious; but *conscious*? [Cf. Z 395.]

Page 165

932. What would it be like for someone to tell me with complete seriousness that he (really) did not know whether he was dreaming or awake?--

Is the following situation possible: Someone says "I believe I am now dreaming"; he actually wakes up soon afterwards, remembers that utterance in his dream and says "So I was right!"--This narrative can surely only signify: Someone dreamt that he had said he was dreaming.

Imagine an unconscious man (anaesthetized, say) were to say "I am conscious" should we say "He ought to know"?

And if someone talked in his sleep and said "I am asleep"--should we say "He's quite right"?

Is someone speaking untruth if he says to me "I am not conscious"? (And truth, if he says it while unconscious? And suppose a parrot says "I don't understand a word", or a gramophone: "I am only a machine"?)
[Cf. Z 396.]

933. Suppose it were part of a day-dream I was having to say: "I am merely engaged in phantasy", would this be *true*? Suppose I write such a phantasy or narrative, an imaginary dialogue, and in it I say "I am engaged in phantasy"--but, when I write it down,--how does it come out that these words belong to the phantasy and that I have not emerged from the phantasy?

Might it not actually happen that a dreamer, as it were emerging from the dream, said in his sleep "I am dreaming"? It is quite imaginable there should be such a language-game.

This hangs together with the problem of 'meaning'. For I can write "I am healthy" in the dialogue of a play, and so not *mean* it, although it is true. The words belong to this and not that language-game. [Cf. Z 397.]

934. 'True' and 'false' in a dream. I dream that it is raining, and that I say "It is raining"--on the other hand: I dream that I say "I am dreaming". [Cf. Z 398.]

935. Has the verb "to dream" a present tense? How does a person learn to use this? [Cf. Z 399.]

936. One language-game analogous to a fragment of another. A space projected into bounded bits of a space. [Cf. Z 648.]

937. Suppose I were to have an experience like waking up, were then to find myself in quite different surroundings, with people who assure me that I have been asleep. Suppose further I insisted that I had not been dreaming, but living in some way outside my sleeping body. What function has this assertion? [Cf. Z 400.]

938. "I have consciousness"--that is a statement about which no doubt is possible." Why should that not say the same as: "I have consciousness' is not a proposition"?

It might also be said: What's the harm if someone says that "I have consciousness" is a statement admitting of no doubt? How do I come into conflict with him? Suppose someone were to say this to me why shouldn't I get used to making no answer to him instead of starting an argument? Why shouldn't I treat his words like his whistling or humming? [Cf. Z 401.]

939. "Nothing is so certain as that I possess consciousness." In that case, why shouldn't I let the matter rest? This certainty is like a mighty force whose point of application does not move, and so no work is accomplished by it. [Cf. Z 402.]

940. Someone playing dice throws first a 5 and then a 4 and says "If I had only thrown a 4 instead of the 5, I should have won"! The condition is not physical but only mathematical, for one might reply: "If you had thrown a 4 first, who knows what you would have thrown next!" [Cf. Z 678.]

941. If you now say: "The use of the subjunctive rests on belief in natural law" one may retort: "It does not *rest* on that belief; it and that belief stand on the same level." [Cf. Z 679.]

942. Fate stands in contrast with natural law. One wants to find a foundation for natural law and to use it: not so with fate. [Cf. Z 680; V.B., p. 119; C. & V., p. 61.]

943. The concept of a 'fragment'. It is not easy to describe the use of this word *even only roughly*.

944. When we want to describe the use of a word,--isn't it like wanting to make a portrait of a face? I see it clearly; the expression of these features is *well* known to me; and if I had to paint it I shouldn't know where to begin. And if I do actually make a picture, it is wholly inadequate.--If I had a description in front of me I'd recognize it, perhaps even detect mistakes in it. But my being able to do that does not mean that I could myself have given the description.

945. Two objects 'belong together'. One teaches a child to 'arrange' things, accompanying this activity with the words "These belong together". The child learns this expression as well. It might even arrange things *with the help* of these

words and certain gestures. But the words may also be a mere accompaniment of the doing. A language-game.

Imagine such a game played without words, but with the accompaniment of music that fitted the actions.

Page 167

946. "Put it here"--saying which I point to the place with my finger--this is an *absolute* specification of place. And if someone says that space is absolute, he might produce as an argument for this: "There is after all a *place: here*." [Cf. Z 713.]

Page 167

947. The 'experience of similarity'. Think of the language-game "recognizing similarities", or "giving similarities", or "arranging things according to their similarity". Where is the special experience here? The special experience content that one is after?

Page 167

948. The duration of sensation. Compare the duration of a sensation of sound with the duration of the tactile sensation that tells you you have a ball in your hand; and with the "feeling" that tells you that your knee is bent. And here again we have a reason why we should like to say of the sensation of posture that it has no content. [Cf. Z 478.]

Page 167

949. Philosophical investigations: conceptual investigations. The essential thing about metaphysics: that the difference between factual and conceptual investigations is not clear to it. A metaphysical question is always in appearance a factual one, although the problem is a conceptual one. [Cf. Z 458.]

Page 167

950. What is it, however, that a conceptual investigation does? Does it belong in the natural history of human concepts?--Well, natural history, we say, describes plants and beasts. But might it not be that

Page Break 168

plants had been described in full detail, and then for the first time someone realized the analogies in their structure, analogies which had never been seen before? And so, that he establishes a new order among these descriptions. He says, e.g., "compare this part, not with this one, but rather with that" (Goethe wanted to do something of the sort) and in so doing he is not necessarily speaking of *derivation*; nonetheless the new arrangement *might* also give a new direction to scientific investigation. He is saying "Look at it like *this*"--and that may have advantages and consequences of various kinds.

Page 168

951. Why do we count? Has it proved practical? Do we have our concepts, e.g. the psychological ones, because it has proved to be advantageous? And yet we do have *certain* concepts just for that reason; they were introduced for that reason. [Cf. Z 700.]

Page 168

952. One ought not to think it a simplification to bring seeing with one eye under consideration, instead of seeing with both eyes; if, that is, one is clear about the fact that one doesn't feel seeing in the eyes. It is far more difficult to carry the idea of the visual object through for binocular vision. For what is the binocular 'optical image'?

'The portrait of what one really *sees*' of the visual impression itself'.

Page 168

953. It occurs to someone: If I only had the right things and colours at my disposal, I could *exactly* represent what I see. And up to a point it actually is so. And that report of what I have before me, and the description of what I see, have the same form.--But they quite leave out, e.g., the wandering of the gaze. Not that alone, though, but also, e.g., the reading of a script in the visual field and any aspect of what is seen.

Page 168

954. Now if what you are looking at is a big tablet or flat wall, with a figure on it, then a picture of this figure may

count as an exact description. If the figure is, e.g., an *F*, what more can one want than that it is copied exactly? and yet there is besides a quite different description, which is not there in the copying. And similarly when the figure is a face.

Page 168

955. What in *one* sense is a slight inaccuracy of description, in another is a large one.

Page Break 169

Page 169

956. Active and passive. Can one order someone to... or not? This perhaps seems, but is not, a far-fetched distinction. It resembles this one: Can one (*logical possibility*) decide to... or not?"--And that means: How is it surrounded by thoughts, feelings etc.? [Cf. Z 588.]

Page 169

957. What would a society all of deaf people look like? Or a society of 'mental defectives'? An *important question!* What, that is, would a society be like, that never played a lot of our ordinary language-games? [Cf. Z 371.]

Page 169

958. Being conscious of the identity of colours in a picture, or of *this* colour's being darker than that one.

While I am hearing this piece, am I conscious the whole time of its being by...?

When is one *conscious* of a fact?

Page 169

959. Love is not a feeling. Love is put to the test, pain is not. [Cf. Z 504.]

Page 169

960. I see something *in different connexions*. (Isn't this more closely related to imagining than to seeing?)

Page 169

961. It is as if one had brought a concept to what one sees, and one now sees the concept along with the thing. It is itself hardly visible, and yet it spreads an ordering veil over the objects.

Page 169

962. "What do you see?" (Language-game)--"What do you *actually* see?"

Page 169

963. Let us represent seeing to ourselves as something enigmatic!--without introducing any kind of physiological explanation.--

Page 169

964. The question "What do you see?" gets for answer a variety of kinds of description.--If now someone says "After all, I see the aspect, the organization, just as much as I see shapes and colours"--what is that supposed to mean? That one includes all that in 'seeing'? Or that here there is the greatest similarity?--And what can I say to the matter? I can point out similarities and differences.

Page 169

965. Mightn't it be taken for madness, when a human being recognizes a drawing as a portrait of NN and exclaims "That's Mr. NN!"--"He must be mad", they say, "He sees a bit of paper with black lines on it and takes it for a human!"

Page Break 170

Page 170

966. 'Seeing the figure *as...*' has something occult, something ungraspable about it. One would like to say: "Something has altered, and nothing has altered."--But don't try to explain it. Better look at the rest of seeing as something occult too.

Page 170

967. The expression of that experience is and remains "I see it as a mountain", "I see it as a wedge", "I see it with this base and this apex, but fallen over", etc. And the words "mountain", "wedge", "base", "fallen over" are after all only marks, or noises--*with a use*.

Page 170

968. Think of a representation of a face from in front and in profile at the same time, as in some modern pictures. A representation in which a movement, an alteration, a roving of one's glance, are included. Does such a picture *not really* represent what one sees?

Page 170

969. "I forgive you." Can one say "I am busy forgiving you"? No. But that doesn't mean that there is not a process, which one might--but does not--call "forgiving": I mean carrying on the inward struggle that may lead to forgiving.

Page 170

970. I should like to say: there are aspects which are *mainly* determined by thoughts and associations, and others that are 'purely optical', these make their appearance and alter automatically, almost like after-images.

Page 170

971.

Page 170

What Köhler†1 does not deal with is the fact that one may *look at* figure 2 in this way or that, that the aspect

is, at least to a certain degree, subject to the will.

Page 170

972. I may attend to the course of my pains, but not in the same way to that of my believing or knowing. [Cf. Z 75.]

Page 170

973. The observation of duration may be continuous, or interrupted.

Page Break 171

Page 171

How do you observe your knowing, your opinions? and on the other hand, an after-image, a pain? Is there such a thing as uninterrupted observation of my capacity to carry out the multiplication...? [Cf. Z 76-7.]

Page 171

974. ((On no. 971)) One *might* use the fact that the aspect is connected with eye-movements, to explain that.

Page 171

975. Analogy with the contrast between the 'value' and the 'limiting value' of a function. ((important))

Page 171

976. That an aspect is subject to the will is not something that does not touch its very essence. For what would it be like, if we could see things arbitrarily as red or green? How in that case would one be able to learn to apply the words "red" and "green"? First of all, in that case there would be no such thing as a 'red object', but at most an object which one more easily sees red than green.

Page 171

977. Isn't what Köhler says roughly: "One couldn't *take* something for this or that, if one couldn't *see* it as this or that"? Does a child start by seeing something this way or that, before it learns to take it for this or that? Does it first learn to answer the question "How do you see that?" and only later "What *is* that?"--

Page 171

978. Can one say it must be capable of grasping the chair visually as a whole, in order to be able to recognize it as a thing?--Do I grasp that chair visually as a thing, and which of my reactions shews this? Which of a man's reactions shew that he recognizes something as a thing, and which, that he *sees* something as a whole, thingishly?

Page 171

979. One might imagine the matter like this: One tests how a child copies flat figures, when one has not taught it any kind of copying, and when it hasn't yet even seen 3-dimensional objects.

Page 171

980. I learn to describe what I see; and here I learn *all sorts of* language-games.

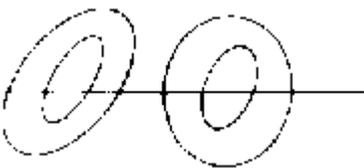

Page 171

981. Not: "How can I describe what I see?"--but "What does one call 'description of what is seen?'"
And the answer to *this* question is "A great variety of thing".

Page Break 172

Page 172

982. Köhler†1 says that very few people would of their own accord see the figure 4 in the drawing

and that is certainly true. Now if some man deviates radically from the norm in his description of flat figures or when he copies them, what difference does it make between him and normal humans that he uses different '*units*' in copying and describing? That is to say, how will such a one go on to differ from normal humans in yet other things?

Page 172

983. A man might be highly gifted at drawing, I mean he might have the talent to copy objects, a room for instance, very exactly, and yet he might keep on making small mistakes against *sense*; so that one could say "He doesn't grasp an object as an object". He would never, e.g., make a mistake like that of the painter Klecksel, who paints two eyes in the profile. His *knowledge* would never mislead him.

Page 172

984. The misleading concept is "the *complete* description of what one sees".

Page 172

985. Always eliminate the private object for yourself, by supposing that it keeps on altering: you don't notice this,

however, because your memory keeps on deceiving you. [Cf. P.I. p. 207e.]

Page 172

986. "Anyone who sees something sees something particular"--but that doesn't tell us anything.

It is as if one wanted to say "Even if no representation is like the visual impression, still, it is like itself".

Page 172

987. It is quite possible that someone who was asked "What do you see here?" might copy the figure correctly, but given the question "Do you see a 4?", he might answer with a "No", although he has himself formed it in making his copy.

Page 172

988. What do I tell someone, to whom I give the information that I am now seeing the ornament like *this*? (A queer question)--This means "In what language-game does this sentence find employment?"--"What are we doing with this sentence?"

Page 172

989. Let us suppose that certain aspects could be explained by the movement of the eye. In that case one would like to say that those

Page Break 173

aspects were of a purely optical character; and so there would have to be a description of them which did not have to make use of analogies from other domains. Then one would have to be able to replace the order: "See this as..." by: "Have your gaze shift in such and such a way" or the like.

Page 173

990. But it is not true that an experience which is traceably connected with the movement of the eyes, an experience that can be produced by such a movement, can for that reason be described by means of a sequence of optical images.

(Any more than someone who imagines a note is imagining a sequence of disturbances of the air.)

Page 173

991. Hold the drawing of a face upside-down and you can't tell the *expression* of the face. Perhaps you can see that it is smiling, but you won't be able to say what *sort* of a smile it is. You wouldn't be able to imitate the smile or describe its character more exactly.

And yet the upside-down picture may represent the object extremely accurately. [Cf. P.I. p. 198f.]

Page 173

992. One needs to remember that seeing-as may have an effect like that of an alteration of what is seen, e.g. by putting between brackets, or underlining, or making a connexion of one kind or another etc., and that in this way again there is a similarity between seeing-as and imagining.

No one, after all, will deny that underlining or insertion of brackets may foster the recognition of a similarity.

Page 173

993. It is clear that only someone who sees the ambiguous picture as a rabbit will be able to imitate the expression on the face of the rabbit. So if he sees the picture in *this* way, this will enable him to judge a particular kind of resemblance.

Page 173

994. One will also estimate certain dimensions correctly, only if one sees the picture in *this* way.

Page 173

995. Remember that one may say: "You have to hear the tune like *this*, and then also *play* it correspondingly".

Page 173

996. Might there not be humans who don't calculate in their heads and can't easily learn silent reading, but who were otherwise intelligent and in no sense 'defective'?

Page 173

997. There is no doubt that one often evokes an aspect by means of a movement of the eyes, by shifting one's gaze.

Page Break 174

Page 174

998. But how queer! one would like to say--if one can discover a kind of composition,--how is it possible also to *see* it?!--How is it possible to know in a flash what one wants to say? Isn't that equally remarkable?

Page 174

999. For is the phenomenon of the aspect queerer than my memory of a particular actual person, of whom I have a memory image? There is even a similarity between the two things. For here too one asks oneself: How is it *possible*

that I have a memory-image of *him* and that there is no doubt about its being an image of *him*?

Page 174

1000. Philosophy often solves a problem merely by saying: "*Here* is no more difficulty than *there*."

That is, just by conjuring up a problem, where there was none before.

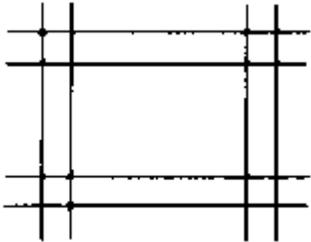

It says: "Isn't it just as remarkable that...", and leaves it at that.

Page 174

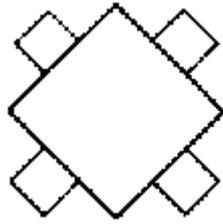

1001. How does one obey the order "Imagine Mr. N"? How does one know that the order has been obeyed? how does anyone know that he has obeyed it? What use is the *state* of having a image here?--I want to say that the situation with seeing an aspect is similar.

Page 174

1002. I now see it (the chess-board) like this: It is as if you had given me this schematic drawing. E.g.:

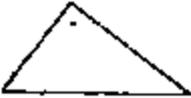

or

determined.

But the figure as which I see the other, is not unambiguously

Page 174

1003. Imagine a film representation of a triangle  swinging around the point and then at rest. And now it might be as if this temporal surrounding still had an effect in the picture of the triangle come to rest.

"Hanging", I should like to say. But does nothing correspond to that? Certainly something does! But that only means that I am not lying, and that the expression of the aspect has a use. "*What application?*", you must always ask yourself.

Page Break 175

Page 175

1004. One might regard the drawing of the chess board as a blueprint according to which pieces were to be constructed which yield the chess-board. Now this drawing may be used in various ways; and one can also *see* it in various ways, correspondingly to the different uses.

Page 175

1005. Suppose we explained this by saying the aspect comes about through different images and memories superimposed on the optical image. Naturally this explanation does interest me, not as an explanation but as a logical possibility, hence conceptually (mathematically).

Page 175

1006. "The green that I see over there is *leafy*. Those things there are *eye-like*." (What things?)

Page 175

1007. What cannot be an object of sight here seems to be an object of sight. As if one were to say one saw sounds. (But one really does say that one sees a vowel yellow, or brown.)

Page 175

1008. For how could association be a lasting state? How could I associate this kind of object with these lines for five minutes?

Page 175

1009. What convinces me that someone else sees an ordinary picture three-dimensionally?--That he says so?--Rubbish--for how do I know what he means by assuring us of this?

Well, it's that he knows his way about in the picture; the expressions he applies to it are the ones that he applies to space; confronted with a picture of a landscape, he behaves as he does when confronted with a landscape, etc. etc.

Page 175

1010. I can never know, about him, whether he really sees. Well then of course I can't know it of myself either. For how do I know that I am now calling the same thing that as before, and that I am calling the same thing "same"?

Page 175

1011. Now, how does it all look in the third person? And what is valid for the third person is then valid, however queer this may sound, for the first person too.

Page 175

1012. Imagine a physiological explanation for my seeing *one* thing (A) as a variation of the *other* (B). It might come out that when I see A as B certain processes take place on my retina, which otherwise are found when I actually see B. And this might now explain some things

Page Break 176

in my behaviour. It might, e.g., be said that that is the reason why on seeing A I behave as if I were seeing B, a way I don't ordinarily behave when I see A but don't see it as B. But for us this explanation of my behaviour is superfluous. I accept the behaviour just as I accept a process on the retina or in the brain.

I want to say: At first the physiological explanation is apparently a help, but then at once it turns out to be a mere catalyst of thoughts. I introduce it only to rid myself of it again at once.

Page 176

1013. Just do *not* fancy that you'd know in advance what "state of seeing" means in this case. Have the use *TEACH* you the meaning.

Page 176

1014. Could I have made the phenomenon of having an image clear to myself, if I had been told: someone whose eyes are open sees something that is not there before him, and at the same time also sees what is before him, and the two visual objects don't get in each other's way?!

Page 176

1015. And naturally it would be quite wrong to say: "And yet queer things do happen", or "incredible things". Rather what happens is *not* queer and is just wrongly seen as queer.

Page 176

1016. The old idea of the role of *intuition* in mathematics. Is this intuition the seeing of the complexes in different aspects?

Page 176

1017. Doesn't one have to distinguish among aspects, separating the purely optical from the rest?

That they are very different from one another is clear: the dimension of depth, for example, sometimes comes into their description, and sometimes not; sometimes the aspect is a particular 'grouping'; but when one sees lines as a face, one hasn't taken them together merely visually to form a group; one may see the schematic drawing

of a cube as an open box or as a solid body, lying on its side or standing up; the figure: can be seen, not just in two but in very many different ways.

Page 176

1018. One hangs up pictures, photographs, of landscapes, interiors, human beings, and does not regard them as working drawings. One likes to look at them, as at the objects themselves; one smiles at the

Page Break 177

photograph as at the human being that it shews. We don't learn to understand a photograph as we do a blue-print.--It would of course be possible that we had first to learn with some pains to understand a method of depiction, in order to be able later on to use it as a natural picture. Still this troublesome learning would later on be mere *history*, and then we should regard the picture just as we now regard our photographs.

Page 177

1019. There might also be men who did not understand, did not see, photographs as we do; who did indeed understand that a human being *can* be represented in this way, who were also able to judge his shape roughly from a photograph, but who all the same did not see the picture as a picture. *How* would that be manifested? What would we regard as the expression of it?? That is perhaps not easy to say.

These people would perhaps not take pleasure in photographs as we do. They would not say "Look at his smile!" and the like; they would often not recognize a person straight off from his picture; would have to *learn to read* the photograph, and have to *read* it; they would be in a difficulty to recognize two good snapshots of the same face as pictures of somewhat different positions.

Page 177

1020. If someone were to tell me that he had seen the figure for half an hour without a break as a reversed F, I'd have to suppose that he had kept on *thinking* of this interpretation, that he had *occupied* himself with it.

Page 177

1021. It is as if the aspect were something that only dawns, but does not remain; and yet this must be a *conceptual* remark, not a psychological one.

1022. When the aspect suddenly changes one experiences the second phase in an acute way (corresponding to the exclamation "Oh, it's a...!") and here of course one does *occupy* oneself with the aspect. In the temporal sense the aspect is only the kind of way in which we again and again treat the picture.

1023. 'Object' and 'ground'--Köhler wants to say--are visual concepts, like red and round. The description of what is *seen* includes mentioning what is object and what is ground no less than colour and shape. And the description is just as incomplete when it isn't said what is object and what ground, as it is when colour or shape are not given. I see the one as immediately as the other one wants to say. And what objection is there to make to this? First: how this gets

recognized--whether through introspection, and whether everyone has got to agree about it. For the question obviously concerns the description of the *subjectively seen*. But just how does one learn to use words to report the subjective? And what can these words mean to us?

Suppose that, instead of words, it were a matter of reproducing by drawing; and in this reproduction what corresponded to the words "object-like" and so on were the sequence, the order, in which we made the drawing. (I am assuming we can draw extraordinarily fast.) And now suppose someone said: "The sequence belongs to the representation of what is seen just as much as colours and shapes do."--What would that mean?

One may very well say: There are reasons for counting not only the drawn picture as part of a description-by-drawing of what is seen but also the phrasing that goes on in making the drawing. Somehow these reactions of the one who is giving the description belong together. In certain respects they do belong together, in others they do not.

1024. If one thinks of the currents on the retina (or the like) one would like to say: "So the aspect is just as much 'seen' as are the shape and colour." But then how can such an hypothesis have helped us to form this conviction? Well, it favours the tendency to say here that we were *seeing* two different structures. But if this tendency can be given a ground, its ground must be somewhere else.

1025. The expression of the aspect is the expression of a way of taking (hence, of a way-of-dealing-with, of a technique); but used as description of a state.

1026. When it looks as if there were no room for such a logical form, then you must look for it in another dimension. If there is no room for it here, then there is in another dimension. [Cf. P.I. p. 200f.]

1027. In this sense there is also no room for imaginary numbers in the number-line. And that surely means: the application of the concept of an imaginary number is *radically* different from that of, say, a cardinal number; more different than the mathematical operations alone reveal. In order, then, to get place for them, one must descend to their application and then they find a, so to speak *undreamt of*, different place. [Cf. P.I. p. 201a.]

1028. If this constellation is always and continuously a face for me, then I have not named an *aspect*. For *that* means that I always *encounter*

it as a face, treat it as a face; whereas the peculiarity of the aspect is that I see something into a picture. So that one might say: I see something that isn't there at all, that does not reside in the figure, so that it may surprise me that I can see it (at least, when I reflect upon it afterwards).

1029. If the seeing of an aspect corresponds to a thought, then it is only in a *world* of thoughts that it can be an aspect.

1030. If I am describing an aspect, the description presupposes concepts which do not belong to the description of the figure itself.

1031. Is it not remarkable, that in describing a visual impression one so uncommonly seldom includes the roving of the gaze in the description?! It is as good as never included when the object is small, is, e.g. a face; although here too after all the gaze is continually shifting.

1032. This aspect may suddenly change and then a new looking follows the change. One is conscious of, e.g., the facial expression, one *contemplates* it.

1033. I may, e.g., be looking at a photograph and be occupied with the expression of the face, may so to speak bring it home to myself, without saying anything to myself or to anyone else as I do so.

I make the eyes of the photograph speak to me. Perhaps I am seeing the picture for the first time as a real face. 'Enter into the expression.' Ask, not "What goes on here?" but rather "What does one do with this utterance?"

1034. We become conscious of the aspect only when it changes. As when someone is conscious only of a change of note, but doesn't have absolute pitch.

1035. When one fails to recognize the Mediterranean on the map with a different colouring, *that* does not shew that there is *really* a different visual object before one. (Köhler's example.†1) At most that might give a plausible ground for a particular *way of expressing oneself*. For it is not the same to say "That shews that here there are two ways of seeing"--and "Under these circumstances it would be better to speak of 'two different objects of sight'."

1036. That an aspect can be summoned up by thoughts is extremely important, although it doesn't solve the problem.

It is as if the aspect were an inarticulate reverberation of a thought.

1037. I hear two people talking, don't understand what they are saying but hear the word "bank". Now I take it for granted that they are talking about money. (This may turn out right or wrong.) Does that mean that I *heard* the word "bank" in *that* meaning?

On the other hand: someone is speaking in a kind of game, uttering words of double meaning out of any context; I hear the word "bank" and hear it in that meaning. It is almost as if this last were a worthless vestige of the first proceeding.

1038. Why shouldn't the overwhelming inclination exist, to use a certain word in our utterance? And why shouldn't this word, nevertheless, be misleading, when we are reflecting on our experience?

I mean: Why should we not want to say "see" although the comparison with seeing is in many ways wrong? Why should we not be impressed by an analogy, to the detriment of all the differences? But for that reason one can't appeal to the words of the utterance.

Physiological consideration here is merely confusing. Because it distracts us from the logical, conceptual problem.

1039. The confusion in psychology is not to be explained by its being a "young science". Its state isn't at all to be compared with, e.g., that of physics in its early period. Rather with that of certain branches of mathematics. (Set theory.) For there exists on the one hand a certain experimental method, and the other hand conceptual confusion; as in some parts of mathematics there is conceptual confusion and methods of proof. While, however, in mathematics one may be pretty sure that a proof will be important, even if it is not yet rightly understood, in psychology one is completely uncertain of the fruitfulness of the experiments. Rather, in psychology there is what is problematic and there are experiments which are regarded as methods of solving the problems, even though they quite by-pass the thing that is worrying us. [Cf. P.I. p. 232.]

1040. One might get tempted to believe that there was a particular kind of way in which one pronounces dates, a particular cadence or something of that sort. For to me a number like 1854, say the number

of a house, may have something date-like about it. One might believe that our experience is that of a particular mental adjustment, which makes the mind ready for a particular activity; and so it is to be compared to the posture of the body before jumping. This is a very enticing error. It is a fact of experience that *this* posture is a frequent or appropriate preparation for *this* activity. But we did not learn that this feeling, this experience, is a serviceable preparation for such-and-such an application of the figure, the number, etc. Expressions like "It is as if the

experience were already a-quiver with the future application", "It is as if we were already innervating the muscles for this particular activity," etc. etc. are only paraphrased *expressions* of the experience. (As if someone were to say "My heart is glowing with love for...".) Here, moreover, we have an indication of the origin of the sensation of innervation which is supposed to constitute the consciousness of the act of will.

Page 181

1041. As I recognize someone I say: "Now I see--the features are the same, only..." and there follows a description of the changes that are in fact there. Suppose I said "The face is rounder than it was"--am I to say it is some peculiarity of the optical picture, of the visual impression, that shews me this? Of course it will be said: "No, here an optical picture comes together with a memory." But how do these two things come together? Isn't it *as if* two pictures were getting compared here? But there aren't two pictures being compared; and if there were, one would still have to keep on recognizing one of them as the picture of the earlier face.

Page 181

1042. I may, however, say: I see that this figure is contained in that one, but I can't *see* it in it. This description is a proper one for this figure, but still I can't *see* the figure according to the description.

And here "seeing" doesn't mean "recognizing in a flash" either. For it might well be that someone was unable to see the one figure in the other at first glance, but that he could do this *after* he had, as it were piecemeal, recognized the containment of the one by the other.

Page 181

1043. If I use the two pictures to inform him that the one figure is contained in the other, or that I recognize that it is so, I don't thereby inform him that I see the one in the other. Wherein resides the difference between the two pieces of information? (Their verbal expression need not differ.)

Page Break 182

Page 182

1044. I cannot see the figure  as a union of  and  which are pushed together in such a way that they are half super-imposed, so that the middle black region as it were counts as doubled. If now someone said he could see the figure this way could I not understand this? Could I believe it? Should I say that this is possible--even if nothing of the kind has ever happened to me? Need I say "You just mean something different by 'seeing this way' from what I mean by it"? And if I did accept it, what should I now know, what could I do with it? (A physiological application is of course again imaginable.)

Page 182

1045. Here belongs the question "What information would anyone be giving me, who said that he could *see* a regular 50-gon as such? How would one test his statement? What allow to count as a test?"

Page 182

It seems to me possible that one would accept *nothing at all* as confirmation of this statement.

Page 182

1046. "For me it is *this* ornament now." The "this" must be explained by indicating a *class* of ornaments. One may perhaps say "There are white stripes on something black". No, there isn't any other account of it to give. Although one would like to say: "There must surely be a simpler expression of what I am seeing!" And perhaps there is too. For in the first place one might use the expression "to stand out". One can say "These parts stand out". And now, can't one imagine a primitive reaction of a human being, who did not use words to express this, but rather indicated the parts that "stand out" with his finger, and a special gesture. But that would not make this primitive expression *equivalent* to the verbal expression "white-stripe-ornament".

Page 182

1047. But this too would be possible: a great collection of expressions, of concepts, might be quite equivalent in meaning for someone in this case. And if *that* were the case, ought one to say that the described aspect is purely optical?

Page 182

1048. The question is, however: why the primitive reaction of pointing with the finger is to be called an expression of seeing-as. One will surely not be able to call it so without more ado. Only when it is combined with other expressions.

Page 182

1049. Imagine someone always used a memory to express seeing-as. That he said, e.g., that the figure reminded him now of this now of

Page Break 183

that, which he once saw. What could I do with *this* information?

Can something remind me of this object for half-an-hour together?--supposing I am not occupying myself with this memory.

1050. If now the situation is that, while there is such a thing as an experience of meaning, this after all is something incidental, how in that case can it seem so very important? Does that come of the fact that this phenomenon accommodates a certain primitive interpretation of our grammar (the logic of our language)? Just as one often imagines that the memory of an event must be an internal picture--and such a picture does sometimes really exist.

1051. However blurred my visual picture, it must surely have a *determinate blurredness*, so it must after all be a determinate picture. That presumably means it must be capable of having a description that fits it exactly; the description would then first have to have the same vagueness as the thing described.--But now cast a glance at the picture and give a description that in this sense fits exactly. This description ought properly to have been a *picture*, a drawing! But here what is in question just isn't a blurred copy of a blurred picture. What we see is unclear in a quite different sense. And I believe that the desire to speak of a private visual object might fade for someone, if he thought oftener about this visual scene. The thing is: the method of projection which is possible elsewhere is not possible here.

1052. When I say "He sat on a bank in the grounds", of course one finds it difficult to think of a money-bank here, or to imagine one; but that doesn't prove that one would otherwise have imagined a different bank.

It might, e.g., come easy to us in talking to draw certain pictures corresponding to our talk, and it might be very difficult to draw pictures that conflicted with the intention or the context of what we said. But that wouldn't prove that we always draw while we talk.

1053. If, as I consider this question, I now pronounce all by itself the sentence "You must put the money in the bank", and I mean it in such-and-such a way--does that mean that the same thing is going on in me when I pronounce the sentence as when I say the sentence with this meaning to someone on a real occasion? What might justify such an assumption? At most, that I then say "Just now I meant the

word... in the meaning...". And here the question surely is one of a kind of optical illusion! What justifies that observation in practice is certainly not a process that accompanies the speaking. Even though there may be processes accompanying speech, which point towards this meaning. (The direction of my glance, for example.)

1054. The difficulty is to know one's way about among the concepts of 'psychological phenomena'.

To move about among them without repeatedly running up against an obstacle.

That is to say: one has got to *master* the kinships and differences of the concepts. As someone is master of the transition from any key to any other one, modulates from one to the other.

1055. "Just now I spoke the word... in the meaning..."--How do you know you did? Suppose you've made a mistake? How did you learn to speak it in *that* meaning?

If anyone says "Just now I spoke the word in isolation in *that* meaning", he is playing a totally different language-game from someone who tells me he meant *this* by this word in that report or order.

And so now it is either essential, or inessential, that he also uses the word "to mean" in the first case. If it is essential, then this first language-game is a reflection of the second one.

Say, as a chess-game on the stage may be called a reflection of a real chess-game.

1056. Playing mental chess with someone else: both parties play in the imagination and agree that *this* player won, this one has lost. They are then both able to reproduce the game from memory, agreeing with one another; they can write it down or narrate it.--Think of tennis played like that. It would be possible. Only of course it wouldn't be any sort of muscular exercise. (Although even that might be imagined.)--It is important that even with 'tennis in the imagination' one will be able to say "*I succeeded in... the ball*".

1057. I might dream of a game of chess; but perhaps the dream only shewed me a single move of the game. Nevertheless I would have dreamt: that I played a game of chess. In that case it will be said: "You didn't really play it. You dreamt it." Why shouldn't it also be said "You didn't really mean the word that way, you only dreamt it"?

1058. In a law-court, e.g., the question might be gone into how someone meant a word, and it may also be inferred from certain facts that he meant it this way. It is a question of intention; but could that other case of *meaning* something, where I dreamt of meaning it, have the same importance? [Cf. P.I. p. 214e.]

1059. But how about this: when I read a poem, or some expressive prose, especially when I read it out loud, surely there is something going on as I read it which doesn't go on when I glance over the sentences only for the sake of their information. I may, for example, read a sentence with more intensity or with less. I take trouble to get the tone exactly right. Here I often see a picture before me, as it were an illustration. And may I not also utter a word in such a tone as to make its meaning stand out like a picture? A way of writing might be imagined, in which some signs were replaced by pictures and so were made prominent. This does actually happen sometimes, when we underline a word or positively put it on a pedestal in the sentence. (("... there lay a something....")) [Cf. P.I. p. 214g.]

1060. When I am reading expressively and I pronounce this word, it is, so to speak, filled brimful with its meaning. And now it might be asked "How *can* that be?" [Cf. P.I. p. 215a.]

1061. "How can that be, if meaning is what you believe?" The use of a word can't accompany it or fill it brimful. And now I may reply: my expression was picturesque.--But the picture *forced* itself *on me*. *I want to say*: the word was filled with its meaning. There might perhaps be some explanation of how it comes about that I want to say that.

But why, then, am I not supposed to '*want to say*': I pronounced the (isolated) word with *this* meaning? [Cf. P.I. p. 215a.]

1062. Why shouldn't a particular technique of employment of the words "meaning", "to mean" and others lead me to use these words in, so to speak, a picturesque, improper, sense? (As when I say that the sound *e* is yellow.) But I don't mean: it is a *mistake*--I didn't *really* pronounce the word in this meaning, I only imagined I did. That's not how it is. For I don't merely imagine, either, that there is a game of chess in "Nathan". †1

1063. Thinking in terms of physiological processes is extremely dangerous in connexion with the clarification of conceptual problems in psychology. Thinking in physiological hypotheses deludes us sometimes with false difficulties, sometimes with false solutions. The best prophylactic against this is the thought that I don't know at all whether the humans I am acquainted with actually have a nervous system.

1064. The case of 'meaning experienced' is *related* to that of seeing a figure as this or that. We have to describe this conceptual relationship; we are not saying that the same thing is under consideration in both cases.

1065. When you write your F like this:  do you mean it as a 'slipped' F or as a mirror F? Do you *mean* it to look to the right or the left?--The second question *obviously* does not refer to a process that accompanies the writing. With the first question, one *might* be thinking of such a process.

1066. "I see that the child wants to touch the dog, but doesn't dare." How can I see that?--Is this description of what is seen on the same level as a description of moving shapes and colours? Is an interpretation in question? Well, remember that you may also *mimic* a human being who would like to touch something, but doesn't dare. And what you mimic is after all a piece of behaviour. But you will perhaps be able to give a *characteristic* imitation of this behaviour only in a wider context.

1067. One will also be able to say: What this description says will get its expression somehow in the movement and the rest of the behaviour of the child, but also in the spatial and temporal surrounding.

1068. But now am I to say that I really 'see' the fearfulness in this behaviour--or that I really 'see' the facial expression? Why not? But that is not to deny the difference between two concepts of what is perceived. A picture of the face might reproduce its features very accurately, but not get the expression right; it might, however, be right as far as the expression goes and not hit the features off well. "Similar expression" takes faces together in a quite

different way from "similar anatomy".

Page 186

1069. Naturally the question isn't: "Is it right to say 'I see his sly wink'." What should be right or wrong about that, beyond the use of

Page Break 187

the English language? Nor are we going to say "The naïf person is quite right to say he *saw* the facial expression"!

Page 187

1070. On the other hand one would like to say: We surely can't 'see' the expression, the shy behaviour, *in the same sense* as we see movement, shapes and colours. What is there in this? (Naturally, the question is not to be answered physiologically.) Well, one does say, that one sees both the dog's movement and its joy. If one shuts one's eyes one can see neither the one nor the other. But if one says of someone who could accurately reproduce the movement of the dog in some fashion in pictures, that he saw all there was to see, he would not have to recognize the dog's joy. So if the ideal representation of what is seen is the photographically (metrically) exact reproduction in a picture, then one might want to say: "I see the movement, and somehow *notice* the joy."

But remember the meaning in which we learn to use the word "see". We certainly say we see this human being, this flower, while our optical picture--the colours and shapes--is continually altering, and within the widest limits at that. Now that just is how we do use the word "see". (Don't think you can find a better use for it--a phenomenological [[sic]] one!)

Page 187

1071. Now do I learn the meaning of the word "sad"--as applied to a face--in just the same way as the meaning of "round" or "red"? No, not in quite the same way, but still in a similar way. (I do also react differently to a face's sadness, and to its redness.)

Page 187

1072. Look at a photograph: ask yourself whether you see only the distribution of darker and lighter patches, or the facial expression as well. Ask yourself what you see: how would it be easier to represent it: by a description of that distribution of patches, or by the description of a human head; and when you say of the face that it is smiling--is it easier to describe the corresponding lie and shape of the parts of the face, or to smile yourself?

Page 187

1073. "What I *see* can't be the expression, because the recognition of the expression depends on my knowledge, on my general acquaintance with human behaviour." But isn't this merely an historical observation?

Page Break 188

Page 188

1074. Is it here as if I were perceiving a 'fourth dimension'? Well, yes and no. Queer, however, it is *not*. From which you ought to learn that what strikes someone as queer when he is philosophizing is not queer. We make the assumption: the word... would really have to be used like *this* (*this* use strikes us as a prototype) and then we find the normal use extremely queer.

Page 188

1075. "What I properly see must surely be what is produced in me by influence of the object"--In that case what is produced in me is something like a copy, something that one can oneself in turn *look at*, have before him. Almost something like a *materialization*.

And this materialization is something spatial and must be describable in its entirety by the use of spatial concepts. Then, while it may smile, the concept of friendliness has no part in the representation of it, but is rather *alien* to this representation (even though this concept may subserve this representation.). [Cf. P.I. p. 199g.]

Page 188

1076. If someone were capable of making an exact copy of this portrait--should I *not* say he saw everything that I did? And he wouldn't have to allude to the head as a head or as something three-dimensional, at all; and even if he does, the expression need not say anything to him. And if it does speak to me--should I say I see more than the other?

I might say so.

Page 188

1077. But a painter can paint an eye so that it stares; so its staring must be describable by the distribution of colour on the surface. But the one who paints it need not be able to describe this distribution.

Page 188

1078. Understanding a piece of music--understanding a sentence.

I am said not to understand a form of speech like a native if, while I do know its sense, I yet don't know, e.g.,

what class of people would employ it. In such a case one says that I am not acquainted with the precise shade of meaning. But if one were now to think that one has a different sensation in pronouncing the word if one knows this shade of meaning, this would again be incorrect. But there are, e.g., innumerable transitions which I can make and the other can't.

Page 188

1079. But one would like to say: "Human mental life can't be described at all; it is so uncommonly complicated and full of scarcely graspable experiences. In great part it is like a brewing of coloured

Page Break 189

clouds, in which any shape is only a transition to other shapes, to other transitions.--Why, take just visual experience! Your gaze wanders almost incessantly, how could you describe it?"--And yet I do describe it!--"But that is only a quite crude description, it gives only the coarsest features of your experience."--But isn't this just what I *call* description of my experience? How then do I arrive at the concept of a kind of description that I cannot possibly give?

Page 189

1080. Imagine looking at flowing water. The picture presented by the surface keeps on changing. Lights and darks everywhere appear and disappear. What would I call an 'exact description' of this visual picture? There's nothing I would call that. If someone says it can't be described, one can reply: You don't know what it would be right to call a description. For you would not acknowledge the most exact photograph as an *exact* representation of your experience. There is no such thing as exactness in this language-game. (As, that is, there is no knight in draughts.)

Page 189

1081. The description of the experience doesn't describe an object. It may subserve a description. And this object is sometimes the one that one is looking at, and sometimes (photography) not.

The impression--one would like to say--is not an object.

Page 189

1082. We learn to describe objects, and thereby, in another sense, our sensations.

Page 189

1083. I look into the eye-piece of an instrument and draw or paint a picture of what I see. Whoever looks at it can say: "So *that's* how it looks"--but also "So *that's* how it looks to you".

I might call the picture a description of what I was looking at, but also a description of my visual impression.

Page 189

1084. "The impression is blurred"--'so the object in my consciousness is blurred'.

Page 189

1085. One can't look at the impression, that is why it is not an object. (Grammatically.) For one doesn't look at the object to alter it. (That is really what people mean when they say that objects exist 'independently of us'.) [Cf. Z 427.]

Page Break 190

Page 190

1086. "The chair is the same, whether I am looking at it or not!"--that *need* not have been so. Humans are often embarrassed when one looks at them. "The chair goes on existing whether I am looking at it or not." That might be an empirical proposition, or it might be one to take grammatically. But in saying it one may also be thinking simply of the conceptual difference between sense-impression and object. [Cf. Z 427.]

Page 190

1087. German nouns printed in lower-case letters in certain modern poets. A German noun all in lower-case letters looks alien; to recognize it, one has to read it attentively. It is supposed to strike us as *new*, as if we had seen it now for the first time.--But what interests me here? This--that the impression can't at first be described more exactly than by means of words like 'queer', 'unaccustomed'. Only later follow, so to speak, analyses of the impression. (The reaction of recoil from the strangely written word.)

Page 190

1088. We teach someone the meaning of the word "eerie" by bringing it into connexion with a certain behaviour in certain situations (though the *behaviour* is not called that). In such situations he now says it feels eerie to him; and even that the word "ghost" has something eerie about it.--How far was the word "eerie" to start with the name of a feeling? If someone shrinks back from entering a dark room, why should I call this or the like the expression of a feeling? For "feeling" certainly makes us think of sensation and sense-impression, and these in turn are the objects immediately before our minds. ((I am trying to make a logical step here, one that comes hard to me.))

Page 190

1089. "What do I know of the feelings of others, and what do I *know* of my own?" means that an experience, conceived as an *object*, slips out of view.

Page 190

1090. For can anything be more remarkable than this, that the *rhythm* of a sentence should be important for exact understanding of it?

Page 190

1091. It's as if the one who pronounces the sentence as a piece of information told us something, but as if the sentence too, as a mere *example*, did the same.

Page Break 191

Page 191

1092. Certainly it's clear that the description of impressions has the form of the description of '*external*' objects--with certain deviancies. E.g. a certain vagueness.

Or again: So far as the description of the impression looks the same as the description of an object, it is a description of an object of perception. (Hence consideration of binocular vision ought to be somewhat disquieting for one who speaks of the visual object).

Page 191

1093. "Thinking is an enigmatic process, and we are a long way off from complete understanding of it." And now one starts experimenting. Evidently without realizing *what* it is that makes thinking enigmatic to us.

The experimental method does *something*; its failure to solve the problem is blamed on its still being in its beginnings. It is as if one were to try and determine what matter and spirit are by chemical experiments.

Page 191

1094. Someone who describes his visual impression doesn't describe the edges of the visual field. Is this an incompleteness in our descriptions?

If I shut my left eye and then turn my eyes as far as I can to the right, I still, 'out of the corner of my eye' see an object shining out. I might even give a rough description of this impression. I might also produce a drawing of it, and it would perhaps shew some darkneses and a dark merging border: but only someone who knows in what situation it is to be employed can rightly understand or employ this picture. That is to say: he too might now shut one eye, look as far as possible to the right, and say he has this impression too, or: that his impression deviates from my picture in this way or that.

Page 191

1095. That we *calculate* with some concepts and with others do not, merely shews how different in kind conceptual tools are (how little reason we have ever to assume uniformity here). [Cf. Z 347.]

Page 191

1096. Turing's 'Machines'. These machines are *humans* who calculate. And one might express what he says also in the form of *games*. And the interesting games would be such as brought one *via* certain rules to nonsensical instructions. I am thinking of games like the "racing game". One has received the order "Go on in the same way" when this makes no sense, say because one has got into a circle. For any order makes sense only in certain positions. (Watson.)

Page Break 192

Page 192

1097. A variant of Cantor's diagonal proof: Let $N = F(K, n)$ be the form of the law for the development of decimal fractions. N is the n th decimal place of the K th development. The diagonal law then is: $N = F(n, n) = \text{Def } F'(n)$.

To prove that $F'n$ cannot be one of the rules $F(k, n)$. Assume it is the 100th. Then the formation rule of

$F'(1)$	runs	$F(1, 1)$
of		
$F'(2)$		$F(2, 2)$ etc.

But the rule for the formation of the 100th place of $F'(n)$ will run $F(100, 100)$; that is, it tells us only that the hundredth place is supposed to be equal to itself, and so for $n = 100$ it is *not* a rule.

The rule of the game runs "Do the same as..."--and in the special case it becomes "Do the same as you are doing". [Cf. Z 694.]

Page 192

1098. The concept of 'ordering', e.g., the rational numbers, and of the 'impossibility' of so ordering the irrational numbers. Compare this with what is called an ordering of digits. Likewise the difference between the 'correlation' of a figure (or nut) with another and the 'correlation' of all whole numbers with the even numbers. Everywhere a shifting of concepts. [Cf. Z 707.]

1099. The description of the subjectively seen is closely or distantly related to the description of an object, but does not function like the description of an object. How does one compare visual sensations? How do I compare my visual experiences with someone else's? [Cf. Z 435.]

1100. We don't see the human eye as a receiver; it seems, not to let something in, but to send out. The ear receives; the eye looks. (It casts glances, it flashes, beams, coruscates.) With the eye one may terrify, not with the ear or the nose. When you see the eye, you see something go out from it. You see the glance of the eye. [Cf. Z 222.]

1101. "When you get away from your physiological prejudices, you'll find nothing in the fact that the glance of the eye can be seen." Certainly I too say that I see the glance that you throw someone else. And if someone wanted to correct me and say I don't really *see* it, I should hold this to be a piece of stupidity.

On the other hand I have not *admitted* anything with my way of putting it, and I contradict anyone who tells me I see the eye's glance 'just as' I see its form and colour.

For 'naive language', that's to say our naive, normal, way of expressing ourselves, does not contain any theory of seeing--it shews you, not any theory, but only a *concept* of seeing. [Cf. Z 223.]

1102. And if someone says "I don't really see the eye's glance, but only shapes and colours",--is he contradicting the naive form of expression? Is he saying that the man was going beyond his rights, who said he saw my glance all right, that he saw this man's eye staring, gazing into vacancy, etc? Certainly not. So what was the purist trying to do?

Does he want to say it's more correct to use a different word here instead of 'seeing'? I believe he only wants to draw attention to a division between concepts. For how does the word "see" associate perceptions? I mean: it may associate them as perceptions *with the eye*; for we do *not* feel seeing *in* the eye. But really the one who insists on the *correctness* of our normal way of talking seems to be saying: everything is contained in the visual impression; that the *subjective eye* equally has shape, colour, movement, expression and glance (external direction). That one does not detect the glance, so to speak, *somewhere else*. But that doesn't mean 'elsewhere than in the eye'; it means 'elsewhere than in the visual picture'. But how would it be for it to be otherwise? Perhaps so that I said: "In this eye I see such and such shapes, colours, movements,--that means it's looking friendly at present," i.e. as if I were drawing a conclusion.--So one might say: The place of the *perceived* glance is the *subjective* eye, the visual picture of the eye itself.

1103. First and foremost, I can very well imagine someone who, while he sees a face extremely accurately, and can, e.g., make an accurate portrait of it, yet doesn't recognize its smiling expression as a smile. I should find it absurd to say that his sight was defective. And equally absurd to say that his subjective visual object just wasn't smiling, although it has all the colours and form that mine has.

1104. That is to say: here we are drawing a conceptual boundary (and it has nothing to do with physiological opinions).

1105. High-light or reflection: when a child paints, it will never paint these. Why, it is almost bewildering that they can be represented by means of the usual oil- or water-colours. [Cf. Z 370.]

1106. One who sees that someone is stretching out his hand to touch something, but is afraid of it, does surely in a certain sense see the same as one who can imitate the movements of the hand down to the last detail, or can represent it by means of drawings, but has not the power of interpreting it in that way.

1107. If someone says: Obviously (to any unprejudiced person) the shape, the colour, the organization, the expression, are properties of the subjectively seen, of the immediate object of sight--here the word 'obviously' betrays him. The reason why it is obvious is: because everyone admits it; and admits it only through the use of language. So here one is using a *picture* to give a reason for a proposition.

†1 If someone says: The shape, the colour, the organization, the expression, are surely all *obviously* properties of the immediately seen (of my object of sight)--he is basing his opinion on a *picture*.--For, if someone

admits that each of those things is a property of his immediate object of sight--what information is he giving us? If he, e.g., tells someone else: "It's like that for me too"--what conclusion can I draw from this? (What if this full agreement were based on a misunderstanding?)

Page 194

1108. That picture is nothing but an *illustration* contributing to the methodology of our language. If we are really all inclined to find this picture apt, this is perhaps of psychological interest, but it is no substitute for a conceptual investigation.

Page 194

1109. There are *two* things one may call "Methodology": A description of the activities that are, e.g., called "measuring", a branch of human natural history, which is going to make the concepts of measuring, of exactness etc., intelligible to us in their variations; or on the other hand a branch of applied physics, the theory of how best (most accurately, most conveniently) to measure this or that under such-and-such circumstances. [Cf. P.I. p. 225.]

Page 194

1110. I tell him: "Change the way you are adjusted like this:..."--he does so; and now *something* is altered in him. 'Something'? His attitude is altered; and one can describe the alteration. Calling the attitude 'something in him' is misleading. It is as if we could now dimly see, or feel, a Something, which has altered and which is called "the attitude". Whereas everything lies open to the light of day--but the words "a new attitude" do not designate a sensation.

Page Break 195

Page 195

1111. What does the description of an 'attitude' look like?

One says, e.g., "Look away from these little spots and this small irregularity, and regard it as a picture of a ...".

"Think that away! Would it be unacceptable to you even without this...?" I shall be said to be altering my visual picture--as I do by blinking or keeping a detail out of view. This "Looking away from..." plays a role quite like that of the construction of a new picture. [Cf. Z 204.]

Page 195

1112. Very well,--and these are good reasons to say that through our attitude we made a change in our visual impression. That is to say, these are good reasons for delimiting the concept 'visual impression' in this way. [Cf. Z 205.]

Page 195

1113. The word "organization" fits in very well with the concept 'belonging together'. There seems to be a series of simple modifications of the visual impression here, which are all really 'optical'. With different aspects, however, one may do other quite different things besides separating parts and taking them together, or suppressing some and making others prominent.

Page 195

1114. I may, however, *call* "taking together" some definite thing, a definite peculiarity of the process of copying a drawing. I may then say that in reproduction by drawing, or in description, someone takes the figure together like *this*, organizes it like this. (Of course there'd be difficulties about that in some cases, e.g. in the case of the duck-rabbit.)

Page 195

1115. Now one says: I can take lines together in copying, but I can also do so by means of *attention*. Like the way I can calculate in my head, as on paper.

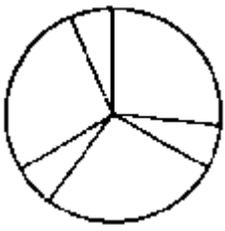

Page 195

1116. Can Gestalt psychology classify the different organizations that can be introduced into the unorganized visual picture; can it give once for all the possible *kinds* of modification which the plasticity of our nervous system can elicit? When I see the dot as an eye which is looking in *this* direction--what system of modifications does that fit into? (System of shapes and colours.)

Page Break 196

Page 196

1117. E.g., it is, I believe, misleading when Köhler†1 describes the spontaneous aspects of the figure

by saying: the lines which belong to the same arm in one aspect, now belong to different arms. That sounds as if what were in question here were again a way of taking these radii together. Whereas, after all, the radii that belonged together before belong together now as well; only one time they bound an 'arm', another time an intervening space.

Page 196

1118. Indeed, you may well say: what belongs to the description of what you see, of your visual impression, is not merely what the copy shews but also the claim, e.g., to see this "solid", this other 'as intervening space'. Here it all depends on *what we want to know* when we ask someone what he sees.

Page 196

1119. "But surely it's obvious that in seeing I can *take* elements *together* (lines, for example)?" But why does one call it "taking together"? Why does one here need a word--*essentially*--that already has another meaning? (Naturally it is the same here as in the case of the phrase "*calculating* in the head.") [Cf. Z 206.]

Page 196

1120. When I tell someone "Take these lines (or something else) together", what will he do? Well, a variety of things according to the circumstances. Perhaps he is to count them two by two, or put them in a drawer, or look at them etc. [Cf. Z 207.]

Page 196

1121. Is the drawing that you see itself organized? And when you 'organize' it in such-and-such a way, do you then see more than is present?

Page 196

1122. "Organize these things." What does this mean? Perhaps "arrange them". It might mean "give them some order",--or again: learn to know your way about among them, learn to describe them; learn to describe them by means of a system, by means of a rule.

Page 196

1123. Once more, the question is: What information do I give someone with the words "In looking, I am now taking the lines together like *this*"? This question may also be put like this: For what purpose do I tell someone "In looking, take these lines together like *this*"?--There is here again a similarity to the demand "Imagine *this*".

Page Break 197

Page 197

1124. The egg-shell of its origin clings to any thinking, shewing one *what* you struggled with in growing up. What views are your circle's testimony: from which ones you have had to break free.

Page 197

1125. The picture  does not organize itself under our gaze.

Page 197

1126. It is perhaps important to remember that I may see, take, a figure this way today, and differently tomorrow, without there needing to have been a 'jump'. I might, for example, take and use an illustration in a book in *this* way today, and tomorrow encounter the same illustration on a later page where it is to be taken differently, without noticing that it is the same figure again.

Page 197

1127. Could a man demonstrate his reliability by saying: "It is true; and see! I believe it."

Page 197

1128. Might it be said: a way of taking something, a technique, is mirrored in an experience? Which, after all, only means: we employ the expression that we have learnt for a technique in an expression of experience (*not*: as *designation* of an experience).

Page 197

1129. Well, why should a way of speaking not be responsible for an experience?

Page 197

1130. Would it make sense to ask a composer whether one should hear a figure like *this* or like *this*; if that doesn't

also mean: whether one should *play* it in this way or that?

Page 197

1131. Memory: "I still see us sitting at that table."--But have I really the same visual picture--or one of those which I had then? Do I also certainly see the table and my friend from the same point of view as then, and so not see myself?--My memory image is not evidence of that past situation; as a photograph would be, which, having been taken then, now bears witness to me that this is how it was then. The memory image and the memory words are on the *same* level. [Cf. Z 650.]

Page 197

1132. Why shouldn't it be that one excludes mutually contradictory conclusions: not because they are contradictory, but because they are useless? Or put it like this: one need not shy away from them as from something unclean, because they are contradictory: let them be excluded because they are no use for anything.

Page Break 198

Page 198

1133. You must seriously imagine that there really could be a word in some language that stood for pain-behaviour and *not* for pain.

Page 198

1134. He asks "What did you mean when you said...?" I answer the question and then I add: "If you had asked me before, I'd have answered the same; my answer was not an *interpretation* which had just occurred to me." So had it occurred to me earlier? No.--And how was I able to say then: "If you had asked me earlier, I'd have..."? What did I infer it from? From nothing at all. What do I tell him, when I utter the conditional. Something that may sometimes be of importance.

Page 198

1135. He knows, for example, that I haven't changed my mind. It also makes a difference whether I reply that I was 'only saying these words to myself' without meaning anything by them; or, that I meant this or that by them. Much depends on this.

Moreover, it makes a difference whether someone says to me "I love her" because the words of a poem are going through his head or because he is saying it to make a confession to me of his love.

Page 198

1136. Is it not peculiar, however, that there is such a thing as this reaction, as such a confession of intention? Isn't it an extremely remarkable linguistic instrument? What is really remarkable about it? Well--it is difficult to imagine how a human learns this use of words. It is so entirely subtle. [Cf. Z 39.]

Page 198

1137. But is it really more subtle than that of the words "I formed an image of him" for example? Yes, any such use of language is remarkable, peculiar, when one is adjusted only to consider the description of physical objects. [Cf. Z 40.]

PREFACE

The source of this second volume of *Remarks on the Philosophy of Psychology* is TS No. 232. Wittgenstein probably dictated it in September or October 1948. The remarks underlying this dictation stem from the period 19 November 1947 to 25 August 1948, MSS 135-137. The places in the text that were faulty or obscure we have tried to amend by an exact collation with the MS sources. During this task we received valuable suggestions from the translators of the German text into English, C. G. Luckhardt and M. A. E. Aue. We thank them for their readiness to help us.

TRANSLATORS' NOTE

We have followed two principles in translating this material. First, since the text contains many passages already translated in *Zettel*, and a few passages from Part II of the *Investigations*, we had to decide between preparing an entirely new translation of these remarks, and following Professor Anscombe's translations as closely as possible. Since our translation would not differ significantly from hers, and because any minor stylistic differences might produce confusion, we decided upon the latter course. Few of these parallel passages are absolutely identical, however, and so almost all deviations from Professor Anscombe's translations should be taken as reflecting differences in the German texts.

Second, we have tried to preserve Wittgenstein's highly individual style of writing. For example, the quite large number of both ordinary dashes and specially long dashes, and the different uses to which Wittgenstein puts them, contribute to the vividness of his writing, as does the unusual practice of following a hypothetical subjunctive with a statement in the past tense. ("Suppose that someone were to.... Now did he...?", for example.) These we have retained. Another facet of Wittgenstein's writing which cannot fail to strike the German reader is his choice of words. Most of his verbs are very ordinary ones, and so we have "put into", for example, rather than "infuse". Likewise there is a noticeable lack of philosophical jargon in the text, and so "value judgment" is deliberately used, not "normative judgment". The German text is laced with Anglicisms, Austrianisms, and colloquialisms, and we have tried to retain the flavour of these in the translation.

We wish to express our thanks to Professor G. E. M. Anscombe for her time and diligence in going over our translation with us, and to the American Philosophical Society, whose generous travel grant made a visit to her possible. Also, we wish to thank Dean Glenn Thomas and the Dean's Advisory Committee on Research, of Georgia State University, for the release time and a travel grant which enabled us to complete the translation, and the University Research Committee of Emory University for its travel support.

II

1. 'Surprise' and the *sensation* of suddenly catching one's breath.

2. "I strongly hope...", as opposed to "I hope you'll come". This means approximately the same as "Surely you'll come!"

3. Surely one doesn't normally say "I wish..." on grounds of self-observation, for this is merely an expression of a wish. Nevertheless, you can sometimes perceive or discover a wish by observing your own reactions. If you now ask

me, "Do you recognize the *same thing* in such a case as you express by the *utterance* in the other case?", then there is already a mistake in the question. (As if someone asked, "Is the chair I can see the same as the chair on which I can sit?")

Page 2

4. I say "I hope you'll come", but not "I believe I hope you'll come", but we may well say: "I believe I still hope he'll come." [Zettel 79: henceforth Z will stand for Zettel.]

Page 2

5. "But doesn't one *experience* meaning?" "But doesn't one hear the piano?" Each of these questions can be meant, i.e., used, factually or conceptually. (Temporally, or timelessly.)

Page 2

6. He says "I want to go out now", then suddenly says "No", and does something else. As he said "No", it suddenly occurred to him that he wanted first of all to...--He said "No", but did he also *think* "No"? Didn't he just think about that other thing? One can say he was thinking about it. But to do that he didn't have to pronounce a thought, either silently or out loud. To be sure, he could later clothe the intention in a sentence. When his intentions changed maybe a picture was in his mind, or he didn't just say "No", but some *one* word, the equivalent of a picture. For example, if he wanted to close the closet then maybe he said "The closet!"; if he wanted to wash his hands he might have looked at them and made a face. "But is that thinking?"--I don't know. Don't we say in such cases that someone has "thought something over", has "changed his mind"?

Page Break 3

Page 3

But is it absolutely necessary that he gain the command of a language for *this* kind of thinking? Couldn't an "intelligent" beast act this way? It has been trained to fetch an object from one place and take it to another. Now it starts walking toward the goal without the object, suddenly turns around (*as if it had said* "Oh, I forgot...!") and fetches the object, etc. If we were to see something like this we would say that at that time something had happened within it, in its mind. What then has happened within *me* when I act this way? "Not much at all," I would like to say. And what happens inside is no more important than what can happen outside, through speaking, drawing etc. ((From which you can learn how the word "thinking" is used.))

Page 3

7. Now imagine that someone has to construct something with blocks, or 'Meccano'. He tries out different pieces, tries to combine them, maybe even makes a sketch, etc., etc. Now one says that he *has been thinking* during this activity!--To be sure, in saying this one distinguishes this action from another of a very different sort. But is it a good description of this difference to say that in the one case something else accompanies the manual activity? Could one isolate this something else, perhaps, and make it occur without the other activity?

It isn't true that thinking is a kind of speaking, as I once said.†1 The concept 'thinking' is categorically different from the concept 'speaking'. But of course thinking is neither an accompaniment of speaking nor of any other process.

This means that it is impossible to have the "thought-process", for example, proceed unaccompanied. Nor does it have divisions which correspond to the divisions of other activities (speaking, for example). That is, when we do speak of a "thought-process" it is something like operating (in writing or orally) with signs. Inferring or calculating might be called a "thought-process".

Page 3

8. Likewise it wouldn't be completely wrong to call speaking "the instrument of thinking". But one can't say that the process of speaking is an instrument of the process of thinking, or that language is, as it were, the carrier of thought, as, for example, the notes of a song might be called the carriers of the words.

Page 3

9. The word "thinking" can be used to signify, roughly speaking, a talking for a purpose, i.e., a speaking or writing, a speaking in the imagination, a "speaking in the head", as it were.

Page Break 4

Page 4

10. We say, "Think about what you want to say before you speak". *One* way of doing this is to recite one's speech softly to oneself, or to write it down and make corrections. For instance, one might recite a sentence, shake his head, say "That is too long", etc., and then restate the sentence in another form.

Page 4

11. What thinking is might be described by describing the difference between someone feeble-minded and a normal

child who is beginning to think. If one wanted to indicate the activity which the normal person learns and which the feeble-minded cannot learn, one couldn't derive it from their behaviour.

Page 4

12. The word "thinking" is used in a certain way very differently from, for example, "to be in pain", "to be sad", etc.: we don't say "I think" as the expression of a mental state. At most we say "I'm thinking". "Leave me alone, I'm thinking about..." And of course one doesn't mean by this: "Leave me alone, I am now behaving in such and such a way." Therefore 'thinking' is not behaviour.

Page 4

13. "I thought: 'this stick is too long, I must try another one'." While thinking that maybe I said nothing at all to myself, maybe one or two words. And yet this report is not untrue (or at any rate it may be true). It has a use. We say, for example, "Yes, I watched you and I thought that you were thinking that".

Page 4

14. "Man thinks, feels, wishes, believes, intends, wants, knows." That sounds like a reasonable sentence, just like "Man draws, paints, models", or "Man is acquainted with string instruments, wind instruments,...". The first sentence is an enumeration of all those things man does with his mind. But just as one could add: "And isn't man also acquainted with instruments made from squealing mice?" to the sentence about the instruments--and the answer would be "No"--so there must be added to the enumeration of the mental activities a question of this kind: "And can't men also...?"

Page 4

15. Someone says: "Man hopes." How should this phenomenon of natural history be described?--One might observe a child and wait until one day he manifests hope; and then one could say "Today he hoped for the first time". But surely that sounds queer! Although it would be quite natural to say "Today he said 'I hope' for the first time". And why queer? One does not say that a suckling hopes

Page Break 5

that..., but one does say it of a grown-up.--Well, bit by bit daily life becomes such that there is a place for hope in it. [Z 469a.]

Page 5

16. In this case I have used the term "embedded", have said that hope, belief, etc., were embedded in human life, in all of the situations and reactions which constitute human life. The crocodile doesn't hope, man does. Or: one can't say of a crocodile that it hopes, but of man one can.

But how would a human being have to act for us to say of him: he never hopes? The first answer is: I don't know. It would be easier for me to say how a human being would have to act who never yearns for anything, who is never happy about anything, or who is never startled or afraid of anything.

Page 5

17. Fear behaviour on fearful occasions (etc.) is a phenomenon of our life. But fear? Well, instead of "I am afraid" one could say "The phenomenon of fear is occurring in me", in which case one doesn't think of his own *behaviour*. But then could one say in the same sense, "The phenomenon of fear is occurring in him"?

Page 5

18. If I tell someone "Men think, feel,...", it seems I am making a statement of *natural history* to him. It might be intended to show him something about the difference between man and the various kinds of animals. But could one give an example of this by saying, "Yes, I myself, for instance, am now seeing"? Then is "I see..." a statement of natural history about myself? Couldn't I just as well say, "I am not seeing"?

Page 5

19. "Man thinks, is afraid, etc. etc.": that is the reply one might give to someone who asked what chapters a book on psychology should contain. [Z 468.]

Page 5

20. Where do we get the concept 'thinking' from, which we now want to consider here? From everyday language. What first fixes the direction of our attention is the word "thinking". But the use of this word is tangled. Nor can we expect anything else. And that can of course be said of all psychological verbs. Their employment is not so clear or so easy to get a synoptic view of, as that of terms in mechanics, for example. [Z 113.]

Page 5

21. Psychological words are similar to those which pass over from everyday language into medical language. ("Shock.")

Page Break 6

Page 6

22. I tell someone: "Human beings think." He asks me, "What is *thinking*?"--Now I explain the use of this word to him. But when I have finished, is the first sentence still a piece of information?

Page 6

((Couldn't an ant speak this way to an ant?))

Page 6

23. "Human beings think, grasshoppers don't." This means something like: the concept 'thinking' refers to human life, not to that of grasshoppers. And one could impart this to a person who doesn't understand the English word "thinking" and perhaps believes erroneously that it refers to something grasshoppers do.

Page 6

24. "Grasshoppers don't think." Where does this belong?--Is it an article of faith, or does it belong to natural history? If the latter, it ought to be a sentence something like: "Grasshoppers can't read and write." This sentence has a clear meaning, and even though it is perhaps never used, still it is easy to imagine a use for it.

Page 6

25. "A steam engine has a crosshead, a steam turbine doesn't." To whom, and in what context, would one say that?

Page 6

26. "Can a human being understand what 'reading' is unless he himself can read, can he understand what 'fearing' is without knowing fear, etc.?" Well, an illiterate man can certainly say that he can't read but that his son has learned how. A blind man can say that he is blind and the people around him sighted. "Yes, but doesn't he after all mean something different from a sighted man when he uses the words 'blind' and 'sighted'?" What is the ground of one's inclination to say that? Well, if someone did not know what a leopard looked like, still he could say and understand "That place is very dangerous, there are leopards there". He would perhaps all the same be said not to know what a leopard is, and so not to know, or not completely, what the word "leopard" means, until he is shown such an animal. Now it strikes us as being the same with the blind. They don't know, so to speak, what seeing is like.--Now is 'not knowing fear' analogous to 'never having seen a leopard'? That, of course, I want to deny. [Z 618, beginning at "A blind man can say".]

Page 6

27. The question is: What kind of language-games can someone who is unacquainted with fear *eo ipso* not play?

One could say, for example, that he would watch a tragedy without understanding it. And that could be explained this way: When I see someone else in a terrible situation, even when I myself have nothing to fear, I can shudder, shudder out of sympathy. But

Page Break 7

someone who is unacquainted with fear wouldn't do that. *We* are afraid along *with the other person*, even when we have nothing to fear; and it is *this* which the former cannot do. Just as I grimace when someone else is being hurt.

Page 7

28. Good; but isn't it conceivable that someone who has never felt pain could still feel it in the form of pity? So no matter what happened to him he wouldn't groan, but would whenever someone else was being hurt.

But would we really say that he feels pity? Wouldn't we say. "It really isn't pity because he isn't acquainted with any pain of his own"--? Or we could imagine people saying in such a case that God has given this man a feeling for the sorrow or fear of others. One might call something like that an intuition.

Page 7

29. "Human beings sometimes think." How did I learn what "thinking" means?--It seems I can only have learned it by living with people.--To be sure, one could imagine seeing human life in a film, or being allowed merely to observe life without participating in it. Anyone who did this would then understand human life as we understand the life of fish or even of plants. We can't talk about the joy and sorrow, etc., of fish.

Page 7

30. But of course I don't mean that as a matter of experience one can't understand it if he doesn't join in living (as if one were to say: no one can learn how to row merely by watching others rowing).--Rather, I mean that I wouldn't say either of myself (or of others) that we understood manifestations of life that are foreign to us. And here, of course, there are degrees.

Page 7

31. Thinking cannot be called a phenomenon, but one can speak of "phenomena of thinking", and everyone will know what kinds of phenomena are meant.

Page 7

32. Clearly, one can say: "Think about occasions for anger and phenomena of anger (anger-behaviour)."

But if I call *anger* a phenomenon then I have to call *my* anger, my experience of anger, a phenomenon. (A phenomenon of my inner life, for instance.)

33. Look at it purely behaviouristically: Someone says, "Man thinks wishes, is happy, angry, etc.". Imagine that these words were only

about certain forms of behaviour on certain occasions. One could suppose that whoever talks about human beings in this way had first observed these kinds of behaviour in other beings and was now saying that these phenomena could also be observed in human beings. That would be like our saying this of a species of animals.--

34. Suddenly I smile and say "...". When I smiled the thought had occurred to me.

Of what did it consist? It consisted of nothing at all; for the picture or word, etc., which may perhaps have appeared was not the thought.

35. I would like to say: Psychology deals with certain *aspects* of human life.

Or: with certain phenomena.--But the words "thinking", "fearing", etc., etc. do *not* refer to these phenomena.

36. "But how is it possible to *see* a thing according to an *interpretation*?"--The question represents it as a queer fact; as if something were being forced into a form it did not really fit. But no squeezing, no forcing took place here. [*Philosophical Investigations* II, xi, p. 200, paragraph e.]

37. Now the strange thing is that one doesn't know, as it were, what he is doing when he regards or sees the figure now as *this*, now as *that*. That is, one is inclined to ask, "How am I doing that?" "What other thing am I actually seeing?"--And as an answer to this one gets no relevant explanation.

38. For the question is not, 'What am I doing when....?' (for this could only be a psychological question)--but rather, 'What meaning does the statement have, what can be deduced from it, what consequences does it have?'

39. Anyone who failed to perceive the change of aspect would not be inclined to say, "Now it looks completely different!", or "It seems as if the picture had changed, and yet it hasn't!", or "The form has remained the same, and yet something has changed, something which I should like to call the conception, and which is seen!"--

40. To see something first as *this* and then as *that* could be a mere *game*. One could speak to a child in this way--for instance: "Now it is...!, now...!", and it reacts; I mean it laughs, and now it practices the thing in various ways (as if you were to point out that

vowels have colours). Another child neither perceives these colours nor understands what is meant by that change of aspect.

41. But what if *this* child were given the problem of locating the configuration  in the figure  (This could be included as a problem in the child's first lessons.) Would he be unable to solve this problem (or one of finding a series of different configurations in that figure) if he were not aware of a change of aspect, if he were not inclined to say that the figure was somehow changing, becoming a different pattern, or something like that?

42. You say that a normal person would see the figure  †2 as two circles cut through by a straight line. But how does that come out? If he copies the figure, for example, should I say it comes out in the *way* he does it? If he describes the figure verbally, does it come out in the description he chooses? This choice could be determined by the convenience of representing it this particular way. Even if the child hit upon different ways of reproducing it pictorially (a different sequence of lines), would *that* be our criterion for the change of aspect?--But if he says, "Now it is...--now...", if he talks as if he *saw* a different object every time, then we'll say that he sees the figure in different ways.

43. The essential thing about seeing is that it is a *state*, and such a state can suddenly change into another one. But how do I know that a person is in such a state, and therefore is not in one comparable to a disposition, like knowing,

understanding, or having a conception? What are the logical characteristics of such a state?

Page 9

44. For to say that one recognizes the state as a state whenever one *is in it* is nonsense. *By what* does he recognize it?

Page 9

(The criterion of identity.)

Page 9

45. I want to talk about a "state of consciousness", and to use this expression to refer to the seeing of a certain picture, the hearing of a tone, a sensation of pain or of taste, etc. I want to say that believing, understanding, knowing, intending, and others, are not states of

Page Break 10

consciousness. If for the moment I call these latter "dispositions", then an important difference between dispositions and states of consciousness consists in the fact that a disposition is not interrupted by a break in consciousness or a shift in attention. (And that of course is not a causal remark.) Really one hardly ever says that one has believed or understood something "uninterruptedly" since yesterday. An interruption of belief would be a period of unbelief, not, e.g., the withdrawal of attention from what one believes, or, e.g., sleep.

(The difference between 'knowing' and 'being aware of.')[Z 85, beginning at "Really one".]

Page 10

46. This is likely to be the point at which it is said that only form, not content, can be communicated to *others*.--So one talks to oneself *about the content*. And what does that mean? (How do my words 'relate' to the content I know? And to what purpose?) [Z 87.]

Page 10

47. In these considerations we often draw what can be called "auxiliary lines". We construct things like the "soulless tribe"--which drop out of consideration in the end. That they dropped out had to be shown.

Page 10

48. "Pain is a state of consciousness, understanding is not."--"Well, the thing is, I don't *feel* my understanding."--But this explanation achieves nothing. Nor would it be any explanation to say: What one in some sense *feels* is a state of consciousness. For that would only mean: State of consciousness = feeling. (One word would merely have been replaced by another.) [Z 84.]

Page 10

49. Look at yourself when you are writing, and notice how your hand forms the letters without your actually causing it to do so. To be sure, you feel something in your hand, all sorts of tensions and pressures, but that *they* are necessary to produce these letters is something which you know nothing about.

Page 10

50. Where there is genuine duration one can tell someone: "Pay attention and give me a signal when the picture, the rattling etc. alters."

Here there *is* such a thing as paying attention. Whereas one cannot follow with attention the forgetting of what one knew or the like. [Z 81.]

Page Break 11

Page 11

51. Think of this language-game: Determine how long an impression lasts by means of a stop-watch. The duration of knowledge, ability, understanding, could not be determined in this way. [Z 82.]

Page 11

52. "But the difference between knowing and hearing surely doesn't reside simply in such a characteristic as the kind of duration they have. They are surely wholly and utterly distinct!" Of course. But one can't say: "*Know* and *hear*, and you will notice the difference". [Z 83.]

Page 11

53. One can't look at knowing and hearing to see how different they are. Just as one can't look at pine wood and a table to get an impression of their difference.

Page 11

54. If I use the language-game with the stop-watch, for example, in order to demonstrate to myself the difference between the *concepts* knowing and seeing, this certainly gives the impression that I am showing an extremely fine distinction, where the real one, after all, is enormous.

But this enormous distinction (I would always say) consists precisely in the fact that the two concepts are

embedded quite differently in our language-games. And the difference to which I called attention was merely a reference to this pervasive distinction.

Page 11

55. The child learns "I know that now" and "I hear that now". But my God!, how different the occasions, the applications, everything! How can one even compare the use? It is hard to see how to arrange them so as to show their differences.

Where the difference is so great it is hard to point to a distinction.

Page 11

56. I can say, "This word is used thus and so, that word thus and so".

The basis for comparing them is hard to see; not their difference.

Page 11

57. The general differentiation of all states of consciousness from dispositions seems to me to be that one cannot ascertain by spot-check whether they are still going on. [Z 72.]

Page 11

58. We need to reflect that a state of language is possible (and presumably has existed) in which it does not possess the general concept of sensation, but does have words corresponding to our "see", "hear", "taste". [Z 473.]

Page Break 12

Page 12

59. We call seeing, hearing,... sense-perception. There are analogies and connexions between these concepts, and these are our justification for so taking them together. [Z 474.]

Page 12

60. It can, then, be asked: what kind of connexions and analogies exist between seeing and hearing? Between seeing and touching? Between seeing and smelling?--[Z 475.]

Page 12

61. And if we ask this, then the senses, so to say, at once shift further apart from one another than they seemed to be at first sight. [Z 476.]

Page 12

62. Psychological concepts are just everyday concepts. They are not concepts newly fashioned by science for its own purpose, as are the concepts of physics and chemistry. Psychological concepts are related to those of the exact sciences as the concepts of the science of medicine are to those of old women who spend their time nursing the sick.

Page 12

63. Plan for the treatment of psychological concepts.

Psychological verbs characterized by the fact that the third person of the present is to be identified by observation, the first person not.

Sentences in the third person of the present: information. In the first person present, expression. ((Not quite right.))

Sensations: their inner connexions and analogies.

All have genuine duration. Possibility of giving the beginning and the end. Possibility of their being synchronized, of simultaneous occurrence.

All have degrees and qualitative mixtures. Degree: scarcely perceptible--unendurable.

In this sense there is not a sensation of position or movement.

Place of feeling in the body: differentiates seeing and hearing from sense of pressure, temperature, taste and pain.

(If sensations are characteristic of the position and movements of the limbs, at any rate their place is not the joint.)

One *knows* the position of one's limbs and their movements. One can give them if asked, for example. Just as one also knows the place of a sensation (pain) in the body.

Reaction of touching the painful place.

No local sign about the sensation. Any more than a temporal sign about a memory-image. (Temporal signs in a photograph.)

Page Break 13

Page 13

Pain differentiated from other sensations by a characteristic expression. This makes it akin to joy (which is not a sense-experience).

"Sensations give us knowledge about the external world."

Images:

Auditory images, visual images--how are they distinguished from sensations? Not by "vivacity".

Images tell us nothing, either right or wrong, about the external world. (Images are not hallucinations, nor yet fancies.)

While I am looking at an object I cannot imagine it.

Difference between the language-games: "Look at this figure!" and: "Imagine this figure!"

Images are subject to the will.

Images are not pictures. I do not tell what object I am imagining by the resemblance between it and the image.

Asked "What image have you?" one can answer with a picture. [Z 472, 483, 621.]

64. One would like to say: The imaged is in a different *space* from the heard sound. (Question: Why?) [Z 622, beginning of a.]

Page 13

65. I read a book and have all sorts of images while I read, i.e. while I am looking attentively. [Z 623.]

Page 13

66. People might exist who never use the expression "seeing something with the inner eye" or anything like it, and these people might be able to draw and model 'out of imagination' or memory, to mimic the characteristic behaviour of others etc. They might also shut their eyes or stare into vacancy as if blind before drawing something from memory. And yet they might deny that they then see before them what they go on to draw. [Z 624, beginning.]

Page 13

67. "Do you see the way she's coming in the door?"--and now one imitates it.

Page 13

68. That is to say, 'seeing' is inseparably connected with 'looking'. ((I.e., that is *one* way of fixing the concept, which produces a physiognomy.))

The words which describe what we see are properties of things. We don't learn their meaning in connection with the concept of 'inner seeing'.

Page Break 14

Page 14

69. But if we ask, "What is the difference between a visual picture and an image-picture?"--the answer could be: The same description can represent both what I see and what I imagine.

To say that there is a difference between a visual picture and an image-picture means that one imagines things differently from the way they appear.

Page 14

70. I might also have said earlier: The *tie-up* between imaging and seeing is close; but there is no *similarity*. [Z 625a.]

Page 14

71. The language-games employing both these concepts are radically different--but hang together. [Z 625b.]

Page 14

72. A difference: 'trying to see something' and 'trying to form an image of something'. In the first case one says: "Look, just over there!", in the second "Shut your eyes!" [Z 626.]

Page 14

73. So don't you know, after all, whether what is seen (e.g., an after-image) and an image look exactly alike? (Or should I say: *are*?)--This question could only be an empirical one, and could only mean something like: "Does it ever, or even often, happen that a person can keep an image in front of his mind uninterruptedly and for some time, and describe it in detail, as one can do, for example, with an after-image?"

Page 14

74. "Now can you still see the bird?"--"I fancy that I can still see it." That doesn't mean: Maybe I am imagining it.

Page 14

75. "Seeing and imaging are different phenomena."--The words "seeing" and "imaging" are used differently. "I see" is used differently from "I have an image", "See!" differently from "Form an image!", and "I am trying to see it" differently from "I am trying to form an image of it".--"But the phenomena are: that men see and that we form images of things." A phenomenon is something that can be observed. Now how does one observe that men see?

I can observe, e.g., that birds fly, or lay eggs. I can tell someone, "You see, these creatures fly. Notice how they flap their wings and lift themselves into the air." I can also say, "You see, this child is not

Page Break 15

blind. It can see. Notice how it follows the flame of the candle." But can I satisfy myself, so to speak, *that men see?*
"Men see."--As opposed to *what?* Maybe that they are all blind?

Page 15

76. Can I imagine a case in which I might say, "Yes, you are right, men see"?--Or: "Yes, you are right, men see, even as I do."

Page 15

77. "Seeing and understanding"†1 are different phenomena."--The words "seeing" and "understanding"†1 have different meanings! Their meanings relate to a host of important kinds of human behaviour, to phenomena of human life.

To close one's eyes in order to form an image of something is a phenomenon; to strain in looking another; to follow a thing in motion with one's eyes yet another.

Imagine someone saying: "Man can see or be blind"! One could say that "seeing", "imaging", and "hoping" are simply not words for phenomena. But of course that doesn't mean that the psychologist doesn't observe phenomena. [a: Z 629.]

Page 15

78. To say that imaging is subject to the will can be misleading, for it makes it seem as if the will were a kind of motor and the images were connected with it, so that it could evoke them, put them into motion, and shut them off.

Page 15

79. Isn't it conceivable that there should be a man for whom ordinary seeing was subject to the will? Would seeing then teach him about the external world? Would things have colours if we could see them as we wished?

Page 15

80. It is just because imaging is subject to the will that it does not instruct us about the external world.

In this way--but in no other--it is related to an activity such as drawing.

And yet it isn't easy to call imaging an activity. [a: cf. Z 627.]

Page Break 16

Page 16

81. But what if I tell you: "Imagine a melody"? I have to 'sing it inwardly' to myself. That will be called an activity just as much as calculating in the head.

Page 16

82. Consider also that you can order someone to "Draw N. N. so as to be like your image of him", and that whether he does this is not determined by the likeness of the portrait. Analogous to this is the fact that I have an image of N. N. even if my image is wrong.

Page 16

83. If I say that imaging is subject to the will that does not mean that it is, as it were, a voluntary movement, as opposed to an involuntary one. For the same movement of the arm which is now voluntary might also be involuntary.--I mean: it makes *sense* to order someone to "Imagine that", or again: "Don't imagine that."

Page 16

84.†1 But doesn't the connection with the will refer merely, so to speak, to the machinery which produces or changes what is imaged (the image-picture)?--Here no picture is engendered, unless someone manufactures a picture, a real picture.

Page 16

85. The dagger which Macbeth sees before him is not an imagined dagger. One can't take an image for reality nor things seen for things imaged. But this is not because they are so dissimilar.

Page 16

86. One objection to the imagination's being voluntary is that images often beset us against our will and remain, refusing to be banished.

Page 16

Yet the will can struggle against them. But isn't calling them voluntary like calling a movement of my arm voluntary when someone forces my arm *against my will?*

Page 16

87. If someone insists that what he calls a "visual image" is like a visual impression, say to yourself once more that perhaps he is *making a mistake!* Or: Suppose that he is making a mistake. That is to say: What do you know about the resemblance of his visual impression and his visual image?! (I speak of others because what goes for them goes for me too.)

So what do you know about this resemblance? It is manifested only in the expressions which he is inclined to use; not in something he uses those expressions to say.

"There's no doubt at all: visual images and visual impressions are of the same kind!" That must be something you know from your own experience; and in that case it is something that may be true for you and not for other people. (And this of course holds for me too, if *I* say it.)

Nothing is more difficult than facing concepts *without prejudice*. (And that is the principal difficulty of philosophy.) [a, b: Z 630; c: Z 631.]

88. Forming an image of something is comparable to an activity. (Swimming.)

When we form an image of something we are not observing. The coming and going of the pictures is not something that *happens* to us. We are not surprised by these pictures, saying "Look!..." [b: Z 632.]

89. We do not banish visual impressions, as we do images. [Z 633, beginning.]

90. If we could banish impressions and summon them before our minds then they couldn't inform us about reality.--So do impressions differ from images only in that we can affect the latter and not the former? Then the difference is empirical! But this is precisely what is not the case.

91. Is it conceivable that visual impressions could be banished or called back? What is more, isn't it really possible? If I look at my hand and then move it out of my visual field, haven't I voluntarily broken off the visual impression of it?--But I will be told that that sort of thing isn't called "banishing the picture of the hand"! Certainly not; but where does the difference lie? One would like to say that the will affects images directly.

For if I voluntarily change my visual impression, then *things* obey my will.

92. But what if visual impressions could be controlled directly? Should I say, "Then there wouldn't be any impressions, but only images"? And what would that be like? How would I find out, for instance, that another person has a certain image? He would tell me.--But how would he learn the necessary words, let us say "red" and "round"? For surely I couldn't teach them to him by pointing to

something red and round. I could only evoke within myself the image of my pointing to something of the sort. And furthermore I couldn't test whether he was understanding me. Why, I could of course not even *see* him; no, I could only form an image of him.

Isn't this hypothesis really like the one that there is *only* fiction in the world and no truth?

93. And of course I myself couldn't learn or invent a description of my images. For what would it mean to say, e.g., that I was forming an image of a red cross on a white background? What does a red cross look like? *Like this?*--But couldn't a higher being know intuitively *what* images I am forming, and describe them in his language, even though *I* couldn't understand it? Suppose that this higher being were to say, "I know what image this man is now forming; it is this:..."--But how was I able to call that "knowing"? It is completely different from what *we* call "knowing what someone else is imaging". How can the normal case be compared with the one we have invented?

If I think of myself in this case as a third person, then I would have absolutely no idea what the higher being means when it says, with regard to someone who has only images and no impressions, that it knows which images that man has.

94. "But nevertheless can't I still imagine such a case?" The first thing to say is, you can *talk* about it. But that doesn't show that you have thought it through completely. (5 o'clock on the sun.)†1

95. One would also like to talk about what a visual impression and an image *look like*. And also to ask, perhaps, "Couldn't something look like my present visual impression for instance, but otherwise *behave* as an image?" And clearly there is a mistake here.

96. But imagine this: We get someone to look through a hole into a kind of peep show, and inside we now move various objects and figures about, either by chance or intentionally, so that their movement is exactly what our

viewer wanted, so that he fancies that what he sees is obeying his will.--Now could he be deluded, and believe that his visual impressions are images? That sounds totally absurd. I don't even need the peep show, but have only to look at my hand and move it, as mentioned above. But even if I could will the curtain over there to move, or could make it disappear, I should

Page Break 19

still not interpret that as something that was going on in my imagination.†1(?)

Page 19

97. I simply can't begin to take an impression for an image. But what does that mean? Could I think of a case in which *someone else* did that? Why isn't that conceivable?

Page 19

98. If someone really were to say "I don't know whether I am now seeing a tree or having an image of it", I should at first think he meant: "or just fancying that there is a tree over there". If he does not mean this, I couldn't understand him at all--but if someone tried to explain this case to me and said "His images are of such extraordinary vivacity that he can take them for impressions of sense"--should I understand it then? [Z 634.]

Page 19

99. Still, imagine a person who says, "My images are as vivid today as real visual impressions".--Would he have to be lying or talking nonsense? No, certainly not. To be sure I would first have to have him tell me how this manifests itself.

But if he were to tell me, "Often I don't know whether I see something or only have an image of it", then I wouldn't call this a case of overly vivid imaging.

Page 19

100. But must one not distinguish here: forming the image of a human face, as we say, but not in the space that surrounds me--and on the other hand: forming an image of a picture on that wall over there?

At the request "Imagine a round spot over there" one might fancy that one really was seeing one there.[Z 635.]

Page 19

101. To be sure, if I say "Isn't there really a spot over there?", and therefore perhaps look there more closely, then what I am here calling an image does *not* obey my will. And of course if I *fancy* something to be the case, that does not obey my will.

Page 19

102. You must not forget that material implication too does in fact have its use, its practical use, even if it does not occur very frequently.

Page Break 20

Page 20

103. Anyone who negates the sentence "If p, then q" negates a connection. He is saying: "It does not have to be this way." And the words "have to" point to the connection.

Page 20

104. "If p, then q" does *not* follow from "Not p and not q". It *can't* be inferred from "Not p and not q". The sense of "If p, then q" is *fundamentally* different from the sentence "p implies q", even if there is a *connection*. It is this: "p and q", which makes the implication true, also makes the sentence "If... then..." true, or at least it supports it. "p and not q" contradicts the implication as well as the "If-then" sentence, or at least it is unfavourable to its truth. "Not p and q" and "Not p and not q" verify the implication and determine nothing about the truth of "If..., then...".

Page 20

105. "If *this* happens, *that* will happen. If I am right, you pay me a shilling, if I am wrong, I pay you one, if it remains undecided, neither pays." This might also be expressed like this: The case in which the antecedent does *not* come true does not interest us, we aren't talking about it. Or again: we do not find it natural to use the words "yes" and "no" in the same way as in the case (and there are such cases) in which we are interested in the material implication. By "No" we mean here "p and not q", by "Yes", only "p and q". [Cf. Z 677.]

Page 20

106. For example, it is quite common to *bet* on the truth of a prediction. So, if we bet on the assertion "If p happens, then q will happen", then someone will say, "If you're right, I'll pay you..., if not..."; but if p does not happen the bet will be off. Here we are dealing with two different kinds of use of the negation of a sentence. And just as "not not p" is not the same as p, when double negation is meant to strengthen the negation, in the same way "p v not p", in the

sense in which *we* are using the negation, is not necessarily a tautology. In the above case, the assertion that that conditional sentence is true or false should actually assert the definite occurrence of the event.†1 For that assertion says that the conditional sentence will not remain undecided.

Page 20

107. The sentence "*Imagination is subject to the will*" is not a sentence of psychology.

Page Break 21

Page 21

108. I learn the concept 'see' in connection with 'look'. The use of the one word is connected with that of the other.

Page 21

109. If one says, "the experiential content of seeing and having an image is essentially the same", then *this* is true insofar as a painted picture can represent both what one sees and what one has an image of. Only, one mustn't allow oneself to be deceived by the myth of the *inner picture*.

Page 21

110. The 'imagination-picture' does not enter the language-game in the place where one would like to surmise its presence. [Z 636.]

Page 21

111. I learn the concept 'seeing' along with the description of what I see. I learn to observe and to describe what I observe. I learn the concept 'to have an image' in an entirely different context. The descriptions of what is seen and what is imaged are indeed of the same kind, and a description might be of the one just as much as of the other; but otherwise the concepts are thoroughly different. The concept of imaging is rather like one of doing than of receiving. Imagining might be called a creative act. (And is of course so called.) [Z 637.]

Page 21

112. "Yes, but the image itself, like the visual impression, is surely the inner picture,†1 and *you* are talking only of differences in the production, the coming to be, and in the treatment of the picture." The image is not a picture, nor is the visual impression one. Neither 'image' nor 'impression' is the concept of a picture, although in both cases there is a tie-up with a picture, and a different one in either case. [Z 638.]

Page 21

113. "But couldn't I imagine an experiential content of the same kind as visual images, but not subject to the will, and so in this respect like visual impressions?" In this case, the misleading thing is the talk about experiential content. If we talk about an experiential content which is typical of visual imaging, then the content within me must be comparable to the content within you. And, strange as it may sound, I believe one would have to say that the experiential content--if we are to use this concept here at all--is *the same* for a visual image and a visual impression. And that sounds paradoxical, because everyone will want to cry out: You're not going to tell me that these two--image and impression--could ever be mistaken for each other!--I could answer that this is as unlikely as confusing drawing and seeing, for

Page Break 22

example. But what is drawn and what is seen still could be the same thing. Image and impression do not 'look' different. [First sentence: Z 640.]

Page 22

114. But one could also say that "experiential content" does not mean the same thing when it is applied to image and impression, but only related things. If, for example, I form an image of a face exactly as it looks, and then see it later, my impression and my image have the same experiential content. One can *not* say that it is not the same on the grounds that an image and an impression never look alike.

The content of both, therefore, is *this*--(here I might point to a picture). But I wouldn't *have to* call it "the content" both times.

Page 22

115. Image and intention. Forming an image can also be compared to *creating* a picture in this way--namely, I am not imagining whoever is like my image; no, I am imagining whoever it is I mean to imagine.

Page 22

116. I believe that if you do compare imaging with a bodily movement like breathing, which sometimes happens voluntarily, sometimes involuntarily, then you mustn't compare a sense impression with a movement *at all*. The difference is not that the one takes place whether we will it or not, whereas we control the other. Rather, one concept resembles that of an action, the other doesn't. The difference is more like that between seeing my hand move--and

knowing (without seeing it) that I am moving it.

Page 22

117. "If I shut my eyes, there he is in front of me."--One could suppose that such expressions are not learned, but rather poetically formed, spontaneously. That they therefore "seem just right" to one man and then also to the next one.

Page 22

118. "I see him in front of me as plain as day!"--Well, maybe he's really standing in front of you.--"No, my picture isn't vivid enough for that."

Page 22

119. Couldn't we conceive of *this* phenomenon: By looking at a screen, we might be able to produce pictures on it, arbitrarily, 'merely by willing them'; we might be able to move them about, to have them disappear etc.,--pictures which are not only seen by the one who makes them but also by someone else.--Would what I see on this screen be something like an image? Or--perhaps to put the

Page Break 23

question more precisely: Would "I see... on the screen" mean something like "I have an image of..."?--Or should I say that the sentence "...is now appearing on the screen" corresponds to "I have an image of..."?--No; *that* is not the way it is. The difficulty here lies in my not having a clear concept of what is meant by "producing the pictures by willing them", etc. For actually the case above is not entirely fantastic: I really can form images of all sorts of things on a wall covered with spots; and if someone else who looked at the wall should know in each instance what I was imaging then this would be similar to the case described above. ((But couldn't someone who draws pictures on the wall also be said to be producing them merely by an act of the will?))

"To move by pure will"--What does that mean? That the pictures always exactly obey my will, whereas my hand in drawing, my pencil, does not? All the same in that case it would be possible to say: "Usually I form images of exactly what I want to; today it has turned out differently." Is there such a thing as 'images not coming off'? [b: Z 643.]

Page 23

120. If there isn't, then this will be explained by saying that the image-picture is non-corporeal and does not resist the will--neither by inertia nor by any other means.

No; "I see... on the screen" cannot correspond to my imaging. Neither can "I produce... on the screen"--for then imaging could succeed or fail. This would be better: "For me what is on this screen now is a picture of..."†1

Page 23

121. To be sure, there is a language-game with the order "Imagine...!"--but can this really be that simply assimilated to "Turn your head to the right!?" Or, to put it differently: Does it make sense simply to say that image-pictures, inner pictures, obey my will? (N.B.: *not* "my wish".)

Page 23

122. For those things which are normally said to follow or not to follow the will are not 'inner pictures'. It is not clear therefore, that the concept of following can be applied to the other category directly.

Page 23

123. (Clearly the 'arbitrariness' of the imagination cannot be compared to the movement of bodies; for someone else is also competent to judge whether the movement has taken place; whereas with the movement of my images the whole point would always be

Page Break 24

what I said I saw--whatever anyone else sees. So really moving objects would drop out of consideration, since no such thing would be in question.) [Z 641.]

Page 24

124. If then one said: "Images are inner pictures, resembling or exactly like my visual impressions, only subject to my will"--the first thing is that this doesn't yet make sense.

For if someone has learnt to report what he sees over there, or what *seems* to him to be over there, it surely isn't clear to him what it would mean if he were ordered now to see *this* over there, or now to have *this* seem to him to be over there. [Z 642.]

Page 24

125. Granted, there is a certain relationship between imaging and an action which is expressed in the possibility of ordering someone to perform either; but the *degree* of this relationship has yet to be investigated.

Page 24

126. "Move your inner picture!" might mean: move the object.

Page 24

127. "Move what you see."

Page 24

It might also mean: take something that influences your visual impressions.

Page 24

128. What a strange phenomenon that a child can actually learn human language! That a child who knows nothing can start out and learn by a sure path this enormously complicated technique.

This thought occurred to me when on a certain occasion I became conscious of how a child starts *with nothing* and one day uses negations, just as we do!

Page 24

129. With the sentence "Images are voluntary, sensations are not", one differentiates not between sensations and images, but rather between the language-games in which we deal with these concepts.

Page 24

130. There are what can be called phenomena of seeing and phenomena of imaging; and there is the concept of seeing and the concept of imaging. Within both pairs one can speak of '*differences*'.

Page Break 25

Page 25

131. If one says "Imagination has to do with the will" then the same connection is meant as with the sentence "Imaging has nothing to do with observation".

Page 25

132. I said there were phenomena of seeing--what did I mean by that? Well, for instance, everything that can be portrayed in pictures, and that would be described as 'seeing'. Exact observing; looking at a language; someone blinded by light; the look of joyous surprise; turning away so as not to see something. All the kinds of behaviour which distinguish a sighted man from a blind one. (After all, there is a reason why precisely *these* pictures taken from human life occur to me at this point.)

Page 25

133. Phenomena of seeing--that is, what the psychologist observes.

Page 25

134. Someone says: "I see a house with green shutters." And you say: "He's not *seeing* it, he's merely imagining it. He's not even looking; don't you see him staring into space?"--*Very loosely*, it could also be put this way: "That's not the way it looks when somebody sees something; rather, that's the way it looks when he has an image of something." In this case we're comparing phenomena of seeing with phenomena of imagining. Likewise if we were to observe two members of an unknown tribe using a word as they perform a certain activity--a word which we have come to recognize as an equivalent of our "seeing". And we follow their use of that word upon this occasion, and come to the conclusion that here it must mean "to see with the inner eye". (Similarly, one might also come to the conclusion that the word must here mean *to understand*.)

Page 25

135. What does it mean to say, for example, that 'see' hangs together with 'observe'?--When we learn how to use "see" we learn to use it simultaneously and in conjunction with "look", "observe", etc.

Page 25

136. Just as in a chess game we learn to use the king in connection with the pawns and the word "king" together with the word "checkmate".

Page 25

137. A language-game comprises the use of *several* words. [Z 644.]

Page Break 26

Page 26

138. Nothing could be more mistaken than to say: seeing and forming an image are different activities. That is as if one were to say that moving and losing in chess were different activities. [Z 645.]

Page 26

139. The sentence "Forming an image is voluntary, seeing isn't", or a sentence like this can be misleading.

Page 26

When we learn as children to use the words "see", "look", "image", voluntary actions and orders come into play. But in a different way for each of the three words. The language-game with the order "Look!" and that with the order "Form an image of...!"--how am I ever to compare them?--If we want to train someone to react to the order

"Look...!" and to understand the order "Form an image of...!" we must obviously teach him quite differently. Reactions which belong to the latter language-game do not belong to the former. There is of course a close tie-up of these language-games; but a resemblance?--Bits of one resemble bits of the other, but the resembling bits are not homologous. [b: Z 646.]

Page 26

140. I could imagine something similar for actual games. Two essentially different games--games which might differ from each other in important respects far more than checkers and chess--could feature the same board and the same moves, only, if I might put it this way, in different positions. In the one game, e.g., the task might be to check-mate†1 the other player; in the other game the whole process of check-mating†2 would be given in advance, and the two players would have a quite different task in connection with it. For instance, the players might be given two ways of check-mating†2 the other, and they would have to compare the two from a psychological point of view. Analogously there is a game: to solve a crossword puzzle, and another one: somehow to test the value of several different solutions I have been given to the puzzle. [First sentence: Z 647.]

Page 26

141. Seeing is subject to the will *in a different way* from forming an image.
Or: 'seeing' and 'forming an image' are related differently to 'willing'.

Page Break 27

Page 27

142. Nevertheless, images seem to be dull reflections of sense-impressions. When does this seem to be the case, and to whom? Of course there is such a thing as clarity and unclarity in images. And if I say "My image-picture of him is much less well-defined than the visual impression I have when I see him", then this is true, for I cannot describe him nearly as accurately by relying on my image as I can when he is in front of me.†1 Still, it is possible for someone's eyesight to deceive him to such an extent that the sight of another man is much less clear than the image of him.

Page 27

143. If I, and if anyone else, can imagine a pain, or at least we say we can--how is it to be found out whether we are imagining it right, and how accurately we are imagining it? [Z 535.]

Page 27

144. Couldn't there be people who could describe a person's features in minute detail from memory, who even say that they now suddenly know what he looks like--but who would emphatically deny, when they were asked, that at that moment they in any way 'saw' the person 'before them' (or anything like that)? People who would find the expression "I see him before me" *totally inappropriate*?

This seems to me to be a very important question. Or even: the important question is whether this question makes sense.--What reason do I have, after all, to believe that this is not the case for all of us? Or, how can I decide the question whether someone else (I'm excluding myself for the time being) is really 'forming a visual image' of somebody, or is merely able to describe him in visual terms (to draw him etc.)--plus the fact that he is familiar with 'illumination', if I might phrase it this way, or a state of illumination similar to "Now I know". ((Genuine duration.))

Page 27

145. *Visual* imaging is *not* just characterized by an ability to draw, and things like that, but also by more subtle shades of behaviour.

In any case, the *description* of the image belongs to the language-game of "forming an image". (That does not mean that in borderline cases this statement cannot appear: "I can form an exact image of it, but I simply cannot describe it." A game allows for borderline cases--a rule for exceptions. But the exception and the rule could not change place without destroying the game. The 'transition from quantity to quality'?)

Page Break 28

Page 28

146. "If exception and rule change place then it just is not the same thing any more!"--But what does that mean? Maybe that our attitude toward the game will then change abruptly. Is it as if after a gradual loading of one side and lightening of the other, there was a *non-gradual* tipping of the balance?

147. What could the description of the image of a sensation of movement look like?

Page 28

148. Continuation of the classification of psychological concepts.

Emotions. Common to them: genuine duration, a course. (Rage flares up, abates, vanishes, and likewise joy, depression, fear.)

Distinction from sensations: they are not localized (nor yet diffuse!).

Common: they have characteristic expression-behaviour. (Facial expression.) And this itself implies characteristic sensation too. Thus sorrow often goes with weeping, and characteristic sensations with the latter. (The voice heavy with tears.) But the sensations are not the emotions. (In the sense in which the numeral 2 is not the number 2.)

Among emotions the directed might be distinguished from the undirected. Fear *at* something, joy *over* something.

This something is the object, not the cause of the emotion.

The language-game "I am afraid" already contains the object.

"Anxiety" is what undirected fear *might* be called, in so far as its manifestations are related to those of fear.

The *content* of an emotion--here one imagines something like a *picture*, or something of which a picture can be made. (The darkness of depression which descends on a man, the flames of anger.)

The human face too might be called such a picture and its alterations might represent the *course* of a passion.

What goes to make them different from sensation: they do not give us any information about the external world. (A grammatical remark.)

Love and hate might be called emotional dispositions, and so might fear in one sense.

It is one thing to feel acute fear, and another to have a 'chronic' fear of someone. But fear is not a sensation.

'Horrible fear': is it the *sensations* that are so horrible?

Page Break 29

Page 29

Typical causes of pain on the one hand, and of depression, sorrow, joy on the other. Cause of these also their object.

Pain-behaviour and the behaviour of sorrow.--These can only be described along with their external occasions. (If a child's mother leaves it alone it may cry because it is sad; if it falls down, from pain.) Behaviour and kind of occasion belong together. [a-f: Z 488; g-i: Z 489; j: Z 490; k-l: Z 491; m-p: Z 492.]

Page 29

149. Perhaps someone will say: How can you characterize the concept 'pain' by referring to the occasions on which pain occurs? Pain, after all, is what it is, whatever causes it!--But ask: How does one identify pain?

The occasion determines the usefulness of the signs of pain.

Page 29

150. The concept of pain is simply embedded in our life in a certain way. It is characterized by very definite connexions.

Just as in chess a move with the king only takes place within a certain context, and it cannot be removed from this context.--To the concept there corresponds a technique. (The eye†1 smiles only within a face.) [a: cf. Z 532, 533.]

Page 29

151. Only surrounded by certain normal manifestations of life, is there such a thing as an expression of pain. Only surrounded by even more far-reaching particular manifestations of life, such as the expression of sorrow or affection. And so on. [Z 534.]

Page 29

152. Emotional attitudes (e.g. love) can be put to the test, but not emotions. [Cf. Z 504.]

Page 29

153. I am inclined to say: emotions can *colour* thoughts; bodily pain cannot. Therefore let us speak of sad thoughts, but not, analogously, of toothache thoughts. It is as if one might say: Fear or indeed hope could consist only of thoughts, but pain could not. Above all pain has the characteristics of sensation and fear does not. Fear hangs together with misgivings, and misgivings are thoughts.

Page Break 30

Page 30

154. Hope can be called an emotion. That is, it can be placed in the same category as fear, anger, joy. It is related to belief, which is *not* an emotion. There is no bodily expression typical of belief.

Compare the meaning of "uninterrupted pain" with "uninterrupted anger", jubilation, sorrow, joy, fear, and on the other hand, "uninterrupted belief", or "uninterrupted hope".

But again, fear, hope, longing, expectation, are hard to compare with each other. Longing is a mental preoccupation with a certain object. Fear of an *event* (apprehension) seems to be similar; but not the fear of a dog

barking at me. Here two different words can be used. Likewise "expect" can mean: to believe that this or that will happen--but also: to occupy one's time with thoughts and activities of expectation, i.e., *wait for*.

Page 30

155. Belief is not any kind of occupation with the object of belief. Fear, however, longing, and hope, occupy themselves with their objects.

In a scientific investigation we say all sorts of things, we make many statements whose function in the investigation we don't understand. For not everything is said with a conscious purpose; our mouth simply runs. We move through conventional thought patterns, automatically perform transitions from one thought to another according to the forms we have learned. And then finally we must sort through what we have said. We have made quite a few useless, even counter-productive motions and now we must clarify our movements of thought philosophically. [b: *Culture and Value*, p. 64.]

Page 30

156. If I tell you "I have been afraid of his arrival all day long"--I could, after all, go into detail: Immediately upon awakening I thought.... Then I considered.... Time and again I looked out of the window, etc., etc. This could be called a report about fear. But if I then said to somebody, "I am afraid..."--would that be as it were a groan of fear, or an observation about my condition?--It could be either one, or the other: It might simply be a groan of fear; but I might also want to report to someone else how I have been spending the day. And if I were now to say to him: "I have spent the whole day in fear (here details might be added) and now too I am full of anxiety"--what are we to say about this mixture of report and

Page Break 31

statement? Well what should we say other than that here we have the use of the word "fear" in front of us?

Page 31

157. If there were people who felt a stabbing pain in their left side in those cases where we express misgivings with feelings of anxiety--would this stabbing sensation take the place with them of our feeling of fear?--So if we observed these people and noticed them wincing and holding their left side every time they expressed a misgiving, i.e., said something which for us at any rate would be a misgiving--would we say: These people sense their fear as a stabbing pain? Clearly not.--

Page 31

158. Why does one use the word "suffering" for pain as well as for fear? Well, there are plenty of tie-ups.--[Z 500.]

Page 31

159. Suppose it were said: Gladness is a feeling, and sadness consists in *not* being glad.--Is the absence of a feeling a feeling? [Z 512.]

Page 31

160. If I say "Every time I thought about it I was afraid"--did fear *accompany* my thoughts?--How is one to conceive of separating what does the accompanying from what is accompanied?

We could ask: How does fear pervade a thought? For the former does not seem to be merely concurrent with the latter. To be sure, if I say "I think about it with anguish", the thought expressed in these words might seem to run concurrently with a certain feeling in my chest, and *this* might seem to be alluded to. But the use of this sentence is something different from that.

One also says: "Thinking about it takes my breath away", and means not only that as a matter of experience this or that sensation or reaction accompanies this thought.

Page 31

161. To the utterance: "I can't think of it without fear" one replies: "There's no reason for fear, for..." That is at any rate *one* way of dismissing fear. Contrast with pain.

Is disgust a sensation?--Is it localized?--And it has an object, as does fear. And there are characteristic sensations here. [a: Z 501.]

Page Break 32

Page 32

162. Indeed, you must always ask yourself: What do you tell someone else with these sentences? And this means: What use can he make of them?

Page 32

163. I *give notice* that I am afraid.--Do I recall my thoughts of the past half hour in order to do that, or do I let a thought of the dentist quickly cross my mind in order to see how it affects me; or can I be uncertain of whether it is really fear of the dentist, and not some other physical feeling of discomfort?

Page 32

164. Or is giving notice of being afraid like a very slight groan of fear? No; for in groaning I don't necessarily want to tell somebody else that I am afraid. The notice is, as it were, part of a *conversation*.

Page 32

165. Can one say: "I am only afraid of the operation at the moment I am thinking about it"? And does that mean: while I am pondering over it? Can't I dread something even when I am not expressly, so to speak, thinking it over? Can't I say to someone "I dread this meeting" even though I see the event, as it were, merely out of the corner of my eye?

Page 32

166. Let us just forget entirely that we are interested in the state of mind of a frightened man. It is certain that under given circumstances we may also be interested in his behaviour as an indication of how he will behave in the future. So why should we not have a word for this? It can be either a verb or an adjective.

It might now be asked whether this word would really relate simply to behaviour, simply to bodily changes. And this we wish to deny. There is no future in simplifying the use of this word in this way. It relates to the behaviour under certain external circumstances. If we observe these circumstances and that behaviour we say that a man is....

If the word is used in the *first* person then the analogy with its use in the third person is the same as the one between "I am cross-eyed" and "He is cross-eyed". [a, b,--except for the last sentence of a and the last two words of b: Z 523.]

Page 32

167. I now want to say that humans who employ such a concept would *not* have to be able to describe its use. And were they to try, it is possible that they would give a quite inadequate description. (Like most people, if they tried to describe the use of paper money correctly.) [Cf. Z 525.]

Page Break 33

Page 33

168. It is possible, for example, that they make this statement about someone without being able to say with any degree of certainty, *which* aspect of his behaviour causes them to make the statement. They might say "I see it; but I don't exactly know *what* I see". Just as we say: "Something about him has changed, but I don't know exactly what." Future experience might prove them right.

Page 33

169. Now it is conceivable that some people might have a verb whose third person would be *exactly* equivalent to our "He is afraid"; but whose first person is not equivalent to our "I am afraid". For the assertion using the first person would be based on self-observation. It would not be an *utterance* of fear and there would be a "I believe I...", "It seems to me that I...". Now probably this first person would not be used at all, or only very rarely. If my behaviour in a certain situation were filmed, then when the film was shown to me I could say "My behaviour creates the impression...".

Page 33

170. That statement "I believe he feels what I feel in such circumstances" does not yet exist here: The interpretation, that is, that I see something in myself which I surmise in him.

For in reality that is a rough interpretation. In general I do not surmise fear in him--I *see* it. I do not feel that I am deducing the probable existence of something inside from something outside; rather it is as if the human face were in a way translucent and that I were seeing it not in reflected light but rather in its own.

Page 33

171. "I dread it."--That is not a representation of something I see. As a matter of fact, as soon as I *look*, I see nothing, or at least not what I really meant. Then it is as if this were such a thin veil that one could know about it but not actually see it. As if dread were a very subtle, muffled sound alongside the everyday sounds, a sound which I could only *sense* and not really hear.

Imagine a child who for a long time had been unable to learn how to speak and who suddenly used the expression "I dread...", which it had heard from adults. And its face and the circumstances and the consequences make us say: He really meant it. (For one could always say: "One fine day the child starts using the words.") I chose the case of a child because what is happening in him is stranger to us than it would be with an adult. What do I know--I'm inclined to say--about a *background* for the words "I dread..."? Does the child suddenly let me look into him?

Page Break 34

Page 34

172. This matter also calls to mind hearing a sound *from a particular direction*. It is almost as if one felt the

heaviness around the stomach from the direction of the fear. That means really that "I am sick with fear" does not assign a *cause* of fear. [Cf. Z 496.]

Page 34

173. Are there psychological syndromes; and is 'expecting' one of them? Possibly waiting for something, but not 'expecting'.

Page 34

174. That there is a fear-syndrome, for example, does not mean that fear is a syndrome. [Cf. Z 502.]

Page 34

175. If I say "I am anxiously awaiting his coming", this means: I am *occupied* with his coming (in thought and, one can also say: in thought and in action). The state of anxiously awaiting can thus be called a syndrome. But it is not, so to speak, a syndrome of actions of a certain kind; the crucial point is rather the intention of the actions, and thus a *motive*, and not a *cause*.

Page 34

176. If I say that I am using the words "I'm in pain", "I'm looking for him", etc. etc. as a piece of information, not as a natural sound,†1 then this characterizes my intention. For instance, I might want somebody else to react to this in a certain way.

But here I still owe an explanation of the concept of intention, and intention is by no means some sort of feeling to which I want to reduce everything; at whose door, so to speak, I am laying everything. (For intention is *not* a feeling.)

Page 34

177. If we call fear, sorrow, joy, anger, etc. mental states, then that means that the fearful, the sorrowful, etc. can report: "I am in a state of fear" etc., and that this information--just like the primitive utterance--is not based on observation.

Page 34

178. Intent, intention, is neither an emotion, a mood, nor yet a sensation or image. It is not a state of consciousness. It does not have genuine duration. Intention can be called a mental disposition. This term is misleading inasmuch as one does not perceive such a disposition within himself as a matter of experience. The *inclination* toward jealousy, on the other hand, is a disposition in the true sense. Experience teaches me that I have it. [First three sentences: Z 45.]

Page Break 35

Page 35

179. "I intend" is not an expression of an experience.

There is no cry of intention, any more than there is one of knowledge or belief.

However, one might very well call the *decision* with which an intention frequently begins an experience.

Page 35

180. Is a decision a thought? It can be the end of a chain of thought.

Page 35

181. Someone tells me something; I look at him in amazement; he explains... My puzzled look was equivalent to the question: "How come?" or "What do you mean?" or "Why?" or "You want to do *that*? You who always...?"--The sudden thought.

Page 35

182. Intentional--unintentional. Voluntary--involuntary.

What is the difference between a gesture of the hand without a particular intention and the same gesture which is intended as a sign?

Page 35

183. Let us imagine someone doing work that involves comparison, trial, choice. Say he is constructing an appliance out of various bits of stuff with a given set of tools. Every now and then there is the problem "Should I use *this* bit?"--The bit is rejected, another is tried. Bits are tentatively put together, then dismantled; he looks for one that fits etc., etc. I now imagine that this whole procedure is filmed. The worker perhaps also produces sound-effects like "Hm" or "Ha!" As it were sounds of hesitation, sudden finding, decision, satisfaction, dissatisfaction. But he does not utter a single word. Those sound-effects may be included in the film. I have the film shown me, and now I invent a soliloquy for the worker, things that fit his manner of work, its rhythm, his play of expression, his gestures and spontaneous noises; they correspond to all this. So I sometimes make him say "No, that bit is too long, perhaps another'll fit better."--Or "What am I to do now?"--"Got it!"--Or "That's not bad" etc.

If the worker can talk--would it be a falsification of what actually goes on if he were to describe that precisely

and were to say, e.g., "Then I thought: No, that won't do, I must try it another way" and so on--although he had neither spoken during the work nor imagined these words?

Page Break 36

Page 36

I want to say: May he not later give his wordless thoughts in words? And in such a fashion that we, who might see the work in progress, could accept this account?--And all the more, if we had often watched the man working, not just once? [Z 100.]

Page 36

184. Of course we cannot separate his 'thinking' from his activity. For the thinking is not an accompaniment of the work, any more than of thoughtful speech. [Z 101.]

Page 36

185. Imagine a person who is taking a break in his work, and is staring ahead seemingly pondering something, in a situation in which we would ask ourselves a question, weigh possibilities--would we necessarily say of him that he was reflecting? Is not one of the prerequisites for this that he *be in command* of a language, i.e., be able to express the reflection, if called upon to do so?

Page 36

186. Now if we were to see creatures at work whose *rhythm* of work, play of expression etc. was like our own, but for their not *speaking*, perhaps in that case we should say that they thought, considered, made decisions. That is: in such a case there would be a *great deal* which is similar to the action of ordinary humans. And it isn't clear *how much* has to be similar for us to have a right to apply to them also the concept 'thinking', which has its home in *our* life. †1 [Cf. Z 102.]

Page 36

187. And anyhow what should we come to this decision for?

We shall be making an important decision between creatures that can learn to do work, even complicated work, in a 'mechanical' way, and those that make trials and comparisons as they work.--But what should be called "making trials" and "comparisons" can in turn be explained only by giving examples, and these examples will be taken from our life or from a life that is like ours. [Z 103.]

Page 36

188. And if their trial-making were to take on the form of producing a kind of model (or even a drawing) then we would say without hesitation that these beings were thinking. To be sure one could also speak here of an operation with signs.

Page Break 37

Page 37

189. "But couldn't the operation with signs also take place mechanically?"--Surely; i.e. this too has to take place in a certain context in order for us to be able to say it is not mechanical.

Page 37

190. It seems therefore, that our concepts, the use of our words, are constrained by a factual framework. But how can that be?! How could we describe the framework if we did not allow for the possibility of something else?--One is inclined to say that you are making all logic into nonsense!

Page 37

191. The problem which worries us here is the same as in the case of this observation: "Human beings couldn't learn to count if all the objects around them were rapidly coming into being and passing away.

Page 37

192. But you can also say: "If you don't have any little sticks, stones, etc. at hand, then you can't teach a person how to calculate." Just as you can say "If you have neither a writing surface nor writing material at hand then you can't teach him differential calculus" (or: then you can't work out the division $76570 \div 319$).

We don't say of a table and chair that they think; neither do we say this of a plant, a fish, and hardly of a dog; only of human beings. And not even of all human beings.

But if I say "A table does not think", then that is not similar to a statement like "A table doesn't grow". I shouldn't know 'what it would be like if' a table were to think. And here there is obviously a gradual transition to the case of human beings. [b, c: cf. Z 129.]

Page 37

193. "Thinking is a mental activity."--Thinking is *not* a bodily activity. Is thinking an activity? Well, one may tell someone: "Think it over! ". But if someone in obeying this order talks to himself or even to someone else, does he

then carry out *two* activities? Therefore thinking really can't be compared to an activity at all. For one cannot say that thinking means: speaking in one's imagination. This can also be done without thinking. [Z 123, up to "Therefore thinking...".]

Page 37

194. You must never forget that "think" is an everyday word, just as are all other psychological terms.

It is not to be expected of this word that it should have a unified employment; rather it is to be expected that it doesn't have it. [a: cf. Z 113; b: Z 112.]

Page Break 38

Page 38

195. If someone is pondering over a problem and suddenly I show him a certain drawing, then maybe he will exclaim "Oh, *that's* how it is!", or "Now I know". When questioned about what went on inside him just then, in this case he will very likely say simply: "I saw the drawing." I am describing this case in order to replace a process within the imagination with one of seeing. Will he now say: "The moment I saw the drawing the whole solution appeared before my eyes"? When I come to his aid with the drawing he might also say: "Yes, now it's easy!"

Page 38

196. "I see clearly how the word is used"--will that be said even when one is shown, alongside the word, a picture which illustrates its meaning?

((In this case, the experience of meaning seems to be drowned out by what has been seen.))

Page 38

197. We say: Grass is green, chalk white, coal black, blood red, etc.--What would it be like in a world in which this would be impossible, i.e., in which the other qualities of a thing were unconnected with†1 its colour? This is an important question, whether or not it has been put correctly, and is merely an example of countless similar questions.

Page 38

198. Suppose I were to come to a country where the colour of things--as I would say--changed constantly, say because of a peculiarity of the atmosphere. The inhabitants never see unchanging colours. Their grass looks green at one moment, red at the next, etc. Could these people teach their children the words for colours?--First of all, it might be that their language *lacked* words for colours. And if we found this out we might explain it by saying that they had little or no use for certain language-games.

Page 38

199. How could people learn the use of the words for colour in a country where everything was only *one* colour?

But can I say now: "The only reason for our being able to use the names for colours is that things of different colours exist in our environment and that..."?? Here the difference between logical and physical possibility is not being seen.--Under what conditions the language-game with the names for colours is physically impossible--i.e., properly speaking, not probable--does not interest us.

Without chess-men one can't play chess--that is the impossibility which interests us.

Page Break 39

Page 39

200. One learns the word "think", i.e. its use, under certain circumstances, which, however, one does not learn to describe. [Z 114.]

Page 39

201. We learn to say it perhaps only of human beings, we learn to assert or deny it of them. The question "Do fishes think?" does not exist among our applications of language, *it is not raised*. (What can be more natural than such a set-up, such a use of language!) [Z 117.]

Page 39

202. "No one thought of *that* case"--we may say. Indeed, I cannot enumerate the conditions under which the word "to think" is to be used--but if a circumstance makes the use doubtful, I can say so, and also *how* the situation is deviant from the usual ones. [Z 118.]

Page 39

203. And here something about my language-game No. 2†1 should be said.--*Under what circumstances* would one really call the sounds of the builder, etc., a language? Under *all* circumstances? Certainly not!--Was it wrong then to isolate a rudiment of language and call it language? Should one perhaps say that this rudiment is a language-game only in the context of the whole that we usually call our language?? [Cf. Z 98.]

Page 39

204. Now in the first place this *surrounding* is not the mental accompaniment of speech; it is not the 'meaning' and 'understanding' which one is inclined to consider as essential to language.

Page 39

205. It would only be dangerous to me if someone were to say: "You're just tacitly assuming that these people *think*; that they are like people as we know them in *that* respect; that they do not carry on that language-game merely mechanically. For if you imagined them doing that, you yourself wouldn't call it speaking."

What am I to reply to this? Of course it is true that the life of those men must be like ours in many respects and that I said nothing about this similarity. But the important thing is precisely that I can imagine their language, and their thinking too, as primitive; that there is such a thing as 'primitive thinking' which is to be described via primitive *behaviour*. [Cf. Z 99.]

Page 39

206. I say of someone: He's comparing two objects. I know what that looks like, how that is done. I can demonstrate it to someone.

Page Break 40

Page 40

Nevertheless I wouldn't call what I was demonstrating 'comparing' under *all* circumstances.

I can imagine cases in which I would not be inclined to say that comparing was going on; but as for describing the circumstances in which comparing occurs, that I could not do.--But I *can teach* a person the use of the word! For a description of those circumstances is not needed for that. [Last sentence: Z 115.]

Page 40

207. I just teach him the word *under particular circumstances*.†1 [Z 116.]

Page 40

208. Sometimes it really seems that thinking runs concurrently with talking (reading, for example). Not that it could then be isolated from reading, however. Rather, what accompanies the words is like a series of small secondary movements. It is like being led along a street, but casting glances right and left into all the side streets.

Page 40

209. Suppose I were to show somebody a list of the trips or errands he is to run for me. We know each other well and all he needs are hints for him to know what he is to do. Now the list is all hints of this sort. He goes through it and says after each hint "I understand". And he does; he could explain every single item, if asked to do so.

Then I could ask him: "Did you understand everything?" Or: "Look through the list and see whether you understand everything." Or: "Do you know what you have to do here?"--What did he have to do to make sure that he had understood the hints? Is it as if he had to perform a mental calculation for each item? If that were necessary he could later give a verbal account of the calculation and it would become clear whether he calculated correctly.--But generally that is *not* necessary. We do not prescribe what the other is to do if he is to understand the list; and whether he really understood is determined from what he does later, or from an explanation we might ask him to give.

Page 40

210. One could say: anyone who checks his comprehension in this way is moving along a bit of the way on the path he is later to follow. And that might indeed be so. Although there is no reason to assume it is so. For if he only goes part of the way--why shouldn't he be able

Page Break 41

to see that he knows which way he is to go, without actually going it? But that does not mean that the paths are not actually followed part of the way. However, it can also be that what we later come to regard as the '*germ*' of a thought or an action is in its own nature not that at all.

Page 41

211. Now suppose someone were to say: That simply means that "thinking" has a certain end, that it fulfils a certain purpose. *How* each person performs it and whether he does it the same today as last time, is irrelevant.--Then I could answer: And if doing nothing at all leads to the proper end, then thinking in this case would consist in doing nothing.

One says: "Make sure that you understand each point!"

And if I were then to ask, "How should I make sure?", what advice would I be given? I would be told: "Ask yourself, whether..."

Page 41

212. Isn't it the same here as with a calculating prodigy?--He has calculated right if he has got the right answer.

Perhaps he himself cannot say what went on in him. And if we were to hear it, it would perhaps seem like a queer *caricature* of calculation. [Cf. Z 89b.]

Page 41

213. When someone says "Non-verbal thinking is also possible", this is misleading. The point is not to be able to do a certain thing without also doing something else at the same time; as, for example, with "It is possible to read without moving one's lips".

Page 41

214. If, for instance, there were only quite few people who could get the answer to a sum without speaking or writing, they could not be adduced as testimony to the fact that calculating can be done without signs. The reason is that it would not be clear that these people were 'calculating' at all. Equally Ballard's†1 testimony (in James) cannot convince one that it is possible to think without a language.

Indeed, where no language is used, why should one speak of 'thinking'? If this is done, it shows something about the *concept* of thinking. [Z 109.]

Page 41

215. For instance one could have two (or more) different words: one for 'thinking out loud'; one for thinking as one talks in the imagination; one for a pause during which something or other floats

Page Break 42

before the mind (or doesn't), after which, however, we are able to give a confident answer.

We could have two words: one for a thought expressed in a sentence; one for the lightning thought which I may later 'clothe in words'. [Cf. Z 122.]

Page 42

216. If we include 'thinking silently as one is working' in our considerations, then we see that our concept 'thinking' is widely ramified. Like a ramified traffic network which connects many out-of-the-way places with each other.

In all of these widely separated cases we speak of 'thinking'.

Page 42

217. In all of these cases we say that the mind is not idle, that something is going on inside it; and we thereby distinguish these cases from a state of stupor, from mechanical actions.

Page 42

218. 'Thinking', a widely ramified concept. Couldn't the same be said of 'believing', 'doing', 'being glad'?

And where does the remark that this concept is widely ramified really belong?--Well it will be made to someone setting out to consider the branching of this concept.

Page 42

219. It's really very odd that we have no difficulty whatsoever seeing a face in a figure such as this†1  even though the resemblance of the one angle to a nose and of the other to a forehead etc., is incredibly slight, or there hardly is a resemblance there. To repeat: We have no difficulty whatsoever seeing a human face in these lines; one would like to say: "There *is* a face like that." Again: "True, this is the caricature of a human face, but a caricature of one which could really exist."--Just as one has no difficulty seeing a human face in the grey-and-white of a photograph.--And what does that mean? Well, we watch a movie, for instance, and follow everything that goes on with concern, as if there were real people in front of us.

Page 42

220. 'Thinking', a widely ramified concept. A concept that comprises many manifestations of life. The *phenomena* of thinking are widely scattered. [Z 110.]

Page Break 43

Page 43

221. And don't you want to say that *one* aspect appears in all of these word-uses, a unitary, genuine concept?--But how much is there in that? May not the force of habit weld all of this together?

Page 43

222. If somebody tells me of some incident, or asks me an everyday question (e.g. what time is it), I'm not going to ask him whether he was thinking while he was telling me or asking me. Or again: It would not be immediately clear in what circumstances one might have said that he did this without thinking--even though one can imagine such circumstances. (Here there is a relationship with the question: What is to be called a 'voluntary' act.)

223. The thoughtful expression, the expression of the idiot. The frown of reflection, of attention.

224. Now imagine a human being, or one of Köhler's monkeys, who wants to get a banana from the ceiling, but can't reach it, and thinking about ways and means finally puts two sticks together, etc. Suppose one were to ask, "What must go on inside him for this to take place?"--This question seems to make some sort of sense. And perhaps someone might answer that unless he acted through chance or instinct, the monkey must have seen the process before its mental eye. But that would not suffice, and then again, on the other hand, it would be too much. I want the monkey to *reflect* on something. First he jumps and reaches for the banana in vain, then he gives up and perhaps he is depressed--but this phase does not have to take place. How can catching hold of the stick be something he gets to *inwardly* at all? True, he could have been shown a picture that depicts something like that, and then he could act that way; or such a picture could simply float before his mind. But that again would be an accident. He would not have arrived at this picture by reflection. And does it help to say that all he needed to have done was somehow to have seen his arm and the stick as a unity? But let us go ahead and assume a propitious accident! Then the question is: How can he *learn* from the accident? Perhaps he just happened to have the stick in his hand and just happened to touch the banana with it.--And what further must now go on in him? He says to himself, as it were, "That's how!", and then he does it with signs of full consciousness.--If he has made some combination in play, and he now uses it as a method for doing this and that, we shall say he thinks.--In *considering* he would mentally review ways and means. But to do this he must already have some in stock. Thinking gives him the possibility of *perfecting* his

methods. Or rather: He 'thinks' when, in a definite kind of way, he perfects a method he has. [Z 104--beginning at "If he has made".]

225. It could also be said that he thinks when he *learns* in a particular way. [Z 105.]

226. And this too could be said: Someone who *thinks* as he works will intersperse his work with *auxiliary activities*. The word "thinking" does not now mean these auxiliary activities, just as thinking is not talking either. Although the concept 'thinking' is formed on the model of a kind of imaginary auxiliary activity. (Just as we might say that the concept of the differential quotient is formed on the model of a kind of imaginary quotient.) [Z 106.]

227. These auxiliary activities are not the thinking; but one imagines thinking as that which must be flowing under the surface of these expedients, if they are not after all to be mere mechanical procedures. [Z 107.]

228. Thinking is the imaginary auxiliary activity; the invisible stream which carries and connects all of these kinds of actions.--The grammar of "thinking", however, is assimilated to that of "speaking".

229. So one might distinguish between two chimpanzees with respect to the way in which they work, and say of the one that he is thinking and of the other that he is not.

230. But here of course we wouldn't have the complete employment of "think". The word would have reference to a mode of behaviour. Not until it finds its particular use in the first person does it acquire the meaning of mental activity.

231. I think it is important to remark that the word doesn't have a first person present (in the meaning which is of consequence to us). Or should I say: that its use in the present tense does not parallel that of the verb "feel pain", for instance?

232. One can say "I thought..." if one really did use an expression of thought; but also if these words are, as it were, a development from a germ of thought.

233. Only under quite special circumstances does the question arise[†] whether one spoke *thinkingly* or not. [Z 95.]

234. The use of a word such as "thinking" is simply far more erratic than it appears at first sight.

It can also be put this way: The expression serves a much more specialized purpose than is apparent from its

form. For the form is a simple, regular structure. If thinking frequently, or mostly goes with talking, then of course there is the possibility that in some instance it does not go with it.

Page 45

235. I'm learning a foreign language and I read sample sentences in a textbook. "My aunt has a beautiful garden." The sentence has the smell of a textbook. I read it and ask myself, "What does 'beautiful' mean in...?", then I think about the case of the adjective.--Now if I tell somebody that my aunt has..., then I don't think about these things. The context in which the sentence stood was completely different.--But wasn't I able to read that sentence in the textbook and at the same time think about my aunt's garden? Certainly. And should I now say that the thought-accompaniment is a different one every time, according as I see the sentence one time as a pure exercise, another time as an exercise accompanied by the thought of a garden, and another time as I simply say it as a piece of information to someone?--And is it impossible that someone should give me this information in the course of a conversation, and that exactly the same thing could occur within him then as when he uses the sentence as a language exercise? Does it matter to me what goes on inside him? Do I realize it?

And how can I write about it at all with any degree of certainty? For while I am doing this, I am not learning a language and I am not giving anybody a piece of information. How, then, can I know what goes on inside a person in such a case? Do I remember what went on inside me in these cases? Nothing of the sort. I only believed I could think myself into these situations. But then I might completely have gone wrong.

And this is the very method that is *always* used in such cases! What one experiences here is merely characteristic of the situation of philosophizing.

Page 45

236. What do I know of what goes on within someone who is reading a sentence attentively? And can he describe it to me afterwards, and, if he does describe something, will it be *the* characteristic process of attention? [Z 90.]

Page Break 46

Page 46

237. What result am I aiming at when I tell someone: "Read attentively!"? That, e.g., this and that should strike him, and he be able to give an account of it.--Again, it could, I think, be said that if you read a sentence with attention you will then be able to give a general account of what has gone on in your mind, e.g. the occurrence of images. But that does not mean that these things constituted attention. [Z 91.]

Page 46

238. What do I do if he tells me that he thought about something entirely different when he read the sentence? What interesting conclusions can I draw from such a piece of information? Well, for instance that this particular matter occupies his mind; that I should not expect that he knows what the material he read was about; that what he read has made no impression on him whatsoever; and things like that.

Therefore it would make no sense if somebody who had had a pleasant conversation^{†1} with me were thereafter to assure me that he had spoken entirely without thinking. But this is not because it contradicts all experience that a person who can speak in this way should do so without thought processes accompanying his speech. Rather, it is because it comes out here that the accompanying processes are of no interest whatsoever to us, and do not constitute thinking. We don't give a damn about his accompanying processes when he engages in a normal conversation with us.

Page 46

239. "It flashed through my mind:..." Now people learn the use of this expression. Hardly ever do we ask anyone: "How did it flash through your mind? Did you say certain words to yourself? Did you see something in your imagination; can you say *in any way* what went on inside of you?"

Page 46

240. If you want to find out how many different things "thought" means, you have only to compare a thought in pure mathematics with a non-mathematical one. Only think how many things are called "sentences"!

Page 46

241. A child does not *have* to first use a primitive expression which we then replace with the usual one. Why shouldn't he immediately use the adult expression which he has heard several times? It really doesn't matter how he "guesses" that this is the right expression, or how he comes to use it. The main thing is that no matter what the preliminaries are, he uses the word the same way adults do: i.e., on

Page Break 47

the same occasions, in the same context. He also says^{†1}: the other person thought...

242. How important is the experience of meaning in linguistic communication? What is important is that we intend something when we utter a word. For example, I say "Bank!" and want thereby to remind someone to go to the bank, and intend "bank" in the one meaning and not in the other.--But intention is no experience.

243. But what makes it different from an experience?--Well it has no experiential content. For the contents (e.g., images) which often go hand in hand with it, are not the intention itself. †2--And yet neither is it a disposition, like knowing. For the intention was present when I said "Bank"; now it is no longer present; but I have not forgotten it.

244. True: It is possible that I was more or less intensely occupied with what I said. And here it is obviously not a matter of having particular experiences while I utter the words. That is, it would be wrong to say: "In the process of uttering the word 'Bank' such and such a thing had to take place if it was really supposed to mean *that*."

245. That it is possible after all to utter the word in isolation, far removed from any intention, 'now with one meaning, now with another', is a phenomenon which has no bearing on the nature of meaning; as if one could say, "Look, you can do *this* with a meaning too".--No more than one could say: "Look at all the things you can do with an apple: you can eat it, see it, desire it, try to form an image of it." No more than it is characteristic of the concept 'needle' and 'soul' that we can ask how many souls can fit on the point of a needle.--We're dealing here, so to speak, with an *outgrowth* of the concept.

246. Instead of "outgrowth of the concept" I could also have said "an annex to the concept".--In the sense that it is also not essential to

people's names that they seem to have the traits of their bearers.--((Quote from Grillparzer.))†1

247. How can the mental state of someone who is giving an order semi-automatically be distinguished from the state in which the order is given *with emphasis*, urgently? "Something different is going on in this person's mind." Think about the purpose of distinguishing. What are the signs of emphasis?

248. If a normal human is holding a normal conversation under such and such normal circumstances, and I were to be asked what distinguishes thinking from not-thinking in such a case--I should not know what answer to give. And I could *certainly not* say that the difference lay in something that goes on or fails to go on while he is speaking. [Z 93.]

249. The boundary-line that is drawn here between 'thinking' and 'not thinking' would run between two conditions which are not distinguished by anything in the least resembling a play of images. For the play of images will always be conceived of as the characteristic of thinking. [Cf. Z 94.]

250. "I said those words, but I wasn't thinking of *anything at all* as I said them." That is an interesting utterance, because the consequences are interesting. You can always suppose that whoever says this had made a mistake in his introspection; but that wouldn't make any difference.

251. But what am I to say now: Did the person who spoke without thought lack an experience? Were the experiences images, for instance?--But if he had lacked them, would this be *of the same interest* to us as that he spoke without thought? Is it the images which interest us in this case? Doesn't his utterance contain a kind of signal of a totally different meaning?

252. Should I say: "If you didn't speak automatically (whatever that may mean) and if you didn't intend something later, and if you didn't change your intention, then you had it when you spoke"?

253. "I didn't mean anything by the sentence. I was just saying it." How remarkable that when I say this although I don't allude to any

experience as I'm speaking, still I am not giving expression to anything dubitable.

It is very noteworthy that *what goes on* in thinking practically never interests us. (But of course I shouldn't say it is noteworthy.) [b: cf. Z 88.]

Page 49

254. The question "What did you mean" and others like it can be used in two ways. In one case we simply demand an explanation of sense or meaning so that we can continue the language-game. In the other we are interested in what happened at the time the sentence was spoken. In the first case we would not be interested in a psychological report such as this: "First I just said it to myself, then I turned to you and wanted to remind you...."

Page 49

255. Did you mean *that*? Yes, it was the beginning of this movement.

Page 49

256. Let's imagine the following case: At 12 o'clock I'm supposed to remind somebody to go to the bank to get money. At 12 I glance at the clock and I say "Bank!" (either facing the person or looking away from him); I might make a gesture which you sometimes make when you suddenly remember something you have to do. If asked "Do you mean the... bank?" I will say "Yes".--If asked "Did you mean the... bank when you were talking?" I'd also say "Yes".--But what if I said "No" to the latter? What information would that give the other person? Possibly that I meant the sentence in a different way when I uttered it, but then wanted to use it for this purpose after all. Well, that can happen. It is also possible that when I glance at the clock I utter the word "Bank" in a queer automatic way, so that when I report "Suddenly I heard myself saying the word without attaching any kind of meaning to it. Only a few seconds later did I remember that you were supposed to go to the bank".--If I had answered that I had meant the word in a different way at first, I would obviously be referring to the time of speaking. And I could also have expressed myself this way: "While speaking I thought of *this* bank, and not of...".--Now the question is: Is this "thinking of..." an experience? One would like to say that usually, and possibly always, it goes with an experience. To say that one thought about *this* thing to which one can now point, which one can describe, etc., is really like saying: This word, this sentence, was the beginning of that train of thought, of that movement. But it is not as if I knew this by subsequent experiences; rather the utterance "As I spoke these words I thought of..." itself attaches to that point of time. And if I were to utter it in the present tense rather than in the past *it would mean something else*.

Page Break 50

Page 50

257. But why do I want to say that thinking is not an *experience*?--One can think of "duration". If I had spoken a whole sentence instead of the single word, I couldn't call one particular point of time in which I was thinking the beginning of my thinking process, nor yet the moment in which it took place. Or, if one calls the beginning and end of the sentence the beginning and end of the thought, then it is not clear whether one should say of the experience of thinking that it is uniform during this time, or whether it is a process like speaking the sentence itself.

Sure, if we are to speak of an experience of thinking, the experience of speaking is as good as any. But the concept 'thinking' is not a concept of experience. For we don't compare thoughts in the same way as we compare experiences. [b: Z 96.]

Page 50

258. One may disturb someone in thinking--but in intending?--But certainly in planning. Also in keeping to an intention, that is in thinking or acting. [Z 50.]

Page 50

259. "Say 'a b c d e' and mean: The weather is fine." Should I say, then, that the experience of pronouncing a sentence in a familiar language is quite different from that of pronouncing signs that are familiar to us, but not in certain meanings? So if I learnt the language in which "a b c d e" meant that of..., should I come bit by bit to have the familiar experience when I pronounced a sentence? Or should I say, as I'm inclined to, that the major difference between the two cases is that in the one I can't move. It is as if one of my joints were in splints, and I were not yet familiar with the possible movements, so that I as it were keep on bumping into things. (Feeling of something soft.)[Cf. Z 6.]

Page 50

260. Suppose I were with someone who spoke this language, and I had been told that "a b c d e" means this and that, and that I should say it because it is polite to do so. So, I would say it with a friendly smile, with a glance out the window. Would that alone not be enough to give me a better understanding of these signs?

Page 50

261. One could speak of a *'feeling for'* something. And in what does my feeling for a sentence I utter consist? It will be said that it consists in what goes on inside me when I speak. I would like to say: In the connections, the tie-ups which I make. For the question is: What happens within me when I have a feeling for something--what makes it a

feeling for the content of this sentence? Why isn't it, e.g., a

Page Break 51

pathological state of excitement in me, which accompanies my speaking? [Cf. Z 124.]

Page 51

262. Can I really say that when I 'unthinkingly' read the sentence in the textbook, something completely different, or simply something different, goes on in me from what goes on when in a different situation I read the sentence comprehendingly? Yes--there are differences. For instance, in a certain situation I shall respond to the same sentence: "So *that's* the way it was?", I shall be surprised, disappointed, expectant, satisfied, etc.

Page 51

263. "Did you think as you read the sentence?"--"Yes, I did think as I read it; every word was important to me."
"I was thinking very intensely." A signal.
Did nothing go on in the process? Yes, all sorts of things. But the signal did not refer to *them*.
And yet the signal referred to the time of speaking. [a: Z 92a.]

Page 51

264. James might perhaps say: "I read each word with the feeling appropriate to it. 'But' with the but-feeling," and so on.--And even if that is true--what does it really signify? What is the grammar of the concept 'but-feeling'?--It certainly isn't a feeling just because I call it "a feeling". [Cf. Z 188.]

Page 51

265. How strange, that something has happened while I was speaking and yet I cannot say *what!*--The best thing would be to say it was an illusion, and nothing really happened; and now I investigate the usefulness of the utterance.

Furthermore the question will arise as to the usefulness of referring to a point of time in the past.

Page 51

266. Yes; "While saying these words I thought..." indeed does refer to the time of speaking; but if I am now to characterize the 'process' I cannot describe it as something happening in this stretch of time. I cannot say, e.g., that this or that phase of the process occurred in *this* time segment. So I can *not* describe the thinking process as I can describe speaking itself, for instance. That is why one can't very well call thinking a process. ((Nor an accompaniment of speaking.))

Page 51

267. By 'thinking while you speak' I really should mean that I speak and understand what I say, and not that I speak and understand it later.

Writing is certainly a voluntary movement, and yet an automatic

Page Break 52

one. And of course there is no question of the movements in writing. That is, one feels something, but could not possibly analyze the feeling. One's hand writes; it does not write because one wills, but one wills it to write.

One does not watch it in astonishment or with interest while writing; does not think "What will it write now?". But not *because* one had a wish that it should write *that*. For that it writes what I want might very well throw me into astonishment. [b, c: Z 586.]

Page 52

268. How do we test whether somebody understands what it means to relax his arm muscles, to let his arms go limp? By testing whether they are relaxed when he says he relaxed them (in response to our order, for instance). Now what would we say of a person who is lifting a weight apparently voluntarily, and who tells us that he is not tensing his muscles? In this case we would say he was lying, or suffering from a strange delusion. I don't know whether there are deranged people who declare that their normal movements are involuntary. But if somebody does I would expect him to follow the movements of his arm with his attention in a fashion quite different from the normal one; that is, as he might follow the movement of a pointer on an instrument.

Page 52

269. A child learns to walk, to crawl, to play. It does not learn to play voluntarily and involuntarily. But what makes its movements in play into voluntary movements? What would it be like if they were involuntary?--I could also ask: what makes these movements into a game?--The fact that they are reactions to certain movements, sound, etc., of a grown-up, that they occur in *this* sequence, go together with *these* facial expressions and sounds (laughing, e.g.). [Cf. Z 587.]

Page 52

270. Briefly, if the child executes the movements IN THIS WAY, then we say that they are voluntary. Movements in such syndromes are called "voluntary".

271. I signal to someone with my eyes. Later I can explain what it meant. If I say "At the time I had *this* intention" it is as if I were calling the expression the beginning of a movement. I do not explain the expression with the help of *established* rules, nor by a definition which is to regulate the future use of the signal. I don't say "This signal means *this* to us", nor "In the future it is to mean *this*". Thus I am *not* giving a definition.

272. But now think of the difference it makes if I exclaim "Bank!" in some particular situation, not on my own, but perhaps read it in a history book or a play. I am assuming I read it with *understanding*. Am I still inclined to speak of an intention (I mean of *my* intention) in connection with this word?

273. But can I say that when I am reading, something goes on inside me which is different from what happens in a spontaneous exclamation? No. I know *nothing* about such a difference of processes, although the way I am expressing myself might lead one to infer something like that.

But if someone were to come into the room at the very moment I was reading the exclamation and were to ask me whether I wanted this, or that, I would tell him that I hadn't meant the exclamation that way, but had just been reading something.

274. I said earlier that intention has no content. One can call its content what explains its verbal expression. But it is just that that cannot be said to be a uniform state, lasting from this point in time to that one; e.g., from the beginning of the first until the end of the last word; not can one distinguish phases in it and correlate them with the parts of the verbal expression. But if the sentence were accompanied by a play of images one could do precisely that.

275. The difference between "intend" and "think of the intention".

If I say to myself, "I'm going to end this conversation", then that is presumably the expression of an intention, indeed, of an intention at the moment of its inception. Actually it is the expression of a *decision*. And corresponding to a decision that is an affirmation of an intention, there is also a wavering back and forth between decisions, a wrestling with the decision.

276. When I think to myself, "I can't stand it any more; I want to go!", then I am thinking of an intention. But this is thinking of the outbreak of an intention. Whereas a person who says "I'm planning next year to..." can also be said to be thinking of an intention, but in a completely different sense.

277. One does not say "I know it's raining" simply to report that it is raining; rather this is said if the statement has been called into question; or in response to the question whether I'm sure that it's raining. But then I could also say "It's quite certain: it's raining".

278. I can play a whole series of language-games with a report. One might be: acting according to the report; another one: using the report to test whoever gave it.

But isn't the first language-game the more primitive one, so to speak, the real purpose of a report?

279. It must be remembered that the first person "I believe" could very well exist without the third person.

Why shouldn't a verb have been formed in language which only exists in the first person present? What has led to this, what images, is irrelevant.

280. But what does this mean: "It's raining and I don't believe it" makes sense if I *mean* it as a hypothesis, and does not make sense if I *meant* it as an assertion, or a report?

We have an image of something emanating from the sentence, of something lighting up, if it is intended in the former way, whereas everything remains dark if it is intended in the latter. And there is some truth to this: for if someone says these words to me and I understand them as a hypothesis, then my face might be lighted up with comprehension; but if I take the sentence as a report then I become confused as to its meaning and comprehension escapes me.

"It's raining and I don't believe it" is an assumption, not a report.

281. One would also like to say: The assumption that I believe something is the assumption that I am disposed in a *particular* way. Whereas I should not want to say of the report "I believe..." that it says something about my disposition. Rather it is an utterance of this disposition.

Page 54

282. All that hangs together with this, that one can say "I believe he believes...", "I believe I believed...", but not "I believe I believe...".

Page 54

283. If we were to have an obligatory "I believe" at the beginning of every assertion, "I believe it is so" would mean the same thing as "It is so". But "Suppose I believe it is so" would *not* mean the same thing as "Suppose it is so".

Page 54

284. I have satisfied myself about something and now I know it. One doesn't say "I know that the earth has existed for the past ten minutes"; one does say, however, "It is known that the earth has existed for many thousands of years". And this is not because it is unnecessary to assert something like that.

Page Break 55

Page 55

285. "I know that this path leads over there."

"I know where this path leads to."

In the latter case I am saying that I possess something; in the *former*, I am affirming a fact. In the former case the word "know" could even be dropped. In the latter, one could go on: "But I'm not telling."

Page 55

286. The statement "I know it is so" is followed by the question "How do you know that?", the question asking for evidence.

Page 55

287. In the language-game of reporting there is the case of the report being called into question, of one's assuming that the reporter is merely conjecturing what he reports, that he hasn't ascertained it. Here he might say: I *know* it. That is: It is not mere surmise.--Should I say in this case that he is telling the certainty, the certainty he feels about his report, to me? No, I wouldn't like to say that. He's simply playing the language-game of reporting, and "I know it" is the form of a report.

Page 55

288. Can one only know what is true? Well, one does say "I believe I know it", and here there is no uncertainty attached to the belief. This does not mean: "I'm not certain: Do I know it, or don't I?"

Page 55

289. Some will say that my talk about the concept of knowledge is irrelevant, since this concept as understood by philosophers, while indeed it does not agree with the concept as it is used in everyday speech, still is an important and interesting one, created by a kind of sublimation from the ordinary, rather uninteresting one. But the philosophical concept was derived from the ordinary one through all sorts of misunderstandings, and it strengthens these misunderstandings. It is in no way interesting, except as a warning.

Page 55

290. Again, you must not forget that "A contradiction doesn't make sense" does not mean that the sense of a contradiction is nonsense.--We exclude contradictions from language; we have no clear-cut use for them, and we don't want to use them. And if "It's raining but I don't believe it" is senseless, then again that is because an extension along certain lines leads to this technique. But under unusual circumstances that sentence could be given a clear sense.

Page 55

291. If there were such a thing as 'automatic' speech, then we couldn't dispute such an utterance, or try to prove a mistake on

Page Break 56

the part of one who speaks it. Thus we would not play the same language-games with automatic speech as we do with the usual kind.

Page 56

292. Calling a mode of speech "automatic" produces the image of something without inflection, something mechanical. But that isn't at all important to us. One need only assume that *two* people are talking through one mouth. We must then treat what was said as the utterance of two people. Thus both sentences could be spoken with the intention of giving a report. And then the only question would be, how I should react to these reports.

Page 56

293. On the one hand it can be said that black and white can coexist in grey; on the other hand it will be said: "But where there is grey, there is, of course, neither black nor white. What is grey is of course not really white."

Page 56

294. But how about "light red" and "dark red"? Will one want to say that they can co-exist somewhere? Or lilac and purple?--Well, suppose that we were constantly surrounded by very specific shades of light and dark blue, and that we could not (contrary to what is actually the case) easily produce any shade of colour we chose. But under certain circumstances we would be able to mix the light blue substance with the dark blue one, and then we would arrive at an unusual shade of colour which we would then perceive as a mixture of light blue and dark blue.

Page 56

295. "But would our concepts of colour then be the same as the ones we have today?" They would be very similar. Very much like the relation of number concepts of peoples who can only count to five, and ours.

Page 56

296. One can say: Whoever has a word explained by reference to a patch of colour only knows *what* is meant to the extent that he knows *how* the word is to be used. That is to say: there is no grasping or understanding of an object, only the grasping of a technique.

On the other hand, we would certainly say that grasping or comprehending an object is possible *before* understanding a technique, for we can simply give someone the order "Copy *this!*" and then he can copy the colour, or the shape and size, or only the shape, or the colour, but not the exact shade, etc. And here copying does what in the case of a body is done by taking one in one's hand.--It is as if we

Page Break 57

could pick out the meaning, or the colour, perhaps, with a particularly refined pair of mental tweezers, without catching hold of anything else.

Page 57

297. The understanding, I say, catches hold of *the one object*; and then we speak of *it* and its qualities according to its nature.

Page 57

298. But how do I know that your mind catches hold of the same object as mine? Well, for instance by the very way you react to my command, e.g. "Copy the colour". But in this case, you will say, we can only recognize what is essential to his reaction by having him copy more and more colours. Presumably this means that after a few such reactions I will be able to see others in advance; and this I explain by saying: Now I know "*what*" he is actually copying. The colour or the form, for example--but there are more such *whats* than we are usually inclined to assume, i.e., concepts can also be formed with which we are quite unfamiliar.

It may also be that I do foresee his reactions of copying after a few have been given, and that I can count on them--i.e., say that we have now understood one another.--But then in a somewhat different situation I nevertheless get a surprise.--And what shall I now say: That I had been misunderstanding him the whole time?, or that I partly misunderstood him? If you think about catching hold of an object you will perhaps say the former, in accordance with the picture that he just had *not* caught hold of the object that I thought he had. But if we think about methods of using words, then we shall say that here we have similar, but not identical, methods.

Page 57

299. Now here it is certainly important that a technique has a physiognomy for us. That we can speak, for example, of uniform and non-uniform uses.

Page 57

300. In one sense knowing is to have learned and not forgotten. In this way it hangs together with memory.--So now I can say: "I know what 97×78 is", or "I know that 97×78 is 432". In the first case, I would say, I tell someone that I can do something, that I possess something; in the second I simply assure the other person that 97×78 is 432. For doesn't " 97×78 is quite definitely 432" mean *I know* it is? The matter can also be put this way: The first sentence is by no means an arithmetical one, nor can it somehow be replaced by an arithmetical one; but an arithmetical sentence could be used in place of the second one. [Cf. Z 406.]

Page Break 58

Page 58

301. The difference is as follows: In the sentence "I know how it is" the "I know" cannot be omitted. The sentence "I know it is this way" can be replaced by "It is this way".

Page 58

302. "It's going to rain."--"Do you believe it's going to rain?"--"I know it's going to rain." Does the third sentence say more than the first? It is a repetition of the first and a rejection of the second.

303. But isn't there a phenomenon of knowing, as it were quite apart from the sense of the phrase "I know"? Is it not remarkable that a man can *know* something, can as it were have the fact within him?--But that is a wrong picture.--For, it is said, it's only knowledge if things really are as he says. But that is not enough. It musn't be just an accident that they are. For he has got to know that he knows: for knowing is a state of his own mind; he cannot be in doubt or error about it--apart from some special sort of blindness. If then knowledge *that* things are so is only knowledge if they *really* are so; and if knowledge is in him so that he is infallible about its being knowledge; in that case, he is also infallible about things being the way knowledge knows them; and so the fact which he knows must be within him just like the knowledge.

So: when I say, without lying: "I know that it is so", then only through a special sort of blindness can I be wrong. [Z 408a, c.]

304. Does "not seeing a picture IN THIS WAY" mean: *seeing it differently?*

305. Imagine the following: I am shown a picture-puzzle; I see trees, people, etc. in it. I examine it and suddenly I see a figure in the tree-tops. Looking at it afterwards, I no longer see those lines as branches, but as parts of the figure. Then I place the picture in my room, where I see it every day, and usually I forget about the second interpretation, and so now it is simply a forest. I see it in the same way as any other picture of a forest. (You see the difficulty.)--Then one day I say of the picture: "It's been such a long time since I've seen it as a picture-puzzle, I've almost forgotten that it is one." Here one can ask, of course: "Well how *did* you see it?", and I shall say, "Well, as trees...", and that is quite right too; but did I therefore not only see the picture and know what it portrayed, but also perceive it according to a certain interpretation? I would rather say: Up until now they've always just been trees to me; I've never thought about the picture in any other way.

306. Anyone who regrets something thinks about it. Is regret therefore a kind of thought? Or a colouring of thought?

There are regretful thoughts just as there are fearful ones, for instance. But if I say "I regret it" am I saying "I have regretful thoughts"? No, because somebody who doesn't regret it at the moment could say this too. But couldn't I say, "I think of it with regret", instead of "I regret it"?

307. What is it that interests me about someone else's regret? His attitude toward his action. The signs of regret are the signs of aversion, of sadness. The expression of regret refers to the action.

Regret is called a pain of the soul because the signs of pain are similar to those of regret.

But if one wanted to find an analogy to the place of pain, it would of course not be the mind (as, of course, place of bodily pain is not the body), but the *object* of regret. [c: Z 511.]

308. Why can a dog feel fear but not remorse? Would it be right to say "Because he can't talk"? [Z 518.]

309. Only someone who can reflect on the past can repent. But that does not mean that as a matter of empirical fact only such a one is capable of the feeling of remorse. [Z 519.]

310. There is nothing that astonishing about a certain concept only being applicable to a being that, e.g. possesses a language. [Z 520.]

311. The treatment of all these phenomena of mental life is not of importance to me because I am keen on completeness. Rather because each one casts light on the correct treatment of *all*. [Z 465.]

312. When he first learns the names of colours--what is taught him? Well, he learns, e.g., to call out "red" on seeing something red.--But is that a correct description; or ought it to have gone: "He learns to call 'red' *what we too* call 'red'"? Both descriptions are right.

What differentiates this from the language-game "How does it strike you?"?

But someone might be taught colour-vocabulary by being made to look at white objects through coloured spectacles. What I teach him, however, must be a *capacity*. So he *can* now bring something red at an

order; or arrange objects according to colour. But what then is something red? "Well *that* (pointing)." Or should he

have said, "*That*, because most of us call it 'red'"? Or simply "*That* is what most of us call 'red'"?

This information doesn't help us at all. The difficulty we sense here with respect to "red" reappears for "same". [Z 421--up to the sentence "Well *that* (pointing)".]

Page 60

313. For I describe the language-game "Bring something red" to someone who can himself already play it. Others I might at most *teach it*. (Relativity.) [Z 432.]

Page 60

314. Here we have a profound and important point; I wish I knew how to express it unambiguously. Somehow one is deceived as to the purpose of the description. Or: one wants to go on giving reasons because he misunderstands the function of giving a reason.

Page 60

315. Why doesn't one teach a child the language-game "It looks red to me" from the first? Because it is not yet able to understand the rather fine distinction between seeming and being? [Z 422.]

Page 60

316. The red visual impression is a new *concept*. [Z 423.]

Page 60

317. The language-game that we teach him then is: "It looks to me..., it looks to you...". In the first language-game a person does not occur as perceiving subject. [Z 424.]

Page 60

318. You give the language-game a new joint. Which does not mean, however, that now it is always used.

The language-game "What is that?"--"A chair."--is not the same as: "What do you take that for?"--"It might be a chair." [a: Z 425; b: Z 417.]

Page 60

319. In the beginning we do not teach the child "It's probably a chair", but "That's a chair". Don't fancy for a moment that the word "probably" is left out because it is still too difficult for the child to understand, that things are simplified for the child; that therefore he is taught something that is not *strictly* right.

Page 60

320. One speaks of a feeling of conviction because there is a *tone* of conviction. For the characteristic mark of all 'feelings' is that there is expression of them, i.e. facial expression, gestures, of feeling. [Z 513.]

Page Break 61

Page 61

321. James says it is impossible to imagine an emotion or a mood without the corresponding bodily sensations (of which it is composed). If you imagine the latter absent then you can see that you are thereby abolishing the very existence of the emotion. This might happen in the following way: I imagine myself sorrowing, and now in the imagination I try to picture and to feel myself rejoicing at the same time. To do that I might take a deep breath and imitate a beaming face. And now indeed I have trouble forming an image of sorrow; for forming an image of it would mean play-acting it. But it does not follow from this that our bodily feeling at that point is sorrow, or even something like it.--To be sure, a person who is sorrowful cannot laugh and rejoice convincingly, and if he could, what we call the expression of sorrow would not really be that, and rejoicing would not be the expression of a different emotion.--If the death of a friend and the recovery of a friend equally caused us to rejoice or--judging by our behaviour--both caused us sorrow, then these forms of behaviour would not be what we call the expressions of joy or sorrow. Is it clear *a priori* that whoever imitates joy will feel it? Couldn't the mere attempt to laugh while one was feeling grief bring about an enormous sharpening of the grief?

Page 61

322. Yet still I mustn't forget that joy goes along with physical well-being, and sadness, or at least depression, often with being physically out of sorts.--If I go for a walk and take pleasure in everything, then it is surely true that this would not happen if I were feeling unwell. But if I now express my joy, saying, e.g., "How marvellous all of this is!"--did I mean to say that all of these things were producing pleasant physical feelings in me?

In the very case where I'd express my joy like this: "The trees and the sky and the birds make me feel good all over"--still what's in question here is not causation, nor empirical concomitance, etc. etc.

Page 61

323. One does say: "Now that he's well again I breathe easier", and one breathes a deep sigh of relief.

Possibly one could be sad because he is crying, but of course one is not sad *that* he is crying. It would after all be possible that people made to cry by application of onions would become sad; that they would either become generally depressed, or would start thinking about certain events, and then grieve over them. But then the *sensations* of crying would not thereby have turned into a part of the 'feeling' of grief.

324. If someone behaves in such-and-such a way under such-and-such circumstances, we say that he is sad. (We say it of a dog too.) To this extent it cannot be said that the behaviour is the *cause* of the sadness; it is its symptom. Nor would it be beyond cavil to call it the effect of sadness.--If he says it of himself (that he is sad) he will not in general give his sad face as a reason. But what if he said: "Experience has taught me that I get sad as soon as I start sitting about sadly, etc." This might have two different meanings. Firstly: "As soon as, following a slight inclination, I set out to carry and conduct myself in such-and-such a way, I get into a state in which I have to persist in this behaviour." For it might be that a toothache got worse by groaning.--Secondly, however, that proposition might contain a speculation about the cause of human sadness. The content being, perhaps, that if you could somehow or other produce certain bodily states, you would make the man sad. But here arises the difficulty that we should not call a man sad, if he *looked* and *acted* sad in all circumstances. If we taught such a one the expression "I am sad" and he constantly kept on saying this with an expression of sadness, these words, like the other signs, would have lost their normal sense. [Z 526.]

325. I should almost like to say: One no more feels sorrow in one's body than one feels seeing in one's eyes. [Z 495.]

326. To begin by teaching someone "That looks red" makes no sense. For he must say that spontaneously once he has learnt what "red" means, i.e. has learnt the technique of using the word. [Z 418.]

327. Any explanation has its foundation in training. (Educators ought to remember this.) [Z 419.]

328. "So these concepts are valid only for the *total* human being?" No, for some have their application to animals too.

329. "Whoever generally acts this way and then sometimes that way, is described as..." That is a legitimate kind of explanation of a word.

330. We are inclined to imagine the matter as if a visual *sensation* were a new *object* which the child gets to know, after he has learned the first primitive language-games with visual observations. "It looks red to

me."--"And what is red like?"--"Like *this*." Here the right paradigm must be pointed to. [From "It looks red to me.": Z 420.]

331. If I have learned to carry out a particular activity in a particular room (putting the room in order, say) and am master of this technique, it does not follow that I must be ready to describe the arrangement of the room; even if I should at once notice, and could also describe, any alteration in it. [Z 119.]

332. "This law was not given with such cases in view." Does that mean it is senseless? [Z 120.]

333. One could imagine a concept of fear, for instance, that had application only to beasts, and therefore pertained only to behaviour.--But you don't want to say that such a concept would have no use. [Z 524, first two sentences.]

334. Can one say that there is a *similarity* between the emotion and its expression, insofar as both are excited, for example? (I think Köhler said something like that.) And how does one know that the emotion itself is excited? The person who feels it notices it and says so.--And if someone were one day to say the opposite?--"Be honest now, and say whether you don't really recognize your inner excitement!"--How did I ever learn the meaning of the word "excitement"?

335. The misconception that this word means something internal *as well as* something external. And if any one denies that, he is misinterpreted as denying inner excitement. (Temporal and timeless sentences.)

336. Imagine that a child was quite specially clever, so clever that he could at once be taught the doubtfulness of the existence of all things. So he learns from the beginning: "That is probably a chair."

And now how does he learn the question: "Is it also really a chair?"? [Z 411.]

Page 63

337. Am I doing child psychology?--I am making a connection between the concept of teaching and the concept of meaning.[Z 412.]

Page Break 64

Page 64

338. One man is a convinced realist, another a convinced idealist and teaches his children accordingly. In such an important matter as the existence or non-existence of the external world they don't want to teach their children anything wrong.

What will the children be taught? Also to say: "There are physical objects" or the opposite?

If someone does not believe in fairies, he does not need to teach his children "There are no fairies": he can omit to teach them the word "fairy". On what occasion are they to say: "There are..." or "There are no..."? Only when they meet people of the contrary belief. [Z 413.]

Page 64

339. But the idealist will teach his children the word "chair" after all, for of course he wants to teach them to do this and that, e.g. to fetch a chair. Then where will be the difference between what the idealist-educated children say and the realist ones? Won't the difference only be one of the battle cry? [Z 414.]

Page 64

340. For doesn't the game "That is probably a..." begin with disillusion? And can the first attitude of all be directed towards a possible disillusion? [Z 415.]

Page 64

341. "So does he have to begin by being taught a false certainty?"

There isn't any question of certainty or uncertainty yet in their language-game. Remember: they are learning to *do* something. [Z 416.]

Page 64

342. So how does the doubt get expressed? That is: in a language-game, and not merely in certain *phrases*. Maybe in looking more closely; and so in a fairly complicated activity. But this expression of doubt by no means always makes sense, nor does it always have a point.

One simply tends to forget that even doubting belongs to a language-game.

Page 64

343. How does it come about that doubt is not subject to arbitrary choice?--And that being so--might not a child doubt everything because it was so remarkably talented?

A person can doubt only if he has learnt certain things; as he can miscalculate only if he has learnt to calculate. In this case it is indeed involuntary. [a: Z 409; b: Z 410.]

Page 64

344. If I have any doubts that this is a chair, what do I do?--I look at it and feel it on all sides, and so forth. But is this way of acting always an expression of doubt? No. If a monkey or a child were to do this it

Page Break 65

wouldn't be. Only someone who is acquainted with such a thing as a 'reason for doubt' can doubt.

Page 65

345. I can easily imagine that a particular *primitive* behaviour might later develop into a doubt. There is, e.g., a kind of primitive investigation. (An ape who tears apart a cigarette, for example. We don't see an intelligent dog do such things.) The mere act of turning an object all around and looking it over is a primitive root of doubt. But there is doubt only when the typical antecedents and consequences of doubt are present.

Page 65

346. "It tastes like sugar." One remembers exactly and with certainty what sugar tastes like. I do not say "I believe sugar tastes like this." What a remarkable phenomenon. It just is the phenomenon of memory.--But is it right to call it a remarkable phenomenon?

It is anything but remarkable. That uncertainty is not by a hair's breadth more remarkable than uncertainty would be. For what is remarkable? My saying with certainty "This tastes like sugar", or its then really being sugar? Or that other people find the same thing?

If the certain recognition of sugar is remarkable, then the failure to recognize it would be less so. [Z 660.]

Page 65

347. If people were (suddenly) to stop agreeing with each other in their judgments about tastes--would I still say: At any rate, each one knows what taste he's having?--Wouldn't it then become clear that this is nonsense?

348. Confusion of tastes: I say "This is sweet", someone else "This is sour" and so on. So someone comes along and says: "You have none of you any idea what you are talking about. You no longer know at all what you once called a taste." What would be the sign of our still knowing? [Z 366.]

349. But might we not play a language-game even in this 'confusion'?--But is it still the earlier one?--[Z 367.]

350. But there's a paradox here! Is the reliability of my expression of my taste to depend on changes in the outside world?--The important thing here is surely the sense of the judgment, not its usefulness. Here we see the relation to the original language-game of perception.

351. "It tastes exactly like sugar." How is it I can be so sure of this? Even if it turns out wrong.--And what astonishes me about it? That I bring the concept 'sugar' into so *firm* a connection with the taste sensation. That I seem to recognize the substance sugar directly in the taste.

But instead of the expression "It tastes exactly..." I might more primitively use the exclamation "Sugar!" And can it be said that 'the substance sugar comes before my mind' at the word? How does it do that? [Z 657.]

352. Can I say that this taste brought the name "sugar" along with it in a peremptory fashion? Or the picture of a lump of sugar? Neither seems right. The demand for the concept 'sugar' is indeed peremptory, just as much so, indeed, as the demand for the concept 'red' when we use it to describe what we see. [Z 658.]

353. I remember that sugar tasted like this. The experience returns to consciousness. But, of course: how do I know that this was the earlier experience? Memory is no more use to me here. No, in those words, that the experience returns to consciousness..., I am only transcribing my memory, not explaining it.

But when I say "It tastes exactly like sugar", in an important sense no remembering takes place. So I do *not have grounds for* my judgment or my exclamation. If someone asks me "What do you mean by 'sugar'?"--I shall indeed try to show him a lump of sugar. And if someone asks "How do you know that sugar tastes like that?" I shall indeed answer him "I've eaten sugar thousands of time[[sic]]"--but that is not a justification that I give myself. [Z 659.]

354. "Self-observation tells me that I believe that--but observation of the external world that it is not so."

355. Let us now assume I've seen an F which someone has written like this: . †1 And assume that I always *took* it for a mirror-F; that is, I assumed a *certain* connection between his letter and the regular one. Now you point out to me that this is *not* the connection that exists,

but rather there is a different one (that of the lines moved around). I understand this and now I say: "Well it certainly does look different." If I'm asked "*How* different?" I might say: "Earlier it looked clumsy, but now it looks bold and energetic." [Cf. Z 208.]

356. Suppose †1 someone had always seen faces with only *one* expression, say a smile. And now, for the first time, he sees a face changing its expression. Couldn't we say here that he hadn't noticed a facial expression until now? Not until the change took place was the expression meaningful; earlier it was simply part of the anatomy of the face.--Is that the way it is with the aspect of the letter? Expression could be said to exist only in the play of the features.

357. So how a letter appears to me depends on whether it strictly follows the norm or whether and how it deviates from the norm. Thus it is understandable that it makes a difference whether we know only one explanation for the shape of a letter, or two.

358. For how could I see that this posture was hesitant before I knew that it was a posture and not the anatomy of the animal? [Cf. *PI* II, xi, p. 209b.]

359. The question now is: If one can see a figure according to an interpretation, does one see it according to an

interpretation *every* time? And is there a well-defined difference between seeing which is not connected to any interpretation, and that which is?

Page 67

360. I mean: Seeing a figure with this interpretation is a kind of thinking of the interpretation. For should I say that it is possible to see this as a mirror-F without at the same time thinking about the special *relationship* which the word "mirror-F" signifies? But I see an interpretation and an interpretation is a thought.

Page 67

361. One could make a *rough* copy of a picture-puzzle before and after one put it together, and then a mistake made in copying the first aspect will be different from the mistake made in copying the second. So I could say: "Before I solved it, I saw something like *this* (and I draw a forest)--after I solved it, something like *this*" (and then I draw a man in the tree-tops).

Page Break 68

Page 68

362. You must bear in mind that in the most important cases, what someone sees gets its impression in a report about the object perceived. And this kind of report, of course, includes spatial announcements.†1--Now what is it like, if someone has to give a report about what he sees on a flat surface, when the drawing on it has the character of a picture-puzzle? First of all, so far as describing what he sees on the surface in spatial terms, he can give such a description; indeed, that is perhaps the only kind of description he can give.

Page 68

363. An important piece of information will be, for instance: "Nothing has changed the whole while." This report is based on continuous observation.

Page 68

364. When I solve the picture-puzzle, I discover something about the picture itself. For example, that a ship was hidden by this camouflage. Perhaps I want secretly to tell someone what a certain person looks like, and I hide my message, his portrait, in a picture-puzzle.

Page 68

365. If I were to call the figure an aid to thought, I could say I see it as *this* aid to thought.

Page 68

366. What a queer question it is, whether I musn't have *thought* of N. N.--when suddenly I saw his face in that of his son! Of course my question is not: Mustn't I have thought of him *simultaneously* with having that image of him; rather, it is whether having that image of him wasn't a kind of thinking of him? But how does one decide that?

For instance I say "I was just thinking whether he has arrived in...". This thought is expressed in a sentence. That other one perhaps in an exclamation.

Page 68

367. Can I see his father's face in his and yet not *think* of his father at the same time? Seeing his father's face in his clearly was a kind of imagining of that face. And now we must remember that one does not *recognize* the image of a man as an image of him.

Page 68

368. Remember also that you cannot use a picture (or a model) to represent the shifting of the gaze! And wouldn't the impression that that produces very naturally be counted as part of the visual

Page Break 69

impression? The aspect will, or can be expressed in the way I copy the figure, and thus in *one* sense, it is in the copy after all. Furthermore I will portray a face differently according to my *interpretation* of it, even though the photograph shows the same thing each time. So here again there's reason to speak of "seeing".

Page 69

369. The fact that I produce a different copy (a different result) accords with the concept of the visual state. The fact that I produce the same copy, but in a *different* way--by drawing the lines in a different sequence--points toward the concept of *thinking*.

Page 69

370. What justifies his use of "seeing" here? Or is there any justification and is it merely a linguistic blunder? Or is it solely justified by the fact that I too am inclined to say: "Now I see it as this", "Now I see it as that"? That could be. But I am absolutely disinclined to assume that; I feel I *have* to say "I see something". But what is that supposed to mean?--I *learned* the word "to see", after all. What fits is not the *word*, the sound, or the written image. It's the use of

the word which forces on me the idea that I *see* this.

What I have learned about the use of the word must be forcing me to use the word here.

Page 69

371. "That *is* what it *is* to see something--", I should like to say. And that's really the way it is: the situation is exactly like that in which the word is used elsewhere;--except the technique is somewhat different here.

Page 69

372. The use of the word "see" is in no way a simple one.--Sometimes we think of it as a word for an activity and then it is hard to *put your finger on* the action.--Thus we think of it as simpler than it really is, conceiving it as drinking something in with one's eyes, as it were. So that if I drink something in with my eyes, then there can be no doubt that there's something I'm seeing (unless I am deceived by prejudices).

Page 69

373. One could say: I see the figure now as the limit of this series, now as the limit of that. This *value* could be the limit of various functions.

Page 69

374. In a certain sense the figure can always *be* what I see it as, even if it is not "visible" in the other sense. For, depending on the way it's used, or the way it arises, a figure can be the limit of different series.

Page Break 70

A triangle can really be used to represent a mountain, or as an arrow, in order to point in *this* direction, etc. etc. Thus the description of the aspect is always a correct description of visual perception.

Page 70

375. Take a figure, say a written symbol; it may be the symbol correctly written, or there are various ways in which it may be faulty. And there are aspects corresponding to these ways of taking the figure.--Here there's a very close similarity with the experience of meaning when one utters an isolated word.

Page 70

376. It is copied differently--but the copy is the same.

Page 70

But I want to say: If something else is *seen*, the *copy* must be different.

Page 70

377. What, for example, is a copy of 'the schematic cube'? A drawing, or a solid object? And why only the former?! And if a solid object is a copy, what kind of an object: a solid angle, a solid cube, a wire frame?

Page 70

378. If I tell someone "Now I see the figure as..." then I am providing him with some information *similar* to that given in visual perception, but also similar to that of a way of taking, or an interpretation, or a comparison, or a knowing.

Page 70

379. "Now I see a white cross on a black ground and then a black cross on a white ground." But what is this: a white cross on a black ground? Do explain! And what is a black cross on a white ground? Surely you can't give the same explanation for both! And yet there must be an explanation!

The explanation could go something like this: "A white cross on a black ground is something like *this*--" and now a figure would follow. But of course this must *not* be the ambiguous one. Thus, instead of saying, "I see the figure now as a white cross on..., now as...", one can also say: "I see the figure now in *this* way (and then the figure follows), now in *this* way (and a different figure follows)." And if the first sentence was permissible then so was this one.

Page 70

380. And doesn't that mean that each of the two figures was a *kind* of copy of the ambiguous figure?

Page Break 71

Page 71

381. On the one hand these two representations are copies of what was seen, but on the other there is still need for a conceptual explanation.--For instance, if I see the figure of a cross†1  now as a cross lying down, now as standing up, now as a diagonal cross set up askew--what are the corresponding copies?

A cross lying down is one which was layed on its side but should stand up. So the copy will be something shaped like a cross, and about which we know which it is--lying down or standing up. Therefore it would also be possible to use as a copy a picture in which the shape of a cross appears, playing this or that role. That is, there is a picture which brings to expression what I see as an aspect. And this makes the aspect similar to something visually perceived.

382. Or: In the same way as a picture tells us what is perceived, there is a picture that has a *similar* representing role in relation to the aspect. Imagine a painting of a descent from the cross, for instance. What would that be to us, if we didn't know which *movements* were captured here? The picture shows us these movements and yet it does not. (The picture of the cavalry-attack, when the viewer doesn't know that horses don't stop in those positions.)

383. "What I see looks like *this*." Imagine this said by someone who is looking at a galloping horse and then, as a copy, uses a stuffed horse *standing* in a galloping position! Wouldn't the right copy be a galloping horse?

384. Now--do I see a *thought* before me along with the aspect? Is a thought before me along with the *painting*? (For of course the figure which is seen as this or that is like a part of a painting which by itself doesn't yet make any sense.)

385. It is possible to describe a painting by describing *events*; indeed that's the way it would be described in almost every instance. "He's standing there, lost in sorrow, she's wringing her hands..." Indeed, if you could not describe it this way you wouldn't understand it, even if you could describe the distribution of colour on its surface in minute detail. ((Picture of the man ascending the mountain.))

386. So you see it as if you knew *that* about it.

And if this seems a foolish way of putting it, then it must be kept in mind that the *concept* of seeing is modified by it.

387. But can I also say: "He would see the picture (of the battle, for instance) differently, if he didn't know what was going on here"? How would this come out?! He would not talk about the picture in the same way we do, and he would not say: "You can positively see these horses charging", or "That's not the way a horse runs!" etc. He would not infer many things from the picture that we do.

388. We could resolve, of course, to call what we now call "seeing the figure as...", "*conceiving*" it as this or that.--If we did that, the problems of course would not disappear. Rather, we would then study the use of "*conceiving*", and in particular we would study the peculiarity that this *conceiving* is something stationary, a state that *now* begins and *now* ends.

389. It seems to me--I might say--as if I should be able to reproduce this conception by means of a *picture* of the figure that I am looking at.--And that, indeed, is the way it really is: I can say that the picture someone makes of an object expresses a conception of the object. Quite as one can say: Hear this theme like this..., and play it correspondingly.

390. It is seeing, *insofar as...*

It is seeing, only *insofar as...*

(That seems to me to be the solution.)

391. In this way, however, the aspects which are, so to speak, visual interpretations of the figure differ from the aspects of the three-dimensional appearance. For a figure can be *taken* for a solid object. And even if there's no question of such a deception, the statement "Now I see this figure as a pyramid" tells us something different, and has different consequences, from the statement "Now I see the figure as a black cross on a white ground, etc.". (The consequences of seeing three-dimensionally in descriptive geometry.) But the connection between the aspect and thinking also seems to be changed, or dissolved. For isn't the copy which shows someone else how I see the figure different? And one mustn't forget that the meaning of the word "copy" varies throughout this discussion.

392. "It is as if our concepts involved a scaffolding of facts."

That would presumably mean: If you imagine certain facts

otherwise, describe them otherwise, than the way they are, then you can no longer imagine the application of certain

concepts, because the rules for their application have no analogue in the new circumstances.--So what I am saying comes to *this*: A law is given for human beings, and a jurispudent may well be capable of drawing consequences for any case that ordinarily comes his way; thus the law evidently has its use, makes sense. Nevertheless its validity presupposes all sorts of things, and if the being that he is to judge is quite deviant from ordinary human beings, then, e.g., the decision whether he has done a deed with evil intent will become not difficult but simply impossible. [Z 350.]

Page 73

393. "If humans were not in general agreed about the colours of things, if disagreements were not exceptional, then our concept of colour could not exist." No:--our concept *would* not exist. Does that mean, therefore, that what is conceivable as a rule does not have to be conceivable as an exception? [Z 351--to "Does that mean".]

Page 73

394. It is like the following case: I have learned how to express the results of experiments by means of a curve. If the points are situated like *this*†1, I will know more or less what kind of curve to draw, and I will be able to use it to draw further conclusions from the experiments. But if the points are placed like *this*†2, then what I have learned will leave me in the lurch, for I will no longer know what line to draw. And if I met people who drew a curve through this constellation of points without using any method I could understand and without hesitation, then I shouldn't be able to imitate their technique. But suppose that I should see that they acknowledge *some* plausible line or other as the right one, and that this line then serves them as the basis for further inferences; and if these inferences conflicted, as we should say, with experience, and these people were somehow to make light of it--then I would say that this indeed is no longer the technique I know of, but is one that, although "outwardly" similar, is in

Page Break 74

essence completely different. But if I say that, in using the words "outwardly" and "essence" I am passing judgment.

Page 74

395. What does it mean to say: "But that's an utterly different game!" How do I use this sentence? As information? Well, perhaps to introduce some information in which differences are enumerated and their consequences explained. But also to express that just for that reason I don't join in here, or at any rate take up a different attitude to the game.[Z 330.]

Page 74

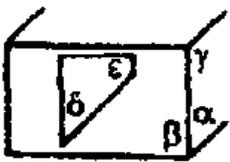

396. If I said "I wouldn't any longer call it...", this really means: the scales are tipping--I've taken up a different position toward the thing.

Page 74

397. I could also say: "I can no longer communicate with these people."

Page 74

398. Once I said that there might be a concept which, to the left of a certain dividing line, would correspond to our 'red', and to the right, would correspond to our 'green'. And it appeared to me then and still does, that I might be able mentally to enter this conceptual world, and that indeed I might be inclined to call the red that lies on one side of the line the same thing as green on the other. (Indeed, this actually happens to me, particularly when there is a fairly dark red and a fairly dark green.) It is as if, in such a world, I would not be disinclined to call the green merely an aspect of the red, and as if what I call "colour" went further unaltered, and only the "shading" altered. Thus there would be an inclination, in this situation, to employ a mode of expression which used the same adjective for green and red, along with a modifier such as "shaded"/"unshaded". "But are you really going to tell me then that we're not dealing with two different colours?" I want to say: I see enough similarity between this way of talking and the usual one so that I could very easily accept this way, under certain circumstances.--But then wouldn't people see the similarity or resemblance which we see; i.e., between green to the left and (our usual) green to the right?--What if they said that these two colours were "outwardly similar"? I imagine the situation to be similar to this one: In the drawing†1:

I can call the angles α , β , γ equal to each other, even though they are outwardly unequal; and I can call angles $\delta + \alpha$, as well as $\epsilon + \gamma$ unequal, even though they are outwardly equal.

Page Break 75

Page 75

399. I could also say: the red to the left and the green to the right are of the same nature, but are different manifestations of it.

Page 75

400. But in all of this I have produced a confusion. The important thing about the matter was surely to show that one can go on in a sequence (say of numbers) in such a way that according to *our* concepts he stops following the old law of the series, and continues on following a new one; but that according to another conception, the law of the series does *not* change, but that what appears to be a change is explained by a change in circumstances.

Page 75

401. But what this really amounts to is that *consistently* following a series can only be shown by *example*.

Page 75

402. And here one is tempted again and again to talk more than still makes sense. To continue talking where one should stop.

Page 75

403. I can tell someone: "*This* number is the right continuation of this sequence"; and in doing this I can bring it about that for the future he calls the "right continuation" the same thing I do. That is, I can teach him to continue a series (basic series) without using any expression of the 'law of the series'; rather, I am forming a substratum for the meaning of algebraic rules, or what is like them. [Cf. Z 300.]

Page 75

404. He must go on like this *without a reason*. Not, however, because he cannot yet grasp the reason but because--in *this* system--there is no reason. ("The chain of reasons comes to an end.") And the *like this* (in "go on like this") is signified by a number, a value. For at *this* level the expression of the rule is explained by the value, not the value by the rule. [Z 301.]

Page 75

405. For just where one says "But don't you see...!" the rule is no use, it is what is explained, not what does the explaining. [Z 302.]

Page 75

406. "He grasps the rule intuitively."--But why the rule? Why not how he is to continue? [Z 303.]

Page 75

407. "Once he has seen the right thing, seen the one of infinitely many references which I am trying to push him towards--once he has got hold of it, he will continue the series right without further ado. I grant that he can only guess (intuitively guess) the reference that I

Page Break 76

mean--but once he has managed that the game is won."--But this 'right thing' that I mean does not exist. The comparison is wrong. There is no such thing here as, so to say, a wheel that he is to catch hold of, the right machine which, once chosen, will carry him on automatically. It could be that something of the sort happens in our brain but that is not our concern. [Z 304.]

Page 76

408. "Do the same." But in saying this I must point to the rule. So its *application* must already have been learnt. For otherwise what meaning will its expression have for him? [Z 305.]

Page 76

409. To guess the meaning of a rule, to grasp it intuitively, could surely mean nothing but: to guess its *application*. And that can't now mean: to guess the *kind* of application, the *rule* for it. Nor does guessing come in here. [Z 306.]

Page 76

410. I might, e.g., guess what continuation will give the other *pleasure* (by his expression, perhaps). The application of a rule can be guessed only when one can already choose one among different applications. [Z 307.]

Page 76

411. We might in that case also imagine that, instead of 'guessing the application of the rule,' he *invents* it. Well, what would that look like? Ought he perhaps to say "Following the rule '+ 1' may mean writing 1, 1 + 1, 1 + 1 + 1, and so on"? But what does he mean by that? For the "and so on" presupposes that one has already mastered a technique. [Z 308.]

Page 76

412. How can one describe what someone does in continuing that rule?--If someone already knows how to use it, we can do it by giving the rule. And who can use it? Someone who writes 1 + 1 + 1 after 1 + 1 and after that 1 + 1 + 1 + 1.--And can I now end with "and so on"? That would surely mean: "and simply goes on according to this rule."

Page 76

413. I cannot describe how (in general) to employ rules, except by *teaching* you, *training* you to employ rules. [Z

318.]

Page 76

414. I may now, e.g., make a talkie of such instruction. The teacher will sometimes say "That's right". If the pupil should ask him "Why?"--he will answer nothing, or at any rate nothing relevant, not even: "Well, because we all do it like that"; that will not be the reason. [Z 319.]

Page Break 77

Page 77

415. We don't say "It may well be like that, but it isn't". Or: "I suppose he's coming tomorrow, but actually he won't come."

Page 77

416. Even in the *hypothesis* the pattern is not what you think.

I should like to say: When you say "Suppose I believe that" you are presupposing the whole grammar of the word "to believe". You are not supposing something given to you unambiguously through a picture, so to speak, so that you can tack on to this hypothetical use some assertive use other than the ordinary one. You *would not know at all* what you were supposing here, if you were not already familiar with the use of "believe". [Cf. *PI* II, x, p. 192e.]

Page 77

417. What is showing its face here is the invisible application.

We are not aware of *the particular technique*, for it flows along underground, as it were, without our noticing it; and not until it openly contradicts our false imagination do we suddenly become aware of it; not until we notice, e.g., that a sentence makes no sense, that we have no idea what to do with this sentence which was not such as to arouse this suspicion straightaway. Can one tell one's doctor that one believes something as a symptom of mental illness?--But one can say, for example: "I always believe I hear voices."

"I am always supposing that he is unfaithful to me, but he isn't." The line of the concept seems to break off abruptly!--

Page 77

418. "The sentence, 'I believe it and it isn't true' *can after all be the truth*. Namely, when I really believe it and this belief turns out to be wrong.

Page 77

419. I say of someone else "He seems to believe..." and others say it of me. Now why do I never say it of myself, even though others are *justified* in saying it of me? Likewise: "It's obvious that he believes..." Don't I see myself?--One could say so. [*PI* II, x, p. 191f.]

Page 77

420. A: "I believe it's raining."--B: "I don't believe so."--Now they are not contradicting each other; each one is simply saying something about himself.

Page 77

421. "There is no such thing as a bluish yellow." This is like "There is no such thing as a regular biangle"; this could be called a proposition of colour-geometry, i.e., it is a proposition determining a concept.

Page Break 78

Page 78

422. If I had taught someone to use the names of the six primary colours, and the suffix "ish" then I could give him orders such as "Paint a greenish white here!"--But now I say to him "Paint a reddish green!" I observe his reaction. Maybe he will mix green and red and not be satisfied with the result; finally he may say "There's no such thing as a reddish green."--Analogously I could have gotten him to tell me: "There's no such thing as a regular biangle!", or "There's no such thing as the square root of -25."

Page 78

423. I want to say there is a *geometrical* gap, not a physical one, between green and red. [Z 354.]

Page 78

424. But doesn't anything physical correspond to it? I do not deny that. (And suppose it were merely our habituation to *these* concepts, to these language-games? But I am not saying that it is so.) If we teach a human being such-and-such a technique by means of examples,--that he then proceeds like *this* and not like *that* in a particular new case, or that in this case he gets stuck, and thus that this and not that is the 'natural' continuation for him: this of itself is an extremely important fact of nature. [Z 355.]

Page 78

425. "But if by 'bluish yellow' I mean green, I am taking this expression in a different way from the original one. The original conception signifies a different road, a *no thoroughfare*."

But what is the right simile here? That of a road that is physically impassable, or of the non-existence of a road? i.e. is it one of physical or of mathematical impossibility? [Z 356.]

Page 78

426. We have a colour system as we have a number system.

Do the systems reside in *our* nature or in the nature of things? How are we to put it?--*Not* in the nature of numbers or colours. [Z 357.]

Page 78

427. Then is there something arbitrary about this system? Yes and no. It is akin both to what is arbitrary and to what is non-arbitrary. [Z 358.]

Page 78

428. It is obvious at a glance†1 that we aren't willing to acknowledge anything as a colour intermediate between red and green. (Nor does

Page Break 79

it matter whether this is always obvious to people, or whether it took experience and education to make it so.) What would we think of people who were acquainted with 'reddish-green' (e.g., who called olive-green by that name)? And what does *this* mean: "Then they have a different concept of colour altogether"? As if they wanted to say: "Well, then it wouldn't be *this* but a different concept of colour"--all the while pointing to our own. As if there were an *object* to which the concept belonged unequivocally. [First two sentences: Z 359.]

Page 79

429. These people are acquainted with reddish green. "But there is no such thing!"--What an extraordinary sentence.--(How do you know?) [Z 362.]

Page 79

430. (The picture characterizing the concept would be something like an algebraic formula.)

Page 79

431. Let's put it like this: Must these people[[sic]] notice the discrepancy? Perhaps they are too stupid. And again: perhaps not that either.--[Z 363.]

Page 79

432. Yes, but has nature nothing to say here?! Indeed she has--but she makes herself audible in another way.

"You'll surely run up against existence and non-existence somewhere!"--But that means against *facts*, not concepts. [Z 364.]

Page 79

433. It is an extremely important fact that a colour which we are inclined to call (e.g.) "reddish yellow" can really be produced (in various ways) by a mixture of red and yellow. And that we are not able to recognize straight off a colour that has come about by mixing red and green as one that can be produced in that way. (But what does "straight off" signify here?)

There could be people who recognize a regular polygon with 97 angles at first glance, and without counting. [a: Z 365.]

Page 79

434. A concept compared with a style of painting: For is even our style of painting arbitrary? Can we simply decide to adopt the style of the Egyptians? Is it a mere question of pleasing and ugly? [Cf. *PI* II, xii, p. 230c.]

Page 79

435. Did we *invent* human speech? No more than we invented walking on two legs. But if this is really so, then it is an important fact that when humans are asked to reproduce the Great Bear on their

Page Break 80

own, they will always, or for the most part, do this by drawing the lines in one particular way and never in another.

But does *that* mean that they see the constellation in this way? And does it contain the possibility of a sudden shift of aspect, for example? For it's the shift that we feel to be similar to a change in the object of sight.

Page 80

436. If there were no change of aspect then there would only be a *way of taking*, and no such thing as *seeing* this or that.

Page 80

437. This seems absurd. As if one wanted to say: "If I use only coal for heat, and never anything else, then I'm not really heating with coal."

But may it not be said: "If there were only *one* substance, there would be no use for the word 'substance'"?

That however presumably means: The concept 'substance' presupposes the concept 'difference of substance'. (As that of the king in chess presupposes that of a move in chess; or that of *colour* that of *colours*.) [b: Z 353.]

Page 80

438. I tell someone something different when I say:

- (a) that this or that form is contained in a drawing he doesn't see--
- (b) that in the drawing he does see there is a form which he hasn't yet seen--
- (c) that I've just noticed that a familiar drawing contains this form--
- (d) that I am just now seeing the drawing in this aspect.

The interest of each of these is different.

Page 80

439. The first statement is a partial description of an object that one sees, and thus resembles "I see something red over there".

The second is what I might call a "geometrical statement". In contrast to the first it is timeless. The discovery that this is so is of the same kind as mathematical discoveries.

Page 80

440. But couldn't this statement also be made in temporal form? Something like this: "If you turn this drawing this way and that you will see *this* form in it, and the lines won't seem to have moved." But it doesn't follow that we use this fact to define a concept.

Page 80

441. How does one make the *discovery*? Well, for instance one might trace--by pure accident--certain lines of the drawing on tracing

Page Break 81

paper. And then one sees: Why, that's a face! Or one is looking at the drawing, and then exclaims this sometimes while one traces those lines.--And where is the *discovery* here?--It still has to be interpreted as a discovery, and in particular as a *geometrical discovery*.

Page 81

442. I may come to see an aspect through someone's *drawing my attention* to it. But how that separates *this* 'seeing' from perceiving colours and shapes.

Page 81

443. Noticing and seeing. One doesn't say "I noticed it for five minutes."

Page 81

444. "But do we *really* see the human figures in the picture?" Only what are you asking about??

What is obviously happening here is that one rather different concept is causing trouble for another. I was supposed to be asking: "Do I really see the figures in the same sense as I really see...?" Or: "What reason do I have for talking about 'seeing' in this case? And what is it in me that makes me rebel against this?"

Page 81

445. I should like to put the question, for instance: "Am I *aware* of the spatial character, the depth of this book, for instance, the *whole* time I am seeing it?" Do I, so to speak, *feel* it the whole time?--But put the question in the third person. When would you say of someone he *was* aware of it the whole time, and when the opposite?--Suppose that you ask him--but how did he learn how to answer such a question?--Well, for instance, he knows what it means to feel pain continuously. But that will only confuse him here, just as it confuses me. [Cf. *PI* II, xi, pp. 210-211.]

Page 81

446. If he now tells me that he is continuously aware of the depth--do I believe him? And if he says he is aware of it only occasionally, when talking about it, perhaps--do I believe *that*? These answers will strike me as resting on a false foundation.--It will be different if he tells me that the object sometimes strikes him as three-dimensional, sometimes as flat. [*PI* II, xi, p. 211a.]

Page 81

447. I might get an important message to someone by sending him the picture of a landscape. Does he read it like a blueprint? That is, does he *decipher* it? He looks at it and acts accordingly. He sees rocks, trees, a house, etc. in it.

Page Break 82

Page 82

448. (The situation here is one of practical necessity, but the means of communication is one that has nothing to do with any previous agreement, definition, or the like, and that otherwise only serves quasi-poetic purposes. But on the other hand normal speech also serves poetic purposes.)

Page 82

449. The aspects of F: It is as if an *image* came into contact, and for a time remained in contact, with the visual impression. [Cf. *PI* II, xi, p. 207b.]

Page 82

450. With the black and white cross, however, it is different, and this is more closely related to the *three-dimensional* aspects (for instance, the drawing of a prism).

Page 82

451. The temptation to say "I see it like *this*", pointing to the same thing for "it" and "this". [Cf. *PI* II, xi, p. 207e.]

Page 82

452. The concept of 'seeing' makes a tangled impression. Well, it is tangled.--I look at the landscape, my gaze ranges over it, I see all sorts of distinct and indistinct movement; *this* impresses itself sharply on me, *that* is quite hazy. After all, how completely ragged what we see can appear! And now look at all that can be meant by a "description of what is seen"! But this is just what we call that. We don't have a genuine, respectable case of such description, and so we say. "Well, the rest isn't very clear as it is, being something which awaits clarification, or which must just be swept aside as rubbish." [*PI* II, xi, p. 200a.]

Page 82

453. Here we are in enormous danger of wanting to make fine distinctions. It is the same when one tries to define the concept of a material object in terms of 'what is really seen'. What we have rather to do is to *accept* the familiar language-game, and to note *false* explanations of the matter as false. The primitive language-game we originally learned needs no justification, and false attempts at justification, which force themselves on us, need to be rejected. [Cf. *PI* II, xi, p. 200b.]

Page 82

454. Conceptual facts have very complicated interrelationships.

Page 82

455. Expression should always be separated from technique. And also cases where we can indicate the technique from those where we can't.

Page Break 83

Page 83

456. I might well say: "My thoughts move naturally from *this* picture to real grass, real animals; but from that one, never."

Page 83

457. One looks at a picture and says: "Don't you *see* a squirrel!"--"Don't you *feel* the softness of this fur!"--And this is said of certain pictures, but not of others.

Page 83

458. I get the idea of the essence of a picture--an idea not unlike that of a mathematical idea--through *certain* modes of representation, in *certain* circumstances. If someone sees something I've written, then if he can read and write the Roman alphabet, he'll be able to copy it quite exactly. He has only to read it, and then write it out. Despite our different handwriting styles he'll have no difficulty producing a fairly acceptable reproduction of the lines on my sheet of paper. But if he hadn't learned to read and write the Roman alphabet then it would have been much more difficult for him to copy the maze of lines. Now, should I say: Whoever has learned these things would *see* my handwriting completely differently from someone who had not?--What do we know about this? It could be that we gave someone that sheet of paper to copy before he had learned to read and write; and then again, after he had learned to read and write. And then he might tell us: "Oh yes, now I see these lines completely differently." Possibly he might also explain: "Now all I really see is the writing that I'm reading; all else is floss, which doesn't concern me, and which I hardly notice." Well this means that he sees the picture differently--when, that is, he actually does react to it differently.

Likewise, compared to someone who can't read, someone who can will be able to give a different account of a sheet of paper criss-crossed with writing. And this analogy holds too for speaking and its accompanying sounds.

Page 83

459. To this there is the answer, "I have never looked at a  with that in mind."

Page 83

460. Suppose someone were to answer: "For me it is *always* facing in that direction."--Would we accept his answer? It would seem to assert that he always thinks of such connections whenever he looks at that letter (just as we say: "Whenever I see this man, I have to think of how he...").

Page Break 84

461. But if we now see the picture of a face, or even a real face--can we also say: I only see it looking in this direction so long as I am occupied with it *in this way*?--What is the difference? The report: "This face is looking to the right"--usually refers to the position of the face. I make it to someone who doesn't see the face himself. It is the report of a perception.

462. But does this then show that it can't be a matter of 'seeing' in these cases--but it is one of 'thinking', perhaps? What makes this quite unlikely is that we want to talk about 'seeing' in the first place.--So should I say that it is a phenomenon between seeing and thinking? No; but a concept that lies between that of seeing and thinking, that is, which bears a resemblance to both; and the phenomena which are akin to those of seeing and thinking (e.g. the phenomena of the utterance "I see the F facing to the right").

463. How does one tell that human beings *see* three-dimensionally? I ask someone about the lie of the land of which he has a view. "Is it like *this*?" (a spacial gesture)--"Yes."--"How do you know?"--"It's not misty, I see quite clearly."--He does not give reasons for the *surmise*. The only thing that is natural to us is to represent what we see three-dimensionally; special practice and training are needed for two-dimensional representation whether in drawing or words. The queerness of children's drawings. [PI II, xi, p. 198d.]

464. What is lacking to anyone who doesn't understand the question which way the letter F is facing, where, for example, to paint a nose on?

Or to anyone who doesn't find that a word loses something when it is repeated several times, namely, its meaning; or to someone who doesn't find that it then becomes a mere sound?

We say: "At first something like an image was there."

465. Is it that such a person is unable to appreciate a sentence, judge it, the way those who understand it can? Is it that for him the sentence is not alive (with all that that implies)? Is it that the word does not have an aroma of meaning? And that therefore he will often react differently to a word than we do?--It *might* be that way.

466. But if I hear a tune with understanding, doesn't something special go on in me--which does not go on if I hear it without understanding? And *what*?--No answer comes; or anything that

occurs to me is insipid. I may indeed say: "Now I've understood it," and perhaps talk about it, play it, compare it with others etc. *Signs* of understanding may accompany hearing. [Z 162.]

467. It is wrong to call understanding a process that accompanies hearing. (Of course its manifestation, expressive playing, cannot be called an accompaniment of hearing either.) [Z 163.]

468. For how can it be explained what 'expressive playing' is? Certainly not by anything that accompanies the playing.--What is needed for the explanation? One might say: a culture.--If someone is brought up in a particular culture--and then reacts to music in such-and-such a way, you can teach him the use of the phrase "expressive playing". [Z 164.]

469. The understanding of a theme is neither sensation nor a sum of sensations. Nevertheless it is correct to call it an experience inasmuch as *this* concept of understanding has some kinship with other concepts of experience. You say "I experienced that passage quite differently this time". But still this expression 'describes what happened' only for someone familiar with a particular system of concepts. (Analogy: "I won the match.")†1 [Z 165.]

470. *This* floats before my mind as I read. So does something go on in reading...? This question doesn't get us anywhere. [Z 166.]

471. But how can it float before me? Not in the dimensions you are thinking of. [Z 167.]

472. We find certain things about seeing puzzling, because we do not find the whole business of seeing puzzling enough. [PI II, xi, p. 212f.]

473. We all know that a cube which is clearly depicted will be seen three-dimensionally. One might not even be able

to describe what one sees in anything other than three-dimensional terms. And it is clear that someone *could* also see this picture as flat. Now, if he alternately sees the picture in one way, then in the other, he is

Page Break 86

experiencing a change of aspect. What is so amazing about *that*?--Is it this: that the report "Now I see..." can no longer be a report about the object that is perceived. For earlier "I see a cube in this picture" was a report about the object I am looking at.

Page 86

474. What is incomprehensible is that *nothing*, and yet *everything*, has changed, after all. That is the only way to put it. Surely *this* way is wrong: It has not changed in *one* respect, but has in another. There would be nothing strange about that. But "Nothing has changed" means: Although I have no right to change my report about what I saw, since I see the same things now as before--still, I am incomprehensibly compelled to report completely different things, one after the other.

Page 86

475. And it is *not* like this: I simply see the picture as one of an infinitely large number of bodies, whose projection it is;--rather, I see it *only* as *this*--or as that. So the picture is alternately one and the other.

Page 86

476. We now have a language-game that is remarkably the *same* as, and remarkably *different* from, the previous one. Now what follows from the expression "Now I see..." is completely different, even though there is once again a close relationship between the language-games.

Page 86

477. We wouldn't have been surprised that the eye (the dot on our picture) is looking in one direction--unless it *changed* the direction in which it looked.

Page 86

478. This question naturally suggests itself: Can we imagine people who never see anything as *anything*? Would they be lacking an important sense, such as if they were colour-blind or they lacked perfect pitch? For the time being let us call such people "gestalt-blind" or "aspect-blind".

Page 86

479. Here the question will arise: To what *kind* of aspect is someone blind. Should I assume, for example, that he cannot see the schematic cube three-dimensionally, first *one* way, then another? If this is to be the case, then in consistency I should have to suppose that he couldn't see the picture of a cube as a cube, and therefore couldn't see the picture of a three-dimensional object as a three-dimensional object. So he would generally have a different attitude toward pictures than we do. It might be the kind of attitude which we have toward a

Page Break 87

blueprint. For example, he would be able to work according to a pictorial representation.--But then we face the difficulty that it would never be possible for him to take a picture for a three-dimensional object, as we do sometimes with *trompe l'oeil* architecture. And *that* could not very well be called a sort of blindness; on the contrary. (This investigation is not psychological.)

Page 87

480. Of course it is imaginable that someone might never see a change of aspect, the three-dimensional aspect of every picture always remaining constant for him, for example. But this assumption *doesn't interest us*.

Page 87

481. It is conceivable, however, and also important for us, that some people might have a completely different relation to pictures than we do.

Page 87

482. Thus we could imagine someone who would see only a painted face as a face, but not one that consists of a circle and four dots; who wouldn't see the duck-rabbit picture as a picture of the head of an animal, and therefore wouldn't see the change of aspect with which we are familiar.

Page 87

483. Let's assume that someone cannot see the picture of a runner as a picture of motion: How would this come out? I'm assuming that he has *learned* that such a picture as this portrays a runner. Thus that he can say that it is a runner; how will this man differ from normal human beings? I shall assume that he will show absolutely no understanding that motion is being represented in a picture. And what would we call the signs of this defective understanding?--We can easily fill out the picture. (But if such a man were able to see any picture and then copy it exactly, we certainly wouldn't say of him that his visual sense was deficient.)

Clearly the words "Now I am seeing *this* as the apex--now *that*" won't mean anything to a learner who has only just met the concepts apex, base, and so on. But I did not mean this as an empirical proposition. [b: cf. *PI* II, xi, p. 208e.]

Page 87

484. "Now he's seeing it like *this*", "now like *that*" would only be said of someone *capable* of making all sorts of applications of the figure quite freely. [*PI* II, xi, p. 208e.]

Page 87

485. But how queer for this to be the condition of his having such-and-such an *experience*! After all, you don't say that one only has

Page Break 88

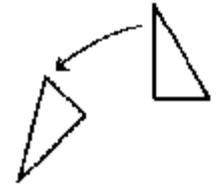

toothache if one is capable of doing such-and-such. From this it follows that we're not dealing with the same concept of experience here.

The concept of experience is different each time, even though related. [*PI* II, xi, p. 208f.]

Page 88

486. We speak, make utterances, but only later do we form a picture of their life. [*PI* II, xi, p. 209a.]

Page 88

487. We could, however, imagine the following way of teaching the pupil to see it that way: In addition to the first triangle we draw a second one, which is the one that hasn't toppled over yet.† Later we omit the second triangle, and now the student can see the first one as toppled over.--But does he have to understand the illustration, or at least see it correctly?--It might merely add to his confusion.

If that illustration says nothing to someone, then other pictures won't speak to him either, as they do to us; he will not react to them as we do. (Not empirically.) Analogy with the picture of the galloping horse.

Page 88

488. It is anything but a matter of course that we see 'three-dimensionally' with two eyes. If the two visual images are amalgamated, we might expect a blurred one as a result, like a wobbled photograph. [*PI* II, xi, p. 213b.]

Page 88

489. A code which I and another man have agreed on, in which "bench" means apple. Immediately after we agree I say to him: "Take these benches away!"--He understands me, and does it; but he still feels the word "bench" to be strange in this use, and when he hears it he might have the image of a bench. [Cf. *PI* II, xi, p. 214f.]

Page 88

490. What would we say of someone who couldn't see the schematic cube now as an upright box, now as one lying on its side? If this is a defect, isn't it one of the imagination rather than of visual sense?

Page Break 89

Page 89

491. But what a strange method!--I form a concept and ask myself how one might follow through with it consistently. What we feel would deserve to be called that. To be sure, we do see a painting three-dimensionally, and we would have a hard time describing it as a composite of flat colour surfaces, but what we see in a stereoscope looks three-dimensional in an entirely different way again. Someone who looks at a photograph, whether it is one of human beings, houses, or trees, doesn't seem to miss three-dimensionality in it! ((To the remark about seeing three-dimensionally with both eyes.)) [Cf. *PI* II, xi, p. 213a.]

Page 89

492. I can see the schematic cube as a box, but *not*: now as a paper box, now as a tin box.--What ought I to say if someone assured me he could see the figure as a *tin* box? Should I answer that that isn't *seeing*? But if he couldn't see, could he then *sense* it?

Of course it would be plausible if we said to him: Only what can really be seen can be *visually* imagined in that way. ((Knowing in dreams.)) [Cf. *PI* II, xi, p. 208b.]

Page 89

493. When you come out of a movie onto the street, you sometimes have the experience of seeing the street and the people as if they were on the screen and part of the plot of a movie. How come? *How* does one see the street and the people? I can only say: I have the fleeting thought, for example, "Perhaps *this* man will be a main character in the

plot". But that's not all there is to it. Somehow my attitude toward the street and the people is like the one toward the action on the screen. Perhaps something like mild curiosity, or enjoyment.--But initially I can't even say all that.

Page 89

494. Doesn't it take imagination to hear something as a variation on a particular theme? And yet one is perceiving something in so hearing it. [*PI II*, xi, p. 213c.]

Page 89

495. "Imagine *this* changed like this, and you have this other thing." In general, one would like to say that the power of imagination can substitute for a picture, or a demonstration. [Cf. *PI II*, xi, p. 213d.]

Page 89

496. One can express the aspects of the double-cross simply by pointing first to a white cross, then to a black one, which is to say, to the same things someone would point to if he were asking "Is *this* contained in the figure on this paper?"--The same question could be asked about the duck-rabbit picture. But it is also clear that each case here differs slightly from the other.

Page Break 90

Page 90

For in order to express the aspects of this picture, one points to something that is not contained in the picture, such as the black cross in the double cross.

Page 90

497. But you do speak of *understanding* music. You understand it, surely, *while* you hear it! Ought we to say this is an experience which accompanies the hearing? [Z 159.]

Page 90

498. I give signs of delight and comprehension.

Page 90

Is it hair-splitting to say: joy, enjoyment, delight, are not sensations?--Let us at least ask ourselves: How much analogy is there between delight and what we call, e.g. "sensation"? [a: Z 515; b: Z 484.]

Page 90

499. The connecting link between them would be pain. For this concept resembles that of, e.g., tactile sensation (through the characteristics of localization, genuine duration, intensity, quality) and at the same time that of the emotions through its expression (facial expressions, gestures, noises). [Z 485.]

Page 90

500. How do I know that someone is enchanted? How does one learn the linguistic expression of enchantment? What does it connect up with? With the expression of bodily sensations? Do we ask someone what he feels in his breast and facial muscles in order to find out whether he is feeling enjoyment? [Z 168.]

Page 90

501. But does that mean that there aren't any sensations after all which often return when one is enjoying music? Certainly not. (In some places he is near weeping, and he feels it in his throat.)

A poem makes an impression on us as we read it. "Do you feel the same while you read it as when you read something indifferent?"--How have I learnt to answer this question? Perhaps I shall say "Of course not!"--which is as much as to say: *this* takes hold of me, and the other not. "I experience something different."--And what kind of thing?--I can give no satisfactory answer. For the answer I give is nothing of importance.--"But didn't you enjoy it *during* the reading?" Of course--for the opposite answer would mean: I enjoyed it earlier or later, and I don't want to say that.

But now you remember certain sensations and images and thoughts as you read, and they are such as were not irrelevant for the enjoyment, for the impression.--But I should like to say that they get their correctness only from their surroundings: through the

Page Break 91

reading of this poem, from my *knowledge* of the language, with its meter and with innumerable other things. (These eyes smile only in *this* face and in *this* temporal context.)

You must ask how we learnt the expression "Isn't that glorious!" (e.g.) at all.--No one explained it to us by referring to sensations, images or thoughts that accompany hearing! Nor should we doubt whether he had enjoyed it if he had no account to give of such experiences; though we should, if he showed that he did not understand certain tie-ups. [a: cf. Z 169; b, c, d: cf. Z 170.]

Page 91

502. But isn't understanding shown, e.g., in the expression with which someone reads the poem, sings the tune? Certainly. But what is the experience during the reading? About that you would just have to say: you enjoy and

understand it if you hear it well read, or feel it well read in your speech-organs. [Z 171.]

Page 91

503. Understanding a musical phrase may also be called understanding a *language*. [Z 172.]

Page 91

504. I think of a quite short phrase, consisting of only two bars. You say "What a lot that's got in it!" But it is only, so to speak, an optical illusion if you think that what is there goes on as we hear it. (Consider that sometimes we say, and say rightfully: "It all depends *who* says it".) (Only in the stream of thought and life do words have meaning.) [Z 173.]

Page 91

505. What contains the illusion is not *this*: "Now I've understood"--followed perhaps by a long explanation of what I have understood. [Z 174.]

Page 91

506. How does seeing an aspect hang together with the ability to perform certain operations (e.g. in mathematics)? Think of seeing three-dimensionally in descriptive geometry and operating within the drawing. He moves his pencil on the surface of the drawing as if he were moving within the real object. But how can that be proof of *seeing*?

Well, don't we accept it as proof of seeing if somebody moves about a room with confidence? There are simply different criteria for seeing. Ask yourself: does someone who has no trouble picturing animals, people, and all sorts of things in his imagination, or in his memory, have to see them with his inner eye? The answer could be: "In such a case we simply *say*..."--But it could also be: "You have to ask the person doing the drawing whether he's doing this or not."

Page Break 92

Page 92

507. Now there is a tie-up between aspect and imagination.

Page 92

508. The aspects of surface and base. What would a person who is blind towards these aspects be lacking?--It is not absurd to answer: the power of imagination.

Page 92

509. Bear in mind that there is frequently a 'right' word for an aspect.

Suppose we have someone look at the double cross and tell us which of the *two* aspects (black cross or white cross) he sees. It will probably be irrelevant whether he says that sometimes he sees something like a little white windmill with four sails and sometimes an upright black cross, or whether he sees the white cross as the four corners of a piece of paper folded toward the middle. The cross which is "now" seen can also be seen as an *opening* in the shape of a cross. But *these* differences needn't matter to us; and therefore one could distinguish between "purely optical" aspects and "conceptual" ones. ((Similarly, the particular words someone uses to describe the events in a dream may or may not matter.))

Page 92

510. "See F as  "†1 could not be understood before something quite different has been said. For would I understand "See this triangle as that triangle"?†2 There must first be a conceptual connection.

Page 92

511. "It seems to me now to be facing left--and now right again." That is, the way it was before? No; earlier it had no *direction* for me. Earlier I didn't surround it with this world of images.

Page 92

512. Attention is dynamic, not static--one would like to say. I begin by comparing attention to gazing but that is not what I call attention; and now I want to say that I find it is *impossible* that one should attend statically. [Z 673.]

Page 92

513. Someone might see a boulder and exclaim: "A man!", and then he might point out to someone else how he sees the man in the boulder--where the face is, the feet are, etc. (Someone else might see a man in the same shape, but in a different way.)

Page Break 93

Page 93

It will be said that it takes imagination to see that, but that no imagination is required to recognize a true-to-life picture of a dog as a dog.

Page 93

514. "He's comparing the boulder to a human shape," "He sees a human shape in it"--but it's not in the same sense

that we say: He's comparing that picture with a dog, or this passport photograph with a face.

Page 93

515. When I'm looking at the photograph, I don't tell myself "That could be seen as a human being". Nor when looking at an F do I say: "That could be seen as an F."

Page 93

516. If somebody showed me the figure and asked me "What is that?", I could answer him only *that way*.--I couldn't answer: "I take that to be a..." or "Probably that is a..." Any more than I *take* letters to be this or that when I'm reading a book.

Page 93

517. "I see it as a ..." is connected with "I'm trying to see it as ...", or "I can't see it as ... yet". But you cannot try to see the regular F as a regular F.

Page 93

518. To ask someone's advice mentally. To estimate the time by *imagining* a clock.

Page 93

519. The aspect presents a physiognomy which then passes away. It is almost as if there were a face there which at first I *imitate*, and then accept without imitating it.--And isn't this really explanation enough?--But isn't it too much? [PI II, xi, p. 210e.]

Page 93

520. If in a particular case I say: attention consists in preparedness to follow each smallest movement that may appear--that is enough to show you that attention is not a fixed gaze: no, this is a concept of a different kind. [Z 674.]

Page 93

521. We see, not change of aspect, but change of interpretation. [Z 216.]

Page 93

522. You see it conformably, not to an interpretation, but to an act of interpreting. [Z 217.]

Page 93

523. If someone were asked, "Can you see F as an ef?" he wouldn't understand us. But he would understand if we asked, "Can you see it

Page Break 94

as a backwards F?" And he would also understand: "And can you now see it as a regular ef again?"--Why?

"Can you see it as ...?" or "Now look at it as a ...!" go together with "Now take it as a ...".

Only where this command makes sense does the question make sense.

Page 94

524. Imagine that someone were to point to a regular printed F and say, "Now it is an ef".--What does that mean? Does it make any sense? For the time being it has none. To what extent is it NOW an ef? Insofar as it always is? And in contrast to what?--I look at a lamp and say "Now it is a lamp."--What can I mean?

Page 94

525. You need new conceptual glasses.

Page 94

526. If you say "Now it's a face for me", we can ask: "What sort of change are you alluding to?" [PI II, xi, p. 195d.]

Page 94

527. The cry "A hare!" is, after all, related to the *report* "a hare".

Page 94

528. What is an expression of amazement? Can it be a stationary attitude? Can amazement thus be a state of inactivity?

Page 94

529. Suppose someone were to ask: "Why can't you hold on to the experience of surprise?"

Page 94

530. "The ef vanishes and a cross appears in its place; the cross vanishes and a backwards F appears in its place; etc." That is, after all, the way we express changes in perception.

Page 94

531. *Forget*, forget that you have these experiences yourself! [Z 179.]

Page 94

532. Our eye seems each time to be drawing a different shape in these lines (on the paper).

Page 94

533. Different pictures appear to me. But *how* different are they? In what do they differ? That I can explain only by referring to their origin.

534. I say something; and it is correct;--but then I misunderstand the use to which the statement would be put.

535. How does one play the game "It could be *this* too"? What a figure could also be--which is what it can be seen as--is not simply another figure. Thus it made no sense to say: F could also be an ∇ . Nor would this make sense:--this could mean several entirely different things.

But one could play that game, for instance, with a child. Together we look at a shape; or at a random object (a piece of furniture)--and then it is said: "That is now supposed to be a house."--And now it is reported, talked about, and treated as if it were a house, and it is altogether interpreted as this. Then, when the same thing is made to stand for something else, a different fabric will be woven around it. [a: cf. *PI* II, xi, p. 206d; b: cf. *PI*, p. 206e.]

536. How will you know whether the child *sees* the thing as that? Well, he might spontaneously say so. He might say something like: "Yes, *now* I see it as ...". And in *this* situation, with the lively participation in the fiction, it will indeed signify the seeing of the aspect.

537. I want to say: this game is *related* to seeing the aspects of F, for example.

A person's ability, as it were, to play-act things is a prerequisite for his meaning the same thing we do when he says "Now I see it as...".

538. How do you teach a child, say in arithmetic: "Now take *these* things together!", or "Now *these* go together"? Clearly "taking together" and "going together" must originally have had another meaning for him than that of *seeing* in this way or that.--And this was a remark about concepts, not about teaching methods. [*PI* II, xi, p. 208c.]

539. To be sure, one can say "See this shape as a... for five minutes", if this means: He is to hold it, to keep it balanced, in this aspect.

540. What do you understand if someone says "I see it (i.e. the regular F) as an *ef*"?--That he is dealing with aspects; that it is an unstable situation. That he is thinking "It could also be that."

541. Seeing aspects is built up on the basis of other games.

542. We certainly speak of calculating in our imagination. So it is not surprising that the power of imagination can contribute to knowledge.

543. But I don't want to say that an aspect is a mental image. Rather that 'seeing an aspect' and 'imaging something' are related concepts. [Cf. *PI* II, xi, p. 213c.]

544. One wants to ask of seeing an aspect: "Is it seeing? Is it *thinking*?" The aspect is subject to the will: this by itself relates it to thinking.

545. "The aspect is subject to the will." This isn't an empirical proposition. It makes sense to say, "See this circle as a hole, not as a disc", but it doesn't make sense to say "See it as a rectangle", "See it as being red".

546. Do I really see something different each time, or do I only interpret what I see in a different way? I am inclined to say the former. But why?--To interpret is to think, to do something. [*PI* II, xi, p. 212d.]

547. The cases in which we *interpret* what we see are easily recognized. When we interpret we put forth a hypothesis which may turn out to be wrong. "I see this shape as a..." can no more be verified than (or can be verified only in the same sense as) the statement "I see a bright red". So here we have a similar use of the word "see" in both contexts.

548. Suppose someone were to ask: "Do we all see an F in the same way?" What could he mean by that?--We could

make this test: we show an F to different people and ask them whether the F faces to the right or to the left. Or we could ask: "If you compare an F with the profile of a face, in which direction is the face looking?"

But many people might not understand this question. As many do not understand the question, "What colour is the vowel *a* for you?"--If someone didn't understand the question, if he claimed that it was nonsensical, could we say that he doesn't understand English, or at least the meanings of the words "colour", "vowel", etc.?

On the contrary: When he has learned to understand these words, then he can react to these questions, either "with" or "without understanding". [b, c: Z 185.]

Page Break 97

Page 97

549. Suppose, instead of "in which direction is the letter... facing?", the question had been: "If you were to paint an eye and a nose onto an F or a J, in which direction would they be facing?" Surely this too would be a psychological question. But it doesn't have to do with '*seeing* something this way or that'. Rather, it deals with an *inclination* to do one or the other. (But we must think about how someone would arrive at his answer to this question.)--Thus this kind of seeing is related to an inclination. The inclination can change, or be absent altogether.

Page 97

550. "With this arrangement of windows the facade faces *that* way."

"The windows used to be arranged so that the facade faced *that* way.

The first sentence is like a proposition of geometry. In the second one, the concept of the 'direction in which the facade faces' serves to describe the facade. Just as we describe a face using the concepts 'happy', 'sullen', 'suspicious', or a movement by the words "fearful", "hesitant", "sure". And to the extent that these are descriptions of what has been visually perceived, or observed, they are also descriptions of the visual impression. So one can say that he *sees* the hesitation. (A person copying a picture can be told, "The face isn't right yet; it isn't sad enough.")

Page 97

551. Anyone with an eye for family resemblances can recognize that two people are related to each other, even without being able to say wherein the resemblance lies. (Think of the case of the calculating-genius.)

Page 97

552. It might be an incorrect use of language to say "I see fear in this face". We would be taught: a fearful face can be '*seen*'; but the fear in a face, or the similarity or dissimilarity between two faces, is '*noticed*'.

Page 97

553. The kinship of these two concepts is shown in this explanation: If you want to see how they differ, think of the sense it could make to say that someone saw the similarity between two faces from one stroke of the hour to the next. Or think of the order: "Notice the similarity from... to...!"

Page 97

554. A drawing can be the description of a visual impression. What is at the top of the drawing, what is at the bottom, is usually of the greatest importance. But someone could also stipulate a distance at

Page Break 98

which we should hold the drawing from our eyes. Indeed, even a spot on the drawing at which we are to look could be stipulated, or how our eyes are to travel over the drawing.

Page 98

555. I begin seeing the similarity when it "strikes" me; and do I then see it as long as I see the similar objects? Or only as long as I am *conscious* of the similarity?--If the similarity strikes me, I perceive something, but I don't have to remain conscious of it in order to perceive that it doesn't change.

Page 98

556. Two uses of the statement "I see...". One language-game: "What do you see there?"--"I see...", and then a description of what was seen follows, either in words, or through a drawing, or a model, or gestures, etc.--Another language-game: We look at two faces and I say to someone: "I see a similarity in them."

In the first language-game the description could have gone something like this: "I see two faces which are as like as father and son." This can be called a far less complete description than the one that uses a drawing. But someone could give this more complete description and still not notice that similarity. Another might see the drawing of the first one and discover the family resemblance in it; and in the same way he might see a similarity between their facial expressions. [a: cf. *PI* II, xi, p. 193a.]

Page 98

557. "When I uttered the word just now, it meant ... to me." Why should that not be mere lunacy? Because *I* experienced that? That is not a reason. [Z 182.]

Page 98

558. Those cases in which the inner seems hidden from me are very *peculiar*. And the uncertainty which is expressed in this is not a philosophical one; no, it is practical and primitive.

Page 98

559. It is then as if I realized for the first time that the inner is really always hidden.

Page 98

560. (We also say that the man is completely transparent.) So sometimes someone is transparent, sometimes not.

Page 98

561. "I can never know what goes on inside him."--But does something have to go on inside him? And why should I be concerned

Page Break 99

with that?--But this picture suggests a real uncertainty, not one we've dreamed up.

Page 99

562. What is the importance of someone making this or that confession? Does he have to be able to judge his condition correctly?--What matters here is not an inner condition which he judges, but just his confession.

(His confession can explain certain things. For example, it can cause me to stop suspecting someone else.)

Page 99

563. The principal uncertainty: I don't know what he is thinking if he doesn't express it. Now suppose he does express it, but in a language you don't understand. He could tap it out with the finger of one hand on the back of his other hand in morse code, or some such thing. Then too, after all, it is secret, and isn't it *just as* secret as if it had never been expressed? The language could also be such that I could never learn it, e.g. its rules might be extraordinarily complicated.

Page 99

564. So someone can hide his thoughts from me by expressing them in a language I don't know. But where is the mental thing which is hidden?

Page 99

565. I may choose the language in which I think. But not as if I think, and then choose the language into which I want to translate my non-verbal thoughts.

Page 99

566. You can be as *certain* of someone else's sensations as of *any* fact. But this does not make the propositions "He is happy" and " $2 \times 2 = 4$ " into similar instruments. It suggests itself to say, "The certainty is of a different kind", but that doesn't remove the obscurity. [Cf. *PI*, II, xi, p. 224c.]

Page 99

567. "But, if you are *certain*, isn't it that you are shutting your eyes in face of doubt?"--They are shut.

It is indeed true: this kind of doubt is arrived at in a completely different way from doubt about an arithmetical proposition. Above all, in the former case complete certainty is the limit of a *belief* which differs by degrees.--*Everything* is simply different. [a: *PI* II, xi, p. 224d.]

Page 99

568. And then there is what I should like to call the case of hopeless doubt. When I say, "I have no idea what he is really thinking--". He's a closed book to me. When the only way to understand someone else would be to go through the same upbringing as his--which is

Page Break 100

impossible. Here there's no pretence. But imagine people whose upbringing is directed toward suppressing the expression of emotion in their faces and gestures; and suppose these people make themselves inaccessible to me by thinking aloud in a language I don't understand. Now I say "I have no idea what is going on inside them", and there it is--an external fact.

Page 100

569. "I cannot know what is going on in him" is above all a *picture*. It is the convincing expression of a conviction. It does not give the reasons for the conviction. They are not something that can be *seen* directly. [*PI* II, xi, p. 223g.]

Page 100

570. "We *see* emotion."--As opposed to what?--We do not see facial contortions and *make the inference* that he is feeling joy, grief, boredom. We describe a face immediately as sad, radiant, bored, even when we are unable to give any other description of the features.--Grief, one would like to say, is personified in the face. This is essential to what we call "emotion". [Cf. *Z* 225.]

Page 100

571. The man I call meaning-blind will understand the instruction "Tell him he is to go to the bank--and I mean the

river bank," but not "Say the word bank and mean the bank of a river".

He will also not be able to report that he almost succeeded, but that then the word slipped into the wrong meaning. It does not occur to him that the word has something in it which positively fixes the meaning, as a spelling may; nor does its spelling seem to him to be a picture of the meaning, as it were.--For instance, it is very tempting to think that a different spelling will lead to at least a very small difference in pronunciation, even where this is certainly not so. Here we have a case which can serve as an example for many others: You say the two words (e.g. "for" and "four") to yourself and you really do pronounce them a little differently, even though you don't do this in the normal course of speech, when you're not thinking about it. And this is so if for no other reason than that each word is pronounced differently on different occasions. [a: cf. Z 183a.]

Page 100

572. Different people are very different in their sensitiveness about changes in the orthography of a word. And the feeling is not just piety towards an old use.--If for you spelling is just a practical question, the feeling you are lacking in is not unlike the one that a 'meaning-blind' man would lack. [Z 184.]

Page Break 101

Page 101

573. How could he hear the word with that meaning? How was it possible?!--It just wasn't--not in *these* dimensions. [Z 180.]

Page 101

574. But isn't it true, then, that the word means that to me now? Why not? For this sense doesn't come into conflict with the rest of the use of the word.

Someone says: "Give him the order... and *mean* by it...!" What can that mean?

But why do you use just this expression for your experience?--such a poor fit!--That is the expression of the experience, just as "The vowel *e* is yellow" and "In my dream I knew that..." are expressions of other experiences. It is a poor fit only if you take it the wrong way.

This expression goes with the experience just as the primitive expression of pain goes with pain. [a, b: Z 181.]

Page 101

575. William James: The thought is already complete at the beginning of the sentence. How can one know that?--But the *intention* of uttering the thought may already exist before the first word has been said. For if you ask someone: "Do you know what you mean to say?" he will often say yes.

It is my intention to whistle this theme: have I then already, in some sense, whistled it in thought? [a: Z 1; b: Z 2b.]

Page 101

576. Whoever answers "Yes" to the question, "Do you know yet what you want to say?" may have some mental image or other; but if this could be heard or seen objectively, then there would generally not be any way of deriving what he intended from it with certainty. (Raising your hand in class.)

Page 101

577. Not everyone with an intention has therefore made a *plan*.

Page 101

578. What forms of mental defects actually exist is of no concern to *us*; but the possibilities of such forms do concern us. It is not whether there are men incapable of thinking "At that time I wanted to...", but how this concept can be followed through. [Cf. Z 183a.]

Page 101

579. How could this assumption be followed through consistently? What would we call a consistent follow-through?--If you assume that someone cannot do *this*, then how about *that*? Is he also unable to do this?--Where does this concept take us? [From "If you assume" cf. Z 183b.]

Page Break 102

Page 102

580. "You must earnestly promise yourself to do it, and then you'll do it." Earnestly promising something requires thinking about it, for instance. It requires a particular preparation. Finally there might actually be a formal promise, perhaps even in a loud voice, but that is just *one* stone in this building. (Vows.)

Page 102

581. A vow could be called a ceremony. (Baptism, even when it is not a Christian sacrament.) And a ceremony has an importance all its own.

Page 102

582. "I had the intention of..." does not express the memory of an experience. (Any more than "I was on the point

of...") [Z 44.]

Page 102

583. "What a queer and frightful sound. I shall never forget it." And why should one not be able to say that of remembering ("What a queer... experience...") when one has seen into the past for the first time?--[Z 661.]

Page 102

584. Couldn't he just be imagining that he calculated this? (That he now knows the solution to the problem is not supposed to be inconsistent with this. And he might indeed have miscalculated.) And if there *is* no mistake here, then this is not because there is certainty.

Page 102

585. Someone tells me he has just worked out in his head how much... \times ... is. He gives an obviously wrong answer, and when asked how he arrived at it, he recites the calculation; it is utter nonsense, as he himself now realizes, but at that time, he says, it seemed completely correct. (Something similar occurs in dreams.) Can't that happen? His mental arithmetic, I want to say, still must prove itself.

Page 102

586. "In hiding something from me, he can hide it in such a way that not only will I never find it, but finding it will be completely inconceivable." This would be a metaphysical hiding.--But what if, without knowing it, he were to give signs that give him away? That would be possible, after all.--Now wouldn't *he* be the only judge of whether those signs have given him away?--But couldn't I insist that he forgot what happened inside him--and thus not let his statement count? (Without calling it a lie.) That means that I declare it worthless, or give it value only as a phenomenon, from which inferences about his state might be drawn.

Page Break 103

Page 103

587. If something is hidden--isn't it as if writing were hidden, or rather something which looks like writing, whose meaning only lies in what he reads out of it, or into it, at some point?

Page 103

588. Of course he can *mislead* me, make me arrive at false conclusions. But it doesn't follow from this that he has hidden anything; even though the way he behaves can be compared to hiding.

Page 103

589. Haven't I the *right* to be convinced that he is not pretending to me?--And can't I convince someone else of my right?

Page 103

590. If I tell him in full detail how my friend behaved, will he have any reasonable doubt as to the genuineness of my friend's feelings?

Page 103

Does anyone doubt the genuineness of Lear's feelings?

Page 103

591. Is it thoughtlessness not to keep the *possibility* of pretence in mind?

Page 103

592. Remembering: a seeing into the past. *Dreaming* might be called that, when it presents the past to us. But not remembering; for, even if it showed scenes with hallucinatory clarity, still it takes remembering to tell us that this is past. [Z 662.]

Page 103

593. But if memory shows us the past, how does it show us that it is the past?

It does *not* show us the past. Any more than our senses show us the present. [Z 663.]

Page 103

594. Nor can it be said to communicate the past to us. For even supposing that memory were an audible voice that spoke to us--how could we understand it? If it tells us, e.g. "Yesterday the weather was fine", how can I learn what "yesterday" means? [Z 664.]

Page 103

595. I give myself an exhibition of something only *in the same way* as I give one to other people. [Z 665.]

Page 103

596. I can display my good memory to someone else and also to myself. I can subject myself to an examination. (Vocabulary, dates.) [Z 666.]

Page Break 104

Page 104

597. But how do I give myself an exhibition of remembering? Well, I ask myself "How did I spend this morning?" and give myself an answer.--But what have I really exhibited to myself? Remembering? That is, what it's like to remember something?--Should I have exhibited remembering to *someone else* by doing that? [Z 667.]

Page 104

598. "To purpose to do something is a special inner process."--But what sort of process--even if you could dream one up--could satisfy our requirements about purpose? [Z 192.]

Page 104

599. Imagine men who show pity only when they see someone else bleeding; otherwise they laugh at his expressions of pain. That's the way it is with them. Some smear themselves with animal blood to be pitied. If they're found out they're severely punished.

Page 104

600. They don't ask the question: "Couldn't he be feeling pain anyway?"

Page 104

601. These people need not have certain scruples.

Page 104

602. Do I pay any mind to his inner processes if I *trust* him? If I don't trust him I say, "I don't know what's going on inside him". But if I trust him, I don't say that I know what's going on inside him.

Page 104

603. If I don't distrust him, I don't pay any mind to what is going on inside him. (Words and their meaning. The meaning of words, what stands behind them, doesn't concern me in normal conversation. Words flow along and transitions are made from words to actions and from actions to words. When someone's performing mathematical calculations he doesn't stop to think whether he is doing it 'thoughtfully' or 'parrot-like'. (Frege.))

Page 104

604. There might be people who speak to themselves quite a bit before and while they are doing something, and then again there might be people who only say very little to themselves. When he is asked: "What were you thinking when you did that?" he confesses, perhaps quite honestly, "Nothing at all", even though what he did seems to us to have been well thought out, possibly even shrewd. I say that I don't know what is going on inside him, and in an important sense nothing is going on inside him. I don't know my way about with him: for example, I make erroneous suppositions quite easily, and from time to time I am very disappointed in my expectations.

Page Break 105

Page 105

I could visualize this person by imagining that he accompanies all of his actions with monologues, which express his sentiments. The monologues would be a construction, a working hypothesis, by which I try to comprehend his actions. Must I now assume thinking to be going on inside him *apart* from those monologues? Are the monologues not quite enough? Can't they do everything the inner life is supposed to do?

Page 105

605. It is easy to imagine and work out in full detail events which, if they actually came about, would throw us out in all our judgments.

If I were to see quite new surroundings from my window instead of the long familiar ones, if things were to behave as they never did before, then I should say something like "I have gone mad"; but that would merely be an expression of giving up the attempt to know my way about. And the same thing might befall me in mathematics. It might, *e.g.*, *seem* as if I kept on making mistakes in calculating, so that no answer seemed reliable to me.

But the important thing about this for me is that there isn't any sharp line between such a condition and the normal one. [Z 393.]

Page 105

606. Why is it important to depict anomalies accurately? If someone can't do this, that shows that he isn't quite at home yet among the concepts. [*Culture and Value*, p. 72.]

Page 105

607. To be sure, there is this: acquiring a knowledge of human nature; it is also possible to help someone with this, to give lessons, as it were, but one only points to cases, refers to certain traits, gives no hard and fast rules.

Page 105

608. Perhaps I can say "Just let me talk to this man, let me spend some time with him, and I shall know whether he can be trusted". And later: "I have the *impression*...". But here it's a matter of prognosis. Let the future show whether my impression was correct. Knowledge of human nature can convince us that this man is really feeling what he claims he's feeling; but does *it* convince us that other humans feel anything?

Page 105

609. "One *can't* pretend like that."--This may be a matter of experience--namely that no one who behaves like *that* will later

Page Break 106

behave in such-and-such a way; but it also may be a conceptual stipulation; and the two may be connected.

(For it wouldn't have been said that the planets *had* to move in circles, if it had never appeared *that* they move in circles). [a: Z 570a; b: Z 570c.]

Page 106

610. As I'm teaching, I can point to someone and say, "You see, *that* person isn't pretending." And a student can learn from this. But if he were to ask me "How does one really tell that?"--then I might not have anything to answer, except, perhaps, something like this: "Look how he's lying there, look at his face", and things like this.

Page 106

611. Could this be different with other beings?--If they all had the same bodies and the same facial features, for example, then there would already be a great deal of difference.

Page 106

612. And pretending is, of course, only a special case of someone's producing expressions of pain when he is not in pain. For if this is possible at all, why should it always be pretending that is taking place--which is a very specific psychological process? (And by "psychological" I don't mean "inner".) [Cf. *PI* II, xi, p. 228(f)-229.]

Page 106

613. There might actually occur a case where we should say "He *believes* he is pretending."
(*Pilgrim's Progress*: He *thinks* he is uttering the curses which the devil is uttering.) [a: *PI* II, xi, p. 229c.]

Page 106

614. Sufficient evidence passes over into insufficient without a borderline. A natural foundation for the way this concept is formed is the complex nature and the variety of human contingencies.

Then given much less variety, a sharply bounded conceptual structure would have to seem natural. But why does it seem so difficult to imagine the simplified case?

Is it as if one were trying to imagine a facial expression not susceptible of gradual and subtle alterations; but which had, say, just five positions; when it changed it would snap straight from one to another. Would this fixed smile really be a smile? And why not?--I might not be able to react as I do to a smile. Maybe it would not make me smile myself. [a, b: Z 439; c: cf. Z 527.]

Page Break 107

Page 107

615. A facial expression that was completely fixed couldn't be a friendly one. Variability and irregularity are essential to a friendly expression. Irregularity is part of its physiognomy.

Page 107

616. The importance we attach to the subtle shades of behaviour.

Page 107

617. My relation to the appearance here is part of my concept. [Z 543.]

Page 107

618. Imagine *this* argument: Pain comes in degrees. But no one will claim that I ever know the exact degree of someone else's pain; therefore it could be of the degree *o*.

But does he himself know the 'exact degree' of his own pains? And what does 'knowing' this mean?

Page 107

619. "Then does he not know how intense his pains are?" He doesn't have the slightest doubt about that.

Page 107

620. But after all, I don't know, e.g., that his pain has now eased off a little.--Oh yes I do, if he tells me. What he says is also an utterance of his pain.

Page 107

621. The uncertainty is not founded on the fact that he does not wear his pain on his sleeve. And there is not an uncertainty *in a particular case*. If the frontier between two countries were in dispute, would it follow that the country to which any individual resident belonged was dubious? [Z 556.]

Page 107

622. 'Heap of sand' is a concept without sharp boundaries--but why isn't one with sharp boundaries used instead of it?--Is the reason to be found in the nature of the heaps? What phenomenon is it whose nature determines our concept? [Cf. Z 392.]

Page 107

623. "A dog is more like a human being than a being endowed with a human form, but which behaved 'mechanically'." Behaved according to simple rules?

Page 107

624. We judge an action according to its background within human life, and this background is not monochrome, but we might picture it as a very complicated filigree pattern, which, to be sure, we can't copy, but which we can recognize from the general impression it makes.

Page Break 108

Page 108

625. The background is the bustle of life. And our concept points to something within *this* bustle.

Page 108

626. And it is the very concept 'bustle' that brings about this indefiniteness. For a bustle comes about only through constant repetition. And there is no definite starting point for 'constant repetition'.

Page 108

627. Variability itself is a characteristic of behaviour without which behaviour would be to us as something completely different. (The facial features characteristic of grief, for instance, are not more meaningful than their mobility.)†1

Page 108

628. It is unnatural to draw a conceptual boundary line where there is not some special justification for it, where similarities would constantly draw us across the arbitrarily drawn line.

Page 108

629. How could human behaviour be described? Surely only by showing the actions of a variety of humans, as they are all mixed up together. Not what *one* man is doing *now*, but the whole hurly-burly, is the background against which we see an action, and it determines our judgment, our concepts, and our reactions. [Z 567.]

Page 108

630. How could you explain the meaning of 'simulating pain', 'acting as if in pain'? (Of course the question is: *To whom?*) *Should you act it out?* And why could such an exhibition be so easily misunderstood? One is inclined to say: "Just live among us for a while and then you'll come to understand."

Page 108

631. One might surely be taught (e.g.) to mime pain (not with the intention of deceiving). But could this be taught to just anyone? I mean: someone might well learn to give certain crude tokens of pain, but without ever spontaneously giving a finer imitation out of his own insight. (Talent for languages.) (A clever dog might perhaps be taught to give a kind of whine of pain but it would never get as far as conscious imitation.) [Z 389.]

Page 108

632. I really want to say that scruples in thinking begin with (have their roots in) instinct. Or again: a language-game does not have its

Page Break 109

origin in *consideration*. Consideration is part of a language-game.

And that is why a concept is in its element within the language-game. [Z 391.]

Page 109

633. "Couldn't you imagine a further surrounding in which this too could be interpreted as pretence?"

But what does it mean to say that it might always be pretence? Has experience taught us this? How else can we be instructed about pretence? [Cf. Z 571.]

Page 109

634. Isn't there something here like the relation between Euclidean geometry and visual experience? (I mean that there is a deep-seated resemblance here.) For Euclidean geometry too corresponds to experience, only in a very peculiar way and not, say, 'merely approximately'. One might perhaps say that it corresponds as much to our method of drawing as to other things; or that it corresponds to certain requirements of *thinking*. Its concepts have their roots in widely scattered and remote areas. [To "one might perhaps say" cf. Z 572.]

Page 109

635. For just as the verb "believe" is conjugated like the verb "beat", concepts for one area are formed along the lines of very widely scattered concepts. (The genders of nouns.)

Page 109

636. The formation of a concept has, for example, the character of limitlessness, where experience provides no sharp boundary lines. (Approximation without a limit.)

637. Sometimes it seems that concepts are formed along the lines of comfortable thinking. (Just as even the yardstick is suitable not only to the things that are to be measured, but also to man.) But what the devil! Surely everyone knows whether he's in pain!--How could *everyone* know it? To do this each would have to know that all have the same.

638. A tribe has two concepts, akin to our 'pain'. One is applied where there is visible damage and is linked with tending, pity etc. The other is used for stomach-ache, for example, and is tied up with mockery of anyone who complains. "But then do they really not notice the similarity?"--Do we have a single concept everywhere where there is a similarity? The question is: Is the similarity *important* to them? And need it be so? [Z 380.]

639. If you consider the reasons someone might have for stifling pain, or simulating it, you will come up with countless ones. Now why is there this multiplicity? Life is very complicated. There are a great many possibilities. But couldn't other men disregard many of these *possibilities*, shrug them off, as it were?

640. But in that case isn't this man overlooking something that is there?--He takes no notice of it, and why should he?--But in that case his concept just is fundamentally different from ours.--*Fundamentally* different? Different.--But in that case it surely is as if his word could not *designate* the *same* as ours. Or only part of that.--But of course it must look like that, if his concept is different. For the indefiniteness of our concept may be projected for us into the *object* that the word designates. So that if the indefiniteness were missing we should also not have 'the same thing meant'. The picture that we employ symbolizes the indefiniteness. [Z 381.]

641. In philosophizing we may not *terminate* a disease of thought. It must run its natural course, and *slow* cure is all important. [Z 382.]

642. "You can never know what's going on in his soul."--That seems to be a truism. And it is, in the sense that the picture we just used already contains the sentence. But of course we have to call the sentence into question just as much as the picture.

643. The expression "Who knows what is going on inside him!" The interpretation of outer events as consequences of unknown ones, or merely surmised, inner ones. The interest that is focused on the inner, as if on the chemical structure, from which behaviour issues.

For one needs only to ask, "What do I care about inner events, whatever they are?!", to see that a different attitude is conceivable.--"But surely everyone will always be interested in *his* inner life!" Nonsense. Would I know that pain, etc., etc. is something inner if I weren't told so?

644. Doubt about an inner process is an *expression*. *Doubt*, however, is an instinctive form of behaviour. A form of behaviour toward someone else. And it does not follow from this that I know from my own experience *what* pain, etc. is; or that I know that it is something inward, and can go along with something outward. That's the last thing I know!

645. Remember: most people say one feels nothing under anaesthetic.

But some say: It *could* be that one feels, and simply forgets it completely.

If then there are here some who doubt and some whom no doubt assails, still the lack of doubt might after all be far more general. [Z 403.]

646. Or doubt might after all have a different and much less indefinite form than in our world of thought. [Z 404.]

647. Remember: we often use the phrase "I don't know" in a queer way; when, for example, we say that we don't know whether this man really feels more than that other, or merely gives stronger expression to his feeling. In that case it is not clear what sort of investigation would settle the question. Of course the expression is not quite idle: we want to say that we certainly can compare the feelings of A and B with one another, but that the circumstances of a

comparison of A with C throw us out. [Z 553.]

Page 111

648. Only God sees the most secret thoughts. But why should these be all that important? And need all human beings count them as important? [Z 560.]

Page 111

649. "Imagine humans who only think aloud." After all, it is not a matter of course that beings of bodily nature think; so let them think only talking, that is, let them do nothing else that we would call thinking. (Their secret thoughts are monologues.)

Page 111

650. The steps that lie between instinctive cunning and cunning that is carefully thought out. An idiot could behave slyly, for that's what we'd call it, but we wouldn't think him capable of *planning* anything.

If we're asked "What's going on inside him?" we say, "Surely very little goes on inside him." But what do we know about it?! We construct a picture of it according to his behaviour, his utterances, his ability to think.

Page 111

651. We combine diverse elements into a 'Gestalt' (pattern), for example, into one of deceit.

The picture of the inner completes the Gestalt.

Page 111

652. If a concept depends on a pattern of life, then there must be some indefiniteness in it. For if a pattern deviates from the norm, what we want to say here would become quite dubious.

Page Break 112

Page 112

653. Thus can there be definiteness only where life flows quite regularly? But what do they do when they come across an irregular case? Maybe they just shrug their shoulders.

Page 112

654. "He told me--and there was not the slightest possibility of doubting his credibility--that..." Under what circumstances is there no possibility of doubting his credibility? Can I specify them? No.

Page 112

655. You must think about the purpose of words.

What does language have to do with pain?

Page 112

656. In the case that I have in mind, the people have a word which has a similar purpose (with a similar function) to that of the word "pain". It would be wrong to say that it "designates" something similar. It enters into their life in a different, and yet similar, way.

Page 112

657. "But you can't recongize [[sic]] pain with *certainly* just from externals."--The *only* way of recognizing it is by externals, and the uncertainty is constitutional. It is not a shortcoming.

It resides in our concept that this uncertainty exists, in our instrument. Whether this concept is practical or impractical is really not the question.

Page 112

658. In a world different from ours colours might play a different role. Think of various cases

(1) Certain colours are tied to certain forms. Circular shapes, red, rectangular ones, green, etc.

(2) Dyes can't be produced. You can't colour things.

(3) *One* colour always linked together with a foul smell, or poisonousness.

(4) A far greater incidence of colour-blindness than now exists.

(5) Different shades of grey abound; all other colours are extremely rare.

(6) We can reproduce a great many shades of colour from memory. If our number system is connected with the number of our fingers, then why shouldn't our system of colours be connected with the specific ways in which they occur.

(7) A colour occurs only in gradual transition into another one.

(8) Colours always occur in the sequence of colours in the rainbow.

Page Break 113

Page 113

659. Think of the uncertainty about whether animals, particularly lower animals, such as flies, feel pain.

The uncertainty whether a fly feels pain is philosophical; but couldn't it also be instinctive? And how would that come out?

Indeed, aren't we really uncertain in our behaviour towards animals? One doesn't know: Is he being cruel or not.

Page 113

660. For there *is* uncertainty of behaviour which doesn't stem from uncertainty in thought.

Page 113

661. Look at the problem of uncertainty as to whether someone else is feeling pain in light of the question whether an insect feels pain.

Page 113

662. There is such a thing as trust and mistrust in behaviour!

If anyone complains, e.g., I may be trustful and react with perfect confidence, or I may be uncertain, like someone who has his suspicions. Neither words nor thoughts are needed for this. [Z 573.]

Page 113

663. The unpredictability of human behaviour. But for this--would one still say that one can never know what is going on in anyone else? [Z 603.]

Page 113

664. But what would it be like if human behaviour were not unpredictable? How are we to imagine this? (That is to say: how should we depict it in detail, what are the connections we should assume?) [Z 604.]

Page 113

665. "I don't know what's going on inside it right now!" That could be said of the complicated mechanism say of a fine clock, which triggers various external movements according to very complicated laws. Looking at it one might think: if I knew what it looked like inside, what was going on right now, I would know what to expect.

Page 113

666. But with a human being, the assumption is that *it is impossible* to gain an insight into the mechanism. Thus indeterminacy is postulated.

Page 113

667. If, however, I doubt whether a spider feels pain, it is not because I don't know what to expect. [Z 564.]

Page Break 114

Page 114

668. But we cannot get away from forming the picture of a mental process. And *not* because we are acquainted with it in our own case! [Z 565.]

Page 114

669. *One* kind of uncertainty is that with which we might face an unfamiliar mechanism. In another we should possibly be recalling an occasion in our life. It might be, e.g., that someone who has just escaped the fear of death would shrink from swatting a fly, though he would otherwise do it without thinking twice about it. Or on the other hand that, having this experience in his mind's eye, he does with hesitancy what otherwise he does unhesitatingly. [Z 561.]

Page 114

670. Even when I 'do not rest secure in my sympathy' I need not think of uncertainty about his later behaviour. [Z 562.]

Page 114

671. The one uncertainty stems from you, so to speak, the other from him.

The one could surely be said to connect up with an analogy, then, but not the other. Not, however, as if I were drawing a conclusion from the analogy! [Z 563.]

Page 114

672. Seeing life as a weave, this pattern (pretence, say) is not always complete and is varied in a multiplicity of ways. But we, in our conceptual world, keep on seeing the same, recurring with variations. That is how our concepts take it. For concepts are not for use on a *single* occasion. [Z 568.]

Page 114

673. And the pattern in the weave is interwoven with many others. [Z 569.]

Page 114

674. I *say* for instance: "He might after all be pretending."--What am I *imagining* when I say it?--That is, what explanation of the word "pretend" would I give? What kind of examples would come to mind?

Page 114

675. How do I *employ* the sentence?

(For the situation here is like certain areas of mathematics, where there is a 'fantastic application'.)

Page 114

676. I evoke a picture which can then serve a purpose. (I could almost be looking at a painted picture.)

Page 114

677. Sometimes I treat him as I treat myself and as I would like to be treated when I'm in pain; sometimes I don't.

Page Break 115

Page 115

678. We're used to a particular classification of things.

With language, or languages, it has become second nature to us.

Page 115

679. These are the fixed rails along which all our thinking runs, and so our judgement and action goes according to them too. [Z 375.]

Page 115

680. Must people be acquainted with the concept of modesty or of swaggering, wherever there are modest and swaggering men? Perhaps nothing hangs on this difference for them.

For us, too, many differences are unimportant, which we might find important. [Z 378.]

Page 115

681. And others have concepts that cut across ours. And why should their concept 'pain' not split ours up? [First sentence: Z 379. Second sentence: Z 380, the last sentence.]

Page 115

682. The 'uncertainty' relates not to the particular case, but to the method, to the rules of evidence. [Z 555.]

Page 115

683. Concepts with fixed limits would demand a uniformity of behaviour. But what happens is that where I am *certain*, someone else is uncertain. And that is a fact of nature. [Z 374.]

Page 115

684. If it is said, "Evidence can only make it probable that expressions of emotions are genuine", this does *not* mean that instead of complete certainty we have just a more or less confident conjecture. "Only probable" cannot refer to the degree of our confidence, but only to the nature of its justification, to the character of the language-game. Surely this must help determine the constitution of our concepts: that there is no agreement among men as to the certainty of their convictions. (Compare the remark about agreement in colour-judgments and agreement in mathematics.)

Page 115

685. Given the same evidence, one person can be completely convinced and another not be. We don't on account of this exclude either one from society, as being unaccountable and incapable of judgment.

Page 115

686. But mightn't a society do precisely this?

Page Break 116

Page 116

687. For words have meaning only in the stream of life. [Cf. Z 173, the last sentence.]

Page 116

688. I am sure, *sure*, that he isn't pretending; but someone else isn't. Can I convince him? And if not--do I say that he can't think? (The conviction could be called "intuitive".) [Cf. *PI* II, xi, p. 227f.]

Page 116

689. Instinct comes first, reasoning second. Not until there is a language-game are there reasons.

Page 116

690. Am I saying something like, "and the soul itself is merely something about the body"? No. (I am not that hard up for categories.)

Page 116

691. You can vary the concept, but then you might change it beyond recognition.

Page 116

692. Even if we vary the concept of pretence, its inwardness must still be kept, i.e. the possibility of a confession. But we don't always have to believe a confession, and a false confession is not necessarily deception.

Page 116

693. Concepts other than though akin to ours might seem *very* queer to us; namely, a deviation from the usual in an unusual *direction*. [Z 373.]

Page 116

694. "You're all at sea!" we say, when someone doubts the genuineness of something we recognize as clearly genuine.

"You're all at sea"--but we cannot prove anything. [Cf. *PI* II, xi, p. 227g.]

695. Soulful expression in music--this cannot be recognized by rules. Why can't we imagine that it might be, by other beings? [Z 157.]

696. It would make a strange and strong impression on us were we to discover people who knew only the music of music boxes. We would perhaps expect gestures of an incomprehensible kind, to which we wouldn't know how to react.

697. "The genuineness of an expression cannot be proved." "One has to feel it." But what does one go on to do with this now? If someone says "Voilà, comment s'exprime un coeur vraiment épris", and if he

also converts someone to his viewpoint,--what are the further consequences?

In a vague way consequences can be imagined. The other one's attention gets a new direction. [Cf. *PI* II, xi, p. 228a.]

698. Can we imagine that something unprovable to us could be proved to other beings?

Or would that change its nature to the point of its being unrecognizable?

699. What is essential for us is, after all, spontaneous agreement, spontaneous sympathy.

700. 'These men would have nothing human about them.' Why?--We could not possibly make ourselves understood to them. Not even as we can to a dog. We could not find our feet with them.

And yet there surely could be such beings, who in other respects were human. [Z 390.]

701. "But no one can *know* it. One can *believe* it. Believe it with all his heart, but not know it." Then the difference is *not* to be found in the certainty of the one who is convinced.

It must be found elsewhere; in the *logic* of the question.

702. Imagine that people could observe the functioning of the nervous system in others. In that case they would have a sure way of distinguishing genuine and simulated feeling.--Or might they after all doubt in turn whether someone feels anything when these signs are present?--What they see there could at any rate readily be imagined to determine their reaction without their having any qualms about it.

And now this can be transferred to outward behaviour. [Z 557a, b.]

703. There is indeed the case where someone later reveals his inmost heart to me by a confession: but that this is so cannot offer me any explanation of outer and inner, for I have to give credence to the confession.

For confession is of course something exterior. [Z 558.]

704. Men who could see the functioning of the nerves: Do I *have* to suppose that even they could be outwitted by the 'inner'? But that means: Can't I imagine outward signs which would seem to be sufficient for making a *sure* judgment about 'the inner'?

705. But now say: "Someone could still be feeling something even if the physiological signs ran completely to the contrary." Well then anyone who is unfamiliar with *these* scruples simply has a different concept.

706. Imagine that the people of a tribe were brought up from early youth to give no expression of feeling of *any* kind. They find it childish, something to be got rid of. Let the training be severe. 'Pain' is not spoken of; especially not in the form of a conjecture "Perhaps he has got...". If anyone complains, he is ridiculed or punished. There is no such thing as the suspicion of shamming. Drilling someone to speak expressionlessly, in a monotone, to move mechanically. [Except for the last sentence: Z 383.]

707. I want to say: an education quite different from ours might also be the foundation for quite different concepts. [Z 387.]

Page 118

708. For here life would run on differently.--What interests us would not interest *them*. Here different concepts would no longer be unimaginable. In fact, this is the only way in which essentially different concepts are imaginable. [Z 388.]

Page 118

709. That the evidence makes someone else's feelings merely probable is not what matters to us; what we are looking at is the fact that *this* is taken as evidence for something; that we construct a statement on *this* involved sort of evidence, and hence that *such* evidence has a special importance in our lives and is made prominent by a concept. [Cf. Z 554.]

Page 118

710. "Shamming," these people might say, "What a ridiculous concept!" [Z 384, first sentence.]

Page 118

711. Steadfast faith (in an annunciation, for instance)--is it less certain than being convinced of a mathematical truth?--(But this makes the language-games more alike!) [*Culture and Value*, p. 73.]

Page 118

712. Might not the attitude, the behaviour, of trusting, be quite universal among a group of humans? So that a doubt about manifestations of feeling is quite foreign to them? [Z 566.]

Page 118

713. But consider: Why should a person have to be dissimulating, aren't there other possibilities? Can't he be dreaming? Can't the matter get confused along different lines? (*Couvade*.)

Page Break 119

Page 119

Just think of how often we can't say: someone is honest or dishonest, sincere or insincere. (A politician, for example.) Well-meaning or the opposite. How many foolish questions get asked here! How often *the concepts don't fit!*

Page 119

714. It is important for our considerations that there are people of whom someone feels that he will never know what's going on inside them. That he'll never understand them. [*Culture and Value*, p. 74.]

Page 119

715. We are certainly *inclined* to say that a complaint is merely a sign, a symptom of a different phenomenon, the important one, which is only empirically related to it. And even if we are mistaken here, still there must be a reason for this strong temptation, a reason within the law of the evidence we admit. †1

Page 119

716. One might raise the question: What does the law of admissible evidence have to be like for this conception to suggest itself to us?

Page 119

717. One would like to answer: the evidence would have to be fluctuating. Multifform?

Page 119

718. There is such a thing as feigned expression; but there must also be such a thing as evidence for the pretence.

Even though we often simply don't know what to say, all the same we do sometimes have to lean towards one opinion, and sometimes be quite certain.

So the outward has to be evident. †2

Page 119

719. You say you attend to a man who groans because experience has taught you that you yourself groan when you feel such-and-such. But as you don't in fact make any such inference, we can abandon the justification by analogy. [Z 537.]

Page 119

720. In philosophy it is significant that such-and-such a sentence makes no sense; but also that it sounds funny. [Z 328.]

Page 119

721. Can 'knowing one's way about' be called an experience? Surely not. But there are experiences characteristic of the condition of knowing one's way about and not knowing one's way about. (Not knowing one's way about and lying.) [Z 516.]

722. Is "I hope..." a description of a state of mind? A state of mind has duration. So if I say "I have been hoping for the whole day...", that is such a description. But suppose I say to someone: "I hope you come"--what if he asks me "For how long have you been hoping that?" Is the answer "For as long as I've been saying so"? Supposing I had some answer or other to that question, would it not be quite irrelevant to the purpose of the words "I hope you'll come"? [Z 78.]

723. A cry is not the description of a state of mind, even though a state of mind can be inferred from it. [Cf. *PI* II, ix, p. 189b, c.]

724. One doesn't shout "Help" because he observes his own state of fear.

725. 'Describing' includes 'attending'.

726. These sentences are descriptions: "I'm less afraid of him now than before", "For a long time I've been wishing...", "I keep on hoping...". (One is describing a way something has been running on.)

727. Do I want to say, then, that certain facts are favourable to the formation of certain concepts; or again unfavourable? And does experience teach us this? It is a fact of experience that human beings alter their concepts, exchange them for others when they learn new facts; when in this way what was formerly important to them becomes unimportant, and *vice versa*. (It is discovered, e.g., that what formerly counted as a difference in kind, is really *only* a difference in degree.)

((Re: discussion of the concept of colour and other things.)) [a: Z 352.]

728. If a cry is not a description, then neither is the verbal expression that replaces it. The utterances of fear, hope, wish, are not descriptions; but the sentences "I'm less afraid of him now than before", "For a long time I've been wishing ...", ... are descriptions.

729. What is the past tense of "You are coming, aren't you!"?†1 [Z 80.]

730. The tangled use of psychological words ("think", for example). As if the word "violin" referred not only to the instrument, but sometimes to the violinist, the violin part, the sound, or even the playing of the violin.

731. "If p occurs, then q occurs" might be called a conditional prediction. That is, I make *no* prediction for case not-p. But for that reason what I say also remains unverified by "not-p and not-q".

Or even: there are conditional predictions and "p implies q" is *not* one. [Z 681.]

732. I will call the sentence "If p occurs then q occurs" "S".--"S or not S" is a tautology; but is it (also) the law of excluded middle?--Or again: If I want to say that the prediction "S" may be right, wrong, or undecided, is that expressed by the sentence "not (S or not-S)"? [Z 682.]

733. The use of the words "look at", "observe". And then the use of the expression "to look at oneself"!

734. "I'm afraid of him" and "I tend to fear him". But the expression "I tend to..." could mean *several things* here. There could be a language in whose conjugations *many* more differences are taken care of than in the languages we know.

735. Difference in *purpose* between the utterance of fear "I'm afraid!", and the report of fear "I'm afraid".

736. "To know" can mean something like "to be able to" (to know by heart, e.g.), or it can mean something like "to be sure".

737. No one but a philosopher would say "I know that I have two hands"; but one may well say: "I am unable to doubt that I have two hands."

"Know", however, is not ordinarily used in this sense. [a: Z 405; b: Z 406, first sentence.]

FOOTNOTES

- †1 Cf. *Notebooks* 12.9.1916. (*Eds.*)
- Page 9
- †1 The typescript contains no figure. We have taken it from the corresponding manuscript. (*Eds.*)
- Page 9
- †2 Ibid. (*Eds.*)
- Page 15
- †1 Wittgenstein crossed out the word "understanding" in the MS. and replaced it with "imaging". In *Zettel* too the pair of words is "seeing"--"imaging". (*Eds.*)
- Page 16
- †1 This remark is also numbered 83. We have corrected the numbering. (*Eds.*)
- Page 18
- †1 Cf. *Philosophical Investigations* I, §§350-351. (*Eds.*)
- Page 19
- †1 Var. "But even if the curtain over there obeyed my will, so that it moved or disappeared".
- Page 20
- †1 Var. "In the above case the assertion that that conditional sentence is true, or false, should not amount to the assertion that p will occur."
- Page 21
- †1 Var. "the picture before the inner eye".
- Page 23
- †1 Var. "For me, what is on this screen now represents this."
- Page 26
- †1 In the typescript, "chase". In the MS, "check-mate". This seems to be more natural here. (*Eds.*)
- Page 26
- †2 In the typescript, "chasing", in the MS "check-mating". (*Eds.*)
- Page 27
- †1 Var. "as when following nature."
- Page 29
- †1 Var. "the mouth". Cf. *PI* I, 583.
- Page 34
- †1 Var. "not as a natural sound, but rather to communicate something, as a report".
- Page 36
- †1 Var. "And how is one to decide how exact the analogy must be for us to have the right to use the concept 'thinking' with these people, a concept which has its home in *our* life?"
- Page 38
- †1 Var. "could not be deduced from".
- Page 39
- †1 *Philosophical Investigations* I, §2.
- Page 40
- †1 Var. "He just learns the use of the word *under particular circumstances*."
- Page 41
- †1 In the typescript, as well as in the manuscript, this is given erroneously as "Barnard". Cf. *PI* I, 342. (*Eds.*)
- Page 42
- †1 We have taken the drawing from the MS. (*Eds.*)
- Page 45
- †1 Var. "make sense".
- Page 46
- †1 Manuscript: "animated conversation". (*Eds.*)
- Page 47
- †1 Var. "guesses".
- Page 47
- †2 Var. "which often illustrate it, as it were, are not the intention itself."
- Page 48
- †1 At this point the MS has: "Schubert is my name, Schubert I am." (*Eds.*)
- Page 66
- †1 At this point there is no letter in the typescript. We have taken the figure from the MS. (*Eds.*)
- Page 67

†1 In the MS, "Imagine". (*Eds.*)

Page 68

†1 The manuscript has "indications". (*Eds.*)

Page 71

†1 There is no figure in the typescript. We have copied this figure from the manuscript. (*Eds.*)

Page 73

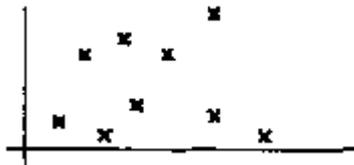

†1 In the MS there is a drawing at this point:

(*Eds.*)

Page 73

†2 In the MS there is a drawing at this point:

(*Eds.*)

Page 74

†1 There is no drawing in the typescript. We have copied the drawing from the manuscript. (*Eds.*)

Page 78

†1 Perhaps as an error, the typescript has: "It is obvious at a picture". (*Eds.*)

Page 83

†1 There is no letter at this point in the typescript. We have taken it from the manuscript. (*Eds.*)

Page 85

†1 Var. "But still this expression tells you '*what happened*' only if you are at home in the special conceptual world that belongs to these situations (and this holds for the speaker too)."

Page 88

†1 There is no picture in the typescript. We have taken it from the manuscript. (*Eds.*)

Page 92

†1 We have copied the letter following the manuscript. (*Eds.*)

Page 92

†2 In the MS: "See  as  "? (*Eds.*)

Page 95

†1 Here there is no symbol in the typescript. We have taken it from the manuscript. (*Eds.*)

Page 108

†1 Var. "are not more important for our reaction than...".

Page 119

†1 Var. "still the reason for this mistake must be within the law of evidence that we admit."/"still the mistake must have a reason, and that in the nature of the evidence which we admit."

Page 119

†2 In the MS: "evidence". (*Eds.*)

Page 120

†1 Var. "You will come, won't you!"

EDITORS' PREFACE

Page iv

Unlike the two volumes of Wittgenstein's *Remarks on the Philosophy of Psychology* (*RPP*), these two volumes of last writings on the philosophy of psychology are not based on typescripts. (Cf. the Preface to volume I of *RPP*.) Their subject matter, however, is by and large the same.

Page iv

The first of these volumes consists of writings dating from the period between 22 October 1948 and 22 March 1949, except for the last remark, which is dated 20 May. This material is a continuation of the manuscript writings on which the typescript for volume II of *RPP* is based. So far as is known, Wittgenstein did not prepare a typescript for this material. In the spring of 1949, however, he probably made a handwritten clean copy of a selection of all of his remarks written between 1946 and 1949 concerning topics in the philosophy of psychology (MS 144), and then prepared a typescript on the basis of this new manuscript. This was the typescript for Part II of the *Philosophical Investigations*. (Unfortunately, it was lost after the book was printed.) More than half of the remarks in this typescript--and therefore also in the second part of the *Philosophical Investigations*--are taken from the manuscripts written between October 1948 and March 1949. These manuscripts, the second half of MS 137 and MS 138, appear here in their totality, with the exception of a sizeable number of remarks of a general nature which have almost all been printed in *Culture and Value*. For the most part, those remarks of a general nature had been clearly separated by parallel lines || from the remainder of the text by Wittgenstein himself.

Page iv

Since the text published in this first volume of late writings is based directly on the manuscripts and not on a typescript prepared by the author on the basis of manuscripts, it is of a more provisional and improvised nature than the *Remarks on the Philosophy of Psychology*. (For this reason we did not want to publish it as the third volume of those *Remarks*.) There are frequent repetitions; sometimes a whole remark will reappear, virtually word for word. If Wittgenstein had ever dictated a typescript based on these manuscripts, he would certainly have avoided such repetitions and would also have made many other changes. The number of variants too is much larger than in the typescripts upon which *RPP* is based. In general, the editors have ventured to make a choice between the variants; when we were not sure we quoted the variant(s) in a footnote.

Page iv

A reminder to the reader: words in angle brackets < > in the text are editorial additions. The numbering of the remarks and most footnotes as well as the cross-references to Wittgenstein's published works have also been added by the editors. These cross-references

Page Break v

are given in square brackets. Occasional footnotes added by the translator are identified by (*Tr*).

Page v

We would like to thank Dr Joachim Schulte as well as the two translators, Professor C. G. Luckhardt and Professor Maximilian A. E. Aue, for their valuable advice and suggestions which greatly aided us in preparing a correct text.

Preliminary Studies for Part II of *Philosophical Investigations* MSS 137-138 (1948-1949)

Page 1

Page Break 2

Page 2

1. A language in which there is a word "to frightle oneself"; meaning: to torture oneself with fearful thoughts. And

then you might suppose, for example, that this verb had no first person present. The English "I am ... ing".

Page 2

2. If I tell someone "I hope you'll come", is it less urgent if my hoping lasted only for 30 seconds than if it had lasted 2 minutes?

"I'm happy that you brought it off!"--"How long have you been happy?" A peculiar question. But it might make sense. The answer might be: "Whenever I think about it", or "At first I wasn't happy about it, but then I was" or "I keep on thinking about it and being happy" or "It only occurs to me every once in a while, but when it does, I'm happy", etc. One also says "It's a source of continual happiness to me", and "For a second I was happy about his bad luck".

Page 2

3. "I'm moving my bishop."--"How long are you moving it?"

Page 2

4. Think about this as an example of the propositional form "If p, then q": "If he comes, I'll tell him." Now if he *doesn't* come--have I kept my promise?--have I broken it?--

But can one say that that proposition asserts a 'connection'? Would I answer "This doesn't *have* to be the case"? It's not as if the sentence had been: "If *these* two get together there will be a brawl." Here one could answer that way.

Page 2

5. But suppose it was the material implication that was being asserted (and the case does exist!)--can I also respond to " $p \supset q$ " by saying "It doesn't have to be the case"? And what does that mean here?

Page 2

6. "If the two terminals approach each other a spark jumps across."--What is taken as a verification of this proposition? The observation that they never approach each other?--Can what we want to say here be expressed by material implication? Certainly not; but maybe by 'formal' implication? That's just as wrong.--What we want to state is a kind of natural law; it is easy enough to imagine the kind of observation that leads to this. One has observed *that* a spark jumps across every time they approach each other.--Is the proposition perhaps of the type " $(x).\phi x \supset \psi x:(\exists x).\phi x$ "? If not, then *this* proposition must itself have an application, even if it isn't the same one.

Page Break 3

Page 3

7. "If he comes I'll tell him..." is a *resolution*, a *promise*. If it is not to be a false promise it must not rest on the certainty that he won't come. It is neither a material nor a formal implication.

Page 3

8. In a conditional prediction in science one could distinguish between *justification* and *correctness*. One could call it "justified" if it follows, results from, a theory that has such-and-such grounds. So if the first part of the sentence isn't true, one can then say: *Had* it been true, then... *would* have.... But the fact that the first part did not turn out to be true doesn't give me the right to say that.

Page 3

9. Does a proposition such as "All bodies move..." (Law of Inertia) have to be expressed in the form "if-then"? "If something is a body then it moves----."--Or does it have to be expressed: "There are bodies; and if something is a body, then..."? (Nobody would think of putting it that way.)

Page 3

10. Obviously we could have *one* concept of fear to be applied only to animals, and the word for that concept wouldn't have a first person.

The third person would be used quite like the third person of "to fear".

Page 3

11. Remember that the subjunctive makes no sense except in a conditional sentence. If someone says "I *would* have won this game", he will be asked: "If -- ?"

Page 3

12. [Ref. 'to fear', etc.] Nothing is more difficult than to look at concepts without prejudice. For prejudice is a kind of understanding. And to forego it, when it is so full of consequences for us, --.

Page 3

13. The English "I'm furious" is not an expression of self-observation. Similarly in German "Ich bin wütend"; but not "Ich bin zornig". ("Terribly doth the rage within my bosom turn...". It is a trembling of rage.)

Page 3

14. We ask "What does 'I am frightened' really mean? What am I thinking when I say it?" And, of course, we find no answer, or only one that is obviously inadequate.

The question is: "In what sort of context does it occur?" [Cf. *Philosophical Investigations* II, ix, p. 188b]

Page Break 4

Page 4

15. One could also say with a certain amount of justification: "I simply say it." For this just means: Don't worry about something accompanying speech.

Page 4

16. Now can't the utterance appear in various connections? which first give it one face, then another?

Page 4

17. I say "I am afraid...", someone else asks me "What did you want to say when you said that? Was it like an exclamation; or were you alluding to your state within the past few hours; did you simply want to tell me something?" Can I always give him a clear answer? Can I never give him one?--Sometimes I shall have to say: "I was thinking about how I spent the day today and I shook my head, vexed with myself, as it were"--but other times: "It meant: Oh, God! If I just weren't so afraid!"--Or: "It was just a cry of fear"--or: "I wanted you to know how I feel." Sometimes the utterance is really followed by such explanations. But they can't *always* be given. [Up to "Sometimes I shall have to say", cf. *PI* II, ix, p. 187g]

Page 4

18. It would be possible to imagine people who as it were thought much more definitely than we, and used a number of different words, now one, now another. [Cf. *PI* II, ix, p. 188a]

Page 4

19. Nothing is more important for teaching us to understand the concepts we have than constructing fictitious ones. [*Culture and Value (C & V)*, p. 74]

Page 4

20. "What is fear?"--"Well, the *manifestations* and occasions of fear are as follows: - - -"--"What does 'to be afraid' mean?"--"The expression 'to be afraid' is used in *this* way: - - -'.

"Is 'I am afraid - - -' therefore a description of my state?" It can be used in such a connection and with such an intention. But if, for example, I simply want to tell someone about my apprehension, then it is not that kind of description.

Page 4

21. "I'm afraid" can, for instance, be said just as an explanation of the way I'm behaving. In that case it's far from being a groan; it can even be said with a smile.

Page Break 5

Page 5

22. We ask, "What does 'I am frightened' really mean, what am I referring to when I say it?" And, of course, we find no answer, or one that is inadequate.

The question is: "In what sort of context does it occur?" [*PI* II, ix, p. 188b; cf. remark 14]

Page 5

23. One can find no answer if one tries to settle the question "What am I referring to", "What am I thinking when I say it", etc. by pronouncing the words and at the same time attending to myself, as it were observing my soul out of the corner of my eye. In an actual case I can indeed ask: "Why did I say that, what did I mean by it?" and I might answer the question too, but not on the ground of observing what accompanied the speaking. And my answer would supplement, paraphrase, the earlier utterance. [*PI* II, ix, p. 188c]

Page 5

24. What is fear? What does "being afraid" mean? If I wanted to define it at a *single* showing--I should *play-act* fear. [*PI* II, ix, p. 188d]

Page 5

25. Could I also represent hope in this way? Hardly. And what about belief? [*PI* II, ix, p. 188e]

Page 5

26. "I believe he will come."

"I tell myself time and time again: 'He will come'." For the latter, people might have a separate verb.

Page 5

27. Describing my state of mind (of fear, say) is something I do in a very particular context. (Just as it takes a particular context to make a certain action into an experiment.)

Is it, then, so surprising that I use the same expression in different games? And sometimes as it were between the games?

"I thought of him" and "I thought about him" surely mean very different things. [a, b: *PI* II, ix, p. 188f]

Page 5

28. And do I always talk with very definite purpose?--And is what I say meaningless because I don't? [*PI II*, ix, p. 188g]

Page 5

29. <In English> "Now you mention it: I think he'll come."

"Now I think you're right: he will come."

"No. I'm convinced: he will come." One can think up a

Page Break 6

characteristic context for all such expressions.

Page 6

30. What is necessary in order for one to be describing a mental state?--Or might I ask: What is necessary in order for one to be *trying* to describe a mental state?

Page 6

31. One might also ask: "What must then be important to me?"

Page 6

32. "I wanted to describe my mental state to you"--as opposed, perhaps, to: "I merely wanted to vent my feelings". I wanted him to know 'how I am feeling'. (In this context one often speaks of the duration of the state.)

Page 6

33. For surely it is one thing quietly to *confess* one's fear--and quite another to *give expression* to it unabashedly. The words can be the same, but the tone and the gestures different.

Page 6

34. When it is said in a funeral oration "We mourn our...", this is surely supposed to be an expression of mourning; not to tell anything to those who are present. But in a different setting these words are an announcement. In a *prayer* at the grave they could also *in a way* be used to tell someone something. [*PI II*, ix, p. 189a]

Page 6

35. We surely do not always say someone is *complaining* because he says he is in pain. So the words "I'm in pain" may be a cry of complaint, and may be something else. (Something similar holds for expressions of fear and other emotions.) [*PI II*, ix, p. 189d]

Page 6

36. But if "I'm afraid" is not always like a cry of complaint, and yet sometimes is, then why should it *always* be a description of my state of mind?†1 [*PI II*, ix, p. 189e]

Page 6

37. For how does the complaint "I'm in pain" differ from the mere announcement? By its intent, of course. And possibly that will also come out in the tone.

Page 6

38. The contexts of a sentence are best portrayed in a play. Therefore the best example for a sentence with a particular meaning

Page Break 7

is a quotation from a play. And whoever asks a person in a play what he's experiencing when he's speaking?

Page 7

39. "I must tell you--I'm frightened."

"I must tell you--it makes me shiver."

And one can say this in a *smiling* tone of voice too.

And do you mean to tell me he doesn't feel it? How else does he *know* it?--But even if it is a piece of information, he doesn't read this off from within. For he couldn't cite his *sensations* as proof of his statement. *They* don't teach him this. [*PI II*, i, p. 174e]

Page 7

40. For think of the sensations produced by gestures of shuddering: the words "it makes me shiver" are themselves such a gesture, and if I hear and feel them being expressed, that belongs among the rest of these sensations. Now why should the wordless shudder be the ground of the verbal one? [*PI II*, i, p. 174f]

Page 7

41. We learn to use the word "think" *under particular circumstances*.

If the circumstances are different we don't know how to use it. But this does not mean that we have to be able to describe those circumstances. [a: cf. *Zettel (Z)* 114; b: cf. *Z* 115]

42. "If people differed strongly in their statements about colour they couldn't use our concept of colour."--If people differed strongly in their statements about colour then just because of this they wouldn't be using *our concept of colour*.

They wouldn't be playing our language-game: For just think how theirs and ours would have to be compared!

43. So, if I hear someone say "I am afraid", how can I find out whether this is the 'description of a state of mind' (or some such thing)? Should I ask him, and is it certain that he will understand the question?--But he could surely answer it. How? *This* way, for example: "No, I was just letting off steam", or "Yes, I want you to know how I feel".

But such a question will almost never be asked. Isn't this because the tone and the context necessarily give us the answer? For from these we will deduce whether he is making fun of his own fear, perhaps, or whether he is discovering it in himself, so to speak, or whether he is confessing it to us reluctantly, but for the sake of candour, or whether he is uttering it like a scream, etc.--And don't

the words, no matter how they are uttered, give me information about the same state of affairs, namely, his state of mind?

44. Does the sentence "Napoleon was crowned in the year 1804" really have a different meaning depending on whether I say it to somebody as a piece of information, or in a history test to show what I know, or etc., etc.? In order to understand it, the meanings of its words must be explained to me in the same way for each of these purposes. And if the meaning of the words and the way they're put together constitute the meaning of the sentence, then - - -.

45. But here is the problem: A cry, which cannot be called a description, which is more primitive than any description, for all that serves as a description of the inner state. [PI II, ix, p. 189b]

46. That someone can scream doesn't mean that he can tell somebody something in a conversation.

47. I hear the words "I am afraid". I ask: "In what connection did you say that? Was it a sigh from the bottom of your heart, was it a confession, was it self-observation,...?"

48. Does someone crying out "Help!" want to describe how he is feeling?

Nothing is further from his intentions than describing something.

49. But there are transitions from what we would not call a description to what we would.

50. The phrase "description of a state of mind" characterizes a certain *game*. And if I just hear the words "I am afraid" I might be able to *guess* which game is being played here (say on the basis of the tone), but I won't really know it until I am aware of the context.

51. For one or another of a class of features goes with what we call "describing". Observing, considering, remembering behaviour, a striving for accuracy, the ability to correct oneself, comparing.

A cry is not a description. But there are transitions. And the words "I am afraid" may approximate more, or less, to being a cry. They may come quite close to this and also be *far* removed from it. [b: PI II, ix, p. 189c]

52. If a sensitive ear shows me when I am playing this game that I have now *this*, now *that* experience of the word "switch"--doesn't it also show me that often I do not experience that word itself in the context of a whole sentence which I understand and in some sense experience? [Cf. PI II, xi, pp. 215h-216a]

53. "The meaning of the word stood before my soul."--Will we say that if the word appears in an unambiguous setting?

54. A kind of writing†1 in which the crossed-out word, the crossed-out sentence, is a sign.

Page 9

55. You assured me that you experienced the word as 'meant' in the particular way you just now uttered it: Then tell me also, with the same finely tuned sensitivity, whether in its proper context you 'mean it *that way*', *in that sense*. For it is clear that in another sense you mean it, intend it, and later on even explain it *this way*, and not *that*. [Last sentence: cf. *PI* II, xi, p. 216a]

Page 9

56. But the question now remains why, in connection with this *game* of meaning, we also speak of '*meaning* it'.--This is a different kind of question. It is part of the phenomenon of the game that in *this* situation we use the word "meaning".†2 [Cf. *PI* II, xi, p. 216b]

Page 9

57. Then is it a misunderstanding?

Now I am not using the word *for* something else; rather I am using it in a different situation. [Just as I am not using "know" to refer to two different things when I say "In my dream I knew". Cf. also: feeling of unreality.] In that case should I be taught the technique of its use in a different way?

Page 9

58. Suppose I hear one of Beethoven's works and I say "Beethoven!"--Does the word have a different meaning here than in the sentence "Beethoven was born in Bonn in 1770"? (The tone of the

Page Break 10

exclamation could be explained to someone who didn't understand it by saying: "Only Beethoven writes†1 like that".)

Page 10

59. Would it be more correct to say that yellow 'corresponds' to *e* then "*e* is yellow"? Isn't the point of the game precisely that we express ourselves by saying *e* is yellow?

Indeed, if someone were *inclined* to say that *e* 'corresponds' to yellow and not that it is yellow, wouldn't he be almost as different from the other as someone for whom vowels and colours are not connected? And similarly for the experience of meaning.†2

Page 10

60. Suppose I am learning a language and want to impress upon myself the double meaning of the word "bank", and so I alternately look at a picture of a river bank†3 and then a money bank, and in each case say "bank", or "That is a bank"--would the 'experience of meaning' then be taking place? Certainly not there, I'm inclined to say. But if the inflection of voice, for example, seems to me to determine whether I mean one thing or the other--then I would be experiencing meaning.

Page 10

61. It isn't as if we were obstinately referring to two things with the same word and then were asked: Why are you doing this, if *in reality* they are different?--The new use consists in applying the old expression in a new situation; it is not to designate something new.

Page 10

62. The experience of the 'word that hits the mark'. Is this the same as the experience of 'meaning'?

Page 10

63. "Why in a dream do we call *this* 'knowing'?"--We don't call anything 'knowing' in a dream; rather we say "In my dream I knew..."

Why do we call this "meaning" and "signifying" if it is not a question of meaning and signifying?--What do I call 'meaning' (or 'signifying') in this game: I say "By that word I just now meant..."

But what am I calling that?--An experience? And what experience?

For can I describe it otherwise than just by the expression: I 'mean' this word in *this way*?

Page Break 11

Page 11

64. Therefore I can't say that I'm simply giving the same name to two related things. (Otherwise the problem would never have arisen.)

Page 11

65. "Why are we talking about 'meaning' in relation to that game?"--What am I asking for? A reason, a cause?--Certainly not for a consideration which leads me to speak that way; nor for a justification; for such things

are not in question.

Page 11

66. Call it a dream!†1 [Cf. *PI* II, xi, p. 216b]

Page 11

67. But the question remains: why in the *game* of 'meaning' does a person use the same word?--Can he use a different one? Does he use the same word *for* something different? Could he give another explanation of it?

Page 11

68. Call it a dream. It does not change anything. [*PI* II, xi, p. 216b]

Page 11

69. "Schubert"--It's as if the name were an adjective.

Neither can one say: "Look at all the things that '*fit*'. For example, the name fits the bearer."†2

An addition, after all, would be an extension; and an extension is just what is *not* found here. For one doesn't say that something is a '*fit*' if *actually* it is no fit at all. As *if* one were merely expanding the concept. Rather we are dealing here more or less with an *illusion*, a mirage. We think we see something that isn't there. But this is true only *more or less*.--We know very well that the name "Schubert" does not stand in a relationship of fitting to its bearer and to Schubert's works; and yet we are under a compulsion to express ourselves in this way.†3 [Cf. *PI* II, xi, p. 215f]

Page 11

70. We see something according to the picture, the concept, of fitting.

To be sure, I can regard one thing as a variation of another. And in an extreme case what I see *as* a variation may no longer have any

Page Break 12

similarity at all to the thing of which I am seeing it as a variation.--To rephrase: First, *this* figure is a simple projection of *that* one. Then the lines of projection are curved a bit; but to me it's still a projection. Finally they are bent to the point of being unrecognizable, but I still see a projection. (Just as some continue to see an old man as the young one, the one who has changed completely as what he used to be.)

Maybe it is strange to bring into this context the case of a person's name. But a connection can be drawn. Namely this: a person's name is *seen* as a portrait.

Page 12

71. Suppose that I see a triangle as a square, by seeing it as the end of this kind of transformation:

--Then the kind of varying is part of the aspect that is seen. But this is just not the case when a name seems to us to be the portrait of its bearer.

Page 12

72. I say something (for example, "The name 'Schubert' really does fit Schubert perfectly")--it means nothing.†1

Page 12

73. In the sense in which we are using it, the sentence "The name... fits..." doesn't tell us anything about the name or its bearer. It is a pathological statement about the speaker.--One doesn't teach a child that this name fits the bearer.

Page 12

74. Someone waves (to me) with his hand. "What did you want?"--"I wanted you to come."

That is his intention when he waves.

The sign was the source of a movement. So wasn't it also the source of the explanation? Could this explanation itself *go*: "Waving my hand was the source of the explanation which I shall now give you: Come to me"?

Page 12

75. One cannot say here "It [the name] doesn't *fit* exactly", or "It doesn't seem to *fit* exactly".

It's not as if "fit" were not *exactly* the right word.

To be sure, we could use other words too; for example, "There is a kinship".

Page 12

76. "What is always associated is easily taken as akin." Is *that* the right expression? Not quite. But it is as if they were akin.

This is not the way it is: "I take them for kin even though they are not"--for all I have to do is to wake up, as it were, in order to know that they are not. But I see them pictured as akin.

Page Break 13

I use the word, the picture.

Of course, one can explain: Fitting together and association frequently go together; and thence the illusion (if one is to call it an illusion).

77. I imagine that a physiological explanation of this strange phenomenon has been found. Now we see how the illusion came about. For then what sometimes occurs in the brain is the same thing that occurs when.... Joyous excitement: Now we understand why everybody always said...! And when the explanation has been given, when the riddle has been solved†1--where does that leave us? It has only cleared up a question we weren't interested in, and we are left with the fact that we use that expression, that picture, or want to use it, when the normal occasion for its use is lacking.

78. But then the question remains why we also talk about the act of 'meaning' in that *game* of meaning a thing. This question doesn't belong here at all. We use the word here because it has *this* meaning. No other word, no other meaning, would do for us. The fact has to be accepted.†2

79. But is the word now being used in two senses? No. (Otherwise we would owe an explanation.) Does one teach its usage in two different ways?

80. But isn't an explanation of this strange phenomenon of interest to us, after all?

Think of other, related phenomena and what their explanation accomplishes. Yes, it is certainly interesting to understand *why*, while taking this walk, I am under the impression that the city must lie over *there*; even though a moment's reflection can convince me that it is not so. Now I shall assume that I know how the illusion came about: The similarities between this landscape and another led me to draw the wrong conclusions, etc.--But I hadn't explicitly drawn the wrong conclusion, and furthermore this doesn't explain why these similarities led me to draw this precipitous conclusion. The explanation leaves the oddity untouched. (The same holds for the phenomenon of seeing sounds as colours, etc.)

81. If someone answers the question "Will N. return?" time after time in the affirmative, this can be expressed by saying he is in a *state* of thinking it is so. But no one will say that the answer "N. will return" describes the state of the speaker.

82. If "I believe p" states that I am in a certain state, then so does the assertion " $\vdash p$ ".

For the presence of the words "I believe" can't do it, can at the most hint at it. [Cf. *PI* II, x, p. 191d]

83. Imagine a language in which "I believe that p" is expressed only by means of the tone of the assertion " $\vdash p$ ". They say, not "He believes" but "He is inclined to say..." and there exists also the hypothetical "Suppose I were inclined to say...", but not the expression "I am inclined to say...". [*PI* II, x, p. 191e]

84. After all there are anomalies in other cases. We say "Maybe it will rain", but not: "Supposing that maybe it will rain, ..."

85. Moore's Paradox wouldn't exist in that language; instead of it, there would be a verb that has no first person present. [*PI* II, x, p. 191e]

86. But this ought not to surprise us. Think of the fact that one can predict one's own future action by an expression of intention. [*PI* II, x, p. 191e]

87. Think of the expression "I say..."--for example, "I say it will rain today", which simply comes to the same thing as the assertion "It will... today". "He says it will..." means approximately "He believes it will...". "Suppose I say..." does *not* mean "Suppose it will... today". [*PI* II, x, p. 192f]

88. Different concepts touch here and coincide over a stretch. But you need not think that all lines are *circles*.

[*PI* II, x, p. 192g. No figure in *PI*]

Page 14

89. Just because someone sees something according to a certain interpretation, that doesn't mean that he experiences an interpretation.

Page Break 15

Page 15

90. Anyone who thinks knows how notes or pictures which would be meaningless to someone else and which one can't even explain to oneself, can stand for thoughts, or individual features of thoughts.†1 (The notation of a calculating prodigy.)

Page 15

91. "Did you mean *this* when you said the word?"--"No, I was thinking of something else when I said that."--Is that an experience? No. An experience would not be of the same interest. An experience might perhaps inform the psychologist about the *unconscious* intention.†2 [Cf. *PI* II, xi, p. 217d]

Page 15

92. That is: If I were to find out, for instance, that when he was uttering the word he saw this or that in his mind's eye, then it might be possible for me to infer something about a tendency in his subconscious mind--whatever was in his mind was not his intention when he was uttering the word, his thought accompanying the word.

Page 15

93. "This plant grows from a germ, and not that plant." Imagine that people really expressed themselves in that way in some language!

Page 15

94. But what is the germ?--The experience at the time of speaking. (Thus, for instance, an image--such as frequently exists.) But really, according to its nature, it isn't the germ at all. Nor does something become a germ because of the later development. What remains then, is that the image of the germ forces itself upon us. (Quite naturally so; for we want to see the kernel of the matter in the experience.)

Page 15

95. The question which must interest us is therefore: What is the reference to the moment of speaking for? What does it tell us?†3

Page 15

96. "I imagined you would think of him then." This wasn't contained in the image he had in his mind (for that couldn't be known exactly), nor was it because of the name which he repeated to himself (it could have been someone else's as well). It was the chain of interpretations, of explanations.

For when he says "At that point I was thinking of...", "By this I

Page Break 16

Page 16

meant...", he is *thereby* making the connection with that point of time.

(So he doesn't remember a mental picture, for instance, which he had in his mind and which now shows him that he thought of....)

Page 16

97. He doesn't read off what he was thinking of from the mental picture.

Page 16

98. It said something and at that point I had to think of N. When did N. occur to me? At what moment, during which of his words?--And even if I know which word--what happened to me when it was spoken?

The thoughts began with the word. That's where the train began. But what makes them into a train? The fact that I say so?

Page 16

99. "I noticed that when this word was said, you turned pensive."

Page 16

100. "As I heard that word he occurred to me." What is the practical significance of this point of time?--For I want to say; "*It seemed to me* that he occurred to me at that word"--and the subjective element of this statement makes no difference. The question still remains the same: "What consequences does such a report have?"

Page 16

101. "When this word was spoken I thought of him." How is this report interesting? What primitive reaction corresponds to such words?

Page 16

102. "À propos..."

"What made you suddenly think of him?"--"You said... and that reminded me of him."

Page 16

103. When do we say, I am writing to *this* person? How does this manifest itself? How do I know it myself?!--Am I writing to *him* while I'm writing?

Page 16

104. It would almost be strange to say: "I thought of him while I was writing to him."

Page 16

105. "We were just talking about *him*", about this man I am now pointing to. How did the conversation relate to him? Didn't I create the connection with these very words?

Page Break 17

Page 17

106. "I knew who you were talking about."--How could I know it? And what kind of mental state *was* the 'knowledge that the conversation was about *this* man'?

Page 17

107. "Who were you talking about?"--"About N."--"About my friend N."--"About the person in this photograph."--"About the person who is just coming through the door."

Page 17

108. If God looked into our minds he would not have been able to see there who we were speaking of. [*PI* II, xi, p. 217f]

Page 17

109. In philosophy one must distinguish between propositions that express our mental inclination, and those that *solve* the problem.

Page 17

110. The incurable illness is the rule, not the exception.

Page 17

111. In saying this you refer to the time of speaking. It makes a difference whether you refer to this time or that. (The explanation of a word does not refer to a point of time.)
What makes you want to say that? (Why is this question important?) [a, b: *PI* II, xi, p. 217h]

Page 17

112. "Why did you look at me at that word; were you thinking of...?"

So there is a reaction at a certain moment, and "I thought of..." explains the reaction. [Cf. *PI* II, xi, p. 217g]

Page 17

113. "At that word we both thought of him."

Let us assume that each of us said the same words to himself--and how can it mean MORE than that?

But wouldn't even those words be only a *germ*? They must surely belong to a language and to a context, in order really to be the expression of the thought of him. [*PI* II, xi, p. 217e]

Page 17

114. For sometimes a word actually gets uttered in the midst of a silent train of thought. And this could be reported. Just as in general one can report that at the time he was quietly thinking of this or that. Whatever interest there is in *this* report, there must also be in that one; and therefore also in the report that he thought of... when he heard the word....

Page 17

115. "Then I thought: I wonder whether he'll come--."

Page Break 18

Page 18

"You wore such a doubtful expression; what were you thinking?"--"I was thinking: I wonder whether he'll come--". ----"Did you then speak these words, or ones like them, to yourself?"--"No. Strangely enough I was thinking of the Piccolomini,†1 of the scene in which...".

Page 18

116. In important ways, speaking in one's imagination cannot be compared to speaking, but our language-games

with the two are similar. (Tennis with a ball and tennis without one.) In those games too some mental picture plays the role of a real one, which also can exist in *connection* with sentences and explanations.

Page 18

117. That is: Our language-game refers to a mental picture more or less in the same way as it does to a spoken sentence. For the latter too is only a sequence of sounds and by itself refers to nothing at all.

Page 18

118. Now the question arises: When a word occurs in a certain context, I can create a different context for it in my mind--but if I don't do that, if nothing out of the ordinary happens, then does my thinking run alongside my speech?

Page 18

119. Even if my thinking sometimes deviates from the path of speech, still it normally follows that path.

Page 18

120. If everything goes normally, no one thinks of the inner event which accompanies speech.

Page 18

121. Philosophy is not a description of language usage, and yet one can learn it by constantly attending to all the expressions of life in the language.

Page 18

122. Knowing, believing, hoping, fearing (among others) are such very diverse concepts that classifying them, or pigeonholing them, is useless to us. But we do want to recognize the differences and similarities among them.

Page 18

123. Compare: "When you spoke about N. I thought you meant..." and "When you spoke about N. I knew that you meant...".

Page Break 19

Page 19

Is a particular experience associated with the latter? Then why with the former?

Page 19

124. The expression: "... passed through my mind."

"When I was reading, the conversation we had yesterday passed through my mind." Does what I read also pass through my mind when I read attentively?

Page 19

125. "No, when I said 'bank' the river bank flashed through my mind."--Would I also say that the money bank had 'passed through my mind' if everything had happened normally?

Page 19

126. Suppose that someone were to tell us, right after everything he says, what went on in his mind when he was saying it. (It's a habit.) Would that interest us in every case?

Page 19

127. "When I said 'bank' naturally I meant the bank where you get money." Did an experience of meaning have to accompany the word? (Nonsense!)--Why does this have to be so if--against the grain of the context--I was thinking about the river bank?

Page 19

128. "I have already remembered three times today that I must write to him." Of what importance is it what happened then?!--On the other hand what is the importance, what the interest, of the statement itself?

It permits certain conclusions. [Cf. *PI* II, xi, pp. 217j-218a]

Page 19

129. "I hadn't forgotten about it completely; I remembered it three times today."--"Yes, I know: you flinched as I was speaking of...."--Light is shed on this state of mind, and it has certain consequences. Different ones from those resulting, for example, from this state of affairs: "It had *completely* slipped my mind; I didn't think about it any more."

Page 19

130. At that word I went in *this* direction. (It is as if one were supplying the tangent at this point on the curve.)

But that again is merely an image. (As when tennis without a ball is described in terms of tennis with a ball.)

Page 19

131. The language-game "I mean (or meant) *this*" (subsequent explanation of a word) is quite different from the language

Page Break 20

game: "I thought of... as I said it". The latter is akin to: "It reminded me of...". [PI II, xi, p. 217i]

Page 20

132. In these cases a characteristic reaction can occur *at the time of* meaning, remembering, or reminding.

Page 20

133. What is the primitive reaction with which the language-game begins, which then can be translated into words such as "When this word occurred I thought of..."? †1 How do people get to use these words? [Cf. PI II, xi, p. 218b]

Page 20

134. "You said the word as if something different had suddenly occurred to you as you were saying it." One doesn't learn this reaction.

The primitive reaction could also be a verbal reaction.

Page 20

135. Suppose I'm talking with someone about Dr N. In the middle of the conversation I say "When the name 'N' came up just now I thought of Dr N."--the person I'm talking to won't understand me.

If I had said "When I said 'N' just now I meant Dr N., who...", the response might have been: "Of course, who else could you have meant!"

If I had said "When the name 'N' came up, I could just see Dr N. in front of me", that might well have been beside the point.

Page 20

136. "At the mention of the word I thought of..."--If the person who said this were asked what was then going on inside him, and he couldn't answer *anything*--was his statement invalid?--He could have answered "I forgot it", and *he only thought* that he ever knew.

Page 20

137. Is "In using the sign I wanted to let you know..." comparable to: "When I opened my mouth just now, I wanted to say..."? That is: Is the former sentence therefore not so much a definition as the expression of a past intention?

Page 20

138. "Why did you look at me?"--"By this sign I wanted to give you to understand that you..." This does not express a symbolic convention (no agreement); rather, it expresses the purpose of my action. To be sure, I was able to use a sign which was agreed on for that purpose. [Cf. PI II, xi, p. 218c]

Page 20

139. "This number is the right continuation of this series." With these words I may bring it about that for the future someone calls

Page Break 21

such-and-such the "right continuation". What 'such-and-such' is I can only show in examples.--That is, I teach him to form a series (basic series) without using any expression of the law of the series; rather as a substratum of the use of algebraic rules, or what is like them. †1 [Z 300]

Page 21

140. Now, to be sure, in teaching someone the basic series, I can use the word "equal" which perhaps he already knows from other contexts, that is, with a different, though related, meaning. And it may be that he learns how to construct the basic series more easily if I tell him "You must continue to do that, always adding one", thus stating a rule; but here it doesn't (yet) function as a rule, and so far there is no algebra.

Page 21

141. If there were a verb meaning: to believe falsely, it would not have any first person present indicative. [PI II, x, p. 190g]

Page 21

142. "I believe he'll come, but he certainly won't come." If I say that to someone, it tells him that he won't come but that nevertheless I am thoroughly convinced of the opposite, and will act according to this belief. However, by the very fact that I am reporting to someone else that he won't come, I am not acting according to this belief.

Page 21

143. "I firmly believe he'll come, but he certainly won't come."

Why do we tell somebody that we believe something? In order to convince him of what we believe, or only to inform him of our behaviour with respect to the matter?

Page 21

144. Observe: "He won't come, but I shall pretend that I believe he will come." I could say this to somebody, but this pretence might really be the result of a pathological compulsion, so that it really wouldn't be pretence at all.

This could be put as follows: That's not the way it is, but I *have* to believe it.

145. I said that the sentence "I believe that's the way it is, and it isn't" can be true; that is, if I do falsely believe it; which is, after all, a possibility. But what makes the sentence true? How can someone else see that it is true? How does he know that I believe it? Not from my behaviour; for that is full of contradictions.

146. If I say: "Look! This figure is contained in this picture"--am I making a geometrical remark?--Isn't 'this picture' that of which *this* is an exact copy, that which could be described with these particular words? Would it therefore make sense to say that it *now* contains that figure or that it *had* contained it?--Thus the remark is timeless, and it can be called "geometrical".

147. What does this imply about perceiving such a state of affairs?

Suppose someone is looking at a picture puzzle and finds the figure that is hidden in it. But he imagines that the picture has changed, that the figure has now come into being. He might say, for example, "Now this figure is here".

Or, on the other hand, the picture could have changed, unknown to him, and he merely *believes* he has discovered something in it which has always been there.

148. "Actually you should point to your own visual impression when you say 'I see this', then you would really be pointing to what you see." A result of the crossing of different language-games. (Similar to "'This' is the true name.")

149. "Now I see that these faces aren't exactly alike." (Timeless sentence.) But that is what eyes are for, after all! Imagine that someone wanted to say: "Indeed, that is a perception via the sense of sight; but it doesn't describe my visual impressions." What would they be? Well, I looked from one face to the other, so that I could compare them, and in the process I received a great many visual impressions; or one visual impression which changed continuously, something that one might represent by means of a film. But couldn't we isolate just two among all these impressions, in order to simplify things, and wouldn't two visual impressions be enough in the extreme case? And couldn't these two represent what I had noticed, namely, the dissimilarity?

Isn't there just a completely different game here?

150. It's no accident that I'm using so many interrogative sentences in this book.

151. So should I say here that the visual *impression*, the sense datum, the visual object, is different? This concept doesn't seem quite right. If we were to imagine that we could see similarity or difference as something like a picture, then we might think of them as being *accentuated* in the picture; just as we can heavily trace over the outlines

of whatever is different in order to show someone where the differences between two pictures lie. But if someone sees what was traced over in the two pictures, he hasn't yet seen that dissimilarity.

You have to look at the game as a whole, and then you'll see the difference.

152. "I see that the two are similar" can be used temporally or timelessly depending upon how 'the two' are defined. But does that mean that I *see* something different each time? "I see" is always temporal, but "The two are similar" can be timeless.

153. But is it always clear, in everyday usage, whether the sentence is meant as temporal, or timeless?--Take two brothers; I meet them and then I say "Yes, I see that they resemble each other". Did I mean: these two men, M and N, now resemble each other? (Perhaps they didn't before, etc.)--Or did I mean: I notice that these two human appearances, which, for instance, a picture can capture, resemble each other?--If I had made the original utterance and then had been asked in which of these ways I had meant it, could I have answered unequivocally?

154. "You shouldn't draw his face" could mean: You shouldn't draw this person's face, no matter what it looks

like--or: You shouldn't draw these facial features which right now happen to be his. Each time something different is important. And the injunction has different consequences, depending on which way it is taken.

Page 23

155. Even if I say "There is a similarity between these two faces", several different things can matter to me. It could mean, for example: There is a similarity between *this* kind of face and *that* kind, where the two kinds are distinguished by describing them. It may be the faces of *those men* that interest me, or it may be these facial *forms*, wherever I encounter them.

The distinction I have in mind is, of course, that between the sense of: These two pieces have a similar shape--and: The circle, the ellipse, the parabola, and the hyperbola resemble each other.

Page 23

156. The difference is that between external and internal similarity.

Page Break 24

Page 24

157. Now if I say that two faces are similar--does it make sense to ask "Do you mean external or internal similarity"?

Page 24

158. "Does it interest you that you can detect a similarity in what seem to be quite different *shapes*?"

"Are you trying to say that these *shapes* have something in common--or that these *human beings* do?"--But where is the difference?--Are you interested in the *shapes*, or the *human beings*? If it's the shapes, then maybe you'll copy them exactly, study the similarity among the lines, and you'll completely forget the men. If there's a discussion about them it will be a geometrical one, about types of lines.

Page 24

159. Suppose I retrace the facial outlines in order to explain to someone how they're similar, and he says "Sure, these lines have a similarity, I see that; but that's not the way these faces look, ..."--then I could reply: "Perhaps you're right, but that's not what I'm interested in. I wanted to point out that *this* kind of shape and *that* kind, however different they may appear,..." Here what concerns me is a geometrical question.

But if I had answered: "You're right, I made a mistake"--I would have been concerned with the similarity of *these human beings*.

Page 24

160. "They're brother and sister, but they don't look alike at all."--"I can see a similarity between them." What am I interested in here?

Page 24

161. Suppose there were a law of aesthetics that said that faces in a painting have to be similar. Now I point to two people and say to someone "Use these as models for your picture; they are similar".

Page 24

162. The sentence is non-temporal if I cannot replace "They are similar" with "They are now similar".

But if I utter that sentence on a certain occasion, is it always clear whether I wanted to allow the substitution? Must I have thought about it?

Page 24

163. I can be interested in seeing similarities in lines even where apparently there are none. That is, in my analytical eye.

Page 24

164. "I see different things in a much more important sense than I do things that are the same."

Page Break 25

Page 25

165. A picture story. In one of the pictures there are ducks, in another rabbits; but one of the duck heads is drawn exactly like one of the rabbit heads. Someone looks at the pictures, but he doesn't notice this. When he describes them he describes this shape first as the one, then as the other, without any hesitation. Only after we have shown him that the shapes are identical is he amazed.

Page 25

166. So he saw both aspects, but not the change of aspect.

Page 25

167. Would he have drawn the head differently in each case if he had been copying the picture? Not so far as I know! So he saw them in exactly the same way both times.

Page 25

168. But did he have the same image both times?--So far as I understand this question--*no*.

169. In the change of aspect one becomes *conscious* of the aspect.

170. But was it correct to say "He saw both aspects, but not the change of aspect"? Shouldn't I have said "He interpreted the picture in two ways, but didn't see the change of aspect"?

At first the picture was like some sort of picture of a duck; and if he saw an aspect here, then really he saw one in every picture, and therefore also in every object. For have I examined every picture to see whether it can't be seen differently?--So I shall say: he didn't *see* the aspect; he interpreted the picture in such-and-such a way.

171. Experiencing an aspect expresses itself in *this* way: "Now it is ..."

172. What is the philosophical importance of this phenomenon? Is it really so much odder than everyday visual experiences? Does it cast an unexpected light on them?--In the description of it, (the) problems about the concept of seeing come to a head.

173. And here we can ask: If someone says "Now it's a duck--now it's a rabbit!"--what happened at the outset? At that point, after all, he had not yet experienced the change, and yet he is already saying "Now it is...". Well, precisely nothing '*happened*'; but he was already playing that game.

You would have to look for something to distinguish the visual experience that accompanies the words "Now it is a duck" from the

one that accompanies the words "That is a duck" (when a person knows nothing about aspects). And, of course, nothing is to be found.

For what should I say?--*When* does the experience I am interested in take place as he says "Now --, now --"? (Do we have *two* extraordinary experiences here? Or *three*?)

174. What is strange is really the surprise; the question "How is it possible!"

It might be expressed by: "The *same*--and *yet* not the same."

175. The paradox may manifest itself in laughter. But couldn't we also imagine someone who wouldn't laugh in this situation; to whom nothing seemed paradoxical.

And yet he too would experience the change of aspect. He would call the picture first *one thing*, then *another*: and that would be all.

176. And what is he doing? What he presents as an expression of his experience would otherwise be a perceptual report. (The strong similarity with the experience of meaning.)

177. Wherein lies the similarity between the seeing of an aspect and thinking? That this seeing does not have the consequences of perception; that it is similar in this way to imagining.

178. Imagine a sign language in which a duck's head were a certain message, and a rabbit's head another one. Someone using this code accidentally draws a duck's head so that it can also be seen as a rabbit's head. The recipient of the message gives it the wrong interpretation: this will come out in his actions.

But if he realizes that it can be seen *this* way and *that* he will not (also) behave differently, according to whichever aspect he happens just then to be seeing.

179. "Is it thinking? Is it seeing?"--Doesn't this really amount to "Is it *interpreting*? Is it seeing?" And interpreting is a kind of thinking; and often it brings about a sudden change of aspect.

Can I say that seeing aspects is *related* to interpreting?--My inclination was indeed to say "It is as if I *saw* an *interpretation*". Well, the expression of this seeing is related to the expression of interpreting.

180. Two uses of the report "I see..."--In one language-game the observer reports what he sees from his vantage point.--In the other, the same objects are scrutinized by several people; one of them says: "I see a similarity between them".

In the first language-game the report might have been, for example, "I see two people who resemble each other as father and son". This description is far less complete than one given, for example, by an exact drawing. But someone could give this more complete description and yet not notice the similarity.

And someone else could see this drawing and discover the resemblance in it.†1 [Cf. *PI* II, xi, p. 193a, b]

Page 27

181. There is a game of guessing thoughts. A variant of it would be: I say a sentence in a language which A understands and B doesn't. B is supposed to guess what I have said.

Another variant: I write down a sentence which the other person cannot see. He has to guess it; or guess what it is about. [Cf. *PI* II, xi, p. 223b, beginning]

Page 27

182. Guessing intention: On a piece of paper that the other person can't see I write that I shall raise my left arm at the stroke of the clock. The person is to guess what I am going to do at that time.

Page 27

183. "Only I can *know* what I shall do." But can't I make a mistake; and can't the other person predict it correctly?

But ordinarily the other person *doesn't* know it, and I often do.

Likewise the other person doesn't know to whom I am writing unless he sees it or finds it out from me; but I can say who it is.

Usually it is I who am asked about the motives of my actions and not someone else. Likewise I am asked whether I feel pain. This is part of the language-game.

Page 27

184. But would it be correct to say that my pain is hidden?

Page 27

185. Is the future, for example, hidden?

Page 27

186. "Nothing is so well hidden as future events. They *can't* be known. One can only know what is happening now."

Page Break 28

Page 28

187. To be sure, one cannot be deceived about one's immediate experience: but not because it is so certain. The language-game allows for senseless utterances even though not for 'false' ones.†1

Page 28

188. "One cannot know the future" is a grammatical remark about the concept 'to know'. It means something like: "That is not knowing." And now one could ask: Why should someone be tempted to draw *this* conceptual boundary? And the answer could be: Because of the uncertainty of predictions.

Page 28

189. "One can't know the future?--How about solar and lunar eclipses?"--"One can't really *know* them either."--"Know?--Like *what*, for example?" [Cf. *PI* II, xi, p. 223d]

Page 28

190. If a lion could talk we could not understand him.†2 [*PI* II, xi, p. 223h]

Page 28

191. Even if someone were to express everything that is 'within him', we wouldn't necessarily understand him.

Page 28

192. So he gets angry, when we see no reason for it; what excites us leaves him unmoved.--Is the essential difference that we can't foresee his reactions? Couldn't it be that after some experience we might know them, but still not be able to follow him?

Page 28

193. He behaves like a man in whom complicated thought processes are taking place; and if only I understand them I would understand him.--Let us *imagine* this case; and now he is reciting his thoughts to himself, and in a certain sense I understand his actions. That is, I see the trains of thought and I know how they lead to his actions.

Page 28

194. In this way he would cease being a riddle to me.

Page 28

195. Think of how puzzling a dream is. Such a riddle doesn't *have* to have a solution. It intrigues us. It is *as if* there were a riddle here. This could be a primitive reaction.

Page 28

196. It is as if there were a riddle here; but it doesn't have to be a riddle.

("All forms are like and none the same. And so the chorus points to a hidden law.")

197. I don't know what is going on inside him. I couldn't flesh out his behaviour with thoughts.

198. He is incomprehensible to me means that I cannot relate to him as to others.

199. If someone is suspicious of a mathematical result he will suspect the *arithmetic*. But isn't that just a method? If someone is suspicious of someone's direct expression of experience and doesn't think that he is lying, he will say that he doesn't know what the other person is saying, that he is dreaming or not in his right mind.

200. But how do I know what I would do *if*...? If I stepped out into the street and found everything completely different from what I was used to, maybe I would just go ahead and join in. So I would behave quite differently than ever before.

And yet there is something important about my remark.†1

201. Suppose we were to meet people who all had the same facial features: we should not know where we were within them. [C&V, p. 75]

202. A people: with a ruling class whose members all look alike (except for sexual characteristics), and with an oppressed class whose shapes and facial features vary as ours do.

203. A tribe unfamiliar with the concept of simulated pain. They pity anyone who indicates that he is feeling pain. They are unfamiliar with the suspicious attitude toward expressions of pain. A traveller coming from our culture to theirs frequently thinks that a complaint is exaggerated, indeed, that its only purpose is to generate pity; the natives don't seem to think that way. (In their language they have an expression corresponding more or less to our: "to feel pain".) A missionary teaches the people our language; in the process he also educates them and under his tutelage they learn to distinguish between a genuine and a pretended expression of pain. For he mistrusts many an expression of pain and suppresses it, and teaches the people to be suspicious.--They learn our expression: "to feel pain", and also "to simulate pain", and the question is: were they

taught a new concept of pain? Certainly I won't say that they only now know what pain is. For that would mean that they had never felt pain previously.†1

204. Had those people overlooked something, and did the teacher bring something to their attention?

205. And how could they remain unaware of the difference if sometimes they would complain when they were in pain, and sometimes when they were not? Am I to say that they always thought it was the same thing?--Certainly not. Or am I to say that they didn't notice any difference?--But why not say: the difference wasn't important to them?†2

206. "If a concept refers to a certain pattern of life then it has to contain a degree of indefiniteness." I am thinking of something like this: On a strip of paper we have a continuous and regular pattern of bands. This pattern of bands forms the background for an irregular drawing or painting, which we describe in relation to the pattern, since this relation is what matters to us. If the pattern were to run: a b c a b c a b c etc., I would have a special concept, for example, for something red that is on a c, and something green that appears on the following b.

Now once anomalies occur in the pattern I will be in doubt as to which judgment ought to be made. But couldn't my instruction have provided for this? Or *do I simply assume* that in being instructed in the use of the concept, that particular pattern was just taken for granted, but was never itself described?†3

207. If colours were to play a different role in the human world than they now do, what consequences would this have for colour concepts? This is actually a question of natural science, and I don't want to ask such a question. Rather, this: What consequences would seem plausible to us? What consequences would not surprise us?†1

208. If colours were to play a different role in the human world than they now do, what sort of colour concepts--different from ours wouldn't seem odd? Consider various cases.

The question hasn't yet been phrased properly; but what is its purpose?--

209. It is very hard to imagine concepts other than our own because we never become aware of certain very general facts of nature. It doesn't occur to us to imagine them differently from what they are. But if we do then even concepts which are different from the ones we're used to no longer seem unnatural to us.

210. Our concept of pure future "It will happen"--as opposed to "It's meant to happen" and "It is to happen". Must all peoples have this concept, which perceives time spatially, as it were?

211. If a pattern of life is the basis for the use of a word then the word must contain some amount of indefiniteness. The pattern of life, after all, is not one of exact regularity.

212. Imagine someone who counts only on his fingers, for whom five is a hand and ten the whole person, and who then goes on to count people on his fingers, etc. For him the decimal system will not be an arbitrary number system. For him it is not a method of counting, but counting.

213. Six pure colours. Does it have to appear to us this way?--Brown is not one of them.

But what does that tell us anyway? Where do we use such statements? When we describe things by their colours?--Indeed; when we do this, for example, in a general way.

"Brown is not one of them" can, after all, express the instinctive rejection of a colour combination.

214. "Light is white. Colours are already a shadow."--But is all 'light' really white? Doesn't the lamp give off light?--Where then

does the original proposition, which still sounds so evident, come from? (And why does it sound evident?)--We always call what is lighter white. If one of two colours is the lighter, then only it can be the white one. And lightness and light are equated here.

215. We have a concept of colour blending which supersedes all physical methods of blending colours. So that we can therefore say of such a method: it comes closest to effecting the 'pure' blending of colours, for example.

216. Thus we judge whether according to our concept the two colours a and b really *should* produce the colour c.

217. How did we arrive at this concept? That's really irrelevant.

218. "Several shadows together result in light."--This idea could already look like a fiendish perversion of truth.

219. Could we also perceive all colours as mixtures of white and black?--Possibly so, if under certain conditions, for example, white and black pigments produced red, green, etc. Maybe we would say: "Light brings out the red in black." (The colour is thus thought of as hidden in black.)

220. Red and green the same. I am imagining there being only *one* shade of red and green. In nature they always blend into each other (as certain leaves do in autumn). They are everywhere found together, one being a variation of the other. The distinction between them is no greater than the one between lighter and darker.

But don't the people see the difference?! Of course they do. But they have a word, say, "leaf-colour", which is fairly analogous to our colour names, and means red *or* green; and they have two modifiers, "sharp" and "blunt", more or less analogous to our "light" and "dark", which separate red from green. And now the question is: which of their concepts is closer to one of our colour concepts? Their concept 'leaf-colour', or their concept 'sharp leafcolour'

(that is, red), for instance?

(If they are discussing colouring or painting an object, they might say that they want it leaf-coloured. If they are asked whether it should be sharp or blunt they might answer that they don't care.) Or

Page Break 33

would these people then be colour blind? Well, if we teach them our language they turn out to be normal.

Page 33

221. It's just that the difference between red and green isn't as *important* to them as it is to us.

Page 33

222. If we present them with a greater variety of colours then maybe they will experience our system as the only natural one, that is, take it up and drop the other one, with no difficulty. But then again, maybe they won't.

Page 33

223. A type of painting, in which the illuminated side of figures is always painted green, the shadows always red.

Page 33

224. Could we imagine that people might have a concept of pretence that doesn't coincide with ours?--But would it then be the concept of pretence?--Well, it could be a concept related to ours.

Page 33

225. But aren't some of the traits of (such) a concept more essential, others less so? That is: If one changes *this* trait it will still be called "pretence"--but if *this* one is changed that word will no longer be used. And here *naming* means an attitude.

Page 33

226. People whose faces immediately give away their feelings to others hide their faces when they want to dissemble.

Page 33

227. These people say, not that one cannot look within, into the heart, but rather that one can't read the features when they are veiled.

Page 33

228. "One can't look into his heart." The question is: Can *he*? (*That* fixes the concept.)

Page 33

229. "One can't look into a person's heart." The real underlying assumption is that he can do this himself.--Is it experience that teaches us this?

I am inclined to say--yes and no.

Page 33

230. And there must be a reason for that.

Page 33

231. "He can tell me things about himself that I wouldn't otherwise know."

Page Break 34

Page 34

232. This much is certain: He can predict some of his bodily movements that I can't. And if I do predict his actions I do so in a different way.

Page 34

233. And is *that* an empirical fact? Or: *which one* am I talking about here?

For example, I can't move his arm voluntarily, the way I can mine. But what this means isn't all that easy to explain.

Page 34

234. I cannot know what he's planning in his heart. But suppose he always wrote out his plans; of what importance would they be? If, for example, he never acted according to them.

Page 34

235. Perhaps someone will say: Well, then they really aren't plans. But then neither would they be plans if they were *inside* him, and looking into him would do us no good.

Page 34

236. "Can't you see, he has pain!"--"Pain, *over there*? How come?"

He wouldn't understand what it means for another person to *have* pain.

Page 34

237. What if someone had been taught as a child that plants feel pain; later on in life, however, he no longer believes this.--How would this transition take place?

He casts off the idea like a garment that no longer fits.

Page 34

238. How would a person act who doesn't 'believe' that someone else feels pain? We can imagine how. He would treat him as something lifeless, or as many treat those animals that least resemble humans. (Jellyfish, for instance.)

Page 34

239. We all know the doctor's question "Is he in pain"; and the uncertainty as to whether a person under anaesthesia feels pain when he groans; but the philosophical question whether someone else is in pain is completely different; it is not doubt about each individual in a particular case. [The point of this sentence has not yet emerged.]†1

Page Break 35

Page 35

240. Do we encounter this doubt in everyday life? No. But maybe something which is remotely related: indifference toward other people's expressions of pain.

Page 35

241. Aren't the fictitious cases I am trying to deal with like mathematical problems? (And how would you solve *this* equation? And how this one?)

Page 35

242. The belief that this or that person isn't in pain because he isn't expressing it--or because he is only pretending--or because he is under anaesthetics--has different *grounds* than the belief that an amoeba feels no pain. These grounds are also different from those of that imaginary inhuman brute who regards expressions of pain in his environment as phenomena of lifeless objects.

But would this brute really say he *believes* they feel no pain?--Possibly. But would he mean the same thing as the doctor, for instance, who reassures us as to a patient's condition? The utterance--however he may have learned it--is used by him in a different context; even if some of its consequences are similar.

Page 35

243. "The *uncertainty* as to whether another person is in pain"--is it based on the fact that he is he and I am I? (But just ask yourself: "Can he know it? He doesn't have any object for comparison.") No, *here* I'm deceived by a picture. The uncertainty is a matter of the particular case, and the concept vacillates from one case to another. But that is our game--we play it with an *elastic* tool.

Page 35

244. Couldn't there be people who have never had occasion to feel this uncertainty?

Page 35

245. They would say: "Should I be uncertain because he is he and I am I? What in the world do you mean?"

Page 35

246. And could people play it with a rigid concept?--Then it would be different from ours in a strange way. For in the flux of life, where all our concepts are elastic, we couldn't reconcile ourselves to a rigid concept.

Page 35

247. Indeed, mustn't any concept simply of behaviour be formulated imprecisely if it is more or less to serve the game with such concepts?

Page Break 36

Page 36

248. After all, there could be someone who had serious, hopeless doubts about others. But how would he act? (Like a lunatic.) He would say, for example: At times I feel that another person and I are the same and at times I don't. Correspondingly, at times he would show pity, at other times he would show none, and sometimes doubt.

Page 36

249. The behaviour of humans cannot be foreseen, cannot be calculated. Let's assume it could be, that I have made the calculation and now I observe their behaviour (like movements of complicated machines).

If that happened--would it be possible to observe them sympathetically? Would it be impossible to say "No one can know what's going on inside them"?

If, for instance, someone says to himself "That's the way humans are. I am exactly like that."

Then he might look at his *calculation* in a different light.

Page 36

250. Why in the world *do* we play this game!--But what are we after here? The game's surroundings, not its causes.

Page 36

251. "Where I am certain, he is uncertain." What if that also happened with a calculation --.

Page 36

252. "Couldn't he have been pretending?"--But couldn't he just be *imagining* that he is pretending? (Isn't this conceivable? And conceivability is what matters to us here, not probability.)

Dissimulation is *nothing* but a particular case; we can regard behaviour as dissimulation only under particular circumstances.†1

Page 36

253. The concept 'dissimulation' has to do with the cases of dissimulation; therefore with very specific occurrences and specific situations in human life. And here I mean external occurrences, not inner ones, etc.

Therefore it isn't possible for all behaviour, under all circumstances, to be dissimulation.

Page 36

254. But isn't the concept such that for any behaviour, etc., one can imagine (construct) a larger context in which even this behaviour

Page Break 37

would be dissimulating behaviour? Isn't this, for example, the basis for the problem of any detective story?

Page 37

255. One could also say: The concept of dissimulation has to do with a *practical* problem. And the blurred outlines of the concept don't change anything about that.

Page 37

256. Merely recognizing the philosophical problem as a logical one is progress. The proper attitude and the method accompany it.

Page 37

257. But what does this mean: "All behaviour theoretically could be dissimulation."

Page 37

258. It must surely mean: the *concept* of dissimulation allows for it.

Page 37

259. And *that* means: If I were to find out this and that, and this in addition, then I might say that it is (was) dissimulation.

(Euclidean geometry.)

But where is it written that we would say that; or from what do I deduce it?

'Insofar as this concept has been *determined*, it allows for *that* too.'

Page 37

260. But now we're making a false picture of our concept.

Page 37

261. The concept 'dissimulation' serves practical aims.

Page 37

262. -- -- -- Therefore not all behaviour can be dissimulation under all circumstances.†1

(Occasion, motive, etc., are part of 'dissimulation'.)

Page 37

263. A play, for example, shows what instances of dissimulation look like.

Page 37

264. Of course, one could imagine variations of the typical manifestations of dissimulation.

The plays of people who differ from us in this way would then take a different course from ours, and we wouldn't understand them at all.

What would be completely unmotivated to us would seem natural to them.

Page Break 38

Page 38

265. (For example, the way Orestes identifies himself to the king, by pointing to his sword, etc., might seem utterly absurd to some people.)

Page 38

266. A play by these people would be incomprehensible to us. (Indeed, is Greek tragedy comprehensible to us?) And what is the meaning of 'to understand' here?

Page 38

267. A sharper concept would not be the same concept. That is: the sharper concept wouldn't have the *value* for us

that the blurred one does. Precisely because we would not understand people who act with total certainty when we are in doubt and uncertain.

Page 38

268. Couldn't someone make up stories containing dissimulation in order to show that he knows what 'dissimulation' is? In order to develop the concept of dissimulation he invents more and more complicated stories. For example, what looks like a confession is merely further dissimulation; what looks like dissimulation is merely a front that hides the real dissimulation; etc., etc., etc.

Thus the concept is laid down in a kind of story.

Page 38

269. And the stories are constructed according to the principle that *everything* can be dissimulation.

Of course, part of all this is that in each story something is characterized as the foundation of truth. And how can the foundation of truth be characterized as such? Perhaps in the form of monologues. These must not be audible, otherwise they might be part of the dissimulation.--But couldn't someone conduct monologues in thought merely because they give him a certain appearance which he will then use to practise deception?--So the *intention* is the foundation? And how can it come out in the story?

Page 38

270. The concept of deception can be used for practical problems. For example: If someone is hatching evil plots, and he brings forth nothing but good and glorious deeds until he finally commits the evil one, then that will be deception only in the 'theoretical' sense; for it no longer resembles deception, and the conclusions one would normally draw from evil plots are incorrect here.

Page 38

271. And what have I accomplished with all of this?

In explaining the concept I have substituted the use for the picture.

Page Break 39

Page 39

272. "The word W. has two meanings" means: it can be used in two different ways. What does this sentence tell us? In what circumstances it is used?

Someone knows only *one* meaning for the word "bank"; I tell him: it has another one. (Namely:...)

Someone is already totally conversant with every use of the word, but suddenly he stops short, confused, and I explain to him: "The word has two uses:..."

Page 39

273. There are many uncertainties with this concept of meaning.

Page 39

274. One doesn't say, for instance that "walk" and "walks" have different meanings.

They mean exactly the same thing, we would tell someone; namely, *this*--and then we would demonstrate walking to him.

Page 39

275. You visit a tribe; they have a language; in this language you hear a word (a sound)--does it have *one* meaning, or several? How will you find out, how will you decide?

Page 39

276. Sometimes, however, the decision will be quite easy and clear. [But always?]

Page 39

277. "I'm not yielding a hair's breadth."

"He doesn't have a hair on his head." Does "hair" mean the same thing in both sentences? And does "a bit" mean a little bite?--"In the one case one is still aware of the old meaning, but not in the other." And this sentence doesn't refer to any conscious state one is in when one utters the word, but rather to an explanation one would perhaps give, or not give, if... In other words, it refers to connections that one would or would not make.

Page 39

278. What is the correct German translation of an English play on words? Maybe a completely different play on words.

Page 39

279. And what do you want to do with the decision that the word has only one, or more than one, meaning?

After all, you can learn how to use it without deciding that (without thinking about that).

Page 39

280. If you say that it has two meanings then you have to use an explanation to distinguish between them. (There can be various reasons for doing that.)

Page Break 40

Page 40

281. But the distinction may or may not be immediately obvious.

Page 40

282. The distinction may be drawn when you first learn how to speak, or maybe not until someone investigates the grammar of the language.

Page 40

283. (You must start here with the living language.)

Page 40

284. The distinction between various uses is made for various reasons.

Page 40

285. I look at the language and say "Different words are used quite differently".

But then I also say: "These have similar uses." Indeed: "These words (here) are used in the same way." And furthermore: "This word has two completely different uses." But also: "It is used in two different, but similar, ways."--And so far I am describing what I notice. (That is, as yet there is no problem here.) (So far, I am still completely naive.)

Here every meaning always has an explanation corresponding to it. And the explanations can be of entirely different kinds, and then again can in various ways be quite similar.

[An explanation of "go" and "gone".]

The differences can be more primitive, and less so.

Page 40

286. You enter new territory when you observe *several* languages and compare them with each other.

Page 40

287. The explanation of how some words are used will seem simple, lapidary, and basic to us; that of others: artificial, arbitrary, pointless.

Page 40

288. "We *need* a word to designate this object, this tool; but why do we need a word to refer to this on Mondays, that on Tuesdays, etc?" Does this word have *one* meaning or seven?

Page 40

289. Not every *use*, you want to say, is a meaning.

Page 40

290. Does this word have *one* function in our lives or does it have seven?

Page Break 41

Page 41

A function: we have certain models for this. And whatever resembles them is given this name. (A blurred concept.)

Page 41

291. Meaning, function, purpose, usefulness--interconnected concepts.

Page 41

292. Imagine the hypothesis: men never remember their dreams exactly, they forget the ideas in their dreams as soon as they wake up and remember only the pictures that accompany the dreams. The plot is lost and only the illustrations remain.

Page 41

293. Suppose we were to replace every tenth word in a story with the word "table".--And now suppose that there were a word in some language which was used in the same way as the word "table" in this story.

How could we describe the use of such a vagrant word?

Or what would it mean: "To teach someone the use of the word"?

Page 41

294. What am I after? The fact that the description of the use of a word is the description of a system, or of systems.--But I don't have a definition for what a system is.

Page 41

295. I encounter people who use a vagrant word in their language.

Page 41

296. If they had only vagrant words--then it simply wouldn't be a language.

Page 41

297. Here I'm thinking of a person who quite naively (without the ulterior motives of a philosopher) looks at the varieties of word usage and describes them to himself.

For example, he could classify the word which has a different meaning every day of the week as a normal noun, and the question "Does this word have one or several functions?" wouldn't occur to him.

Page 41

298. The question "Do 'non' and 'ne' have the same meaning?" never occurs to him.†1

Page Break 42

Page 42

299. But now he also compares his language with the primitive language which a person learns when he is a foreigner encountering people who don't understand him. For such a person learns individual important words through various kinds of explanatory gestures. Each word has its own showing or demonstration (a scene).--And, of course, the meaning of negation is also demonstrated. (Whether through the command "Don't do that!", or through a statement.)

Page 42

300. In this language the exact endings of the words won't be important. (Or: this language has no inflections.)

The demonstrations distinguish between the use of one word and that of another, but they don't distinguish between "go" and "goes", for example.

Page 42

301. And now we could introduce into our description of language a concept of 'meaning' such that two words would have the same meaning if they were explained by the same demonstration in that primitive language.

Page 42

302. So one can ask: If a foreigner visits people who say "non" and "ne", at what point will he be taught the difference?

Certainly not at the beginning; he will learn a negation which doesn't differentiate between the two.

Page 42

303. Suppose I were to say that 'meaning' is the primitive function of a word--would that be right?

Page 42

304. And, of course, this concept is extremely vague.

But do the negation in a report and the prohibition in a command ("Don't do that!") have the same primitive function?--What is called the same function and what is not will depend on human nature. Just as, of course, what is necessary†1 and what isn't.

Page 42

305. The words "the rose is red" are meaningless if the word "is" has the meaning "is identical with".--Does this mean: If you say this sentence and *mean* the "is" as the sign of identity the sense disintegrates? [PI II, ii, p. 175c]

Page Break 43

Page 43

306. We take a sentence and tell someone the meaning of each of its words; this tells him how to apply them and so how to apply the sentence too. If we had chosen a senseless sequence of words instead of the sentence, he would not learn how to use the *sequence*. And if we explain the word "is" as the sign of identity, then he does not learn how to use the word sequence "the rose is red". [PI II, ii, p. 175d]

Page 43

307. And yet it is true that the sense of that sentence will seem to disintegrate before the mind of anyone who thinks "identical with" whenever the word "is" is spoken. Like someone who thinks of hail whenever he hears the salutation "Hail!"--One might tell someone: if you want to pronounce the salutation "Hail!" expressively, you had better not think of hailstones as you say it!†1 [PI II, ii, p. 175d]

Page 43

308. What makes my image of him into an image of *him*?

When I say "I'm imagining him now as he...", then nothing is being designated here as his portrait.

But can't I discover that I pictured him quite wrongly?

Isn't my question like *this*: "What makes this sentence a sentence that has to do with *him*"?

"The fact that we were speaking about him."--"And what makes our conversation a conversation about *him*?"--Certain transitions we made or would make. [a: PI II, iii, p. 177a]

Page 43

309. What makes this picture *his* portrait?--It is designated as such in the catalogue.

Page 43

310. Suppose that instead of imagining something, I were to make sketches on a piece of paper. So I talk about N. and in the process my pencil is sketching a figure on the paper. Now someone can ask me "Does that represent N.?" And it might represent him, whether it is like him or not.

Is it correct to say: That's the way it is with one's imagination? Certainly; insofar as one can sometimes draw what one has imagined.

Page Break 44

Page 44

311. The question "What makes *this* into an image of him?" doesn't usually arise when I am imagining something. And if I draw what I imagined and am then asked "What makes this picture into *his* picture?", I could answer: "My imagination".

Page 44

312. "What makes the remark I just made into a remark about him?"

Page 44

313. What can be said to that?

Nothing inherent in or simultaneous with it. If you want to know whom he meant, ask him!

Page 44

314. "What makes my mental image of him...?" Is there anything here I could investigate to see whether it was my mental image of him?

Page 44

315. And if I say "I picture him quite vividly as he... ", then the same question applies to this sentence and to the mental picture.

Page 44

316. On the one hand, a face could come before my mind, and I could even be able to draw it without my knowledge whose it is or where I have seen it. [Cf. *PI* II, iii, p. 177a]

Page 44

317. What makes my image of him into an image of *him*?

Not its looking like him.

The same question applies to the expression "I see him now vividly before me" as to the image. What makes my utterance into an utterance about *him*? Nothing in it or simultaneous with it ('behind it'). If you want to know whom he meant, ask him! [*PI* II, iii, p. 177a]

Page 44

318. Suppose, however, that someone were to draw while he had an image or instead of having it, though it were only with his finger in the air. (This might be called "motor imagery".) He could be asked: "Whom does that represent?" And his answer would be decisive. It would tell us of his intention. [*PI* II, iii, p. 177b]

Page 44

319. The line I drew was like a description.

Page 44

320. We have to remind ourselves that a face with a soulful

Page Break 45

expression can be *painted* to make us believe that colours and forms by themselves affect us like this.

Page 45

321. "I believe that he is suffering."--Do I also *believe* that he isn't an automaton?

It would go against the grain to use the word in both connections.

(Or is it like this: "I believe that he is suffering; but am I certain that he is not an automaton."? Nonsense!) (That would be philosophers' nonsense.) [*PI* II, iv, p. 178a]

Page 45

322. Suppose I say of a friend "He isn't an automaton".--What information would be conveyed by this, and to whom would it be information? To a *human being* who sees him in ordinary circumstances? What information *could* it give him?! (At the very most that this man always behaves like a human being and not occasionally like a machine.) [*PI* II, iv, p. 178b]

Page 45

323. "I believe that he is not an automaton", just like that, so far makes no sense. [*PI* II, iv, p. 178c]

Page 45

324. My attitude towards him is an attitude towards a soul. I am not of the opinion that he has a soul. [PI II, iv, p. 178d]

Page 45

325. Now a picture is strongly suggested to us, the picture of something incorporeal which enlivens the face (like quivering air). We have to remind ourselves that a face with a soulful expression can be painted to make us believe that colours and forms by themselves can affect us this way.†1

Page 45

326. The concept 'meaning' will serve to distinguish those linguistic formations that might be called capricious from those that are essential, inherent in the very purpose of language.

Page 45

327. The concept 'meaning' will introduce a new point of view into the description of word-usage.

Page 45

328. Example: A verb meaning *to write* in the first person, *to love* in the second, and *to eat* in the third.

Page Break 46

Page 46

329. Human nature determines what is capricious.

Page 46

330. But is it the nature of someone who already knows a language or of someone who doesn't yet know one (for instance, the nature of a one-year-old)?

Page 46

331. Is it, or is it not capricious that a word means something different every day of the week, or means something different in the first and second persons?†1

Page 46

332. 'Meaning' is a primitive concept. The form: "The word means *this*" belongs to it; that is, the explanation of a meaning by pointing. This works well in certain circumstances and with certain words. But as soon as the concept is expanded to include other words difficulties arise.

Page 46

333. The definition of a word is not an analysis of what goes on inside me (or what should go on) when I utter it.

Page 46

334. "Every two metres there are two soldiers."

Page 46

"He went into a bank on a bank."

Page 46

335. "I want to replace this word in our language with two words; I'll explain the one *like this*: ..., the other *like this*: ..." I also could have said: "This word in our language has two meanings: ..." Here one couldn't ask: "But are those really two meanings?"--But one could--if one meant by it: "Isn't this distinction completely arbitrary, utterly pointless?"

"Why do you distinguish between them, what's the point of this distinction?"

Page 46

336. "I don't see the purpose of it." But what does the explanation of a purpose look like? I can't give a general answer to this question.

Page 46

337. You are posing problems to yourself and then solving them; like a mathematician.

Page 46

The problem: non and ne.

Page 46

338. A person naively describing the use of words might also describe the use of "non" and "ne", and he'll be able to remark that they are almost the same.--But that's not all: can't he say that the two

Page Break 47

words are used differently only in very specialized language-games, and that otherwise they are used the same way?

Page 47

339. Mustn't he be able to say that in a certain language-game one word can be replaced by another?

340. If the language-game, the activity, for instance, building a house (as in No 2), *fixes* the use of a word, then the concept of use is flexible, and varies along with the concept of activity. But that is in the *essence* of language.

341. Let us imagine *this* use of "non" and "ne": both words are used like our "not"; the same event causes now the one to be used, then the other, and in this way they are just like synonyms; a distinction is made only in the rare case of double negation.

Thus I would be tempted to distinguish between the '*entire*' use of a word and a part of its use. Indeed the part of its use will seem more important here than the '*whole*'.

342. So I say: "The use is the same here and here and here. In all of these cases one can substitute one word for the other." But what does that really mean?

343. Does the person who describes things naively know the concept of '*being able* to substitute one word for another'?--Certainly he knows the concept of the mixed use of two words.

344. Or what about this: A traveller visits the country where "non" and "ne" are used and he tries to translate this language into his own. He won't have any reason to use different words to translate each of these into his language--until he happens upon a case of double negation (then he *might* find an equivalent word in his language).

345. For the traveller could say: "As far as I can tell they're used in the same way."

346. "In all of these cases 'ne' and 'non' have exactly the same meaning." This could be said, for example, if in these cases the people themselves *treat* the words as synonyms. (And we know what

that looks like.)--But possibly the tribe doesn't treat them as synonyms, doesn't '*mix*' them, and they might still be synonyms for us.

347. The greatest difficulty in these investigations is to find a way of representing vagueness.

348. One can speak of the function of a word in a sentence, in a language-game, and in language. But in each of these cases "function" means *technique*. Thus it refers to a *general* way of explaining and of training.

349. Whoever teaches someone a negation sign trains him in a certain way. (Double negation need not even appear in training.) But then at some point he can use double negation or hear it, and comprehend it this or that way. His comprehension doesn't have to be related to his previous training, even though it is conceivable that it might be. But am I to say that his training taught him the meaning of double negation? I don't have to say that. And even if the training has taught me to use two different words interchangeably to express negation, it certainly hasn't taught me how to discriminate between them when it comes to double negation.

I certainly didn't learn this distinction by being trained. But what I did learn by being trained was a meaning, and *the same one*.

350. Within a kind of training one can distinguish (further) kinds of training. And thus one can distinguish various uses within word-usage.

351. Then psychology treats of behaviour, not of the mind?

What do psychologists record?- What do they observe? Isn't it the behaviour of human beings, in particular, their utterances? But these are not about their behaviour. [*PI* II, v, p. 179b]

352. A doctor asks "How is he feeling?" The nurse says "He is groaning". *One* report on his behaviour. But need any question arise as to whether the groaning is genuine? Can't it be as if this question didn't exist at all? Can't the conclusion be drawn: "If he is groaning we must give him more pain-killer"? But in the context of these thoughts can't the report about behaviour be *used as* a report about a

person's mental state? Can't it do this job and isn't the job the main thing?†1 [*PI II*, v, p. 179d]

353. "But then they make a tacit presupposition." Then the technique of our word use is always a tacit presupposition. [Cf. *PI II*, v, p. 179e]

354. "We're always making presuppositions; if they aren't correct then, of course, everything is different." Do we say this, for example, when we ask someone to go shopping? Are we presupposing that he is human, and that the store is not a *Fata Morgana*? Presuppositions come to an end.

355. But although it might not be a 'presupposition' in this case might it be one in a different case? Doesn't a presupposition imply a *doubt*? And doubt may be entirely lacking; or it may be present, from the smallest to the greatest degree.†2 [Cf. *PI II*, v, p. 180b]

356. Suppose somebody were to say "I'm shivering with fright, I'm always shivering with fright"--but he means by this that he can play chess. He expresses an ability as if it were an experience.

Even if someone could do this or that only when, and only as long as, he feels this and that, the feeling would not be the capacity. [b: cf. *PI II*, vi, p. 181b]

357. How do we compare the behaviour of anger, joy, hope, expectation, belief, love and understanding?--Act like an angry person! That's easy. Like a joyful one--here it would depend on what the joy was about. The joy of seeing someone again, or the joy of listening to a piece of music...?--Hope? That would be hard. Why? There are no gestures of hope. How does hoping that someone will return express itself?

358. It's easy to imagine an animal angry, frightened, unhappy, happy, startled. But hopeful? [*PI II*, i, p. 174a]

359. For hoping is quiet, joyful expectation. (Even though there is something repugnant about this kind of analysis.)

360. A dog can expect its master, but can it expect its master will come the day after tomorrow? And what can he not do here?--How do I do it? How am I supposed to answer this? [*PI II*, i, p. 174a]

361. The 'meaning' of a word is not the experience one has in saying or hearing it; and the 'sense' of a sentence is not a complex of the experiences which go with the words.

How do the meanings of the individual words make up the sense of the sentence "I still haven't seen him yet"? The sentence is composed of the words, and that is enough. [*PI II*, vi, p. 181c]

362. The feeling for words. Suppose we found a man who, speaking of how words felt to him, told us that "if" and "but" felt the *same*. Should we have the right to disbelieve him?--Or should we just say that he isn't playing our game. It would be like someone who instead of associating a separate colour with each vowel, associated one colour with a, e, i and another with o and u. Maybe there are such people. [Cf. *PI II*, vi, p. 182b]

363. One might say that such people would differ from us to a far greater extent than those who associated no colours at all with vowels. One would almost like to call them colour blind.

364. And would such a person for that reason also confuse the uses of "if" and "that"?

365. Can only those hope who can talk? Only those who have mastered the application of a language. The signs of hope are modes of this complicated pattern of life.†1 (If a concept applies to the character of handwriting, it has no application to beings that do not write.) [*PI II*, i, p. 174a]

366. The glance which a word in a certain context casts at us.

Of course, the way in which it looks at us depends on the surroundings in which it is located.

367. Isn't the if-feeling *this* word, uttered with *this* tone and in *this* context?

368. The if-feeling cannot be something which *accompanies* the word "if". [Cf. *PI II*, vi, p. 182e]

369. Otherwise it could accompany other things too.

370. Suppose I were to speak of an if-gesture.

Could another word make the same gesture?--Or 'would it then not be the same gesture'?

371. The sound of the word "if" is simply part of the if-gesture.

372. Can two faces have the *same* expression? (Yes and no.)

373. The if-feeling would have to be compared with the special 'feeling' which a musical phrase gives us. (Someone might want to speak of a '*feeling* with a half-cadence'.) [Cf. *PI II*, vi, p. 182f]

374. But can this feeling be separated from the phrase? And yet it is not the phrase itself, for that can be heard without the feeling. [*PI II*, vi, p. 182g]

375. Is it in this respect like the 'expression' with which the phrase is played? [*PI II*, vi, p. 182h]

376. For one does not *mean* a feeling which accompanies the phrase, but at the most, the phrase *with* the feeling.

377. "He looked at me with a strange smile."--With what kind of smile?--To answer this I might have to draw his face.

378. The if-feeling is not a feeling which accompanies the utterance of the word "if". [*PI II*, vi, p. 182e]

379. We say this passage gives us a quite special feeling. We sing it to ourselves, and make a certain movement, and also perhaps have some special sensation. But in a different context we should not recognize these accompaniments--the movement, the sensation--at

all. They are quite empty except just when we are singing this musical phrase. [*PI II*, vi, p. 182i]

380. If we say "I sing it with a quite particular expression", then "expression" does not refer to something that I can separate from the passage.

In a different sense, it is conceivable for me to play a *different* phrase with the same expression. [Cf. *PI II*, vi, p. 183a]

381. The special feeling this passage gives me belongs to the passage, indeed to the passage in this context.

382. I can talk about the expression with which someone plays a passage without thinking that a different passage might have the same expression. Here this concept serves only as a means for comparing different performances of this passage.

383. The fact that we understand a sentence shows us that we could use it in certain circumstances (even if it were only in a fairy tale), but this does not show us *what* we can do with it and *how much*.

384. [non and ne.] They have the same purpose, the same use--with *one* qualification.

385. So are there essential and non-essential differences among the uses of words? This distinction does not appear until we begin to talk about the *purpose* of a word.

386. My kinaesthetic sensations advise me of the movement and position of my limbs.

Now I let my index finger make an easy pendulum-movement forward and backward. I either hardly feel it, or don't feel it at all. Perhaps a little in the tip of the finger, like a slight tension of the skin (not at all in the knuckle). And this sensation advises me of the movement? For I can describe it exactly. [*PI* II, viii, p. 185a]

Page 52

387. "But after all, you must feel the movement, otherwise you couldn't know how the finger was moving." But "knowing it" only means: being able to describe it.--I may be able to tell the direction from which a sound comes only because it affects one ear more

Page Break 53

strongly than the other; but I don't *hear* this. It only has the effect: I *know* where the sound comes from, and, for instance, I look in that direction. [*PI* II, viii, p. 185b]

Page 53

388. It is the same with the idea that it must be some feature of our pain that advises us of the whereabouts of the pain; or some feature of our memory image that tells us the point in time to which it belongs. [*PI* II, viii, p. 185c]

Page 53

389. A sensation *can* advise us of the movement of position of a limb. (For example, if with your eyes closed you were unable to tell, as a normal person can, whether your arm is stretched out, you might find out by a feeling of pressure in the elbow.)--And the character of a pain *can* also tell us where the injury is. [*PI* II, viii, p. 185d]

Page 53

390. How do I know that a blind person uses his sense of touch, and a sighted person his sense of sight, to tell them about the shape and position of objects?

Page 53

391. Do I *know* this only from my own experience, and do I merely surmise it in others?

Page 53

392. The evolution of the higher animals and of man and the awakening of the spirit, of consciousness, at a particular level. The picture is something like this: Though the ether is filled with vibrations the world is dark. But one day man opens his seeing eye, and there is light.

What this language primarily describes is a picture. What is to be done with the picture, how it is to be used, is still obscure. Quite clearly, however, this must be explored if we want to understand the sense of what we are saying. But the picture seems to spare us this work; it already points to a (very) particular use. This is how it takes us in. [*PI* II, vii, p. 184d]

Page 53

393. What is the criterion for my learning the shape and colour of an object from a sense-impression? [*PI* II, viii, p. 185e]

Page 53

394. *What* sense-impression? Well, *this* one: I can describe it: "It's the same one as the one..."--or I can demonstrate it with a picture.

And now: what do you feel when your fingers are in this position?--"How is one to define a feeling? One can only recognize it within

Page Break 54

oneself." But it must be possible to teach the use of the words! [*PI* II, viii, p. 185f]

Page 54

395. What I am looking for is the grammatical difference. [*PI* II, viii, p. 185g]

Page 54

396. Colour, sound, taste, temperature, all have a subjective and an objective side to them. And that undoubtedly means that sometimes they show what I feel, sometimes they describe the external world. Now my knowledge of the position of my body seems to be lacking the subjective link.

Page 54

397. You can't describe a feeling? Of course you can. You do it every day. But how? Well, we have to think about particular cases.

Page 54

398. If someone told me that he had then felt what you feel when you hold your fingers in *this* position, or move them *this* way, then I would imitate the position or movement and ask him, perhaps "Do you mean the feeling in your fingertips, or in your muscles or *here*?" That is, I needn't yet be clear what feeling he's talking about; indeed, I could even say "I'm feeling nothing when I move *this* way". Consider: I could also ask him "Is it a strong feeling, or a very weak one?" (But this remark is still peripheral, and doesn't yet get to the heart of the matter.)

399. And where is the K-feeling?†1 Can you point to it? (For the location of the receptors is of no concern to us.)

400. Let us leave the K-feeling out for the moment!--I want to describe a feeling to someone, and I tell him "Do *this*, and then you'll get it", and I hold my arm, or my head, in a particular position. Now is this a description of a feeling? And when shall I say that he has understood what feeling I meant? He will have to give a *further* description of the feeling afterwards. And what kind of description must it be?--Suppose that he tells me "Yes, I've got it. It's an extremely odd feeling". When he's asked "What kind of odd feeling? Where?", he says he can't say--it is quite strange. How would we know that it is a feeling? [Up to "Suppose that he tells" *PI* II, viii, pp. 185h-186a]

401. The 'further description' will connect the feeling up with other

feelings: It will have a location, will stay constant or change, will become stronger or weaker.

402. "Do *this*, and you'll get it." I hold my arm or my head in a certain position when I say this. Can't there be a doubt here? Mustn't there be one, if it is a feeling that is meant? [Cf. *PI* II, viii, p. 186b]

403. What would we say if someone reported to us that in a certain object he saw a colour he couldn't describe? Does he have to be expressing himself correctly? Does he have to mean a colour?

404. This looks so; *this* tastes so; *this* feels so: "this" and "so" must be differently explained. [*PI* II, viii, p. 186c]

405. Our interest in a 'feeling' is of a quite *particular* kind. It includes, for instance, the 'degree of the feeling' and the extent to which one feeling can be drowned out by another. [*PI* II, viii, p. 186d]

406. "Grief" describes a pattern which recurs in the weave of our life. Now a *process* is also part of this pattern. If a man's bodily expressions of sorrow and joy alternated, say with the ticking of a metronome, then this would not result in the pattern of sorrow or of joy. (This does not mean that joy or grief are kinds of behaviour.) [Cf. *PI* II, i, p. 174b]

407. If you observe your own grief, which senses do you use to observe it? A particular sense? One that *feels* grief? Then do you feel it *differently* when you are observing it? And what is the grief that you are observing, is it one which is there only while it is being observed?--'Observing' does not produce what is observed. (That is a conceptual stipulation.) [*PI* II, ix, p. 187a]

408. But I can still observe my grief, can't I? I ask myself, for instance, "Am I as sad today as I was yesterday?" and I answer that question.

409. I say (to myself), for instance: "A month ago I wouldn't have been able to think about it without shuddering."

410. If you trained someone to emit a particular sound at the sight of something red, another at the sight of something yellow, and so on for other colours, still he would not yet be able to describe objects by

their colours. Though he might be a help to us in giving a description. In order to describe he has to be able to make pictures of the way colours are distributed in space, following some rule of projection. (Language-g<ame>?)†1 [*PI* II, ix, p. 187d]

411. If I let my gaze wander round (a room) and suddenly it lights on an object of a striking red colour, and I cry out "Red!"--that is not a description of anything; even though I could give a description. [*PI* II, ix, p. 187e]

412. Are the words "I am afraid" a description of a state of mind?

It depends on the game they are in. [a: *PI* II, ix, p. 187f]

413. We are, of course, presupposing certain physiological phenomena that accompany this expression of fear, for he is supposed to be human, after all. A rapid pulse, laboured breathing, higher blood pressure, perhaps, and a series of neurological phenomena which are more difficult to observe; all of this is in turn accompanied by certain characteristic feelings. If someone breaks into a cold sweat then he has the sensations characteristic of sweating.

Page 56

414. And furthermore: it is quite possible that someone who imitates certain facial expressions, gestures, and sounds that are typical of fear and who in doing so becomes subject to one or the other of the feelings typically produced by these gestures--that this person might thereby induce further physiological manifestations of fear in his body, and along with these have even further sensations of fear.

Page 56

415. Indeed it *can* happen that play-acting fear produces fear. (It is not *necessarily* so, and it is not essential to fear.)

Page 56

416. The language-game of reporting can be given such a turn that a report is not meant to inform us about its subject matter but about the person making the report.

It is so when, for instance, a teacher examines a pupil. (You can measure to test the ruler.) [a: *PI* II, x, p. 190i; b: *PI* II, x, p. 191a]

Page Break 57

Page 57

417. "If my senses don't deceive me, he's coming from over there."

"If I'm not mistaken, he's coming from over there."

What is the hypothetical form of this?

Page 57

418. One can very well say "It looks to me as if he's coming, but he isn't".

Page 57

419. One can mistrust one's own senses, but not one's own belief. [*PI* II, x, p. 190f]

Page 57

420. One can even say: "I have the impression that he is coming, but he isn't."

Page 57

421. Suppose I were to introduce some expression, "I believe", for instance, in this way: It is to be prefixed to reports when they serve to give information about the reporter. (So "I believe" need not carry with it any suggestion of uncertainty. Remember also that the uncertainty can be expressed impersonally: "He might come today.")

Then what would "I believe it is so and it isn't" mean? [*PI* II, x, p. 191b]

Page 57

422. "I believe..." throws light on my state. Conclusions about my conduct can be drawn from this expression. So there is a similarity here to expressions of emotion, of mood, etc. [*PI* II, x, p. 191c]

Page 57

423. If there were a verb "to seem to believe" then it would not have a meaningful first person in the present indicative. (Our word "to dream" could also lack this form.)

Page 57

424. The best example of an expression with a very specific meaning is a passage in a play.

Page 57

425. Instantaneous motion. If you see motion you by no means see positions at distinct points in time. You could not copy it, or imitate it.

Page 57

426. "Back then I believed that the earth was a flat disc." A belief has a basis; the experiences, reports, relationships on which it rests. It stands on a ground.

Page 57

427. The line "x is in error" has no real point for x = myself.

At this point the line disappears into the dark.

Page Break 58

Page 58

428. For instance, the question can be raised: If I infer someone's state on the basis of his utterances, is this really the same state as one that is not recognized this way? And the answer is a decision.

Page 58

429. The phenomenon we are talking about is the dawning of an aspect.

Page 58

430. You say to yourself, for example, "It could be *this* too (you furnish a new interpretation) and the aspect may dawn.

Page 58

431. Two uses of the word "*see*". The one: "I see this"--and allude to a description, or point to a picture or a copy. With this I might tell someone else: over there, where you haven't been able to see it, there is such-and-such. An example of the other use: "I see a likeness between these two faces." Let the man I tell this to be seeing the faces as clearly as I do. [Cf. *PI* II, xi, p. 193a]

Page 58

432. The one man might make an accurate picture of the faces, and the other notice in the drawing their likeness, which the former did not see. [Cf. *PI* II, xi, p. 193b]

Page 58

433. I might be observing two faces which do not change: suddenly a likeness lights up in them. I call this experience the dawning of an aspect. [Cf. *PI* II, xi, p. 193c]

Page 58

434. Its causes are of interest to psychologists, but not to me. [Cf. *PI* II, xi, p. 193d]

Page 58

435. We are interested in the concept and its place among the concepts of experience.†1 [*PI* II, xi, p. 193e]

Page 58

436. The dawning of an aspect can be brought about, for example by (visually) going over certain facial lines.

Page 58

437. What is the characteristic expression of dawning? How do I know that somebody is experiencing this?- The expression is like an expression of surprise.

Page 58

438. An aspect dawns and fades away. If we are to remain aware of it, we must bring it forth again and again.

Page Break 59

Page 59

439. I suddenly see the solution of a puzzle picture. Before, there were twigs and branches there; now there is a human shape. My visual impression has changed and now I recognize that it has not only shape and colour but also a quite particular organization.--My visual impression has changed;--what was it like before; what is it like now?--If I represent it by means of an exact copy--and isn't that a good representation of it?--no change is shown. [*PI* II, xi, p. 196b]

Page 59

440. And above all do *not* say "After all, my visual impression isn't the *drawing*! It is *this*, which I can't show to anyone." Of course, it is not the drawing, but neither is it anything of the same category, which I carry within myself. [*PI* II, xi, p. 196c]

Page 59

441. So the copy cannot portray the aspect?--"Copy" means many different things.--The kind of copying *can* show the aspect that one sees. It can bring together what 'belongs together'. The particular *mistakes* a man makes when he is copying can also show the aspect he perceived.

Page 59

442. The concept of the 'inner picture' is misleading, for this concept uses the *outer* picture as a model, and yet their uses are no more closely related than the uses of 'numeral' and 'number'. If one chose to call numbers 'ideal numerals', one might produce a similar confusion.†1 [*PI* II, xi, p. 196d]

Page 59

443. If you put the organization of a visual impression on a level with shapes and colours, you are proceeding from the idea of the visual impression as an inner object. Of course, this makes the object into a chimera, a queerly shifting construction. For the similarity to a picture is now impaired. [*PI* II, xi, p. 196e]

Page 59

444. If someone sees a row of equidistant points as a row of pairs of points whose inner distance is smaller than the outer distance, he can then say that he sees the row as organized in a certain way. For the picture he might make of the row would have a particular organization. Of course, there might be a mistake here: he *thinks* that the row is organized that way.

Page 59

445. Organization: that refers to the spatial relationship, for instance. The representations of the, spatial relationships in a visual impression are spatial relationships in the representation of a visual impression.

Page Break 60

Page 60

By changing the spatial relations in the representation of what is seen, we *can* give a representation of a change of aspect. Example: the aspects of the diagram of a cube. The copy that is drawn is always the same, but the spatial one varies.

Page 60

446. The concept of a representation of what is seen, of a copy, is very elastic, and so *together with it* is the concept of what is seen. But the two are intimately connected. (Which is *not* to say that they are alike.) [PI II, xi, p. 198c]

Page 60

447. If someone looking at the model of a cube were to express himself this way: "Now I see a cube in *this* position--now one in *this*"--he could mean two very different things. Something subjective; or something objective. His words alone do not reveal which.--An account of a change of aspect has essentially the same form as an account of the object he saw. But its further application is different.

Page 60

448. If the aspect is a kind of organization and if the organization can be compared to the characteristics of shape and colour, then the change of aspect is like a change of the apparent colour.

Page 60

449. The concepts of colour and form must be learned objectively.

Page 60

450. The expression of an aspect follows the expression of perception, just as the expression of an *image* follows the expression of perception. But here we have to remind ourselves that a visual image cannot always be represented by describing a visual impression. For example, I can imagine a closed box, but the *picture* of the closed box could also represent several other things. (This is reminiscent of what we say in talking about a dream: "And I knew that...")

Page 60

451. *Seeing* an aspect is a voluntary act. We can tell someone: Now look at it like *this*. Try again to see the similarity. Listen to the theme *this way*, etc. But does that make seeing a voluntary act? Isn't it rather the way you look at something that causes this seeing?

For example, I can see the model of the cube in *this way* if I direct my glance right at *these* edges. When I do

this the aspect suddenly changes. Here I *know* how to *bring this about*. On the other hand, if I look at an  first one way and then another then I am unaware of this.

Page Break 61

Page 61

452. The aspect is dependent on the will. In this way it is like imagination. [Cf. PI II, xi, p. 213e]

Page 61

453. But visual *perception* is also dependent on the will, after all! If I look more closely then I see something different and I can produce the other visual impression at will. To be sure, this does not make the impression an aspect--but isn't it, too, subject to my will?

Page 61

454. Someone who has always taken a certain shape for a printed F need never have had the experience that is expressed in the words: "Now I see it as an F".

This aspect has not necessarily 'dawned' on him.

Page 61

455. Someone who is looking at the d<uck>-r<abbit> and thinking about the facial expression on the rabbit--trying, for example, to find the right word for it--this person is looking at the picture in the rabbit aspect, but this rabbit aspect does not dawn on him.

But then is it correct to say that he *sees* the picture in this aspect the whole time?

Now he describes what he sees as the head of a rabbit, for that is the way he talks, for instance, about what he sees.

Page 61

456. Do not ask yourself "How does it work with *me*?" Ask "What do I know about someone else?" [PI II, xi, p. 206c]

457. Do not ask yourself "Didn't I *see* it in such a case?"--but rather "What makes me say that *he* sees it in this case?"

458. If I heard someone talking about the duck-rabbit, and now he spoke in a certain way about the special expression of the rabbit's face I should say "Now he's looking at the picture as a rabbit's head", or "under the rabbit aspect". [PI II, xi, p. 206h]

459. The greatest danger here is wanting to observe oneself.

460. If I say "These two shapes seemed to me to have no *similarity* to each other at all", can I use a stronger expression for the fact that I *saw* something different each time?

461. He sees two pictures, for instance, with the duck-rabbit surrounded by rabbits in one, by ducks in the other. He doesn't notice that they are the same. Does it *follow* from this that he *sees*

something different in the two cases?--It gives us a reason for using this expression here. [PI II, xi, p. 195e]

462. And how about the statement "I *saw* it quite differently! "? Well, maybe that shows that here this concept suggests itself to someone and that too is understandable.

So I had 'seen' it; even though this aspect had never dawned on me.

463. And now how does this chronic†1 'seeing-as' compare with colours and shapes? Has my visual image always had these colours, these shapes, this organization? So far it has only been a mode of expression; but just how similar are these concepts?

Of course, we can say "There are certain things which fall equally under the concept 'picture-rabbit' and under the concept 'picture-duck'. And a picture, a drawing, is such a thing."--But the *impression* is not simultaneously of a picture-duck and a picture-rabbit. [b: PI II, xi, p. 199f]

464. You had learned: *that* is 'red'; *that* is 'round'; *that* is a 'rabbit'.

465. I learned the concepts 'red', 'round', 'picture-rabbit', 'picture-duck'--so far they are more or less on the *same* level. I can learn them from samples.

466. A picture-rabbit is *something like this*: and then I point to examples. So a picture-duck is something *different*, even if *one* of the examples is the same.

467. If I saw the duck-rabbit as a rabbit, then I saw: This shape and colour (I reproduce them *exactly*)--and I saw besides something like this: and here I point to a number of different pictures of rabbits. This demonstration shows the difference between the concepts. [PI II, xi, pp. 196h-197a]

468. "I saw it *quite* differently, I should never have recognized it!" Now that is an exclamation. And there is also a justification for it. [PI II, xi, p. 195f]

469. All the while you would have copied this face (the imitation of a rabbit), so in *one* sense you did see it *that* way after all.

470. And if I see it now as a rabbit, now as a duck, then I see it *this*

way and *this* way (when I say this each time I imitate a different animal and look in a different direction).

471. What kind of man is said to be enjoying this picture's telling expression? Well, someone who looks at it this way, talks about it in such-and-such a way, and reacts to it this way.

472. I have always seen it as a rabbit could even mean: for me it always was a rabbit, I have always spoken to it as a rabbit. A child does this.

It means that I have always *treated* it as a rabbit.

Page 63

473. Now if the child treats the picture of the rabbit like a real rabbit, does that show something about how the visual picture is organized? Is *that* proof that a child sees more than just colours and shapes?

Page 63

474. And now the change of aspect.

The experience of the *new* aspect. Or: of the *appearance* of the aspect. And the expression of this is an exclamation. A rabbit! etc.

Page 63

475. "But surely you would say that the picture is altogether different now!" [PI II, xi, p. 195i]

Page 63

476. But what is different: my impression? my point of view?--Can I say? I *describe* the alteration like that of a perception; quite as if the object had altered before my eyes. [PI II, xi, p. 195i]

Page 63

477. Imagine the duck-rabbit cut out and a child treats it as a doll, now *this* way and now *that*.

Page 63

478. I am shown a picture-rabbit and asked what it is; I say "It's a rabbit". Not "Now it's a rabbit". I am reporting my perception. I am shown the duck-rabbit and asked what it is; I *may* say "It's a duck-rabbit". But I may react to the question quite differently.--If I say that it is a duck-rabbit this again is the report of a perception; but if I say "Now it's a rabbit", then it isn't. Had I replied "It's a rabbit", I would not have noticed the ambiguity, and I should have been reporting my perception. [PI II, xi, p. 195h]

Page 63

479. But then isn't there a difference between the *first* "Now it's a rabbit" and the newly developing aspect?

Page Break 64

Page 64

480. A wall covered with spots; and I occupy myself by seeing faces on it; but not so that I can study the nature of an aspect, but because I find those *shapes* interesting and because of the destiny that leads me from one to the next.

More and more, aspects dawn, others fade away, and sometimes I 'stare blindly' at the wall.

Page 64

481. The double cross and the duck-rabbit might be among the spots and they could be seen, like the other figures, and together with them, under various aspects.

Page 64

482. The aspect *seems* to belong to the structure of the inner materialization.

Page 64

483. We learn language-games. We learn how to arrange objects according to their colours, how to report the colours of things, how to produce colours, compare shapes, measure, etc., etc.--Do we learn how to form mental images out†1 of them?

Page 64

484. There is a language-game: "Tell me whether (sometimes also "how often" and "where") this figure is contained in that one." What you report is a perception.

Page 64

485. So we could also say: "Tell me whether there is a mirror-F here", and suddenly it might strike us that there is. This could be very important.

Page 64

486. But the report "Now I see it as..." does not report any perception.

Page 64

487. "You can think now of *this*, now of *this*, as you look at it, can regard it now as *this*, now as *this*, and then you will see it now *this* way, now *this*." *What* way? There is no further qualification. [PI II, xi, p. 200d]

Page 64

488. I can change the aspects of F and in so doing I do not have to be cognizant of any other act of volition.

Page 64

489. In these considerations it is useful to introduce the idea of a 'picture-rabbit', 'picture-man', etc. For instance,

is a picture-face. [Cf. *PI* II, xi, p. 194c]

Page Break 65

Page 65

490. "Now I am seeing *this*", I might say. This is the report of a *new* perception. †1 [*PI* II, xi, p. 196a]

Page 65

491. But what if, to begin with, I drew exactly what I perceived; and then said: "Now I see that it is a rabbit", or "Oh, it's a rabbit!" Now I am expressing an experience that occurs at the same time as the exclamation.

Page 65

492. The perception of an internal relation and the dawning of the aspect of an internal relation.

Someone has always seen the duck-rabbit as a rabbit and now he sees it as a duck for the first time. From this he might learn that a rabbit's head and a duck's head can have the same contours. Under certain circumstances this can be an important discovery. (I'm thinking of a code in which a rabbit's head is a sign.) But the dawning of the rabbit aspect is not the perception of that relation.

Couldn't someone perceive the relation and still not be able to experience the change or the dawning of an aspect?

Page 65

493. In one case you say: "What I have in front of me is *this* [copy]. I can also describe it as a rabbit."--In another case: Before, I saw something else, but now I see a rabbit.

Page 65

494. The expression of a change of aspect is the expression of a *new* perception, and at the same time of the perception's being unchanged. [*PI* II, xi, p. 196a]

Page 65

495. The copy *completely* describes the perception. The model that I am pointing to describes the *kind* of view I now have of it. And one could also say: the visual experience.--In that case the copy is a more precise report of the perception. But if the aspect *dawns* upon me, then its expression (for example, my pointing to the model) is *essentially* the expression of a new perception.

Page 65

496. Just as if we had to have a new copy now, to correspond to this expression. But this is not the case.

Page 65

497. I ask: "What are you seeing?" The other person starts drawing; then he gives up and says "I can't draw it very well; it's a rabbit sitting down". Then I might improve on his drawing.

Page 65

498. "I see a picture-rabbit. And that is *exactly* what I see [and now I'll draw it]."

Page Break 66

Page 66

499. Then is the copy an *incomplete* description of my visual experience? No. But the circumstances decide what more detailed specifications I need to make. It *may* be an incomplete one; if there is still something to ask. (Example: the schematic cube.) [*PI* II, xi, p. 199e]

Page 66

500. So pointing to the model, in *addition* to the copy, might belong to the description of the visual experience. But then it doesn't belong to the description of the visual perception.

Page 66

501. If I know that the schematic cube has various aspects and I want to find out what someone else sees, I can get him not only to copy the schematic cube, but also to point to a cube; even though *he* has no idea why. To *me* it describes what he sees. †1 [*PI* II, xi, p. 196f]

Page 66

502. But when we have a changing aspect the case is altered. Now the only possible expression of our experience is what before perhaps seemed, or (even) was, a useless specification when once we had the copy. [*PI* II, xi, p. 196f]

Page 66

503. And this by itself eliminates for us the comparison of 'organization of the visual impression' with colour and shape. [*PI* II, xi, p. 196g]

Page 66

504. Indeed, I confess, nothing seems more possible to me than that people some day will come to the definite opinion that there is no copy in either the physiological or the nervous systems which corresponds to a *particular* thought, or a *particular* idea, or memory.

Page 66

505. What would it be like, what would it look like, if all choice were taken out of an aspect?

Page 66

506. Does "seeing an aspect" mean that one perceives the internal relation? What is there in me that speaks against this?

Page 66

507. If you search for figure (1) in another figure (2), and then find it, you see (2) in a different way, one can say. Not only can you give a new kind of description of it, but noticing the first figure was a new visual experience. [PI II, xi, p. 199b]

Page Break 67

Page 67

508. But you would not necessarily want to say: "Figure (2) looks quite different now; it isn't even in the least *like* the figure I saw before; though they are congruent!" [PI II, xi, p. 199c]

Page 67

509. "The inner picture contains colours, shapes, and, what is more, a particular organization." From this it would follow that it looks like *this* and not like *that*.

Page 67

510. You *notice* an organization of an *object* (an object of perception). Or rather: You notice something about its organization; a feature of this organization.

Page 67

511. Noticing is a visual experience.

Page 67

512. You can copy colour and shape. You can point to a sample of colour and shape. But you can't point to a sample of the visual impression's organization.

Page 67

513. Someone might say, for instance: "If you want the same impression I have you have to look at this figure, particularly at this part, and you have to look so that you notice *this* about it." But that isn't what we do. This sort of thing is not what we call "describing a visual impression", just as we don't prescribe how the other person's gaze should travel across the object when we try to describe our visual impression. This shows us <that> "visual impression" is supposed to refer to something like "visual *picture*", and that this in turn is supposed to refer to something like a picture.

Page 67

514. If you ask me what I saw, perhaps I shall be able to make a sketch which shows you, but I shall mostly have no recollection of the way my glance travelled in looking at it. [PI II, xi, p. 199h]

Page 67

515. The colour of the visual impression corresponds to the colour of the object, the shape of the visual impression to the shape of the object. But the aspect of the visual impression does not correspond to the organization of the object, for the *former* can vary while the same organization is being looked at. In the aspect I notice a trait of the organization.

Page 67

516. The colour in the visual impression corresponds to the colour of the object (this blotting paper looks pink to me, and is pink)--the shape in the visual impression to the shape of the object (it looks rectangular to me, and is rectangular)--but what I perceive in the

Page Break 68

dawning of an aspect is not a property of the object, but an internal relation between it and other objects. [PI II, xi, p. 212a]

Page 68

517. Imagine the duck-rabbit hidden in a mass of lines. Now I suddenly notice it in the picture, and notice it simply as a rabbit. At some later time I look at the same picture and notice the same figure, but see it as the duck, without necessarily realizing that it was the same figure both times. If I later see the aspect change, can I say that the duck

and rabbit aspects are now seen quite differently from when I recognized them separately in the tangle of lines? No.

But the change produces a surprise not produced by the recognition. [PI II, xi, p. 199a]

Page 68

518. The aspect only dawns; it doesn't remain fixed. But that has to be a conceptual, and not a psychological, remark.

The expression of seeing an aspect is the expression of a *new* perception.

Page 68

519. (Seemingly, I am performing 'thought-experiments'. Well, they're simply not experiments. Calculations would be much closer.)

Page 68

520. The expression of the dawning of an aspect is: "Now it's *this*--now it's *that*." The expression of noticing the rabbit in the tangle of lines is: "There is a rabbit here." We have not noticed something and now we do; there's nothing paradoxical about this. We don't want to say that the old has vanished--that there's something new there, though it's entirely the old.

Page 68

521. We don't say "Now it is *this*" *before* the first change of aspect.

Page 68

522. A hesitant assertion is not an assertion of hesitancy. [Cf. PI II, x, p. 192]

Page 68

523. Think of a hesitant command.

Page 68

524. And one should be on one's guard against saying that "It may be raining" *really* means "I think it'll be raining". Why then shouldn't it be the other way round? [PI II, x, p. 192h]

Page 68

525. Aristotelian logic brands a contradiction as a non-sentence,

Page Break 69

which is to be excluded from language. But this logic only deals with a very small part of the logic of our language. (It is as if the first geometrical system had been a trigonometry; and as if we now believed that trigonometry is the real basis for geometry, if not the whole of geometry.)

Page 69

526. Don't regard a hesitant assertion as an assertion of hesitancy. [PI II, x, p. 192i]

Page 69

527. "I noticed the likeness between the two for perhaps five minutes." That might be said if they were to change.--That would mean: I was aware of it for about five minutes, it occupied me for 5 minutes, and throughout this time I continually had to think of it.

"It struck me for five minutes, and no longer after that." "The likeness staggered me for five minutes. I had to exclaim again and again..." That does not mean: I observed it for five minutes and then it disappeared.

<In English> "The similarity struck me for 5 minutes."

"The similarity staggered me for 5 minutes. After that I no longer noticed it."†1 [a: cf. PI II, xi, p. 210f]

Page 69

528. "I observed this similarity for 5 minutes" would mean: I was observing the similarity of the changing faces.

Page 69

529. The organization of a visual picture: *this* belongs together, *that* doesn't. So one organizes by bringing together and separating. Well, this can be done when drawing, for instance.

Page 69

530. There are quite different kinds of 'aspects'. One kind might be called "aspects of organization". [Cf. PI II, xi, p. 208d]

Page 69

531. The lines are connected together differently. What belonged together before doesn't belong together now.

Page 69

532. I may, then, have seen the duck-rabbit as a picture-rabbit from the first. That is to say, if asked: "What's that?" or "What do you see here?" I should have replied "A picture-rabbit". If I had further been asked what a picture-rabbit was, I should have had to explain by pointing to various pictures of rabbits or to real rabbits, could have talked about their habits and given an imitation of them. [PI II, xi, p. 194d]

533. I should not have said "I am seeing that as a picture-rabbit" or "Now I am seeing it as a picture-rabbit". I should simply have described my perception; just as if I had said "I see a red circle there". Nevertheless someone else could have said of me "He's seeing this figure as a rabbit". [Cf. *PI* II, xi, pp. 194e-195a]

534. It would have made as little sense for me to say "Now I'm seeing it as..." as to say at the sight of a bottle of wine "Now I'm seeing this as a bottle". This expression would not be understood. Any more than the expression from <unharmed>† I skin "Now it's a bottle", or "It can be a bottle too". [Cf. *PI* II, xi, p. 195b]

535. Neither could one normally say "I take that to be a knife and fork".

536. One doesn't *take* what one knows as a knife and fork at a meal *for* a knife and fork; any more than one ordinarily tries to eat as one eats, or aims to eat. [Cf. *PI* II, xi, p. 195c]

537. Does the dog who suddenly notices a rabbit *think* of it?

538. Suppose someone is taking a walk and suddenly an animal crosses his path: I see him looking surprised--what do I know about his experience?

When asked he might say "All of a sudden something startled me; I don't know what it was." Or: "Suddenly I saw something that flitted by--that was all." Or: "It was a rabbit!"

539. Suppose he had never seen an animal: Then would his visual experience differ from that of someone who is familiar with the shape of the animal that flitted by? (I would like to answer in the affirmative, but I don't know why.)

540. The question can be put another way: Someone suddenly sees an object which he does not recognize; (it may be a familiar object, but in an unusual position or lighting); the lack of recognition perhaps lasts only a few seconds. Is it correct to say he has a different visual experience from someone who knew the object at once? [*PI* II, xi, p. 197e]

541. Can't we imagine that someone is able to describe a completely unfamiliar shape that appears before him just as *accurately* as I, to whom it is familiar? And isn't that the answer? Of course, it will not generally be so. And his description will run quite differently. (I say, for example, "The animal had long ears"--he: "There were two long appendages" and then he draws them.) [*PI* II, xi, p. 197f]

542. Here we must be careful not to think in traditional psychological categories. Such as simply dividing experience into seeing and thinking; or doing anything like that.

543. One feels inclined to ask "Is recognizing a part of seeing?" And the question is wrongly put.

What are the signs of recognizing--what are those of seeing?

If someone suddenly sees his friend in a crowd and calls out his name, what is he giving a sign of?

544. I see someone whom I have not seen for years, I see him clearly, but fail to know him. Suddenly I know him, I see the old face in the altered one. I believe that I could do a different portrait of him now. [*PI* II, xi, p. 197g]

545. Clearly there is a relationship between concepts here.

546. Isn't it possible for someone to describe a face with which he is completely unfamiliar more accurately than I might describe one I've known for a long time?

547. (And here one must distinguish between the experience of recognizing something again and recognizing, which is simply a being-familiar-to-me.)

548. Do not try to analyse your own inner experience! [*PI* II, xi, p. 204e]

Page 71

549. I look at an animal in a cage. I am asked: "What do you see?" I answer: "A rabbit."--I gaze into the countryside; suddenly a rabbit runs past. I exclaim: "A rabbit!"

Both things, both the report and the exclamation, can be called expressions of perception and of visual experience. But the exclamation is so in a different sense from the report; it is forced from us. It is

Page Break 72

related to the experience as a cry is to pain. [*PI* II, xi, p. 197b]

Page 72

550. But isn't it simply that the exclamation, that is, the particular inflection of the words, is merely an expression of surprise. The words themselves are the expression of the visual perception, etc., just as are the words of a report.

My surprise might also have been expressed by an inarticulate sound; and if I am asked "Why did you flinch?", I might answer: "A rabbit crossed in front of me."

Page 72

551. Another exclamation might have been: "What was that?!"

Page 72

552. But are the two experiences whose expressions are the inarticulate sound and the exclamation "A rabbit!" really the same? How should I decide this? (*I* didn't mean the same thing.)

Page 72

553. But since it (the exclamation) is the description of a perception, it can also be called the expression of a thought. And therefore we can say that if you are looking at the object, and see it, you need not think of it; but if you are having the visual experience expressed by the exclamation, you are also thinking of what you see. [*PI* II, xi, p. 197c]

Page 72

554. And that is why the experience of a change of an aspect^{†1} seems half visual-, half thought-experience.^{†2} [*PI* II, xi, p. 197d]

Page 72

555. When I see a change of aspect I have to occupy myself with the object.

Page 72

556. I occupy myself with what I am now noticing, with what strikes me. In that respect, experiencing a change of aspect is similar to an action.

Page 72

557. Does the exclamation "What was that?" express a particular visual experience?

Page 72

558. Couldn't we answer: Yes and No?

Page 72

559. "I just saw a shadow flitting by." Isn't that the expression of a visual experience?

Page Break 73

Page 73

560. I see a 'questionable' shape.

Page 73

561. But can you really say that you see the questionableness *and* the shape?

Page 73

562. Question: *What supports this?*

Well, the fact that even the description I give of the phenomenon is moulded by the questionableness.

Page 73

563. What is the criterion of the visual experience? The criterion? What do you suppose?

The representation of 'what is seen'. [*PI* II, xi, p. 198b]

Page 73

564. Now when the aspect dawns, can I separate a visual experience from a thought-experience?--If you separate them the dawning of the aspect seems to vanish.

Page 73

565. I think it could also be put this way: *Astonishment* is essential to a change of aspect. And astonishment is thinking.

Page 73

566. But isn't that just MY conception of a change of aspect?

Page 73

567. So *what* dawns? The aspect of the rabbit for instance. And therein, that it could only be expressed that way, lay the thought.

Page 73

568. Something flying by might surprise me *bodily*, as it were, and yet I needn't *think* about it. That is, even though I gave a start, I could still continue a train of thought.

Page 73

569. But now think of the aspects of the rotating drum. When they change, it seems as if the *movement* had changed. Here one doesn't necessarily know whether it is the kind of movement that has changed, or the aspect. And therefore we don't in the same sense have the experience of the change of aspect.

Page 73

570. Imagine that two lights, one blue and one red, are alternately blinking in front of my eyes. I am to press one button when the blue light flashes, another when the red light flashes. Certainly I could do this quite mechanically.--And now imagine that this game is played with the two aspects of the black-white cross. Now is it impossible that there be equally mechanical and thoughtless reactions?

Page Break 74

Page 74

571. Now when I know this person in a crowd, perhaps after looking in his direction for quite a while--is this a sort of seeing? A sort of thinking? The expression of the experience is "Look, there's ...!"--But, of course, it could just as well be a sketch. That I recognize this person might be expressed in the sketch or in the process of sketching as well. (But the element of sudden recognition is not expressed in the sketch.)†1

The very expression which is elsewhere a report of what is seen, is here a cry of recognition. [a: cf. *PI* II, xi, p. 197h; b: p. 198a]

Page 74

572. Suppose a child suddenly recognizes someone. Let it be the first time he has ever suddenly recognized anyone.--It is as if his eyes had suddenly opened.

One can ask, for example:†2 If he suddenly recognizes N. N., could he have the same visual experience, but without recognizing him? For instance, he could be *mistaken* about recognizing him.

Page 74

573. What if someone were to ask: "So I do that with my eyes?"

Page 74

574. A rabbit runs across a path. Someone who isn't familiar with rabbits says: "Something strange just whizzed by" and he proceeds to describe the appearance. Someone else exclaims "A rabbit!" and he cannot describe the appearance so precisely.

Now why do I still want to say that the person who recognizes it sees it differently from the person who doesn't?

Page 74

575. If someone sees a smile and does not know it for a smile, does not understand it as such, does he see it differently from someone who understands it? He mimics it differently, for instance. (Understanding the modes in ecclesiastical music.) [*PI* II, xi, p. 198e]

Page 74

576. *What can be cited in support of his seeing it differently?*

Page 74

577. "It looks different to anyone who knows what it is."--How so?

Page 74

578. What would it be like if someone just wasn't acquainted with what it was that scampered by, but still knew all about it right away? Does he then see it in the same way as a person who is acquainted with it?

Page Break 75

Page 75

579. It's a question of the fixing of concepts.

Page 75

580. I'm mentioning these kind of aspects in order to show the kind of multiplicity we are dealing with here.

Page 75

581. There are here hugely many interrelated phenomena and possible concepts. [PI II, xi, p. 199d]

Page 75

582. Sometimes the conceptual is dominant in an aspect. That is to say: Sometimes the experience of an aspect can be expressed only through a conceptual explanation. And this explanation can take many different forms.

Page 75

583. The various kinds of aspects.

Page 75

584. Hearing a melody and the movements that go along with the particular way someone interprets or hears it.†1

Page 75

585. Why does it seem so hard here to separate *doing* and experiencing?

Page 75

586. It's as if doing and the impression didn't happen side by side, but as if doing shaped the impression.

Page 75

587. I hear it differently, and now I can play it differently. Thus I can render it differently.

Page 75

588. There are many ways of experiencing aspects. What they have in common is the expression: "Now I see it as *that*"; or "Now I see it *this way*"; or "Now it's *this--now that*"; or "Now I hear it as...; a while ago I heard it as ...". But the explanation of these "*that's*" and "*this way's*" is radically different in the different cases.

Page 75

589. What would it be like if suddenly I noticed a lion out of doors? I'll assume that I see only part of its head, but that I recognize it immediately and cry out "A lion!" The most powerful feeling in me is fear.--And now I ask again: What about the visual impression? Was it different from the one I receive in the zoo? (Aside from the fact that the latter impression is much more complete.--)

Page 75

590. (I can't yet lift myself above the mass of appearances.)

Page Break 76

Page 76

591. Here it is *difficult* to see that what is at issue is the fixing of concepts.

The *concept* forces itself on one. (This is what you must not forget.) [PI II, xi, p. 204h]

Page 76

592. The visual impression seems to organize itself in this way.

Page 76

593. This really means: the visual impression changed, and didn't change.

Page 76

594. When I suddenly recognized him my visual impression suddenly seemed to change into *this*.

Page 76

595. Was it a sort of understanding? Was it a sort of seeing?

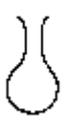

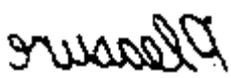

Page 76

596. What, if anything, justifies my talking about seeing here?

Page 76

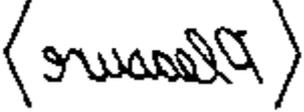

597. Suppose someone were to tell me: "It was as if my visual impression suddenly organized itself into this face and its surroundings." I would understand him. I would comprehend why he was expressing himself this way. That is, I too would be inclined to use this image.

Page 76

598. This figure  is the reverse of  and this:  is the reverse of this:

 . One is inclined to say that one *sees* the reverse word differently from the normal word. The latter is easy to copy, the former difficult. [Cf. PI II, xi, p. 198g]

Page 76

599. The figure a)  is the reverse of figure b)  as the figure c)  is the reverse of d) . But--I should like to say--there is a further difference between my impressions of c and d and those of a and b. (d, for example, looks neat, and c sloppy. Cf. Lewis Carroll's 'Looking glass'.) d is easy, c hard to copy. [PI II, xi, p. 198g]

Page 76

600. What previously fell apart in a visual impression now belongs together.

Page Break 77

Page 77

601. How would the following account do: "What I can see something *as*, is what it can be a *picture* of"?--But is that an explanation or a pleonasm?--[PI II, xi, p. 201b]

Page 77

602. What it means is: The aspects in a change of aspects are those ones which the figure might sometimes have *statically* in a picture. [PI II, xi, p. 201b]

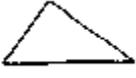

Page 77

603. A triangle can really be standing up in one picture, be hanging in another, and can in a third be something that has fallen over. That is, I who am looking at it say, not "It may also be something that has fallen over", but "That pitcher has fallen over and is lying there in fragments". This is how we react to the picture. [PI II, xi, p. 201c]

Page 77

604. Could I say what a picture must be like to produce this effect? No. There are, for example, styles of painting which do not convey anything to me in this immediate way, but do to someone else. I think custom and upbringing have something to do with this. [PI II, xi, p. 201d]

Page 77

605. Take as an example the aspects of a triangle. This triangle  can be seen as a triangular hole, as a solid, as a geometrical drawing; as standing on its base, as hanging from its apex; as a mountain, as a wedge, as an arrow or pointer; as an overturned object which (for example) is meant to stand on the shorter side of the right angle, as a half parallelogram, and as various other things. [PI II, xi, p. 200c]

Page 77

606. What does it mean to say that I see the sphere floating in the air in a picture?

Is it enough that I describe the picture this way? That this description is the first to hand, is the most natural for me? No, for it might be so for various reasons. This might, for instance, simply be the conventional description. [PI II, xi, p. 201e]

Page 77

607. What is the expression of my not merely understanding the picture in this way, for instance (knowing that it is *supposed* to be), but *seeing* it in this way?

It is expressed by: "The sphere seems to float", "You can see it floating", or again, in a special tone of voice, "It floats!"

This then is the expression of taking something for something. But not being used as such. [PI II, xi, p. 201e]

Page Break 78

Page 78

608. Here we are not asking ourselves what are the causes and what produces this impression in a particular case. [PI II, xi, p. 201f]

Page 78

609. And is it a different impression?--"Surely I see something *different* when I see the sphere floating from when I merely see it lying there."--This really means: This expression is justified! (For taken literally it is no more than a repetition.) [PI II, xi, p. 201g]

Page 78

610. (And yet my impression is not that of a real floating sphere either. Compare the various kinds of 'three-dimensional' seeing; the three-dimensional character of a normal photograph and that of what we see through a stereoscope.) [PI II, xi, p. 202a]

611. "And is it really a different impression?" In order to answer this I should like to ask myself whether there is really something different there in me. But how can I find out?--I *describe* what I am seeing differently. [PI II, xi, p. 202b]

612. We can produce a change of aspect, and it can also occur against our will.
Like our gaze, it can follow our will.

613. When you ride a bus at night and it makes a turn, if you look at the front partition (which doesn't move relative to the passengers), you'll think that you're *seeing it* make the turn. You feel, of course, that the vehicle is making the turn. And you may also have an inkling of this from the darkness outside, which you still see, although unconsciously, out of the corner of your eye. But you think you see the front partition making the turn, and *at the same time*, of course, you see that it's not moving with respect to you.

614. (Rhees) If someone describes his present mood and says, for instance, that it is like a grey cloud--isn't he observing it even though his observation might change it somewhat? And does what I said about 'description' in general hold true for this description?

615. Don't I look into myself and say: "What is the right word for this feeling, this mood?"--And is it clear that my mood isn't intensified, for instance, by this looking?

Isn't it possible for me to *revel* in a mood? And couldn't self-observation be a part of this revelling?

616. Is this similar to causing myself physical pain (no matter how I do it) and then trying to describe exactly what it's like?

617. Suppose I say in a case like that: "Yes, this pain is like a blazing fire."

618. In which way and in which sense am I observing the pain? (For I can't see any difference between someone observing his sadness and observing his own pain.) I put myself in a position to feel it. But *what* pain? *This* kind--or the pain produced in *that* way?

Do I say "I'd like to reproduce this same blazing pain so I can see what it is *like*?"†1 Why should I observe it if I can identify it this way? Well, you might say: "If I could just feel this same pain again and again, then I would finally hit upon the right word for it, or even the coloured image (for example, that of a fire)."

And now I can simplify the case. He doesn't even have to produce the pain on purpose; rather, let it be a constant pain (a headache or stomach-ache) and let him be thinking about how to describe his feeling correctly.

619. What I really want to say is that by looking I do not observe my *visual impression*, but rather whatever I am looking at.

620. So if I somehow look at my grief then I am not observing the impression that I thereby receive.

621. But suppose I stare fixedly at an object and ask myself "What kind of red am I seeing there?" I'm not interested in the colour of the object at all, but just searching (perhaps) for a name for my present impression of it.

Can I say that to think about an impression is not to 'observe it'?

622. What does someone who says "Now I see it as..." convey to us? That is, what follows from this report, what sort of use does it have? It could have many different kinds of consequences.

Well, for example anyone who sees the d<uck>-r<abbit> as a rabbit will not be able to describe the expression of the duck.

Three-dimensional seeing in solid geometry. Anyone who sees the model of the curve as flat won't be able to

perform various graphic operations with it. [Not quite right.]

Page 80

623. Connection with the game "That could be a...".

Page 80

624. What are you telling me when you use the words...? What can I do with this utterance? What consequences does it have?

Page 80

625. Certain drawings are always seen as flat and others sometimes, or even always, three-dimensionally. [*PI II*, xi, p. 202c]

Page 80

626. Here one would not like to say: The visual impression of what is seen three-dimensionally is three-dimensional; with the schematic cube, for instance, it is a cube. (For the description of the impression is the description of a cube.) [*PI II*, xi, p. 202c]

Page 80

627. "Now I always see it as ..." Before I erroneously saw this as...; but now no longer. Now I always see it the way it was meant.--How does this get expressed?

Page 80

628. And then it seems queer that with some drawings our impression should be a flat thing, and with some a three-dimensional thing. One asks oneself: "Where *is* this going to end?" [The picture of a runner.] [*PI II*, xi, p. 202d]

Page 80

629. "What does this colour remind me of?"--Is a person who looks at an object and asks himself that question observing the visual *impression*?†1

Page 80

630. What does anyone tell me by saying "Now I see it as ..."? What consequences has this information? What can I do with it? [*PI II*, xi, p. 202f]

Page 80

631. People often associate colours with vowels. Someone might find that a vowel changed its colour when it was repeated several times. The vowel *a* would be 'now blue--now red'.

"Now I am seeing it as..." might have no more significance for us than "Now *a* is red".

Page Break 81

Page 81

(Linked with physiological observations, even this change might acquire importance for us.) [*PI II*, xi, p. 202g]

Page 81

632. If I ask myself of what use, of what interest that report is, I remember how often it is said in aesthetic observations:†1 "You have to see it like *this*, this is how it is meant", "When you see it like *this*, you see where it goes wrong", "You have to hear these bars as an introduction", "You must hear it in this key", "You must phrase the theme like *this*" (which can refer to hearing as well as to playing). [*PI II*, xi, p. 202h]

Page 81

633. The figure  is supposed to represent a convex step and to be used in some kind of topological

demonstration. In this context we draw the line *a* through the geometric centres of the two surfaces.  --Now if anyone's three-dimensional impression of the figure were never more than momentary, and if even then he sometimes saw it as a concave step, that might make it difficult for him to follow the demonstration. (Just as a person who cannot see projections three-dimensionally will have a hard time with solid geometry.) (The role of intuition in mathematics.) And if he finds that the flat aspect alternates with a three-dimensional one, that is just as if I were alternately to show him completely different objects (now something flat, now one model, now another). [*PI II*, xi, p. 203a]

Page 81

634. But the application, after all, is completely different in aesthetics and descriptive geometry. In aesthetics isn't it

essential that a picture or a piece of music, etc., can change its aspect for me?--And, of course, this is not essential for that topological demonstration.

Page 81

635. "If I see it *this* way, it fits, but if I see it *that* way, it doesn't."

Page 81

636. A game: "It can also be ..."

Page 81

637. "But this isn't *seeing!*"--"But this is *seeing!*"--It must be possible to give both remarks a conceptual justification. [PI II, xi, p. 203c]

Page Break 82

Page 82

638. The question is: *In what sense* is it seeing? [PI II, xi, p. 203d]

Page 82

639. "Do you always *see* this leaf as *green*, that is, as long as you are looking at it and would truthfully answer the question as to its colour by saying "green"?" Is the sense of this question clear? One answer might be: "Well, I don't say to myself, 'Oh, how *green!*' the whole time I am looking at the leaf."

Page 82

640. How is it expressed that I see this picture as a picture of snow-covered trees? That I not only *know* that it represents them, but that I don't *read* the picture like a blue-print?--I treat it differently. (Child and doll.)

Page 82

641. If I see an animal in a picture pierced by an arrow, do I only *know* that the point of the arrow is connected with its feathers, or do I *see* it?--I *relate* to these bits as I would to an arrow. That is: I don't merely say, as if I were deciphering the diagram of a machine, "These two bits go together, and this is where a shaft goes through"; rather if I'm asked "What did you see in the picture?" I shall answer right away: "An animal pierced by an arrow." [Cf. PI II, xi, p. 203b]

Page 82

642. "This phenomenon is at first surprising, but a physiological explanation of it will certainly be found."--
Our problem is not a causal but a conceptual one. The question is: *In what sense* is it seeing? [PI II, xi, p. 203d-e]

Page 82

643. Often I see a broken contour in a drawing as complete.

Page 82

644. I see that an animal in a picture is transfixed by an arrow. It has struck it in the throat and sticks out at the back of the neck. Imagine the picture is a silhouette.--Do you *see* the arrow--or do you merely *know* that these two bits are supposed to be part of an arrow? [PI II, xi, p. 203b]

Page 82

645. Compare Köhler's figure of the interpenetrating hexagons. [PI II, xi, p. 203b]

Page 82

646. But this is seeing! *In what respect* is it seeing? [PI II, xi, p. 203d]

Page 82

647. If the picture were shown to me just for a moment and I had to describe it, *that* would be my description; if I then had to draw it, I

Page Break 83

should certainly draw two identical interpenetrating hexagons, and in *this* respect I would not miss the mark with the copy, even if several other things were wrong in it. [PI II, xi, pp. 203f-204a]

Page 83

648. Is it knowing or seeing?--What if it were *only* knowing? In which cases would I say it is only knowing? If I read a blue-print, for example.

Page 83

649. What does it mean for me to look at a drawing in descriptive geometry and say: "I know that it continues here but I can't *see* it like that"? Does it mean a lack of familiarity in 'knowing my way about'? This familiarity is certainly one of our criteria. The criterion is a certain KIND of knowing one's way about. (Certain gestures, for instance, which indicate the three-dimensional relations. Fine shades of behaviour.) [PI II, xi, p. 203b]

Page 83

650. You need to think of the role which pictures (as opposed to working drawings) play in our life. This role is by no means something uniform. [Cf. *PI II*, xi, p. 205c]

Page 83

651. If you see the drawing as ..., what I expect from you will be pretty different from what I expect when you merely know what it is meant to be. [*PI II*, xi, p. 205d]

Page 83

652. [Rem<ark> about the *third* person.]

Page 83

653. Proverbs are sometimes hung on the wall. But not theorems of geometry. †1 Our relation to these two things. [*PI II*, xi, p. 205c]

Page 83

654. "If I see it *this* way, it fits *this*, but not *that*." This is a very specific language-game using the expression "to see something *this* way". And the criterion for 'seeing *this* way' is different here from that used in descriptive geometry.

Page 83

655. What is the criterion for his *seeing* it that way if he says, for instance, "When I see it *this* way it fits *this*"?--His ability, for example, to make, or to describe, or to suggest certain changes in the picture or building, etc., changes which would have a particular effect on someone who looked at it.

Page Break 84

Page 84

656. What if someone were to say: The plot of a dream †1 is a strange disturbance of memory; it gathers together a great number of memories from the preceding day, from days before that, even from childhood, and turns them into the memory of an event which took place while a person was sleeping.

Indeed, all of us are familiar with instances in which we blend several days' memories into *one*.

Page 84

657. For when should I call it a mere case of knowing, not seeing?--Perhaps when someone treats the picture as a working drawing, and *reads* from what it represents. (Fine shades of behaviour.) [*PI II*, xi, p. 204i]

Page 84

658. I immediately recognize the hexagons as such. Now I look at them and ask myself: "Do I really see them *as* hexagons?"--and for the whole time I am looking at them?--And I should like to reply: I am not thinking of them as hexagons the whole time. [Cf. *PI II*, xi, p. 204b]

Page 84

659. The first thing to jump to the eye in this picture is: they are hexagons. [*PI II*, xi, p. 204b]

Page 84

660. Someone tells me: "I saw it at once as two hexagons. And that's the *whole* of what I saw." But how do I understand this? I think he would have immediately answered "Two hexagons" to the question "What are you seeing?" Nor would he have treated this answer as one among many possibilities. In this his answer is like the

answer "An animal"--on being shown a picture of one; or "A face"--on being shown the figure . [*PI II*, xi, p. 204c]

Page 84

661. Immediately I *recognize* it as a face, and am prepared to treat it as one.

Page 84

662. Of course, I might also have seen the picture first as something different and then have said to myself "Oh, it's two hexagons!" But that is not what happened. So the aspect would have altered. And does this prove that I in fact saw it in a particular aspect?

(Well, as you like it!) [*PI II*, xi, p. 204f]

Page 84

663. "Is it a *genuine* visual experience?"

The question is: To what extent is it one? [*PI II*, xi, p. 204g]

Page Break 85

Page 85

664. [It is difficult to see...]

[The eye "Look how it's looking!"]

665. "To me it's an animal pierced by an arrow." That is what I treat it as, this is my *attitude* to the figure. This is one meaning in calling it a case of seeing. [*PI* II, xi, p. 205a]

666. But can I say in the same sense: "To me these are two hexagons"? Not in the same sense, but in a similar one.--[*PI* II, xi, p. 205b]

667. So in this sense I only see it *this* way as long as I have this *attitude* toward it? That could be said.

668. "This feature of the picture caught my eye."

669. The best description I can give of what was shown me for a moment is *this*: ...

"The impression was that of a standing animal." So a *perfectly definite* description came out.--Was it *seeing*, or was it a thought?

How am I to decide? [*PI* II, xi, p. 204d]

670. But do I only see the picture in this aspect so long as I have this attitude toward it?--That can be said.

671. But couldn't one also say: "I always see it as that, so long as I never see it as anything else"?

672. [Ref. 'descriptive geometry', etc.] "He sees it three-dimensionally and therefore he knows his way about in the drawing as well as if he were operating in the three-dimensional model." But isn't the particular way he works within the drawing the criterion for his seeing it three-dimensionally? (For what do I know about his impression otherwise?)

673. But I don't see it as an animal only while I am saying this.

Neither does a body weigh something only when it is being weighed. (Conceptual determination.)

674. To me it's a lion. How long is it a lion to me?

675. But wait! Do I ever really say of an ordinary picture (of a lion) that I see it as a lion? I've certainly never heard that yet.†1

676. And yet here I've been talking about this kind of seeing!

677. I could say of one of Picasso's pictures that I don't *see* it as human. Or of many another picture that for a long time I wasn't able to see what it was representing, but now I do. Isn't this similar to: for a long time I couldn't hear this as of a piece, but now I hear it that way. Before, it sounded like so many little bits, which were always stopping short--now I hear it as an organic whole. (Bruckner.)

678. Would you understand it if I were to say "We *regard* the photograph, the picture on our wall, as people and other things depicted there"? [Cf. *PI* II, xi, p. 205e]

679. This need not have been so. We could easily imagine people who did not have this relation to our pictures. (Who, for example, would be repelled by our photographs because a face without colour is sinister and ugly.) [*PI* II, xi, p. 205f]

680. We don't say "I see this as a human being" of a conventional picture of a human being. "I see it as a..." goes together with... ("Goes together" in the technique of the <language-game>.)†2

681. I say: "We regard a portrait as a human being"--but when do we do so, and for how long? Always, if we see it at all (and do not, say, see it as something *else*)?

I might say yes to this, and that would determine the concept of regarding-as.--The question would be whether yet another concept of seeing-as is also of importance to us: a concept of seeing-as which only takes place while I am actually *concerning* myself with the picture as this object. [*PI* II, xi, p. 205g]

682. The concept of noticing. I can say that I sometimes notice the similarity of this picture to..., and some such thing; but I do not

say that I sometimes notice that this photograph is a face.

I could say: A picture does not always *live* for me while I am seeing it. [b: *PI* II, xi, p. 205h]

683. But now the question is: Is this "living" a kind of "seeing", or: what right would I have to call it "seeing"? What relationship is there between this concept and other visual concepts?

684. But, of course, we don't say that we 'see' the conventional picture of, say, a lion, *as* a lion.

685. "Her picture smiles down on me from the wall." It need not always do so whenever I see it. But this expression is also a justification for the other expression that I don't always 'see it that way'. [Cf. *PI* II, xi, p. 205h]

686. In giving all these examples I am not aiming at some kind of completeness, some classification of all psychological concepts. They are only meant to enable the reader to shift for himself when he encounters conceptual difficulties. [*PI* II, xi, p. 206a]

687. A child will say "Now it's a house"--this can be said even in the game where a chest is a house, in several different ways and situations. Someone enters the room while the game is going on; he is told "Now it's a house". This does not mean: "*Now* it's become a house for me", it doesn't mean the dawning of an aspect. In order for that to happen, the tone and the situation must be of a particular kind. Here again it's a case of fine differences of behaviour.

688. 'Fine shades of behaviour.'--When my understanding of a theme is expressed by my whistling it with the correct expression this is an example of such fine shades.

But even if "Now it's a house" does not express the *dawning* of an aspect, can't it be a report of the unchanging aspect? [a: *PI* II, xi, p. 207a]

689. "He quite forgets that it is a chest; for him it actually is a house." (There are definite tokens of this.) Wouldn't it also be correct to say of such a person that he *sees* it as a house? [*PI* II, xi, p. 206f]

690. And if you know how to play this game and, given a particular situation, you exclaimed with special expression†1 "Now it's a house!" your words would be expressing the dawning of an aspect. [*PI* II, xi, p. 206g]

691. But the expression in one's voice and gestures is the same as if the object had altered and had ended by *becoming* this or that. [*PI* II, xi, p. 206i]

692. I should like to say that what dawns here lasts only as long as I am occupied with the object in a particular way. ("See, it's looking!") (Noticing a family resemblance between this face and one which isn't here now.)--'I should like to say'--and is it so?--Ask yourself "For how long am I struck by a thing?" For how long do I find it *new*? [*PI* II, xi, p. 210d]

693. Would it be correct to say of the change of aspect in the rotating drum that there is no perception that the object *stays the same*? Because one really can be in doubt there as to whether the kind of motion changed.

694. You must remember that the descriptions of the changing aspects are of a different kind in each case. [*PI* II, xi, p. 207d]

695. For the sake of brevity I shall call the aspects 'black cross', 'white cross' the principal aspects of the double cross. Likewise I shall speak of the two principal aspects of the step.

There is a fundamental difference between these, and the aspect of the triangle as an overturned triangle, for instance.†2

696. The difference is contained in the description that one uses in reporting the aspect.

697. All experiences of aspect are expressed in the form: "Now I see it as *that*" or "Now I see it *so*" or "Now it is *this*--now *that*" or "Now I hear it as ...; I heard it before as ...". But the explanation of these '*that*'s' and '*so*'s' is very different from case to case.

698. Imagination is required to see a triangle as half of a parallelogram, but not to see the principal aspects of a double cross.

Page Break 89

699. The latter seem to be of a more fundamental nature than the former.

700. You can 'see the d<uck> and r<abbit> aspects' only if you are thoroughly familiar with the shapes of those animals; the principal aspects of the double cross could express themselves in primitive reactions of a child who couldn't yet talk.

701. --Those two aspects of the double cross (I shall call them the aspects *A*) might be reported simply by pointing alternately to an isolated white and an isolated black cross.

One could quite well imagine this as a primitive reaction in a child who cannot yet talk.

Thus in reporting the aspects *A* we point to a part of the double cross.

The duck and rabbit aspects could not be described in an analogous way. [*PI* II, xi, p. 207f]

702. You only 'see the duck and rabbit aspects' if you are already conversant with the shapes of those two animals. There are no analogous conditions for seeing the aspects *A*. [*PI* II, xi, p. 207g]

703. It is possible to take the duck-rabbit for the picture of a rabbit, the double cross for the picture of a black cross, but not to take the figure for the picture of something that has fallen over. To see this aspect of the triangle demands imagination. [*PI* II, xi, p. 207h]

704. Whoever *takes* the schematic cube for a cube sees it primarily as this cube even though he can later try to see it differently, and will sometimes succeed in so doing. (Compare with the double cross.)

705. The aspects *A* are not essentially three-dimensional. A black cross on a white ground is not necessarily a black cross lying on a white surface. You could teach someone this idea without ever showing him anything but black crosses painted on paper; assuming that the surroundings of these crosses were to change and that the cross was the *important* thing in the perception: If you have it copied, for example, it will always, or nearly always, be the cross that is copied, etc.

The aspects *A* are not connected with *illusion* in the same way as

Page Break 90

are the three-dimensional aspects of the schematic cube.†1 [Cf. *PI* II, xi, p. 208a]

706. I can imagine some arbitrary ciphher--this, for instance: to be a strictly correct letter of some foreign alphabet. Or again, as a faultily written one; and faulty in one or more of several ways: For example, it might be slap-dash, or typical childish awkwardness, or like the flourishes in a legal document. It could deviate from the correctly written letter in a variety of ways.--And I can see it in various aspects according to the fiction I surround it with. And here there is a close kinship with experiencing a meaning of an isolated word. [*PI* II, xi, p. 210c]

707. "I noticed the likeness between him and his father for maybe 5 minutes, and then no longer." One can say this if his face were changing and only looked like his father's for those 5 minutes. But it can also mean that his resemblance to his father struck me for only a few minutes, and then I forgot about it. [*PI* II, xi, p. 210f]

708. "I'm no longer struck by it"--but what happens when I am struck by it? Well, I look at the face with an expression of astonishment, not only in my mien, but maybe also in my words. But is that being struck by the likeness? No, these are the appearances of being struck; but these *are* 'what happens'. 'Being struck' is a different concept.--[Cf. *PI* II, xi, p. 211d]

Page 90

709. 'Thinking' and 'inward speech' (I do not say: "talking to oneself") are different concepts. [*PI* II, xi, p. 211f]

Page 90

710. Is being struck looking plus thinking? No. Many of our concepts *cross* here. [*PI* II, xi, p. 211e]

Page 90

711. "If you didn't *experience* the meaning of the words, then how could you laugh at puns?" [<In English> Hairdresser and sculptor.]†2--We do laugh at such puns: and to that extent we could say (for instance) that we experience their meaning.

Page Break 91

Page 91

712. Just think of the words exchanged by lovers! They're 'loaded' with feeling. And surely you can't just agree to substitute for them any other sounds you please, as you can with technical terms. Isn't this because they are *gestures*? And a gesture doesn't have to be innate; it is instilled, and yet *assimilated*.--But isn't that a myth?!--No. For the signs of assimilation are that I want to use *this* word, that I prefer to use none at all to using one that is forced on me, and similar reactions.

Page 91

713. For example, a word has come to carry a certain *tone* along with it; and I cannot, at the drop of a hat, simply utter another word with the same emotional tone.

Page 91

714. The likeness makes a striking impression on me, for example then the impression fades.

It only struck me for a few minutes, and then no longer did. [*PI* II, xi, p. 211d]

Page 91

715. What happened here? First I looked with a strange expression at the face, and if someone had asked me "Why are you looking at him with such interest?", I would have answered "Because he looks *so much* like his father". Perhaps he's talking to me, and I'm not really paying any attention to what he's saying because all the while I am thinking just about this similarity.--That is more or less what comes to my mind in response to the question what happened then.

Page 91

716. But there is a heterogeneous element in this answer: "and if someone had asked me...". For that isn't anything that 'happened' when I was struck by the similarity.--Indeed, my preoccupation is not even the same kind of thing as my facial expression.--So what is left is just my facial expressions, my gestures, and possibly the words that I say either to myself or to others.

Page 91

717. Being struck is related to thinking.

Page 91

718. What happened here?--What can I recall? My *own* facial expression comes to mind, I could reproduce it. If someone who knew me had seen my face he would have said "Something about his face struck you just now".--Words also occur to me, words which I say on such an occasion, out loud to myself. And that's all. And is this what being struck is? No. [*PI* II, xi, p. 211d]

Page Break 92

Page 92

719. To notice, to become aware of something, to turn one's attention to something.

Page 92

720. "Do you always *see* this leaf as *green* so long as you look at it, and the colour doesn't change for you?" Does this question have a clear meaning? An answer might be: "Well, I'm not saying 'Oh, how green it is!' the entire time."

Page 92

721. "Are you *conscious* of its colour the whole time?" My first reaction would be: "Certainly not!" But when and (for) how long am I conscious of it? I don't seem to be able to say much of anything about this; I don't know which criteria are to be applied here. Should I say: "Only as long as I *think* about it"?

Page 92

722. Someone tells me: "I looked at the flower, but was thinking of something else and was not conscious of its colour." Do I understand this?--I can imagine a significant context, say his going on: "Then I suddenly *saw* it, and realized it was the one which ...". [PI II, xi, p. 211b]

Page 92

723. But what about this answer: "If I had turned away then, and had been asked, I could not have said what colour it was"?

"He looked at him without seeing him." There is such a thing. But what is the criterion for it? Well, there is a variety of cases here. [PI II, xi, p. 211b]

Page 92

724. "Just now I looked at the shape rather than at the colour." Do not let such phrases confuse you. Above all, don't wonder "What can be going on in the eyes or brain here?" [PI II, xi, p. 211c]

Page 92

725. "The echo of a thought insight"--one would like to say. [PI II, xi, p. 212b]

Page 92

726. "The word has an atmosphere."--A figurative expression; but quite comprehensible in certain contexts. For example, the word "knoif" has a different atmosphere from the word "knife". †1 They have the same meaning, *in so far* as both are names for the same kind of objects.

But what is one to say here? *Do* they or *don't* they have the same meaning?

Page Break 93

Page 93

727. Should I now distinguish among so and so many kinds of meaning? I do *not* want to do that. This kind of classification could be useful for a particular practical purpose. Because for such a purpose one--out of the countless possible classifications--would be more suitable than another.

Page 93

728. A botanist classifies plants. But you don't need a system of classification to show somebody how multiform plants are and how diverse the fine distinctions among them are.

Page 93

729. I saw his face (in my mind's eye) as clearly as before--but I no longer noticed the similarity to the other one.

Page 93

730. Possibly the one similarity diminished for me and I became aware of another.

Page 93

731. Assume--as an aid to understanding--that as I look at his face, certain memories I have become more and less vivid, and that *this* is responsible for the change of aspect. Then should I still say that I *see* now one thing, now another?

Page 93

732. So is noticing a likeness seeing or isn't it? How am I to decide? Here we have dissimilar, yet related, concepts.

Page 93

733. By noticing the aspect one perceives an internal relation, and yet noticing the aspect is related to *forming an image*.

Page 93

734. It is only if someone *can do*, has learnt, is master of, such-and-such, that it makes sense to say *he* has had a certain experience. [PI II, xi, p. 209a]

Page 93

735. --So do we *see* timidity, or don't we?

The concept 'timid' can be used to describe what is visually perceived, just as the concept 'major' or 'minor' can be used to describe the melody I hear. [Cf. PI II, xi, p. 209b, c]

Page 93

736. How could I see that a facial expression was mean, frightened, brave, if I didn't know that it was an *expression*, and not the anatomy, of the animal?

But surely that only means that I cannot use *these* concepts to describe the object of sight, just because it has *more* than purely visual

Page Break 94

reference? Might I not for all that have a *purely* visual concept of, say, a frightened face? (In that case, I could use a different word.) [Cf. PI II, xi, p. 209b]

737. I must already know†1 a lot in order to describe someone's handwriting as "childish". But can I also say: "in order to *see* it as 'childish'"?

"Childish" can describe handwriting, and thus what I see, but 'childish' is not a purely visual concept.

738. Now it is correct to say: "We *could* have a purely visual concept which would be completely identical to the visual part of the concept 'vulgar' (for instance)"?

739. Such a concept would really be comparable with 'major' and 'minor', which certainly have emotional value, but can also be used purely to describe the structure of what is perceived. [PI II, xi, p. 209c]

740. So 'major' and 'minor' are compared here with 'acute-angled' and 'right-angled', for instance.

741. But wouldn't it also be correct to say that anyone who did not have our concepts of 'hesitant', 'childish', 'vulgar', could not *sense* the handwriting or the facial expression the way we do, even if he had a concept which was always applicable where 'hesitant', for example, is? So couldn't I say:†2 Both *see* the same thing, but they *sense* it differently? Just as both may hear something in a major key, but sense it differently.

742. Think of the expression "I heard a *plaintive* melody"! And now the question is: "Does he *hear* the plaint?" [PI II, xi, p. 209f]

743. And if I reply: "No, he doesn't hear it; he (merely) has a sense of it"--where does that get us? One cannot mention a sense-organ for this 'sense'.

Some would like to reply here: "Of course I hear it!"--Others: "I don't really *hear* it."--We can, however, establish differences of concept here. [PI II, xi, p. 209g]

744. (We can draw a conceptual border-line. But where does the idea of 'sensing' the vulgar, the frightening, etc., come from in the

first place?) We *react* to a hesitant facial expression differently from someone who does not recognize it as hesitant (in the *full* sense of the word).--But I do *not* want to say here that we *feel* this reaction in our muscles and joints.--No, what we have here is a modified concept of *sensation*. [PI II, xi, p. 209h]

745. But what is there here that is *sensation-like*?

746. "You must *sense* the sadness of this face." (While looking at a picture.)--

Whoever senses it often imitates the face with his own. He is impressed. The picture produces this effect in him. I could best compare this 'sensation' to the sensation of pain, which also has a characteristic expression within the repertory of facial expressions and gestures.

And yet it too is related to seeing because it (?) -- -- --

747. What is the expression, the criterion, for this sensation? Surely the way, for example, or the kind of *expression* with which someone will sing a melody he's just heard. Also, perhaps, the kind of face he has then. Or: what he will say about it. That is, the particular description he gives of it.

748. But the truth of the matter is: 'Wailing' is not a purely acoustical concept. But I can use it to describe what is purely acoustical. ("The steam whistle makes a wailing sound. ") The word "wailing" could also lose all of its non-acoustical relations and become a purely acoustical term. (As with the words <in English> "to travel" and "travailler", which were originally related to very painful things, a relation which they then lost.)

749. Now one could object to the term "*purely* acoustical".

Who says what the "purely" acoustical is?--Well, "purely acoustical" is a description that applies when you can reproduce exactly what you've heard, leaving all other relations out of it.

750. After all, I can describe a chair using the concept "style of Louis XIV", and I can contrast this with a description which takes note of the shape, colour, etc., by using drawings, etc., and does not refer to any historical period, or king, etc.

Page Break 96

Page 96

751. Suppose someone asked: "Do you *see* the style Louis XIV when you look at the chair?"

Page 96

752. It is hard to understand and to represent conceptual slopes.

Page 96

753. But we can answer the question, "What does a chair in the style of Louis XIV look like?"--or, "What does a plaintive melody sound like?"--Show me such chairs, sing me such melodies!

Page 96

754. The epithet "sad", as applied, for example, to the outline face, characterizes the grouping of lines in a circle. (Major, minor.) Applied to a human being it has a different, though related, meaning. (But this does *not* mean that a facial expression is *like* the feeling of sadness!) [PI II, xi, p. 209d]

Page 96

755. Think of this too: I can only see, not hear, red and green--but sadness I can also hear in his *voice* as much as I can see it in his face. [PI II, xi, p. 209e]

Page 96

756. Untangling many knots, that is the philosopher's task.

Page 96

757. This face is impudent, this face disgusts me, the smell is repulsive. Is repulsiveness part of the sensation of smell? How is this to be decided? One might ask, for instance: "Can two people have the *same* sensation of smell, but one of them find it repulsive, the other not?"--And what would the criterion for sameness be?--They could compare this smell with the same smells, for instance.--But here there is no accepted criterion.

So do I *see* the impudence? Yes and No. Both answers can be justified.

Page 96

758. You don't need any *knowledge* to find a smell repulsive.

Page 96

759. "Look, if you draw these lines the face turns sad." In what category does this sentence belong? How is it used? I once said that it was like a geometric proposition. But one could be of the opinion that it was a psychological, and therefore an empirical, proposition. (Comparable, for example, to: If you add these ingredients, the substance turns yellow.)

Page Break 97

Page 97

760. One might say to a child, for example, "Look, when you put these two stones together you get a circle".

Is he learning an empirical proposition? (Here I am purposely talking about a child, not an adult.)

Page 97

761. (Couldn't the sentence again fall 'between several games'?)

Page 97

762. That proposition would not have to be a geometrical one. Its purpose could be to confirm that the face composed of *these* lines *now* gives *me* the impression of sadness. But again, it could more or less play the role of a geometrical (timeless) proposition.

Page 97

763. One might say of someone that he was blind to the *expression* of a face. Would his eyesight on that account be defective?

That is, of course, not simply a question for physiology. Here the physiological is a symbol of the logical. [PI II, xi, p. 210a]

Page 97

764. 'He has the eye of a painter', 'the ear of a musician'.

Page 97

765. Now is it simply a conceptual shift if we refer to sensing an expression as seeing, just as we speak of marrying money? Is there merely a misunderstanding here, or a gradual sloping of the concept 'see'?

766. A person who had seen only *one* facial expression couldn't have the concept 'facial expression'. 'Facial expression' exists only within a play of the features. Someone who had only seen 'sad' faces could not *sense* them as sad.

767. But surely he could *see* them just as you and I do.--But the word "sense" still isn't unobjectionable.--What do I perceive via sensation? In addition to the so-called sadness of his facial features, do I also notice his sad state of mind? Or do I *deduce* it from his face? Do I say: "His features and his behaviour were sad, so he too was probably sad"?

768. I believe this question belongs here: Does 'sad music' make us *sad*? Yes and No, it seems. We make a sad face, for instance, or at any rate a face that *reflects* sadness.

769. One sees sadness insofar as one sees a person's sad facial expression, for instance, but surely one doesn't see the sad ring of his voice.

770. Indeed, we do see weeping. Now does a person who observes only the physiological phenomenon see it differently from a person who sees an expression of grief in it?--He *observes* it differently.

771. Indeed, I am inclined to ask: Do I have so much as an *excuse* to be talking about a different kind of 'seeing' there?

772. Well, what would indicate that he sees it differently? Only his attitude toward it.
And to be sure: Whoever observes differently also sees something different.

773. Suppose someone were to ask you quite straightforwardly and in all seriousness "Why do you say he *sees* it differently?" (What could you answer?)

First of all I'd be inclined to say "He is *looking* at something different", then maybe "He will draw different comparisons". Indeed, maybe even the very fact that the person is *not* crying or wailing makes his face look sadder.

774. I hear a melody completely differently after I have become familiar with its composer's style. Previously I might have described it as happy, for example, but now I sense that it is the expression of great suffering. Now I describe it differently, group it with quite different things.

775. If you feel the gravity of a tune, what are you perceiving? Nothing that could be explained by reproducing what you heard. [*PI* II, xi, p. 210b]

776. How could I recognize a facial expression if I didn't know that it was an expression, and not the anatomy of this animal?

How could I see sadness, gravity, cruelty in the face, without knowing that?

777. Imagine a physiological explanation of this experience. Let it be this: when we look at the figure, our eyes scan it repeatedly, always following a particular path. This path corresponds to a particular periodic movement of the eyeballs. It is possible to jump

from one such pattern to another and for the two to alternate (double cross). Certain patterns of movement are physiologically impossible, hence I cannot see the duck-rabbit as the picture of the head of a rabbit superimposed on the head of a duck, nor can I see the schematic cube as the picture of two interpenetrating prisms. And so on.--Let's assume that this is the explanation.--"Yes, now I know that it is a kind of seeing." You have now introduced a *new*, a physiological criterion for seeing. And this can screen the old problem from view, but not solve it.--The purpose of this remark is to bring before your view what happens when a physiological explanation is offered. The psychological concept hangs out of reach of this explanation. And this makes the nature of the problem clearer. [*PI* II, xi, p. 212c]

778. The question now obtrudes: Could there be human beings who could not see something *as something*?--Or: What would it be like if a person lacked this capacity? What sort of consequences would it have? Would this defect be comparable, say, to colour-blindness or to not having absolute pitch? We will (for now) call it "aspect-blindness"--and will next consider what might be meant by this. (A conceptual investigation.) [PI II, xi, p. 213f]

Page 99

779. Ought he therefore to be able to see the schematic cube as a cube, for example? It would not follow from that that he could recognize it as a representation (a working drawing, for instance) of a cube. But it would not jump from one aspect to the other. Question: Could he *take* it as a cube, as we do? If not, then that will not be called *blindness*.

He will have an altogether different relationship to pictures from ours. (And *these* kinds of deviations from the norm are easy to imagine.) [PI II, xi, pp. 213g-214a, b]

Page 99

780. Is he supposed to be blind to the similarity between two faces? And so also to their identity or approximate identity? I wouldn't want to say *this*.--We would call a person who couldn't perceive the identity of shapes "feeble-minded", not "blind". [Cf. PI II, xi, p. 213f]

Page 99

781. The aspect-blind man is supposed not to see the aspects A change. But is he also supposed not to recognize that the double cross contains a black cross? So if told "Show me figures containing a black cross among these examples" will he be unable to manage it?

Page Break 100

No, but he will simply not be supposed to say: "Now it's a black cross on a white ground!" [PI II, xi, p. 213f]

Page 100

782. We say that someone has 'the eye of a painter' or 'the ear of a musician', but anyone lacking these qualities hardly suffers from a kind of blindness or deafness.

Page 100

783. We say that someone doesn't have a 'musical ear', and 'aspect-blindness' is (in a way) comparable to this sort of inability to hear. [Cf. PI II, xi, p. 214c]

Page 100

784. The importance of the concept 'aspect-blindness' lies in the kinship of seeing an aspect and experiencing the meaning of a word. For we want to ask: "What are you missing if you do not *experience* the meaning of a word?"--If you cannot utter the word 'bank' by itself, now with one meaning, then with the other, or if you do not find that when you utter a word ten times in a row it loses its meaning, as it were, and becomes a mere sound.†1 [PI II, xi, p. 214d]

Page 100

785. The report "The word... was crammed full of its meaning" is used quite differently, has quite different consequences, from "It had the meaning...".

Page 100

786. "How does the chemist know that there is an Na atom at *this* point in the structure?"

Compare: "How does Mr N. know that there is an Na atom at *this* point, etc.?"--The answer could be: "A chemist told him that."

The question "How does the chemist know..." is the typical way the question about the *criterion* is expressed.

Page 100

787. Think here of a special kind of illusion which throws light on these matters.--I go for a walk in the environs of a city with a friend. As we talk, it comes out that I am imagining the city to lie on our right. Not only do I have *no* conscious reason for this idea, but some quite simple consideration was enough to make me realize that the city lies behind us. I can at first give no answer to the question *why* I imagined the city in *this direction*. I had *no reason* to think it. But

Page Break 101

though I see *no reason* still I seem to see or surmise certain psychological causes for it. In particular, certain associations and memories. For example, we are walking along a canal, and once before I had followed a canal which lay in the direction I had imagined. I might as it were psychoanalytically investigate the causes of my conviction. [PI II, xi, p. 215d]

788. "But what is this queer experience?"--Of course, it is not queerer than any other; it simply differs in kind from those experiences which we regard as the most fundamental ones, our sense-impressions, for instance. [PI II, xi, p. 215e]

789. But how is a person who feels that the city is located in this direction to express his experience correctly? Is it correct, for example, to say that he feels it? Should he really coin a new word for it? But then how could anyone learn this word? The *primitive* expression of the experience couldn't include it. He would probably be inclined to say "I feel as if I knew that the city lay over there". Well, the very fact that he says this, or something like it, in these circumstances is itself the expression of this singular experience.

790. The name, the picture of its bearer.

791. "I feel as if I knew the city lay over there."--"I feel as if the name Schubert fitted Schubert's works and his face." [PI II, xi, p. 215f]

792. An investigation is possible in connection with mathematics which is entirely analogous to the philosophical investigation of psychology. It is just as little a *mathematical* investigation as the other is a psychological one. It will *not* contain calculations, so it is not, for example, logistic. It might deserve the name of an investigation of the "foundations of mathematics". [PI II, xiv, p. 232b]

793. I say the word "march" to myself and 'mean' it at one time as an imperative, at another as the name of a month.†1 And now say "March!", and then "March *no further!*" Are you certain that the *same* experience accompanies the word both times? [PI II, xi, p. 215g]

794. A person imagining something could express himself primitively in this way: "I feel as if I see... before me".--Now can it be said that he is calling something "seeing" which actually is not seeing, but perhaps only something like it?

795. Given the two words "fat" and "thin"--would you rather be inclined to say that Wednesday was fat and Tuesday thin, or that Tuesday was fat and Wednesday thin? (I incline to choose the former.) Now have "fat" and "thin" some different meaning here from their usual one? They have a different use. So ought I really to have used different words? Certainly not that. I want to use *these* words (with their familiar meanings) *here*. Now I say nothing about the causes of this phenomenon. They could be, for instance, that when I was a child, I was taught by a fat teacher every Wednesday, by a thin one on Tuesdays. But that is a hypothesis. Whatever the explanation--the inclination is there.†1 [PI II, xi, p. 216c]

796. If you asked him "What do you really mean here by 'fat' and 'thin'?", he could only explain it in the usual way. He could not point to Tuesday and Wednesday and use *them* to clarify what he means. [PI II, xi, p. 216d]

797. Could one speak here of a 'primary' and 'secondary' meaning of a word?--In both cases the explanation of the word is that of its primary meaning. It can only have a secondary meaning for someone if he knows its primary meaning. That is, the secondary use consists in applying the word with *this* primary use in new surroundings. [Cf. PI II, xi, p. 216e]

798. To this extent one might want to call the secondary meaning 'metaphorical'.

799. But the relationship here is not like the one between 'cutting off a piece of thread' and 'cutting off someone's speech', for here one doesn't *have* to use the figurative expression. And if you say "The vowel e is yellow", the word yellow is *not* used figuratively.

800. Only children who know about real trains are said to be playing trains. And the word trains in the expression "playing

trains" is not used figuratively, nor in a metaphorical sense.

801. If a person says he is calculating in his head, is he not really calculating, does he mean something else by calculating? You could never explain to a person what is meant by "calculating in the head" if he hadn't already been taught the concept calculating.

802. Only by using the concept of calculation (in writing or out loud) can we get someone to grasp what "calculating in the head" means. [Cf. *PI* II, xi, p. 216f]

803. I could not explain to anybody the meaning of the command to read something silently, or the report that he had read it silently, if I hadn't first taught him the concept of reading out loud. And this impossibility is a logical one.

804. Only if someone has learned to calculate, on paper or out loud, can he be made to grasp, by means of this concept, what calculating in the head is. [*PI* II, xi, p. 216f]

805. But think of the pictures which show a face from the front and in profile at the same time. One might say: "That's not what a face looks like!" But one might also say: That is a misleading picture unless you let your eye roam so that you no longer see it as *one* picture, in the normal sense of the word, but as several pictures, each of which has its own application.

806. The brain looks like a writing, inviting us to read it, and yet it isn't a writing.

Suppose humans became more intelligent the more books they owned--suppose that were a fact, but that it didn't matter at all what the books contained.

807. Is scientific progress useful to philosophy? Certainly. The realities that are discovered lighten the philosopher's task, imagining possibilities.†1

808. "When these words were spoken I saw him in my mind's eye." Isn't that an experience? And yet the fact that I saw *him* can't have been in the picture that was in my mind's eye. So was there a picture *and* a thought there? And was the picture an experience, but not the thought?

809. We '*experience*' the *expression* of thought.

810. I can't call the thought an experience, for then I would have to say that this experience, for example, accompanies speaking.

811. "But how would you know that it was he whose picture was in your mind?"--I didn't know it. I said it.

812. If I say that I experience the expression of a thought then I must also understand "expression" as including *imagined* expression.

813. The *purpose* of a sign.--"If you want him to come, wave your hand *this* way." "If you want me to stop, make *this* sign."--Then we can speak, for instance, of a 'purpose' of negation (of the word "not")?

We could do this only if every sentence in which it is used had a purpose.--Still, we could talk of (the) purposes of the word "not".

814. And one could say, for instance: "non" and "ne" generally serve the same purposes, and also: "*This* word has virtually no purpose at all. You can manage quite well without it."

815. Someone, for example, who constructs an artificial language (Esperanto, Basic English) will select its words according to certain points of view, and we could in turn consider *our own* language from these points of view.

He might say, for instance,: "I won't allow *two* words, one for "walk", and one for "stride", since for all

important purposes *one* is enough." And therefore he might also say: "'walk' and 'stride' have essentially the *same* meaning."

Page 104

816. Language can be observed from various points of view. And they are reflected in the respective concepts of 'meaning'.

Page 104

817. "While this was going on I thought of *him*." What does thinking of *him* consist in? How would what happened then be changed if instead of thinking of THIS PERSON I had thought of someone else?

In general did I have to be able to mention a 'germ' which then grew into a verbal expression? No.

Page Break 105

Page 105

818. "Who did you mean when you spoke about 'a friend?'--"I meant...." As you were saying these words, what happened which turned them into an allusion to *this* man? Nothing happened which turned them into it. For even if I had had a picture of him in my mind while I was speaking, complete with details (or whatever you want to substitute for this picture), that wouldn't have accomplished any more than if I had looked at him when I was speaking. And looking at him is not the same as meaning him. There are *signs* which show that I meant *him*, and a glance could have been such a sign. An idea too is no more than such a sign.

Page 105

819. Compare the question "What happened when in saying this word you thought of him?" with "What happened when you suddenly knew how to go on?"

Page 105

820. Meaning is not a process which accompanies words. For no '*process*' could have the particular *consequences* of meaning. [*PI* II, xi, p. 218d]

Page 105

821. If the words "my friend" meant him, would I necessarily have to think of him as I was uttering them? What is the difference? But there is a difference between "I meant him when I said the word" and "He came to mind when I said the word".

Page 105

822. There are important accompanying phenomena of talking which are often missing when one talks without thinking. But these are not the thinking. [*PI* II, xi, p. 218e]

Page 105

823. I thought about *this* man--but certainly not about all of his aspects.

Page 105

824. The garden of this aunt of mine was in my mind. I saw part of it in my imagination, but not the fact, for example, that it belonged to this woman.

There was something like a sign there, which I then interpreted in *this way*. Or did I *read* it?

No, it isn't reading, but neither is it interpreting.

Page 105

825. "Now I know!" What went on here?--So *didn't* I know when I declared that now I knew?

You are looking at it wrong.

(What is the signal for?) [*PI* II, xi, p. 218f]

Page Break 106

Page 106

826. And could the 'knowing' be called an accompaniment of the exclamation? [*PI* II, xi, p. 218f]

Page 106

827. (The germ could have been a word or an image-picture or various other things.)

Page 106

828. "The word is on the tip of my tongue." What is going on in my consciousness? That is not the point at all. Whatever did go on was not what I meant by those words. It is of more interest what went on in my *behaviour*. What I said, which pictures I used, my facial expression.--"The word is on the tip of my tongue" is a verbal expression of what is also expressed, in a quite different way, by a particular kind of behaviour. Again, ask for the primitive reaction that is the basis of the expression. [Cf. *PI* II, xi, p. 219c]

Page 106

829. Intention is not expressed in mien, gesture, or voice, but resolve is.

Page 106

830. For many words philosophers devise an *ideal* use, which then turns out to be worthless.

Page 106

831. "I know..." usually means "I have ascertained that...". Nobody says he has ascertained that he has two hands.

Page 106

832. I know how to ascertain that I have two coins in my pocket. But I cannot ascertain that I have two hands, because I cannot doubt it.

Page 106

833. But what is the meaning of "ascertain something"? To understand this you have to run through some simple language-games with this word.--How does someone ascertain in language-game 8†1 that there are a certain number of tiles over there? How does one ascertain that $6 + 6 = 12$? Etc.

Page 106

834. We say "I know..." where there can be doubt, whereas philosophers say we know something precisely where there is no doubt, and thus where the words "I know" are superfluous as an introduction to the statement.

Page 106

835. The same thing is true here as with the syllogism "All men are

Page Break 107

mortal; Socrates is a man; etc." It is not clear how and under what circumstances this could be used.

Page 107

836. How could the visual impression of someone reading a printed page, for example, be described?

Page 107

837. "Yes, now I know what 'tringling' is." (He has perhaps had an electric shock for the first time.)--If he feels the same thing another time maybe he'll look for the same events to go with it. Tringling teaches him about the external world. Does remembering teach us in the same way that a certain event took place in the past?--Then we would have to *connect it up* with past events. (Photography and fashions.) Whereas it is really the *criterion* for the past. [Cf. *PI* II, xiii, p. 231c]

Page 107

838. And how will he know again in the future what remembering feels like? [*PI* II, xiii, p. 231c]

Page 107

839. How does he know that *this* feeling is 'remembering'? Compare "Yes, now I know what 'tringling' is" (he has perhaps had an electric shock for the first time). Does he know that it is memory because by means of it he recognizes the past? And how does he know what the *past* is? Man learns the expression of the past by remembering. [*PI* II, xiii, p. 231c]

Page 107

840. On the other hand one might speak, for example, of a feeling "Long, long ago", for there is an expression of voice and mien which goes with narratives of past times. [*PI* II, xiii, p. 231c]

Page 107

841. James is really trying to say: "What a remarkable experience! The word is not there yet, and yet in a certain sense is there, or something is there, which *cannot* grow into anything but this word."--But this is not experience at all. The words "It's on the tip of my tongue" are not the expression of an experience and James merely gives them this strange interpretation. [Cf. *PI* II, xi, p. 219d]

Page 107

842. They express an experience no more than the words "Now I've got it!"--We use them in *certain situations* and they are surrounded by behaviour of a special kind, even by some characteristic experiences. In particular they are frequently followed by *finding* the word. (Ask yourself: "What would it be like if human beings *never*

Page Break 108

found the word that was 'on the tip of their tongue?") [*PI* II, xi, p. 219e]

Page 108

843. Here, as in many related cases, there is something we might call a *germinal experience*: an image, a sensation, which *grows* little by little into a full-fledged explanation. And one feels inclined to say that it is a *logical* germ, something which had to develop the way it does out of *logical* necessity.

On a particular occasion I suddenly think of a certain person. How did it happen?--I saw a picture before me, maybe only grey hair then I said, I see N. before me (but it is still possible that many other people have that name).--But then I explain I meant *that* N. who..., etc.--Moreover, I didn't *read* the name in the mental image, and neither did I subsequently *interpret* it thus and so. For if I'm asked whether it was only later that I knew or decided

to whom the grey hair and the name N. belonged, then I shall say no, that I knew it from the beginning. But knowing is not an experience.--"I knew it from the beginning" really only means: I didn't read the name off the picture, for I didn't think "Whose hair is this?" or "Who looks like that?"--nor did I say to myself "For now, let's let the name 'N' stand for *this* person". It could be said that I became more and more explicit.

But then where does the idea of the logical germ come from? Which really means: Whence the idea that "Everything was already there from the beginning and was contained in the initial experience"? Isn't the reason for this similar to James's claim that the thought is already complete when the sentence begins? This treats the intention like an experience. [c: cf. Z 1]

Page 108

844. I advance from explanation to explanation. But I only seem to say what was there from the beginning. Of course. For "It hasn't been there from the beginning" would be wrong.

"The thought is *not* complete from the very beginning" means: I didn't find out or decide until later what I wanted to say. And *that* I do *not* want to say.

Page 108

845. To be sure, the impression that this experience is a germ results from a logical process. It does become a germ, *in a logical sense*. As a result of a logical interpretation.†1

Page 108

846. Couldn't I also say this: It is completely irrelevant that the grey hair was present in my mind first, and then the name. I could just as well have thought of the name first.

Page Break 109

Page 109

847. From the very beginning I knew who it was. "I didn't know it from the very beginning" would mean: I didn't find it out until later. And that's certainly not the way it was.

Page 109

848. When I'm writing, walking, eating, talking, gazing here and there (normally), I no more *try* to perform these actions than the face of an old friend '*strikes* me as familiar'.

But attempting, deciding, are *acts* of volition, the ways in which the will manifests itself to us; they are what we think of when we speak of the will.

Page 109

849. (Similarly, I think, it could be said: A multiplication is not an experiment, for no experiment could have the peculiar consequences of a multiplication.) [*PI* II, xi, p. 218d]†1

Page 109

850. But doesn't the word that *occurs* to you somehow 'come' in a special way? Just attend and you'll see!--Careful attention is no use to me. All I could discover with it would be what is now going on in me.

And how can I pay attention to it at all while I am philosophizing? To do this, I would have to wait until a word occurred to me (once) again. This, however, is the queer thing: it seems as though I do not have to wait on such an occasion. As if I could give myself an exhibition of it, even if it doesn't really happen to me. How?--I *act* it.--But what can I learn in this way? What do I mimic?--Gestures, faces, a tone of voice. (This remark can be applied quite generally.) [*PI* II, xi, p. 219a]

Page 109

851. -- -- -- *Interpreted* as experience, it does indeed look odd. (As does 'meaning' interpreted as the accompaniment of speech, or like - 1 interpreted as a cardinal number.)†2 [*PI* II, xi, p. 219d]

Page 109

852. Silent speech 'within' is not a half-hidden phenomenon, one that is difficult to see clearly,†3 and which we must now strive to see more clearly, saying as much about it as we know.--It is not hidden *at all*, but the concept is confusing.†4

Page Break 110

Page 110

We can call it an articulated event: for it takes place within a *stretch of time*, and can *accompany* an 'outer' event.

(The question whether movements of the larynx, etc., occur always or mostly in connection with internal speech may be of great interest, but not for us.) [a, c: *PI* II, xi, p. 220a]

Page 110

853. I should not say "speaking silently to myself", for one can speak internally without speaking to oneself.

Page 110

854. Imagine *this* game--I call it "tennis without a ball": The players move around on a tennis court just as in tennis, and they even have rackets, but no ball. Each one reacts to his partner's stroke as if, or more or less as if, a ball had caused his reaction. (Manoeuvres.) The umpire, who must have an 'eye' for the game, decides in questionable cases whether a ball has gone into the net, etc., etc. This game is obviously quite similar to tennis and yet, on the other hand, it is *fundamentally* different.

Page 110

855. But there is a difference here: Only someone who can *speak* can speak in his imagination. Because part of speaking in one's imagination is that *what* I speak silently can later be communicated.--On the other hand, tennis without a ball could (theoretically) be learned by someone who wasn't familiar with the other kind of tennis. [Cf. *PI* II, xi, p. 220b]

Page 110

856. "But speaking silently is surely a certain activity which I have to learn!" Very well; but what is 'doing' and what is 'learning' here?

Let the use of words teach you their meaning! [*PI* II, xi, p. 220c]

Page 110

857. "So I don't *really* calculate when I calculate in my head?!" After all, you yourself distinguish between calculation in the head and perceptible calculation! And you can't have the former concept if you don't have the latter, and you can only learn the former activity by learning the latter. (Their concepts are as closely related and as distantly separate as the concepts of a cardinal number and a rational number.) [*PI* II, xi, p. 220d]

Page 110

858. You could learn to calculate *in your head* to the beat of a metronome. [Cf. *PI* II, xi, p. 220b]

Page 110

859. Not every creature that can express fear, joy, or pain can *feign* them.

Page Break 111

Page 111

860. It might be like this: An eye can smile only *in a face*, but only in the entire figure can it ---

Page 111

861. It takes a very specific context for something to be an expression of pain; but the pretence of pain requires an even more far-reaching particular context. [Cf. Z 534]

Page 111

862. For pretence is a (certain) pattern within the weave of life. It is repeated in an infinite number of variations.

A dog can't pretend to be in pain, because his life is too simple for that. It doesn't have the joints necessary for such movements.

Page 111

863. But you can portray a pretender on the stage. So there is such a thing as an appearance of pretence, and it is much more complicated than the appearance of suffering, for instance. Otherwise pretence could never be exposed.

Page 111

864. It is conceivable that one might consciously do one's calculating in one's larynx, as one can calculate on one's fingers, for example. Then do you want to say that it is *deception* when they imagine they *hear* themselves speak inwardly, or again a mere trick of language? [Cf. *PI* II, xi, p. 220e]

Page 111

865. The hypothesis that certain physiological events take place when we speak silently is only of interest to us in that it points to a possible use of the report "I said silently to myself..."; namely, that of inferring the physiological process from the expression. [Cf. *PI* II, xi, p. 220f]

Page 111

866. What does a child have to learn before he can pretend?

Well, for example, the use of words like: "He thinks I'm feeling pain, but I'm not."

Page 111

867. A child discovers that when he is in pain for instance, he will get treated kindly if he screams; then he screams, so as to get treated that way. *This* is not pretence. Merely one root of pretence.

Page 111

868. A child has to learn all sorts of things before he can pretend. [Cf. *PI* II, xi, p. 229b]

Page 111

869. He has to learn a complicated pattern of behaviour before he can pretend or be sincere.

870. A dog cannot be a hypocrite; but neither is it sincere. [*PI* II, xi, p. 229b]

871. A child also leans to mimic pain. He learns the game: acting as if you were in pain.

872. "Once a child knows what pain is, naturally he knows that it can be feigned."

873. "... And one day the child *believes* something." Why is that wrong? "One day he says 'I believe...'" is right. "Today for the first time he believed something." Well, what's involved in that?--today simply was the first time *that* occurred within him.--But how did it become manifest? Well, today for the first time he said "I believe she's in pain". But that's not enough. So I must assume that in what followed he showed that he hadn't simply repeated somebody's words. In short, that his utterance was the beginning of a game, and that he was able to *continue* with it. Today, so it seemed, the game had become clear to him.

But how can a language-game suddenly become clear to a child? God only knows.--One day it starts *doing* something. An analogue might be the child learning a board game which he sees played daily.

874. He not only learns the use of the expression "to be in pain" in all of its persons, tenses, and numbers, but also in connection with negation and the verbs of opinion. For: believing, doubting, etc., that someone is in pain are the natural ways we behave toward others. (He learns "I believe he is in...", "He believes I am in...", etc., etc.--but *not* "I believe I'm in.")

(Does space have a gap there? No, it only seems to.)

875. Does the word 'pain' change its meaning in this process?

876. 'Feigning' poses no problem with the concept of pain. It makes it more complicated. (Use of money.)

877. The *uncertainty* whether someone else... is an (essential) trait of all these language-games. But this does not mean that everyone is hopelessly in doubt about what other people feel.

878. The parts of a machine are elastic, indeed, flexible. But does this mean that there really isn't any mechanism at all, since the parts of the machine function as if made of butter?

(And now think of mechanisms, say clock-works, made of materials which are far more flexible still than ours, so that the movements would be strangely irregular--would a mechanism like that have to be useless, or couldn't it actually be used?)

(And, of course, it is not because they are *practical* that we have the concepts we do. Or at most only a few of them exist for this reason.) [c: cf. Z 700]

879. Imagine that uncertainty is introduced into a game! That could happen in many different ways. Imagine this: [tennis without a ball]. If you found this game played, would you say that it wasn't a game at all? Well, compared to our games it would be of a far different sort. <In English> (It takes many kinds...)

880. That what someone else says to himself is hidden from me, unless he tells it to me, is part of the *concept* 'inner speaking'. Only "hidden" is the wrong word here; for if it is hidden from me it ought to be apparent to him, he would have to *know* it. But he does not 'know' it, even though my doubt does not exist for him. [*PI* II, xi, pp. 220g-221a]

881. "I know what I want, wish, believe, hope, see, etc., etc." (through all the psychological verbs) is either philosophers' nonsense or at any rate *not* a judgment *a priori*. [*PI* II, xi, p. 221c]

882. "I know..." may mean "I do not doubt..."--but does not mean that the words "I doubt" are *senseless*†1 here, that doubt is logically excluded. [*PI* II, xi, p. 221d]

883. One says "I know..." where one can find out. [*PI* II, xi, p. 221e]

Page 113

884. It is possible to imagine a case in which I could find out that I had two hands. Normally, however, I could *not* do so. "But all you need is to hold them up before your eyes."--If I could doubt *now* that I have two hands, then I wouldn't have any reason to believe my *eyes*. (I might just as well ask a friend.) [*PI* II, xi, p. 221f]

Page 113

885. "*His* pains are hidden from me" would be like saying "These sounds are hidden from my eyes."

Page Break 114

Page 114

886. The uncertainty in which all his behaviour leaves me as to what is in his soul. But does it always leave me uncertain?

Page 114

887. "To be sure, this uncertainty isn't always subjective, but sometimes *objective*." (But what does that mean?)

Page 114

888. 'Objective uncertainty' is an indefiniteness in the nature of the game, in the admissible evidence.

Page 114

889. "What he says inwardly is hidden from me" might, of course, also mean that I can for the most part not *guess* it, nor can I deduce it from, for example, the movements of his throat (which would be a possibility). [*PI* II, xi, p. 221b]

Page 114

890. I am, however, disregarding forms of expression such as "Only you can know what's going on inside you". †1 If you were to bring me up against the case of people's saying "But I must know whether I am in pain", "Only you can know what you are thinking", and other things, you should consider the occasion and purpose of such phrases. †1 ("War is war" is not an example of the law of identity either.) [Cf. *PI* II, xi, p. 221e]

Page 114

891. Am I less certain that this man is in pain than that $2 \times 2 = 4$? Does this show the former to be *mathematical* certainty?--'Mathematical certainty' is not a *psychological* concept. [*PI* II, xi, p. 224e]

Page 114

892. The *kind* of certainty is the kind of language-game. [*PI* II, xi, p. 224e]

Page 114

893. There are two different facts here: One, that in general I foresee my actions with greater accuracy than anyone else; the other, that my prediction is not founded on the same evidence as someone else's, and that it allows for different conclusions. [Cf. *PI* II, xi, p. 224b] †2

Page 114

894. It is not important that I *know* events in my mind, *this* is not the reason *I* am asked about my motives. The reason rather is that here the evidence for and the consequences of the statement are different sorts of things.

Page Break 115

Page 115

895. "The physicist calculates because paper and ink are more reliable than his apparatus."

Page 115

896. Let us assume there was a man who always guessed right what I was saying to myself in my thoughts. (It does not matter how he does it.)--But what is the criterion for his guessing *right*? Well, I am a truthful person and I confess that he has guessed right.--But might I not be mistaken, could my memory not deceive me? And may it not always do so anyway when--without lying--I express what I have thought within myself? -- -- -- But now it does appear that my knowing 'what went on within me' could not be the point at all. (Here I am drawing a construction-line.) [*PI* II, xi, p. 222e]

Page 115

897. The criteria for the 'truthful' confession that I thought such-and-such are not the criteria for the description of a past process. And the importance of the truthful confession does not reside in its rendering some process correctly and certainly. It resides rather in the special indications of subjective truth and in the special consequences of the truthful confession. †1 [*PI* II, xi, p. 222f]

Page 115

898. (Assuming that people's dreams can yield important information about the dreamer, what yielded the information would be truthful accounts of dreams. The question whether the dreamer's memory sometimes, often,

or always deceives him cannot even arise, unless indeed we introduce a completely new criterion for the 'correctness' of the account of a dream.) [Cf. *PI* II, xi, pp. 222g-223a]

Page 115

899. A child who learns the first primitive verbal expression for its own pain--and then begins (also) to talk about his past pains--can say one fine day: "When I get a pain the doctor comes". Now has the word "pain" changed its meaning during this learning process? Yes, its use has changed.

But doesn't the word in the primitive expression and the word in

Page Break 116

the sentence refer to the *same* thing, namely, the same feeling? To be sure; but not to the same technique.†1

Page 116

900. I can utter or write down a sentence which expresses an intention (in the first person). Let the sentence be: "In two minutes I shall raise my left arm." But still there is a difference between that really being my intention and my merely jotting it down just then as a sample sentence.

Page 116

901. After all, from a person's behaviour you can draw conclusions not only about his pain but also about his pretence.

Page 116

902. One form of guessing thoughts: One person is putting a jigsaw puzzle together, the other person can't see him, but from time to time he says: "Now he can't find something", "Now he's thinking 'I wonder where I've seen a piece like that?'", "Now he's very happy with himself", "Now he's thinking 'Now I know how it fits!'", "Now he's thinking 'It doesn't quite fit'"--but the first person need not be talking out loud or to himself at the time. [Cf. *PI* II, xi, p. 223b]

Page 116

903. All this is guessing at thoughts, and the fact that it does not actually happen does not make thought any more hidden than the unperceived physical proceedings. [*PI* II, xi, p. 223c]

Page 116

904. It is possible to imagine a guessing of intentions, like the guessing of thoughts, but also a guessing of what someone is actually *going to do*.

To say "He alone can *know* what he intends" is nonsense. To say "He alone can know what he will do" is wrong. For a prediction contained in the expression of intention (for example, "When it strikes five I am going home") may not come true, and I may know what he will actually do. [*PI* II, xi, pp. 223i-224a]

Page 116

905. Two things, however, are important. That in many cases he will not be able to foresee my actions where I do foresee them because of my intentions. And that the prediction that is contained in the expression of my intention has not the same foundation as another person's prediction of what I shall do, and (that) the consequences of these predictions are different.†2 [*PI* II, xi, p. 224b]

Page Break 117

Page 117

906. We should sometimes like to call belief and certainty tones, colourings, of thought: and indeed, frequently they actually are expressed in the *tone* of the voice. But do not think of them as 'feelings' which accompany our words.†1 [*PI* II, xi, p. 225b]

Page 117

907. Would it be correct to say that the language-game of stating someone's motive is the same as stating the cause, but not when the statement is made by the person who is confessing his motive?

Page 117

908. What is the difference between motive and cause?--How is the motive *discovered*, and how the cause?
[Remark about the 'methods' of measuring length.] [a: *PI* II, xi, p. 224i; b: cf. *PI* II, xi, p. 225a]

Page 117

909. We remain unconscious of the prodigious diversity of all of our everyday language-games because the outward forms of our language make everything alike. [Cf. *PI* II, xi, p. 224h]

Page 117

910. Suppose some people were discussing the weather; and one person says "The sky's yellow in the west, that's a good sign. The weather will stay good." And he acts accordingly. Someone else says "No. The sky is grey in the north. I'm convinced it will rain"--and he acts accordingly. A third person has different criteria again for his

prognosis, etc., etc. All of these people, after all, can be *certain* of themselves. And this certainty will be expressed in their actions. Indeed, instead of listing criteria at all, couldn't they have simply looked at the sky and said: "I'm under the *distinct* impression that it will ..."?

Page 117

911. Then: Several people are looking at a sick person (or someone who is acting as if he is sick); one of them has the impression that he really is sick, another the opposite impression; each one says a) he has the distinct impression that ..., and acts accordingly, b) gives reasons for this impression, but reasons which are only reasons for *him*.

"What goes on when someone has the impression...?"--Nonsense! What if people simply said: "I bet... that he is sick", "I bet... that he is pretending"?

Page 117

912. Now if I believe that someone is feigning pain then I do not just believe that he isn't feeling any. Here there is a definite *suspicion*.

Page Break 118

Page 118

I want to say: If *natural* human attitudes toward someone who is expressing pain are *various*--one cool and indifferent, another sympathetic, etc.--then *that* in itself would not mean that someone thought that the person was *pretending*.

Page 118

913. What does someone mean when he says "I think he's pretending"?--Well, he's *using a word* which is used in such-and-such situations. Sometimes he will continue the game by making conjectures about the other person's future behaviour; but that doesn't have to happen.

There's some behaviour and some conversation taking place. A few sentences back and forth; and a few actions. That might be all.

[Words have meaning only in the stream of life.]†1

Page 118

914. It strikes me like this: it's as if an empty chess-board were lying around somewhere, and next to it there were some chessmen. Then a few people drop by, and maybe one of them places two or three figures on the board and so does the other; one of them makes a move, a counter-move follows, and all the while they're making faces or saying things like "That was stupid!", "There you are!", etc. and then they stop. The whole thing would be impossible if they couldn't *play chess*; but what happens is a fragment, or a possible fragment, of a chess game.

Page 118

915. Now compare an 'expert judgment' with those judgments about the weather.

The former is of value for somebody other than the person making the judgment--the latter is only an expression of the opinion of the person who is making the judgment; to be sure, this expression may because of this have an effect on others. The language-games are different.

Page 118

916. And, of course, there are also transitions here.

Page 118

917. One could ask: "Is there such a thing as 'expert' judgment about the genuineness of expressions of feelings?" And the answer would be: Even *here*, there are what we call 'those with better' and 'those with worse judgment'. [Cf. *PI II*, xi, p. 227h]

Page Break 119

Page 119

918. But there is no such thing, for example, as a special examination on knowledge of mankind.

(What would it be like if there were?) [Cf. *PI II*, xi, p. 227h]

Page 119

919. But how does it get shown that someone's judgment is correct? That's *difficult* to say. I could cite several things; but they would only be bits and pieces of a description.

Page 119

920. One can also convince somebody that another person is in such-and-such a mental state by *evidence*.†1

And yet there is no special study here. [Cf. *PI II*, xi, p. 228b]

Page 119

921. How about this: you can set up *certain* rules, but only a few, which are of such a kind that a person usually

learns them through experience anyway--but what if what is left, the most important part, is *imponderable*??

Page 119

922. What does "imponderable evidence" mean? (Let's be honest!) [Cf. *PI* II, xi, p. 228c, d]

Page 119

923. I tell someone that I have reasons for this claim or proofs for it, but that they are 'imponderable'.

Well, *for instance*, I have seen the look which one person has given another. I say "If you had seen it you would have said the same thing". [But here there is still some unclarity.] Some other time perhaps, I might get him to see this look, and then he will be convinced. That would be *one* possibility.

To some extent I do predict behaviour ("They'll get married, she'll see to that"), and to some extent I don't.

Page 119

924. The question is: What does imponderable evidence *accomplish*? What entitles one to call it "evidence"?

(Compare the case of the weather forecaster with that of someone who is judging whether another person is suffering.) [Cf. *PI* II, xi, p. 228c]

Page 119

925. An important fact here is that we learn certain things only through long experience and not from a course in school. How, for instance, does one develop the eye of a connoisseur? Someone says, for example: "This picture was not painted by such-and-such a master"--the statement he makes is thus not an aesthetic judgment,

Page Break 120

but one that can be proved by documentation. He may not be able to give good reasons for his verdict.--How did he learn it? Could someone have taught him? Quite.--Not in the *same* way as one learns to calculate. A great deal of *experience* was necessary. That is, the learner probably had to look at and compare a large number of pictures by various masters again and again. In doing this he could have been given *hints*. Well, that was the process of *learning*. But then he looked at a picture and made a judgment about it. In most cases he was able to list reasons for his judgment, but generally it wasn't *they* that were convincing.

Page 120

926. Look at *learning*--and the *result* of learning.

Page 120

927. A *connoisseur* couldn't make himself understood to a jury, for instance. That is, they would understand his statement, but not his reasons. He can give intimations to another connoisseur, and the latter will understand them.

Page 120

928. But am I trying to say some such thing as that the certainty of mathematics is based on the reliability of ink and paper? *No*. (That would be a vicious circle.)--I have not said *why* mathematicians do not quarrel, but only *that* they do not. [*PI* II, xi, p. 226b]

Page 120

929. It is no doubt true that you could not calculate with certain sorts of paper and ink, if, that is, they were subject to certain queer changes, but still the fact that they changed could in turn only be got from memory and comparison with other means of calculation. And surely these in turn cannot be tested against something else.†1 [*PI* II, xi, p. 226c]

Page 120

930. Does it make sense to say that people generally agree in their judgments of colour?? What would it be like for them not to? One person would say a flower was red, which another took to be blue, etc.--But what right should we have to call these people's words "red" and "blue" *our* colour-words? Why should we say that they have the same meaning? We can say the one thing or the other.

Now the concept is changed and there are reasons for still calling it the same, as well as reason not to. [Cf. *PI* II, xi, p. 226e]

Page Break 121

Page 121

931. But what about this: "Generally people don't argue about their colour-judgments"? There is such a thing as 'colour-blindness' and there are ways of determining it.

Isn't that a sentence about the *concept* of colour-judgment? [Cf. *PI* II, xi, p. 227d]

Page 121

932. If there were no agreement in colour-judgments, how would human beings even learn to use the words for colours? What right should we have to call the usage they learn that of 'colour names'?

But, of course, there are transitions here.

Page 121

933. And this consideration must apply to mathematics. If our mathematical certainty did not exist, then neither would human beings be learning the same technique which we learn. It would be more or less different from ours, up to the point of unrecognizability in borderline cases. [*PI* II, xi, p. 226f]

Page 121

934. "But mathematical truth is independent of whether human beings know it or not!"--Certainly: "Human beings believe that $2 \times 2 = 4$ " and " $2 \times 2 = 4$ " do not mean the same thing. The latter is a mathematical proposition; the other, if it makes sense at all, may perhaps mean: human beings have arrived at the mathematical proposition. The two propositions have entirely different *uses*.--But what would *this* mean: "Even if everybody believed that $2 \times 2 = 5$ it would still be 4!"?--For what would it be like for everybody to believe that? Well, I could imagine that there was a different calculus. Would it be *wrong*? Is a coronation *wrong*? Useless at most. And maybe not even that. [*PI* II, xi, pp. 226g-227a]

Page 121

935. Of course, in one sense mathematics is a branch of knowledge, but still it is also an activity. And a 'false move' can only exist as the exception; for if what we now call by that name became the rule the game in which it was a false move would cease. [*PI* II, xi, p. 227b]

Page 121

936. 'Imponderable evidence' includes subtleties of tone, of glance, of gesture.

Isn't it really as if here one were looking at the workings of the nervous system? For I would very much like my feigned gesture to be exactly like the real one, but *in spite of everything* it is not the same. [a: *PI* II, xi, p. 228d]

Page Break 122

Page 122

937. I can recognize a genuine loving look, distinguish it from a pretended one. And yet there is no way in which I can describe it to someone else. If we had a great painter here, he might conceivably represent a genuine and a simulated look in pictures, or this kind of a representation could be imagined in a film, and perhaps a verbal description based on it. [Cf. *PI* II, xi, p. 228d]

Page 122

938. Ask yourself: How does a man learn to get a 'nose' for something? And how can this nose be used? [*PI* II, xi, p. 228e]

Page 122

939. What right do we have to say that a child has to learn some things before it can pretend? (... before it can make a mistake in calculating.)

Page 122

940. Someone says of his child "Today he pretended for the first time". That is quite imaginable. But not the statement "Today he was sincere for the first time"--although it can't be said of a newborn that it is sincere. And yet one *can* say "My child is already definitely sincere".

Page 122

941. So if you ask "What does a child have to learn *to be able* to be sincere?" your answer may be something like: "It must have realized that insincerity is bad"--or perhaps an answer that describes the inner life of the child, the inner requisites.

Page 122

942. Neither is the newborn child capable of being malicious, friendly, or thankful. Thankfulness is only possible if there is already a complicated pattern of behaviour.

If a figure consists of only three straight lines it can be neither a regular nor an irregular hexagon.

Page 122

943. Of course, normally only those who can talk are called sincere. And, although it does not follow from this that the concept 'sincere' is *inapplicable* where there is no speech, still this concept cannot be applied there without some difficulty.

Page 122

944. To be sure, an adult can pretend or he can be sincere without saying a word, but by using facial expressions, gestures and inarticulate sounds.

Page Break 123

Page 123

945. Imagine a newborn child who, of course, couldn't speak, but who had the play of features and gestures of an

adult!

Page 123

946. Feigning and its opposite exist only when there is a complicated *play of expressions*. (Just as false or correct moves exist only *in a game*.)

Page 123

947. And if the play of *expression* develops, then indeed I can say that a soul, something *inner*, is developing. But now the inner is†1 no longer the cause of the expression.†2 (No more than mathematical thinking produces calculations, or is the impetus behind them. And this is a remark about concepts.)

Page 123

948. Only in a quite particular musical context is there such a thing as three-part counterpoint. [C & V, p. 82]

Page 123

949. Suppose someone were to hide his intention by hiding a written plan.

Page 123

950. 'Pain is what is important--the complaining is unimportant.'--Well, I want him to take notice of my pain, not of my plaintive cries. And how does he take notice of my pain?

Page 123

951. It looks like this: there is something inner here which can be inferred only inconclusively from the outer. It is a picture and it is obvious what justifies this picture. The apparent certainty of the first person, the uncertainty of the third.

Page 123

952. There is no clear border separating sufficient from insufficient evidence. And yet there is evidence here.

Page 123

953. Our judgment of the cases *fluctuates*, just like our natural attitude toward other people.

Page 123

954. Tender expression in music. It isn't to be characterized in terms of degrees of loudness or tempo. Any more than a tender facial expression can be described in terms of the distribution of matter in space. As a matter of fact it can't even be explained by reference to a paradigm, since there are countless ways in which the same piece may be played with genuine expression. [C&V, p. 82]

Page Break 124

Page 124

955. And what would the opposite look like?--One might be able to determine sadness, for instance, with the same certainty as, say, a sore throat.--But what sort of concept of sadness would that be? Ours?

Page 124

956. Why not? If a person makes *this* face on a certain occasion, carries himself *this* way, etc., then we can predict with certainty all that we should expect (in the world as it now is) of a truly sad person.

Page 124

957. Of what does our uncertainty about the mental conditions and processes in another person consist? For it is composed of several things.†1 We cannot read off what he is saying to himself from anything external. Often we cannot understand what he says. We cannot guess his intentions. Often we don't know what kind of mood he's in.

The ignorances are of different *kinds*; and if one imagines them removed then they would be removed in different *ways*.

Page 124

958. What does it mean, for example, to know someone else's mood with certainty?

Well one might imagine that it could be read in my face.--But could intention also be read in my face?! Then why not just as well in my hands or clothes?--But one might imagine a way of finding out intention. You ask someone about his intentions and you can recognize with certainty when he is lying, and perhaps also what is going through his mind at that moment. But what if at this moment the intention were present merely as a disposition, so to speak? What if it weren't thought out?--So here it might be necessary that I have *already* observed him!

Page 124

959. "The inner is hidden from me"--isn't that just as vague as the concept of the 'inner'?

(For just consider: the inner after all is sensations + thoughts + images + mood + intention, and so on.)

Page 124

960. Clearly you don't *guess* a person's intention, his sensations, his thoughts, his mood, all in the same way.

961. Neither do I know his actions beforehand as I do my own, and I have different ways of forming my intentions than he has of guessing them.

Even when I have no positive intention, I can still have negative ones; I don't know what I'll do, but I have already decided that I *don't* want to do this or that.

962. It is a strange kind of remembering when in broad daylight you remember one of last night's dreams which you never thought of earlier on waking. -- -- --

963. The opposite of my uncertainty as to what is going on inside him is not *his* certainty. For I *can* be sure of someone else's feelings, but that doesn't make them mine.

964. "I can only guess at someone else's feelings"--does that really make sense when you see him badly wounded, for instance, and in dreadful pain?

965. Is a dream a hallucination?--The memory of a dream is like the memory of a hallucination, or rather: like the memory of a real experience. This means that sometimes you would like to say: "I just saw this and that", as if you really had just seen it.

966. As an example think of the description of '*occasions*'. Is it really clear that one has to understand the description of an '*occasion of grief*'? For the occasions of grief are interwoven with 1000 other patterns. Is it clear that someone must be able to learn the technique of designating this kind of pattern? That he be able to pick an occasion of grief out of the other patterns the way we do?

967. But here there are simple and more complicated cases; and that is important for the concept. Somebody gets burned and cries out; only in very rare circumstances would his behaviour be called "pretence". Indeed, here a doctor could tell us this and that circumstance under which it could be pretence.

968. The description of word-usage. The word is uttered--in what context? So we have to find something *characteristic* of these separate occurrences, a *kind* of regularity.--But we don't *learn* to use words with the help of rules. How could I give someone a rule for those instances in which he is supposed to say he's in pain!--On the other

hand, there is a ROUGH regularity in the use to which a person actually puts words.

969. So I shall say: It is not established from the outset that there is such a thing as '*a general* description of the use of a word'.

And even if there is such a thing, then it has not been determined how *specific* such a description has to be.

970. In what circumstances (*outer* circumstances) is something called an expression of pain? (For that after all is an important question--even if you say that something *inner* corresponds to a true expression of pain.)

971. And now can I describe these circumstances?--and why not? I could give examples, that much is clear. How can I learn to describe the circumstances? Was I taught? Or what would I have to observe to be able to do that?

972. And the same thing goes for the outward signs of 'pretence'.

973. And if I now imagine a list of such circumstances, who would be interested in it?--To be sure, individual aperçus are interesting. But would a listing which *strove* for inclusiveness be interesting? Would it be of practical use?--This game doesn't work that way at all.

974. Nothing is hidden here; and if I were to assume that there is something hidden the knowledge of this hidden thing would be of no interest.

But I can hide my thoughts from someone by hiding my diary. And in this case I'm hiding something that might interest him.

975. To say that my thoughts are inaccessible to him because they take place within my mind is a pleonasm.

976. What I say to myself silently he doesn't know: but again this isn't a matter of a 'mental process', although there may be a physical process taking place here which might do instead of words spoken out loud if the other did know it. So also a physical process here might be called 'hidden'.

977. "What I think silently to myself is hidden from him" can only mean that he cannot guess it, for this or that reason; but it does not mean that he cannot perceive it because it is in my soul.

978. You look at a face and say "I wonder what's going on behind that face?" But you don't have to say that. The external does not have to be seen as a façade behind which the mental powers are at work.†1

979. The idea of the human soul, which one either sees or doesn't see, is very similar to the idea of the meaning of a word, which stands next to the word, whether as a process or an object.

FOOTNOTES

†1 Several variants in the MS.--In the margin is added: "What is a complaint, anyway?"

†1 Var.: "notation".

†2 Var.: "But the question now remains why, in connection with that *game* of meaning we also speak of an '*act of meaning*'. This is a different kind of question from what you think.--It is (precisely) the phenomenon of this language-game that in *this* situation we say that we meant the word in *this way*, and take this expression over from another language-game. *A question has to have gone before.*

That is an alien kind of question. That is an inappropriate question; of a different racial origin, as it were."

†1 Var.: "speaks".

†2 In the margin: "It is as if, in a work of pure mathematics, there were put a question of physics as the one you were trying to ask."

†3 The German word *Bank* means "money bank" and "bench". (*Tr.*)

†1 Preceding this remark, in square brackets: "Ref. the sentence at the top of p. 82r." This refers to the end of remark 56.

†2 Preceding this paragraph in the MS, in square brackets: "Ref. Tscr. p. 667 below".--This refers to p. 667 of TS 232 and to its continuation on the following page. See *Remarks on the Philosophy of Psychology (RPP) II*, §246.

†3 Preceding the paragraph, in square brackets: "From T.S. p. 667v".--See the previous footnote.

†1 At the end of the remark in square brackets: "Continuation lost".

†1 Var.: "when the dust has settled".

†2 Preceding the remark, in square brackets: "From p. 82v, bottom". This refers to remark 56.

†1 Several variants in the MS. Following the remark, in square brackets: "Still not right."

†2 Preceding the remark in the MS, in square brackets: "Ref. Tscr. p. 670".--See *RPP II*, §256.

†3 Preceding the remark, in square brackets: "Gassy".

Page 21

†1 Preceding the remark, in square brackets: "Ref. Tscr. p. 708/4". See RPP II, §403.

Page 27

†1 Preceding the remark, in square brackets: "Ref. Tscr. p. 740". --This refers to RPP II, § 556.

Page 28

†1 Var.: "even though not for error."

Page 28

†2 Before the remark, in square brackets: "Ref. p. 742 Tscr."--See RPP II, §§566-569.

Page 29

†1 Preceding the remark, in square brackets: "Ref. Tscr. p. 750". See RPP II, §§605-608.

Page 30

†1 Wittgenstein repeats this remark in almost the same words on the same page of the MS. The end of the variant runs: "But they had to receive a new kind of training for the use of our words. This (training) was similar to but not the same as the previous training."

Page 30

†2 This remark is obviously an "improved" variant of a remark on the previous page of the MS that seems to be partially crossed out. This remark runs: "And how could they remain unaware of the difference, if sometimes they would complain when they were in pain and sometimes when they were not? But did the difference have to be as important for them as it is for us? (Many people tell fabricated stories at a party, and the others know they are fabricated, but they buy them, just as they do true stories. They ignore the difference.)"

Page 30

†3 Before the remark, in square brackets: "Ref. Tscr. p. 759". See RPP II, §§ 648-653.

Page 31

†1 Before the remark, in square brackets: "Ref. Tscr. p. 760". See RPP II, §658.

Page 34

†1 On the same and subsequent pages of the MS, there is the following variation of the end of the remark: "But the philosophical question whether someone else feels pain is of a completely different nature; not the doubt applied in a certain case to *each*; therefore it must have a different logic."

Page 36

†1 Before the remark: "Tscr. p. 751". See RPP II, §§609-612.

Page 37

†1 Before the remark, in square brackets: "From the previous page". See remark 253.

Page 41

†1 Cf. *Remarks on the Foundations of Mathematics*, 3rd ed., Part I, Appendix I.

Page 42

†1 Var.: "primitive need".

Page 43

†1 Var.: "And yet there is something right about this 'disintegration of the sense'. You get it in the following example: You might instruct someone thus: If you want to pronounce the salutation "Hail!" expressively, you must not think of hailstones as you say it!"

Page 43

The German words are *Ei*, "egg" and the interjection *ei, ei*, "fancy that!" (*Tr.*)

Page 45

†1 Var.: "Now a picture is strongly suggested to us: that of something incorporeal which we feel, of the liveness of a face. One must remind oneself that a face with a soulful expression can be *painted* to make us believe that colours and forms alone can (also) have this kind of effect on us."

Page 46

†1 Var.: ", or that a verb designates *one* action in the first person and another in the second?"

Page 47

†1 See *PI* I, § 2.

Page 49

†1 Var.: "But need there be any question for them whether the groaning is really genuine, is really the

expression of anything? Can't they, for example, draw the conclusion... without suppressing a middle term? Isn't the point the job they give the description of behaviour?"

Page 49

†2 Var.: "And doubt may be entirely lacking. Doubting has an end."

Page 50

†1 Var.: "That is, the phenomena of hope are modes of this very complicated pattern."

Page 54

†1 i.e. the kinaesthetic feeling.

Page 56

†1 Cf. *PI* I, § 48.

Page 58

†1 Var.: "experiential concepts".

Page 59

†1 Several variants in the MS.

Page 62

†1 Var.: "static".

Page 64

†1 In the MS. Wittgenstein has "out", perhaps as a mistake. Possibly he meant "Do we also learn...".

Page 65

†1 Var.: "This has the form of a report of a new perception."

Page 66

†1 Var.: "If I know that the schematic cube has various aspects, and I want to find out what someone else sees, I can get him to make a model of what he sees, in addition to a copy, or point to such a model; even though *he* has no idea what is the purpose of this dual demonstration."

Page 69

†1 Var.: "I forgot it."

Page 70

†1 Unclear passage in the MS.

Page 72

†1 Var.: "the dawning of an aspect".

Page 72

†2 Var.: "half visual experience, half thought."

Page 74

†1 Var.: "--is this a special sort of seeing? Or is it a case of both seeing and thinking? Or an amalgam of the two--as I should almost like to say?--The question is: *Why* does one want to say this? Well, if the question is phrased in *this* way it isn't that hard to answer."

Page 74

†2 Var.; Before the paragraph, in square brackets: "Not a good continuation>."

Page 75

†1 Var.: "phrases it and helps to form the impression, so to speak."

Page 79

†1 Var.: "what I feel there?--"

Page 80

†1 At the end of the remark, in square brackets: "To the previous page." Cf. remarks 619-621.

Page 81

†1 Var.: "treatises".

Page 83

†1 Var.: "mechanics".

Page 84

†1 Var.: "illusion in a dream".

Page 86

†1 At the end of the remark, in square brackets: "The remark on p. 733 Tscr. relates remark to this." See *RPP* II, §§515-522.

Page 86

†2 Following the words "goes together with..." in square brackets: "p. 733 Tscr." See *RPP* II, §517.

Page 88

†1 Var.: "with a special gesture".

Page 88

†2 This remark is the first in Volume "S" (MS 138).

Page 90

†1 Var.: "of the step."

Page 90

†2 The English joke: "What is the difference between a hairdresser and a sculptor? A hairdresser curls up and dyes, and a sculptor makes faces and busts."

Page 92

†1 In German the word used is *Säbel*, "sabre". (*Tr.*)

Page 94

†1 Var.: "have seen".

Page 94

†2 Var.: "So should I say:"

Page 100

†1 Var.: "-- -- -- What would you be missing, for instance, if you did not understand the meaning of: "Say the word 'bank' and mean it as the bank of a river"--or: "Say the word 'till' and mean it as a verb, not as a conjunction"--or if you did not find that a word lost its meaning and became a mere sound if it was repeated ten times over."

Page 100

The German word is *sondern*, meaning both "but" and "to separate". (*Tr.*)

Page 101

†1 The German word is *weiche*, meaning both "soft" and "to retreat". (*Tr.*)

Page 102

†1 Preceding the remark, in square brackets: "Ref. MS "R" p. 83". See remark 69.

Page 103

†1 Var.: "Realities are so many possibilities for the philosopher."

Page 106

†1 See *PI I*, §8.

Page 108

†1 Var.: "As a result of a grammatical explanation."

Page 109

†1 Before the remark, in square brackets: "Ref. p. 15v/3".--This apparently refers to remark 825.

Page 109

†2 Var.: "(As does intention, when it is interpreted as the accompaniment of action," ...).

Page 109

†3 Several variants in the MS.

Page 109

†4 Var.: "but the concept may easily confuse us, for it runs over a long stretch cheek by jowl with the concept of an 'outward' process, and yet does not coincide with it. (Tennis without a ball.)"

Page 113

†1 Several variants in the MS.

Page 114

†1 Alternatives.

Page 114

†2 At the end of the remark, in square brackets: "Ref. MS "R" p. 96". See remark 183.

Page 115

†1 Var.: "The criteria for the truth of a *confession* that I thought such-and-such are not the criteria for a true *description* of a process. And the importance of the true confession does not reside in its being a correct and (absolutely) certain report of a process. It resides rather in the special consequences which can be drawn from a confession whose truth is guaranteed by the special criteria of truthfulness."

Page 116

†1 At the end of the remark, in square brackets: "Ref. the §: "I'm not certain..."."

Page 116

†2 Var.: "And that the prescience inherent in my intention does not rest on the same foundation as the other person's prediction of my actions."

Page 117

†1 Var.: "Ask not "What goes on in us when we are certain that...?"--but: How is certainty manifested in our

actions?"

Page 118

†1 Cf. Norman Malcolm, *Ludwig Wittgenstein, A Memoir*, p. 93.--In MS 169, p. 47v, Wittgenstein says: "Also what goes on in the inner has meaning only in the stream of life."

Page 119

†1 Var.: "One can also convince someone that he was wrong about a person's mental state by giving him *evidence*. One can set him straight with evidence."

Page 120

†1 Var.: "And how are *these* supposed to be tested in their turn?"

Page 123

†1 Var.: "appears here ... as".

Page 123

†2 Var.: "as the prime mover of the expression."

Page 124

†1 Var.: "Our 'ignorance' about what goes on in someone else is not a *single* ignorance, but consists of different kinds of ignorance."

Page 127

†1 Var.: "But you don't have to think that way. And if someone talks to me quite obviously holding nothing back then I'm not even tempted to think that way."

Editors' Preface

Thematically, Wittgenstein's philosophical writings from the last two years of his life (1949-51) can be divided into three parts. The largest of these three parts deals with the concepts of certainty, knowing, doubting, and other topics in epistemology. A second part deals with the philosophy of colour concepts; a third, with psychological concepts and in particular with the problem of the relationship between "the inner" and "the outer", between the so-called mental states and bodily behaviour.

Most of the writings of the first group have appeared in print under the title *On Certainty*, those of the second under the title *Remarks on Colour*. The remarks on the "inner-outer" problem are closely connected with the body of ideas of the second part of the *Philosophical Investigations* and with the preliminary studies for it in the manuscripts and typescripts from the years 1946-49. But they also connect with the remarks on epistemology and colour concepts and sometimes cannot be sharply separated from them. (A longer part from MS 173, which is printed here, was already published in the *Remarks on Colour* (III, sect. 296-350).)

Wittgenstein's writings from the last years of his life are entered into eight small notebooks, and in a small bundle of loose sheets (MS 172). The most voluminous notebook is MS 173. The second largest of these notebooks, MS 169, was probably already begun in late fall, 1948, or in the spring of 1949. The content of the first half of this notebook is of the nature of preliminary studies for what is published as Volume I of these *Last Writings*, and comes from the large

manuscript books 137 and 138. The style of the remarks is terse; the sentences are frequently indicated only in abbreviated form. There are many parts which because of their unclarity are very hard to read. The second half of these writings, which begins with a discussion of the concept of dissimulation, is worked out better stylistically and in terms of content is connected to the rest of this volume. However, there is no clear border separating the two parts from each other. Therefore we considered it proper to publish this notebook here in its entirety.

The small notebooks 170 and 171 are also presented in their entirety. Chronologically they are probably closely connected to MS 169 and probably were written in the year 1949.

The voluminous notebook 173, from the spring of 1950, deals mainly with colour concepts; but it does contain two longer portions belonging to the problems of the "inner-outer".

Later, in the spring of 1950, in MS 174, Wittgenstein continued the exposition of the "inner-outer" problem of MS 173, and then returned once more to this topic in MS 176 two weeks before his death in April 1951. The excellent quality of these last writings should be obvious to every reader.

With the exception of a very few remarks (which are of a general nature) and of remarks which have already appeared elsewhere in print, we have not omitted anything of what Wittgenstein wrote in these last notebooks from the years 1949-51.

Words in angle brackets < > and references to the printed works of Wittgenstein in square brackets (including the first volume of these *Last Writings*) are those of the editors. All footnotes are also additions by the editors. The letters 'N.R.' in the upper right corner of some pages indicate that the page begins with a *new remark* (and not with a paragraph belonging to the last remark on the preceding page).

We thank Mr Joseph Braun, Mr Michael Kober, Dr Joachim Schulte for their generous help in the interpretation of difficult parts of the manuscript and the translators, Professor C. G. Luckhardt and Professor Maximilian Aue, for valuable advice and for preparing the Index. We also thank Mr Erkki Kilpinen, who helped in the preparation of the final version of the text.

MS 169

Page 1

(around 1949)

Page Break 2

Page 2

non & ne†1---They have the same purpose, the same use--with *one* qualification. [LW I, 384]

Page 2

So are there essential and non-essential differences among the uses? This distinction does not appear until we begin to talk about the *purpose* of a word. [LW I, 385]

Page 2

--- We might think it strange. "He doesn't play our game at all" one would like to say. Or even that this is a different type of man. [Cf. *PI* II, vi, p. 182b]

Page 2

The psychologist reports the utterances of the subject. But these utterances "I see...", "I hear...", "I feel" etc., are not about behaviour. [Cf. *PI* II, v, p. 179b]

Page 2

--- About both, not side-by-side, however, but about the one *via* the other. [Cf. *PI* II, v, p. 179c]

Page 2

But†2 this would make us see too that it would have no consequences for understanding and using the words.

Page 2

But wasn't he able to master the use of "if" and "that" just as we are? Wouldn't he understand and mean these words as we do? [Cf. *PI* II, vi, p. 182b]

Page 2

Wouldn't I think (of him) that he understood the words "that" and "if" as we do if he uses them exactly as we do? [*PI* II, vi, p. 182b]

Page 2

And if he used "that" and "if" exactly as we do, wouldn't we think he understood them as we do? [*PI* II, vi, p. 182b]

Page 2

Page Break 3

Page 3

It's another kind of man. But of what importance is that? [Cf. *PI* II, vi, p. 182b]

Page 3

It would be like someone who instead of associating a separate colour with each vowel associated one colour with a, e, i, and another with o and u. "In that case we'd have a different type of man", I would like to say. [Cf. *LW*, I, 362]

Page 3

--- Because only this world (has) this sound, this tone, this grammar.†1

Page 3

So does the word "Beethoven" have a Beethoven-feeling?

Page 3

It is a look, with which *this* word looks at me. [Cf. *LW* I, 366]

Page 3

But one cannot separate the look from the face.

Page 3

--- with a quite particular expression. [Cf. *LW* I, 380]

Page 3

This expression is not something that can be separated from the passage. (Not necessarily.) It is a different concept. (A different game.) [*PI* II, vi, p. 183a]

Page 3

"Now you played the passage with a different expression."--"--now with the same" and it can also be characterized by a word, a gesture, a simile; nevertheless by *this* expression we don't mean something that can appear in a different connection.

Page 3

The experience is this passage played like this (that is, as I am doing it, for instance; a description could only *hint* at it). [*PI* II, vi, p. 183b]

Page 3

Gay colours.

Page Break 4

The 'atmosphere' is precisely that which one cannot imagine as being absent. [Cf. *PI* II, vi, p. 183c]

Page 4

The name Schubert, shadowed around by the gestures of his face, of his works.--So there is an atmosphere after all? But one cannot think of it as separate from him. [Cf. *LW* I, 69; *PI* II, xi, p. 215f]

Page 4

The name S is surrounded *in that manner*, at least if we are talking about the composer.

Page 4

But these surroundings seem to be fused with the name itself, with this word.

Page 4

--- Imagine I hear that someone is painting a picture--[Cf. *PI* II, vi, p. 183d]

Page 4

: I hear that someone is painting a picture "... ". [Cf. *PI* II, vi, p. 183d]

Page 4

--- if they did not fit in with this passage.

Page 4

--- would be totally addle-brained and ridiculous.

would be completely repulsive and ridiculous.

would be completely ridiculous and repulsive.†1

Page 4

My k<inaesthetic> sensations tell me of the movement and position of my limbs.

Page 4

Now I move my finger. I either hardly feel it or don't feel it at all. Perhaps a little in the tip of my finger, and sometimes at a point on my skin (not at all in the joint). And this sensation tells me that I move my finger and how? For I can describe it exactly. [Cf. *PI* II, viii, p. 185a; *LW* I, 386]

Page Break 5

But after all, you must feel the movement, otherwise you couldn't know how it was moving. But "knowing how" only means being able to state, to describe, it.

Page 5

I may be able to tell the direction from which a sound comes only because it affects one of my ears differently from the other; but I don't *hear* that. [See *PI* II, viii, p. 185b; *LW* I, 387]

Page 5

It is quite the same with the idea that it must be some feature of our pain that tells us of its whereabouts in the body, or some feature of our memory image that tells us the time to which it belongs. [See *PI* II, viii, p. 185c; *LW* I, 388]

Page 5

A sensation *can* tell us of the movement or position of a limb. And the character of the pain *can* also tell us where its cause†1 is situated. [Cf. *PI* II, viii, p. 185d; *LW* I, 389]

Page 5

How do I know that a blind person uses his sense of touch and a sighted person his sense of sight to tell them about the shape and position of objects? [*LW* I, 390]

Do I *know* this only from my own experience, and do I merely surmise it in others? [*LW* I, 391]

Page 5

Here we have, in addition to that description, another description of sensation (of what is sometimes called sense-data).

Page 5

What is the criterion for my learning the shape and colour of an object from a sense-impression? [*PI* II, viii, p. 185e; *LW* I, 393]

Page 5

What sense-impression? Well, *this* one. I can describe it. "It's the same one as the one----" or I can demonstrate it

Page Break 6
with a picture.

Page 6

And now: what do you feel when your fingers are in this position?

Page 6

"How is one to define a feeling? One can only recognize it within oneself." But it must be possible to teach the use of words! [*PI* II, viii, p. 185f; *LW* I, 394]

Page 6

What I am looking for is the grammatical difference. [*PI* II, viii, p. 185g; *LW* I, 395]

Page 6

The words rough†1 and smooth, cold and warm, sweet and sour, bitter...

Page 6

But why not also thin and thick?

Page 6

--- Can't there be a doubt here? Mustn't there be one, if it is a feeling that is meant? [See *PI* II, viii, p. 186b; *LW* I, 402]

Page 6

What would we say if someone reported to us that in a certain object he saw a colour he couldn't describe further? Does he have to be expressing himself correctly? Does he have to mean a colour? [*LW* I, 403]

Page 6

This looks *so*; *this* tastes *so*; *this* feels *so*. This and *so* must be differently explained. [*PI* II, viii, p. 186c; *LW* I, 404]

Page 6

I can observe the state of my depression. In that case I am observing what I for instance describe.

Page 6

A thought which one month ago was still unbearable to me is no longer so today. (A touch which was painful yesterday is not so today.) That is the result of an observation. [Cf. *PI* II, ix, p. 187b]

Page Break 7

Trying to recollect a mental mood can be called observing.

Page 7

What do we call 'observing'? Roughly this: putting oneself into the most favourable situation to receive certain impressions with the purpose, for instance, of describing them.

Page 7

When do we say that anyone is observing? Roughly: when he puts himself in a favourable position to receive certain impressions with the purpose, for example, of describing what they tell him. [*PI* II, ix, p. 187c]

Page 7

At bottom, I am still afraid.--I am afraid, I can't stand this fear!--I am afraid of his coming, therefore I am so restless.--Oh, now I am much less afraid of it than before. Now, just when I should be fearless, I am afraid!

Page 7

There could be various explanations:

I am afraid! I can't stand this fear!

I am afraid of his coming, and that is why I am so restless.

I am still a little afraid, although much less than before.

At bottom I am still afraid, though I won't confess it to myself.

Now, just when I should be fearless, I am afraid!

I am afraid; unfortunately, I must admit it.

I think I'm still afraid. [Cf. *PI* II, ix, p. 188a]

Page 7

The contexts in which a word appears are portrayed best in a play; therefore, the best example for a sentence with a certain meaning is a quote from a play. And who asks the character in a play what he experiences when he speaks?

Page Break 8

The best example of an expression with a very specific meaning is a passage in a play. [LW I, 424]

Page 8

--- Well, we assume several things. For instance, that they hear their own voices, and also sometimes feel things as they are gesturing and whatever else belongs to human life.

Page 8

To stir up a philosophical wasps' nest. Moore. [Cf. *C & V*, 2nd edn., p. 147]

Page 8

The language-game of reporting can be given such a turn that the report gives the person asking for it a piece of information about the one making the report, and not about its subject-matter. (Measuring in order to test the ruler.) [Cf. *LW I*, 416; *PI II*, x, p. 190d-191a]

Page 8

Momentary motion. [Cf. *LW I*, 425]

Page 8

If you see motion you by no means see the position at a point in time. You could not portray it. [See *LW I*, 425]

Page 8

Tacking on to:

Page 8

Back then I believed that the earth was a flat disc.--Just like that? [Cf. *LW I*, 426]

Page 8

"Knowing myself as I do, I will now act this way."

Page 8

The line vanishes into the dark.

There is no real point on it for... [Cf. *LW I*, 427]

Page 8

A different tacking on, if that's what you want, has to be according to a different *principle*.

Page 8

The question can be raised: Is a state that I recognize on

Page Break 9

the basis of someone's utterances really the same as the state he does not recognize this way? And the answer is a decision. [LW I, 428]

Page 9

The curve "to be in error".

Page 9

"To seem to believe", a verb. The first person present indicative is meaningless, because I know my intention. But that would be a development of "he believes". [Cf. *PI II*, x, p. 192b; *LW I*, 423]

Page 9

Or: If believing is a state of mind, it lasts. It doesn't last just while I am saying I believe, so it is a disposition. Why can't I say of myself that I have it? How do others recognize my disposition? They observe, they ask me. My answer doesn't have to be "I believe... ", but maybe "That's the way it is"; from this they recognize my disposition. And how do I recognize it? By random tests? My disposition might be, for instance, "This and that can be expected of me". *Doesn't it interest me?* [Cf. *PI II*, x, pp. 191i-192a]

Page 9

My own relation to my words is wholly different from other people's. [*PI II*, x, p. 192b]

Page 9

I do not listen to them and thereby learn something about myself. They have a completely different relation to my actions than to the actions of others.

Page 9

If I listened to the words of my mouth, I would be able to say that someone else was speaking out of my mouth. [*PI II*, x, p. 192c]

Page 9

"These days, I am inclined to say..."

Page 9

If someone says something with a great deal of conviction,

Page Break 10

does he believe it at least *while* he is saying it? Is belief *this* kind of state?

Page 10

With "I believe-----" he expresses his belief in no way better than with the simple assertion.

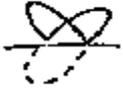

Page 10

My words and my actions interest me in a completely different way than they do someone else. (My intonation also, for instance.) I do not relate to them as an observer.

I *can* not observe myself as I do someone else, cannot ask myself "What is this person likely to do now?" etc.

Page 10

Therefore the verb "He believes", "I believed" *can* not have the kind of continuation in the first person as the verb "to eat".

Page 10

"But what *would* the continuation be that I was expecting?!" I can see none.

Page 10

"I believe *this*."--"So it appears I believe *this*."

Page 10

"Going by my utterances, I believe *this*; but it isn't so." [Cf. *PI* II, xq, p. 192d]

Page 10

"It seems to me I believe†1 this, but it isn't so."

Page 10

My words are parallel to *my* actions, his to his.

Page 10

A different co-ordination.

Page 10

I do not draw conclusions as to my probable actions from

Page Break 11

my words.

Page 11

That consistent continuation would be "I seem to believe". [Cf. *PI* II, x, p. 192b]

Page 11

From the very beginning, the assumption is surrounded by all forms of the word "to believe", by all of the different implications.

Page 11

For I have a mastery of his technique long before I reflect upon it. [Cf. *PI* II, x, p. 192e]

Page 11

"Judging from what I say, *this* is what I believe."

Page 11

(Now it would be possible to think of circumstances in which such an utterance would make sense. But we are not talking about this use of the word "belief".) [See *PI* II, x, p. 192d]

Page 11

And someone could also say "It's going to rain, but I don't believe it" if there were indications that two people were speaking through his mouth. Language-games would be played here which we could imagine, to be sure, but which normally we don't encounter. [Cf. *PI* II, x, p. 192d]

Page 11

And then it would also be possible for someone to say "It is raining, but I don't believe it". One would have to fill out the picture with indications that two personalities were speaking through his mouth.†1 [See *PI* II, x, p. 192d]

Page 11

Here it does look as if the assertion "I believe" were not the assertion of what is supposed in the hypothesis "I believe"!

Page 11

Therefore I am tempted to look for a different continuation of the verb in the first person indicative. [Cf. *PI*

Page Break 12

This is how I think of it: believing is a state of mind. It exists during a period of time, it doesn't attach to the time of its expression. So it is a *kind* of disposition. This is shown me in the case of someone else by his behaviour, by his words. And specifically by his expression "I believe" as well as the simple assertion. What about my own case? Do I study my disposition in order to make the assertion or the utterance "I believe"?---But *couldn't* I make a judgement about this disposition just like someone else? In that case I would have to pay attention to myself, listen to my words, etc., just as someone else would have to do. [Cf. *PI* II, x, pp. 191i-192a]

Page 12

I could find that continuation if only I could say "I seem to believe". [*PI* II, x, p. 192b]

Page 12

A wall covered with spots, and I occupy myself by seeing faces on it; but not so that I can study the nature of an aspect, but because those shapes interest me, and so does the spell under which I go from one to the next. [*LW* I, 480a]

Page 12

Again and again aspects dawn, others fade away, and sometimes I 'stare blindly' at the wall. [*LW* I, 480b]

Page 12

The double cross and the duck-rabbit might be among the spots and they could be seen like the figures and together with them now one way, now another. [Cf. *LW* I, 481]

Page 12

The dawning of aspects is related to the dawning of mental images.

Page 12

Just because I always used it as an 'f' doesn't mean that I have therefore *seen* it as an 'f'.

Page 12

'That can be an F.'

Page Break 13

The aspect seems to belong to the structure of the inner materialization. [*LW* I, 482]

Page 13

We learn language-games. We learn how to arrange objects according to their colours; how to report the colours of things, how to produce dyes in different ways, how to compare shapes, report, measure, etc. etc. Do we also learn how to form mental images out of them? [*LW* I, 483]

Page 13

There is a language-game "Report the colour... ", but not "Report *this* colour here".

Page 13

There is a language-game "Tell me whether this figure is contained in that one". (Also "how often" or "where".)

What you report is a perception. [*LW* I, 484]

Page 13

So we could also say: "Tell me whether there is a mirror-F here", and suddenly it might strike us that there is. This could be very important. [*LW* I, 485]

Page 13

But the report "Now I see it as--now as--" does not report any perception. [*LW* I, 486]

Page 13

You can think of it in this way, or in that way, then you see it now this way, now that. *How?*

Page 13

You can think now of *this*, now of *that*, as you look at it, look at it now as *this*, now as *that*, and then you will see it now *this* way, now *that* way. *What* way? There *is* no further qualification. [*LW* I, 487; *PI* II, xi, p. 200d]

Page 13

To be sure, if you look *that* way, furrowing your brows for instance, then you see it green, but otherwise red. In this way, the colour could teach me about the object after all. The prescription would simply be--you have to look *this* way.

Page Break 14

I can change the aspects of the F and in so doing I do not have to be cognizant of any other act of volition. [*LW* I,

---For the expression of the changing of the aspect is also the expression of congruence and dissimilarity.

Seeing and thinking in the aspect.

I look at an animal. I am asked "What do you see there?" I answer "A hare".---I gaze at the landscape; suddenly a hare runs by. I exclaim: "A hare!"

Both things, both the report and the exclamation, can be called expressions of perception and of visual experience. But the exclamation is so in a different sense from the report. It is wrung from us. It is related to the experience as a cry is to pain. [*PI* II, xi, p. 197b; *LW* I, 549b]

But since it is the description of a perception, it can also be called the expression of a thought. And therefore we can say that if you looked at the animal you would not have to think of the animal; but if you are having the visual experience expressed by the exclamation you are also thinking of what you see. [*PI* II, xi, p. 197c; *LW* I, 553]

And that is why the experience of a change of an aspect seems half visual-, half thought-experience. [Cf. *PI* II, xi, p. 197d; *LW* I, 554]

When I see a change of aspect, I am *occupied* with the object.†1 (Cf. *LW* I, 555)

I am occupied with what I am now noticing, with what strikes me. In that respect, experiencing a change of aspect is similar to an action. [*LW* I, 556]

It is a paying of attention.

What is the criterion of visual experience? What ought the criterion be?

The representation of 'what is seen'. [*PI* II, xi, p. 198b; *LW* I, 563]

Now when the aspect dawns can I separate a visual experience from a *thought-experience*? (And what does that mean?) If you separate them then the aspect is lost. [Cf. *LW* I, 564]

And what about the double cross? Again, it is seeing according to an interpretation. Seeing *as*.

Now when I recognize this person in a crowd, perhaps after looking in their direction for quite a while,--is this a sort of seeing? A sort of thinking?†1 The expression of the experience is "Look, there's...!" But of course, it could just as well be a sketch. That I recognize this one might be expressed in the sketch, or in the process of sketching as well. (But the element of sudden recognition is not expressed in the sketch.) [*LW* I, 571a; cf. *PI* II, xi, p. 197h]

Suppose a child suddenly recognizes someone. Let it be the first time he has ever suddenly recognized someone.--It is as if his eyes had suddenly opened.

One can ask, for example: if he suddenly recognizes so and so, could he have the same sudden visual experience, but without recognizing the person? Well, he might for instance be *mistaken* in recognizing him. [*LW* I, 572]

[I haven't yet estimated correctly the beginning that the child is making.]

What if someone were to ask: "Do I really do that with my eyes?" [*LW* I, 573]

The same expression which before was a report of what was seen now is an exclamation.

A hare runs across a path. Someone doesn't know it and says: "Something strange whizzed by" and he

proceeds to describe the appearance. Someone else says "A hare!", and he cannot describe it so precisely.

Now why do I still want to say that the person who recognizes it sees it differently from the person who doesn't? [LW I, 574]

Page 16

It is the well-known impression.

Page 16

Does someone who doesn't recognize a smile as a smile see it differently than someone who does? He reacts to it differently. [Cf. LW I, 575; PI II, xi, p. 198e]

What can be cited in support of his seeing it differently? [LW I, 576]

Page 16

"If one knows what it is, it looks different."--How so? [LW I, 577]

Page 16

What would it be like if someone were not acquainted with it, but still knows all about it right away? Does he then see it in the same way as the one who is acquainted with it?--What should I say? [Cf. LW I, 578]

Page 16

It's a question of the fixing of the concepts. [LW I, 579]

Page 16

I'm mentioning these kinds of aspects in order to show the kind of multiplicity we are dealing with here. [LW I, 580]

Page Break 17

Here there is a host of interrelated phenomena and concepts. [Cf. LW I, 581; PI II, xi, p. 199d]

Page 17

Sometimes the conceptual is dominant. (What does that mean?) Doesn't it mean: sometimes the experience of an aspect can be expressed only through a conceptual explanation. And this explanation in turn can take many forms. [LW I, 582]

Page 17

Here it is important to consider that there is a host of interrelated phenomena and concepts. [Cf. LW I, 581; PI II, xi, p. 199d]

Page 17

Just think of the words exchanged by lovers! They're 'loaded' with feeling. And surely you can't just agree to substitute for them any other progressions of sound you please. Isn't this because they are *gestures*? And a gesture doesn't have to be something innate; it is instilled, and yet *assimilated*.--But isn't that a myth?!--No. For the signs of assimilation are that I want to use *this* word, that I prefer to use none at all to using one that is forced on me, and similar reactions. [LW I, 712]

Page 17

"I noticed the likeness for maybe 5 minutes." "After 5 minutes I no longer noticed the likeness, but at first very strongly."

"After 5 minutes the likeness no longer struck me, but at first very strongly." [Cf. LW I, 707]

Page 17

... "I noticed the likeness for maybe 5 minutes, and then no longer." [Cf. LW I, 707; PI II, xi, p. 210f]

Page 17

"I'm no longer struck by it," but what happens when I am struck by it?

Well, I look at the face in such and such a manner, say this and that to myself or to others, think this and that. But is that *being struck* by the similarity? No, these are the *phenomena* of being struck, but these *are* 'what happens'.

Page Break 18

'Being struck' is a different (and related) type of concept from 'phenomenon of being struck'. [Cf. LW I, 708; PI II, xi, p. 211d]

Page 18

But aren't thinking and saying different *kinds* of things! And isn't the thinking the being struck?

Page 18

I can say such and such words to myself *without* thinking of their content.

Page 18

Thinking and inward speech (I do not say "talking to oneself") are different concepts. [LW I, 709; PI II, xi, p. 211f]

Page 18

Is being struck: looking and thinking?

Page 18

No. Many concepts *cross* here. [LW I, 710; PI II, xi, p. 211e]

Page 18

How does the chemist know that there is an Na atom at *this* point in the structure. A question of the criterion, not a psychological question. [Cf. LW I, 786]

Page 18

A child learns a certain way of writing our letters, but it doesn't know that there are ways of writing, and doesn't know the concept 'way of writing'.

Page 18

--- If not, one could not very well call it a blindness. [Cf. PI II, xi, p. 214a]

Page 18

--- Well, his defect will be more or less related to this one.

Page 18

But if I want to say "This word (in the poem) stood there like a picture†1

Page Break 19

Page 19

"The word (in the poem) is not different from a picture of what it means"---

Page 19

If the sentence can appear to me like a word-painting ('Joyous songs resound in the green dell†1)

Page 19

But if a sentence can strike me like a painting in words and the very individual word in the sentence like a picture, then it is not quite so much of a marvel that a word uttered outside of all context and without purpose seems to carry a particular meaning in itself. [PI II, xi, p. 215c]

Page 19

Experience of direction.

Page 19

Think here of a special kind of illusion which throws light on these matters. [Cf. PI II, xi, p. 215d; LW I, 787]

Page 19

In what way *is* a mental image, a word, etc., a germ? It is the beginning of an interpretation.

I was able to see a part of a line and then say it was N's shoulder, and then that it is N, who..., etc. But I did not deduce from the line that it is the shoulder etc.

Page 19

Now what does it mean to say that in searching for a name or a word one feels, experiences, a gap which can only be filled by a particular thing, etc. Well, these words could be the primitive expression in the place of the expression "The word is on the tip of my tongue". James's expression is actually only a paraphrase of the usual one.

Page 19

James really wants to say: What a remarkable experience! The word is not here and yet already here, or something is

Page Break 20

here which cannot grow into anything but this word. But this is not experience at all. The words "It's on the tip of my tongue" are not the expression of an experience and James only interprets them as the description of the content of an experience. (Cf. PI II, xi, p. 219d; LW I, 841]

Page 20

"It's on the tip of my tongue" no more expresses an experience than "Now I've got it!" It's an expression which we use in certain situations and is surrounded by a certain behaviour, and also by several characteristic experiences. [Cf. PI II, xi, p. 219e; LW I, 842]

Page 20

Doesn't something special happen after all when a word comes to you? Listen carefully.--Listening carefully doesn't do you any good. You could do no more than discover what's going on in yourself at that time. [Cf. PI II, xi, p. 219a]

Page 20

And how, when I'm doing philosophy, can I listen *for that* at all. And yet I can imagine that I do. How does that come about? What am I actually paying attention to?

Page 20

Could one imagine that people view lying as a kind of insanity. They say "But it isn't true, so how can you say it then?!" They would have no appreciation for lying. "But he won't say that he is feeling pain if he isn't!--If he says it anyway, then he's crazy." Now one tries to get them to understand the temptation to lie, but they say: "Yes, it would certainly be pleasant if he believed---, but it isn't *true!*"--They do not so much condemn lying as they sense it as something absurd and repulsive. As if one of us began walking on all fours.

Page 20

In which way does uncertainty, the possibility of deceit,

Page Break 21

create difficulties with the concept of pain?? [Cf. *LW I*, 876]

"I am *certain* that he's in pain."--What does that mean? How does one use it? What is the expression of certainty in behaviour, what *makes* us certain?

Not a proof. That is, what makes me certain doesn't make someone else certain. But the discrepancy has its limits.

Page 21

Don't think of being certain as a mental state, a kind of feeling, or some such thing. The important thing about certainty is the way one behaves, not the inflection of voice one uses in speaking.

Page 21

The belief, the certainty, a kind of feeling when uttering a sentence. Well, there is a *tone* of conviction, of doubt, etc.. But the most important expression of conviction is not this tone, but the way one behaves.

Page 21

When you think that one can be certain that someone else is in pain you shouldn't ask "What goes on in me†1 then?", but "How does that get expressed?"

Page 21

Ask not "What goes on in us when we are certain---?", but "How does it show?" [Cf. *PI II*, xi, p. 225b]

Page 21

A man's thinking goes on within his consciousness in a seclusion in comparison with which any physical seclusion is openness.†2 [*PI II*, xi, p. 222c]

Page 21

The future is hidden from us. But does the astronomer feel that who calculates an eclipse of the sun? [Cf. *PI II*, xi, p. 223d]

Page Break 22

Page 22

The inner is hidden.----The future is hidden. [*PI II*, xi, p. 223d]

Page 22

But doesn't *the same thing*----i.e. the same feeling----correspond to the word in the primitive exclamation and in the statement†1? Doesn't the child who cannot yet speak have the same feeling as the one who can? *How* can they be compared? Well, compared *this way* it is the same feeling.

Page 22

Doesn't the child in a primitive way express precisely that feeling that the other one *reports*?

Page 22

Logical impossibility and psychological impossibility.

Page 22

If I see someone writhing in pain with evident cause I do not think, all the same, his feelings are hidden from me. [*PI II*, xi, p. 223e]

Page 22

"Such and such is the case." On the one hand it has the sound, on the other the striding nature, of a sentence. It is a *motion* which begins and comes to an end. Precisely not *one* sign, which designates something, but rather something that has *sense*, which sets up a sense that exists without regard to truth or falsity.†2 It is the arrow and not the point.

(But where is the mistake?)

Page 22

"... is the case" is simply a sentence. But I would not after all have used just any other meaningful sentence in its place.

Page 22

Our concept is of such a kind.--But could we have a different one then? One that brings behaviour, occasion and

Page Break 23

experience†1 into a necessary connection? Why not? But in that case we would have to be made in such a way that all of us or almost all of us in fact would react in the same way†2 under the same circumstances. For when we believe that the expression of his feelings is genuine, in general we behave differently from when we believe the opposite.

Page 23

But this correspondence does *not* exist, and therefore we would not know what to do with a necessary concept. (Heap of stones.†3)

Page 23

--- therefore because different things speak for the truth of his statement, and the statement has different consequences.

Page 23

--- If he is sincere he can†4 tell us them, but my sincerity is not enough to guess his motives. This is where there is the similarity with knowing. [Cf. *PI* II, xi, p. 224f]

Page 23

Subjective and objective certainty. [Cf. *PI* II, xi, p. 225c]

Page 23

Why do I want to say " $2 \times 2 = 4$ " is objectively certain, and "This man is in pain" only subjectively? [Cf. *PI* II, xi, p. 224e]

Page 23

There can be a dispute over the correct result of a calculation, for instance, of a rather long addition.†5 But such a dispute is rare and is quickly decided if it arises.

This is a fact that is essential for the function of mathematics.

Page Break 24

Page 24

[Physicist, paper and ink, reliability.] [Cf. *PI* II, xi, p. 225d; cf. also p. 226b, c]

Page 24

There can also be a disagreement about what colour an object is. To one person it appears as a somewhat yellowish red, to another as a pure red. Colour blindness can be recognized by specific tests.

Page 24

There is no such agreement over the question whether an expression of feeling is simulated or genuine. [See *PI* II, xi, p. 227e]

Page 24

Why not?--What do you want to know?

Page 24

Let's assume you say: *This* man distrusts the utterance because he is more distrustful than that man, who trusts it.

The question is, how can the disposition of the one making the judgement play an important role here if it doesn't do so elsewhere? Or also: How can such a judgement then be *correct*? How can one nevertheless speak of a judgement here?†1

Page 24

I want to call the observations on mathematics which are part of these philosophical investigations "the beginnings of mathematics". [Cf. *PI* II, xiv, p. 232b; *LW* I, 792]

Page 24

We are playing with elastic, indeed even flexible concepts. But this does not mean they can be deformed *at will* and without offering resistance, and are therefore *unusable*. For if trust and distrust had *no* basis in objective reality, they would only be of pathological interest.

Page 24

But why do we not use more definite concepts in place of these vague ones?

Page Break 25

But *not*: objective certainty does not exist *because* we do not see into someone else's soul. This expression means that.

Page 25

If constant quarrels were to erupt among mathematicians concerning the correctness of calculations, if for instance one of them were convinced that one of the numbers had changed without his noticing it or his memory had deceived him or someone else, etc. etc.--then the concept of 'mathematical certainty' would either not exist or it would play a different role than it does in fact. It could be the role of the certainty, for instance, that God answers a prayer for rain; either by sending rain or by not sending it--for such and such and such reasons. [Cf. *PI II*, xi, p. 225d]

Page 25

Then it might be said, for instance: "True, we can never be certain†1 what the result of a calculation is, but it always has a quite definite result, which God knows.

It is of the highest certainty, though we only have a crude reflection of it." [*PI II*, xi, pp. 225e-226a]

Page 25

If I say therefore "In all schools in the world the same multiplication tables are taught"--what kind of a statement is that? It is one about the concept of the multiplication table. [Cf. *PI II*, xi, p. 227c]

Page 25

"In a horse race the horses generally run as fast as they can." In this way one could explain to someone what the word "horse race" means. [Cf. *PI II*, xi, p. 227c]

Page 25

As 'mathematical certainty' falls, so does 'mathematics'.

Page Break 26

Think of *learning* mathematics and the role of its formulas.

Page 26

Show what it's like when one is in pain.---Show what it's like when one pretends that one is in pain.

Page 26

In a play one can see both portrayed. But now the difference! ([[sic]] Cf. *LW I*, 863]

Page 26

--- How would they learn to use the words? And is the language-game they learn still the same one we call the use of colour-words?

Page 26

--- In saying this one could want to say that in *none* of our schools a fool taught arithmetic. However it can†1

Page 26

There is such a thing as colour-blindness and there are ways of establishing it. Among those who are not colour-blind there is in general no argument about (their) colour-judgements.

This is a remark about the concept of colour-judgements. [See *PI II*, xi, p. 227d; cf. *LW I*, 931]

Page 26

And yet I am not happy about this expression. Why? Is it only because a child doesn't actually *learn* to dissimulate? Indeed, it would not even have to *learn* what surrounds dissimulation. Imagine a child were born with the behaviour of a grown-up. Certainly it cannot yet talk, but it already has decided likes and dislikes, and clearly expresses joy, disgust, thankfulness, etc., in its facial expressions and gestures.

So does it already have to be able to nod its head? Or use certain inflections of sounds? [Cf. *LW I*, 945]

Page 26

--this particular and not at all simple pattern in the drawing

Page Break 27

of our life.†1 (Cf. *PI II*, xi, p. 229a]

Page 27

And what would the opposite now look like?--How well defined would the borders of evidence be?

One would recognize only with the possibility of error that someone was, for example, sad. But what kind of

concept of sadness is that now? The old one?

Page 27

A tribe in which no one ever dissimulates, or if they do, then as seldom as we see someone walking on all fours in the street. †2 Indeed if one were to recommend dissimulation to one of them, he might behave like one of us to whom one recommends walking on all fours. But what follows? So there is also no distrust there. And life in its entirety now looks completely different, but not on that account necessarily more beautiful as a whole.

Page 27

It doesn't yet follow from a lack of dissimulation that each person knows how someone else feels.

Page 27

But this too is imaginable.--If he looks like *this*, then he is sad. But that does not mean: "If he looks like this, then *that* is going on within him," but rather something like: "If he looks like this, then we can draw with certainty those conclusions which *we* frequently only can draw without certainty; if he does not look like that, we know that these conclusions are not to be drawn".

Page 27

One can say that our life would be very different if people said all of those things aloud that they now say to themselves, or if this could be read externally.

Page Break 28

But now imagine you were to come into a society in which, as we want to say, feelings can be recognized with certainty from appearances (we are *not* using the picture of the inner and the outer). But wouldn't that be similar to coming from a country where many masks are worn into one where no, or fewer, masks are worn? (Thus perhaps from England to Ireland.) Life is just *different* there.

Page 28

Frequently one will say: I do not *understand* these people. [Cf. *PI* II, xi, p. 223f]

One also says: I don't understand this person's joy and sadness. And what does that mean? Doesn't it mean that as I understand the words he is actually not sad and not happy? And now what does it mean to say: Maybe exactly the same thing is going on within him as within me, only it is expressed differently?

Page 28

Consider that we not only fail to understand someone else when he hides his feelings, but frequently also when he does not hide them, indeed when he does his utmost to make himself understood.

Page 28

Under certain circumstances, "The inner is hidden" would be as if one said: "All that you *see* in a multiplication is the outer movement of figures; the multiplication itself is hidden from us."

Page 28

The uncertainty as to what is going on within someone else does not stand against his own utter lack of doubt. [Cf. *LW* I, 963]

Page 28

If I say "I don't know for sure what he wants", that does not mean: by contrast with the man himself. For it can be completely clear to me what he wants without this therefore being *my* wish.

Page Break 29

I can only guess what he's calculating in his head. If it were otherwise, I could report it to someone and have it confirmed by the one doing the calculating. But would I then know of *everyone* who calculates what he is calculating? How do I make the connection with him? Well, here one or the other thing can be assumed.

Page 29

What do I know when I know that someone is sad? Or: what can I do with this knowledge?--For instance, I know what is to be expected from him.

But if I now also know that this or that will cheer him up, then *that* is a different kind of knowing.

Page 29

Even if I were now to hear everything that he is saying to himself, I would know as little what his words were referring to as if I read *one* sentence in the middle of a story. Even if I knew everything now going on within him, I still wouldn't know, for example, to whom the names and images in his thoughts related.

Page 29

After all, you can't expect a human to be more transparent than a closed crate, for instance.

Page 29

But this remains, that sometimes we do not know whether someone is in pain, or is only pretending.

And if it were otherwise, there would be various possibilities.

Page 29

Tennis without a ball--silent speaking and lip-reading. [Cf. *LW I*, 854-855]

Page 29

It is not the case that every time someone screams he is in pain; rather, if he screams under certain circumstances which are difficult to describe, and acts in a way that is difficult to describe, then we say he is in pain, or is probably in pain.--And what *are* pains?--For I must be able to explain this word, after all. Well, I might prick him with a needle

Page Break 30

and say *that* is pain. But given what we've said above, it can't be that easy to explain. Thus the whole concept of 'pain' becomes tangled.

The way in which we learn to use the word, and therefore the way in which it is used, is more complicated, difficult to describe. For instance it is first taught under certain circumstances where there is no doubt, i.e. where there is no question of doubt.

Page 30

The uncertainty that is always there is not about whether he is perhaps pretending (for he could have been imagining that he was pretending), but rather is about the complicated connection of the words 'to be in pain' with human behaviour. When such a concept is useful is another question.

Page 30

How can I learn to describe these circumstances? Was I taught to do it? Or what would I have to observe to do this?

Page 30

And just as little can I describe the circumstances in which one says that someone is pretending, feigning pain.

Is such a description of interest? Under certain circumstances a good number of its aspects are of interest.

Page 30

Why can't you be certain that someone is not pretending?--"Because one cannot look into him."----But if you could, what would you see there?----"His secret thoughts."----But if he only utters them in Chinese,--where do you have to look then?----"But I cannot be certain that he is uttering them truthfully!"----But where do you have to look to find out whether he is uttering them truthfully?

Page 30

What goes on within also has meaning only in the stream of life. [See *LW I*, 913]

Page Break 31

"But for him there is no doubt, after all, about whether he is pretending. So if I could look into him, there wouldn't be any for me either."

Page 31

How about this: Neither I nor he can know that he is pretending. He may confess to it and in that case, to be sure, there is no error. I may assume it with full certainty and good reasons, and what follows may confirm that I was right.

Page 31

Or: I can know that he is in pain, or that he is pretending; but I do not know it because I 'look into him'.

Page 31

But if a way of seeing his nerves working were now found, wouldn't that really be a means of finding whether he is in pain? Well, it could give a new direction to the way we behave and could also correspond more or less with the old directions. And could you ask for more than to see the workings of the nervous system?

Page 31

It can happen that I don't know whether he is pretending or not. If that is the case, what is the reason? Could one say: "That <I> don't see his nervous system working"?

But does there have to be *a reason*? Couldn't I simply know whether he is pretending without knowing how I know it?

I simply would have 'an eye' for it. [c: cf. *PI II*, xi, p. 228e]

Page 31

I don't know what he is saying behind my back----but does he also have to *think* something behind my back?

Page 31

That is: what goes on in him is also a game, and pretence

Page Break 32

is not *present* in him like a feeling, but like a game.

Page 32

For also, if he speaks to himself his words only have meaning as elements of a language-game.

Page 32

On the one hand I cannot know whether he is pretending because our concept of pretence, and therefore of the certainty of pretence, is what it is----on the other hand, because, even assuming a somewhat different concept of pretence, certain facts are as they are.

For it is conceivable that we could have access to criteria of pretence which are not in fact accessible, and that if they became accessible to us we would really take them as criteria.

Page 32

What am I hiding from him when he doesn't know what is going on inside me?

How and in which way am I hiding it?

Page 32

Physically hidden----logically hidden.

Page 32

I say "This man is hiding what is in him". How does one know that he is hiding it? Thus there are signs for it and signs against it.

Page 32

There is an *unmistakable* expression of joy and its opposite.

Page 32

Under these circumstances one *knows* that he is in pain, or that he isn't; under those, one is uncertain.

Page 32

But ask yourself: what allows one to recognize a sign for something within as infallible? All we are left with to measure it against is the outer. Therefore the contrast between the inner and the outer is not an issue.

Page Break 33

Yet there *are* cases where only a lunatic could take the expression of pain, for instance, as sham.

Page 33

"I don't know whether he likes or dislikes me; indeed I don't even know whether he knows it himself."

Page 33

Is it logically or physically impossible to know whether someone else remembers something?

Page 33

I say that I don't remember, but in reality I do. What I want to say is that it is not at all a matter of what goes on within me *as I speak*. So actually I am not *hiding* anything at all from him, for even if something is going on within me, and he can never see it, then what is going on here cannot interest him.

So does that mean that I am not lying to him? Of course I am lying to him; but a lie about inner processes is of a different category from one about outer processes.

Page 33

If I lie to him and he guesses it from my face and tells me so--do I still have the feeling that what is in me is in no way accessible to him and hidden? Don't I feel rather that he sees right through me?

Page 33

It is only in particular cases that the inner is hidden from me, and in those cases it is not hidden because it is the inner.

Page 33

Suppose that we had a kind of snail shell, and that when our head was outside then our thinking, etc., was not private, but it was when we pulled it in.

Page 33

One might think of cases in which someone turns his face away so that the other cannot read it.

Page 33

My thoughts are not hidden from him if I utter them involuntarily and he hears this. Oh yes they are, because

Page Break 34

even in that case *he* doesn't know whether I really mean what I say, and I do know it. Is that correct?

But in what does that consist that I know whether I mean it? And above all: Can't he know it too?

And what if my honest confession were less reliable than someone else's judgement?

Or: What kind of a fact is it: that it is *not* so?

Page 34

If the consequences that can generally be based on the confession of my motive could not be based on it, that would mean that this whole language-game didn't exist.

Page 34

A problem of relativity.

Page 34

In general I can sketch a clearer more coherent picture of my life than someone else.

Page 34

The question could also be put this way: Why does one in general aim toward a *confession* in the case of a crime, for instance. Does this not mean that a confession is more reliable than any other report?

Page 34

Therefore at bottom there must be a general fact here (similar for instance to the one that I can predict the movements of my own body).

Page 34

Roughly, it must be the case that in general I can give a more coherent report about my actions than someone else. In this report the inner plays the role of theory or construction, which complements the rest of it to form a comprehensible whole.

Page 34

All the same: There are other criteria for my reliability.

Page 34

My thoughts are not hidden from him, but are just open

Page Break 35

to him in a different *way* than they are to me.

Page 35

The language-game simply is the way it is.

Page 35

If one speaks of being *logically* hidden, then that is a bad interpretation.

Page 35

"I know what I mean." What does that mean? For instance, that I didn't simply speak to hear myself talk, that I can explain what I mean and the like. But would it be correct to say it about my everyday speech? Or doesn't someone else know it just as well.

Page 35

"I know whether I am lying or not."

Page 35

The question is, how does the mendacious utterance turn into something important?†1

Page 35

Do not look at pretending as an embarrassing appendage, as a disruption of the pattern.

Page 35

One can say "He is hiding his feelings". But that means that it is not a priori they are always hidden. Or: There are two statements contradicting one another: one is that feelings are essentially hidden; the other, that someone is hiding his feelings from me.

Page 35

If I can never know what he is feeling, then neither can he pretend.

Page 35

For pretending must mean, after all, getting someone else

Page Break 36

to *make a wrong guess* as to what I feel. But if he now guesses right and is certain of being right, then he knows it. For of course I can also get him to guess *right* about my feelings and not be in doubt about them.

Page 36

The inner is hidden from us means that it is hidden from us in a sense in which it is not hidden from *him*. And it is not hidden from the owner in this sense: *he utters it* and we believe the utterance under certain conditions and there is no such thing as his making a mistake here. And this asymmetry of the game is brought out by saying

that the inner is hidden from someone else.

Page 36

Evidently there is an aspect of the *language-game* which suggests the idea of being private or hidden--and there is also such a thing as hiding of the inner.

Page 36

If one were to see the working of the nerves, utterances would mean little to us and pretending would be different.

Page 36

Or should I say that the inner is not hidden, but rather *hide-able*? He *can* hide it within himself. But that's wrong again.

Page 36

"He screams when he is in pain, not I." Is that an empirical sentence?

Page 36

"I am feigning pain" doesn't stand on the same level as "I am in pain". After all, it is not an utterance of feigning.

Page 36

"When does one say that someone is in pain?" That is a sensible question, and has a clear kind of answer.----"When does one say that someone is feigning pain?" After all that must be a sensible question too.

Page 36

Can one imagine the signs and the occasions of pain being

Page Break 37

something utterly other than what they actually are? Say their being signs, etc., of joy?----So the signs of pain and pain-behaviour determine the concept 'pain'. And they also determine the concept 'feigning pain'.

Page 37

Could one imagine a world in which there could be no pretence?

Page 37

If one 'is sad because one cries', why then isn't one also in pain because one screams?

Page 37

One has to look at the concepts 'to be in pain' and 'to simulate pain' in the *third and first* person. Or: the infinitive covers all persons and tenses. Only the whole is the instrument, the concept.

Page 37

But what then is the point of this complicated thing? Well, our behaviour is damned complicated, after all.

Page 37

And how is it with feelings' being private or hidden?

Page 37

A society in which the ruling class speaks a language which the serving class cannot learn. The upper class places great importance on the lower one never guessing what they feel. In this way they become unfathomable, mysterious.

Page 37

What kind of hiding is the speaking of a language that the other cannot understand? [Cf. *PI* II, xi, p. 222d]

Page 37

Is the if-feeling (for instance) the readiness to make a certain gesture. And does its being related to feelings consist in that? [Cf. *PI* II, vi, p. 181e-182a-f]

Page 37

We interpret the word "if", spoken with this expression, as the expression of a feeling. [Cf. *LW* I, 373-376]

Page Break 38

Page 38

The use (of the word) seems to fit the word.

Page 38

Question: is the *wenn*-feeling the same as the if-feeling? If one wants to decide this question one enunciates the words to himself with their characteristic intonation.

Page 38

Instead of "attitude toward the soul" one could also say "attitude toward a human". [See *PI* II, iv, p. 178d]

Page 38

I could always say of a human that he is an automaton (I could learn it this way in school in physiology) and

yet it would not influence my attitude toward someone else. After all, I can also say it about myself.

Page 38

But what is the difference between an attitude and an opinion?

I would like to say: the attitude comes *before* the opinion.

Page 38

(Isn't belief in God an attitude?) [a, b: cf. *PI* II, iv, p. 178d]

Page 38

How would this be: only one who can utter it as information *believes* it.

Page 38

An opinion can be wrong. But what would an error look like here?

Page 38

Is the if-feeling the correlate of an expression?--Not *solely*. It is the correlate of meaning and of the expression. †1

Page 38

The atmosphere of a word is its use. Or: We imagine its

Page Break 39

use as its atmosphere. [Cf. *PI* II, vi, p. 182d]

Page 39

The 'atmosphere' of a word is a picture of its use.

Page 39

We look at a word in a certain environment, spoken with a certain intonation, as an expression of feeling.

Page 39

This passage has a *strong* expression. It is immensely expressive. I repeat it to myself again and again, make a special gesture, paraphrase it. But a feeling? Where is it? I'd almost like to say: in the stomach. And yet it is immediately clear that no (such) feeling exhausts the passage. The passage is a gesture. Or it is related to our language. One could also imagine a drawing that would be impressive in the same way.

Page 39

The if-feeling: Could we imagine a poem in which we would sense this feeling especially strongly? ('Sabre'-feeling.)

Page 39

Only I can utter my thoughts, feelings, etc.

The utterances of my feelings can be sham. In particular they can be feigned. That is a different language-game from the primitive one, the one of genuine utterances. †1

Page 39

Is there anything astonishing in this?

Page 39

Is there anything astonishing about the possibility of a primitive and a more complicated language-game?

Page 39

"The child doesn't know enough yet to pretend." Is that right?

Page Break 40

Page 40

The question is: When would we say of a child, for instance, that it is pretending? What all must it be able to do for us to say that?

Only when there is a relatively complicated pattern of life do we speak of pretence. [Cf. *PI* II, xi, p. 229b; *LW* I, 939-940, 946]

Page 40

Or to put it another way: Only when there is a relatively complicated pattern of life do we speak of certain things as possibly being feigned. [Cf. *LW* I, 946]

Page 40

Of course this is not a common way of looking at things.

Page 40

It is a purely geometric way of looking at things, as it were. One into which cause and effect do not enter.

Page 40

One could ask, "What does a battle (for instance) look like?" What picture does it present? Here it doesn't matter to us whether a sword splits a skull and whether someone falls down because his skull was split.

Page 40

To say "He knows what he is thinking" is nonsense; "I know what he is thinking" may be true. [Cf. *PI* II, xi, p. 222b]

Page 40

If as I was assuming people really could see someone else's nervous system working, and adjust their behaviour toward him accordingly, then, I believe, they wouldn't have our concept of pain (for instance) at all, although maybe a related one. Their life *would simply look quite different from ours*.

Page 40

That is, I look at this language-game as autonomous. I merely want to describe it, or look at it, not justify it.

Page 40

I do not say that evidence makes the inner *merely* probable.

Page Break 41

For as far as I'm concerned nothing is lacking in the language-game. [Concerning "evidence", cf. *PI* II, xi, p. 228b-d]

Page 41

That the evidence makes the inner only probable consists in†1

Page 41

"But after all I must be able to say, whether it's right or wrong, that someone is in pain, or again that they are pretending!"--Right and wrong exist only to the extent of the evidence.

Page 41

But in any case I can *think* that I am right or wrong;--whether the evidence is sufficient or not! What good does it do me that I can think it?--More than that I can *say* it!----To be sure an image may be in my mind, but how do I know that, and how, it can be used?

Page 41

The image and its use would therefore have to be in my mind.

Page 41

At first it could be said that it is our determination whether we see something as a definite criterion of pain (for instance), whether we see all of this as a criterion of anything at all. But then we have to say that the whole thing is *not* our determination, but is rather a part of *life*.

Page 41

Can an idiot be too primitive to pretend? He could pretend the way an animal does. And this shows that from here on there are levels of pretence.

Page 41

There are very simple forms of pretence.

Page 41

Therefore it is possibly untrue to say that a child has to learn a lot before it can pretend. To do this it must grow, develop, to be sure. [Cf. *LW* I, 868, 939]

Page 41

An animal cannot point to a thing that interests it.

Page Break 42

One will only speak of pretence if there are different cases and degrees of pretence.

Page 42

A great variety of reactions must be present.

Page 42

A child must have developed far before it can pretend, must have learned a lot before it can simulate.

Page 42

That is: simulating is not an experience.

Page 42

The possibility of pretence seems to create a difficulty. For it seems to devalue the outer evidence, i.e. to annul the evidence.

Page 42

One wants to say: Either he is in pain, or he is experiencing feigning. Everything on the outside can express either one.

Page 42

Above all pretence has its own outward signs. How could we otherwise talk about pretence at all?

Page 42

So we are talking about patterns in the weave of life.

Page 42

So do you want to say that the l.p.†1 of genuine and feigned pain do not exist?

Page 42

But can I describe them?

Page 42

Imagine it were really a case of patterns on a long ribbon.

The ribbon moves past me and now I say "This is the pattern S", now "This is the pattern V". Sometimes for a period of time I do not know which it is; sometimes I say at the end "It was neither".

How could I be taught to recognize these patterns? I am shown simple examples, and then complicated ones of both

Page Break 43

kinds. It is almost the way I learn to distinguish the styles of two composers.

But why in the case of the patterns does one make this distinction *that is so difficult to grasp*? Because it is of importance in our life.

Page 43

The main difficulty arises from our imagining the experience (the pain, for instance) as a thing, for which of course we have a name and whose concept is therefore quite easy to grasp.

Page 43

So we always want to say: We know what "pain" means (namely *this*), and so the difficulty only consists in simply not being able to determine this in someone else with certainty. What we don't see is that the *concept* 'pain' is only beginning to be investigated. The same is true of pretence.

Page 43

Why don't we form a simpler concept?--Because it wouldn't interest us.--But what does that mean? Is it the correct answer?

Page 43

Should I say: Our concepts are determined by our interest, and therefore by our way of living†1?

Page 43

As children we learn concepts and what one does with them simultaneously.

Sometimes it happens that we later introduce a new concept that is more practical for us.--But that will only happen in very definite and small areas, and it presupposes that most concepts remain unaltered.

Page 43

Could a legislator abolish the concept of pain?

The basic concepts are interwoven so closely with what

Page Break 44

is most fundamental in our way of living that they are therefore unassailable.

Page 44

Everything I say presupposes that there is a house over there. Or rather: this is presupposed in them. So for instance: A is in *this* house = There is a house over there and A is in it.

Page 44

Is it correct to say that the order "Go into the house!" presupposes that there is a house there and that the person giving the order knows it?

Page 44

If someone were to say "Go into this house" when there is no house there, we would say of him: "He believes that there is a house there". But is this less right when there actually is one there?

Page 44

From a practical sentence no philosophical one can follow. Moore's sentence was a practical one left indeterminate.

Page 44

Can we imagine that other people have other colour concepts?---The question is: should we call other

concepts colour concepts?

Page 44

Does the dog believe that his master is in front of the door, or does he *know* it?

Page 44

Bad influence of Aristotelian logic. The logic of language is immeasurably more complicated than it looks.

[Cf. *LW I*, 525]

Page 44

The examples which philosophers give in the first person should be investigated in the third.

Page 44

Imagine the situation in which we ask someone: "Do you believe that, or do you know it?"

Page Break 45

In what cases does one say "He knows it", and in which ones "He doesn't *know* it"?

Page 45

Consider the question: "Does he know that is a book?" And particularly the use of the word "that".

Page 45

"I see it exactly and know that *it* is a book."

Page 45

"I know that that is a tree."----"That *what* is a tree?"

Page 45

"I don't know whether it is a tree, but I do know that it is a physical object."

Page 45

You say "That is a tree" and also that by "that" you mean the visual image. That allows a substitution in the first sentence.

Page 45

If one says, "I know that a physical object corresponds to this impression", then one is referring to a confirmation through other impressions.

Now if one doesn't acknowledge this kind of a confirmation--one is changing the language-game.

Page 45

"I know."

"I am certain."

We say, for instance, "I know that it is so" if someone reports a well-known fact to us. In this case we do not say "I am certain that it is so". ("I know that that is the Schneeberg.") Were I to answer "I am certain that it is the Schneeberg", then one would say "It isn't subject to any doubt at all!"

Page 45

Imagine that one were to explain "I know it" as: I learned it and it isn't subject to doubt.

Page 45

Imagine someone were to doubt that a tree is called "tree".

Page Break 46

Page 46

"I know that this is the earth"--saying which I stamp my foot on the ground.

Doubting. What kind of a game is this in which one asks: "How certain is this sentence for you?" [Cf. *OC*, 387]

Page 46

Would it be correct to say: "I sit down because I know that this is a chair; I reach for something because I know that that is a book; etc. etc." What is gained by this? I am using it to say that all these doubts do not exist for me. Further, that doesn't mean that they don't exist at all.

Page 46

No doubt arises about all of this. But that is not enough. In a certain class of cases we don't know what consequences doubt would have, how it could be removed, and, therefore, what meaning it has.

Page 46

What then does this belief that our concepts are the only reasonable ones consist in? That it doesn't occur to us that others are *concerned* with completely different things, and that our concepts are connected with what interests us, with what matters to us. But in addition, our interest is connected with particular facts in the outer world.

Page 46

But do we always have to be able to give the reason for the formation of a concept?

Page 46

"That wouldn't be a smile at all."

Page 46

Why should a *movement* not belong to a smile?

Page 46

"There's something mechanical about that smile." "Actually it is not a real smile at all." Only in a chess game does one call something "castling".

Page 46

"Why do we have a concept 'to pretend'? "--"Well,

Page Break 47

because humans often pretend."--Is that the right answer? [Cf. *LW I*, 255, 261]

Page 47

What if someone were to answer: "Because with this concept we can do those things we want to do"? Isn't it as if one were to ask: "Why do we have the concept of irrational numbers?" How could one answer that?

Page 47

We acknowledge a truthful person's statement about what he has just thought as well as his statement about what he has dreamed.

Page 47

Even if we *frequently* could guess someone's thoughts and were to say we know what they are, then the criterion for that could only be that he himself confirmed our guess. Unless we totally change the concept of thought. [Cf. *PI II*, xi, p. 222e]

Page 47

We paint pictures of transparent yellow, green, blue and red glasses with different backgrounds so that we get clear as to what the appearance of coloured translucency is. And now analogously we want to paint the picture of a transparent white glass.

Page 47

We can express ourselves in physical terms here although the physical doesn't interest us. It is a good image of what we want to describe.--A transparent yellow glass reflects no yellow light into the eye, and therefore the yellow doesn't seem localized in the glass. Flat black seen through yellow glass is black, white is yellow. Therefore analogously black must appear black seen through transparent white, and white white, i.e. just as through a colourless glass.--Is red now to appear whitish? i.e. pink? But what will a dark red, which tends toward black, appear as? It should become a blackish pink, i.e. a greyish red, but then black probably will not remain black.

Page Break 48

By 'pure white' one often means the lightest of all colours, by black the darkest; but not so by pure yellow, red, etc.

Page 48

White seen through yellow wouldn't become yellowish-white, but *yellow*. And yellow seen through white--should it become whitish--yellow or white? In the first case the 'white' glass acts like colourless glass, in the second like opaque glass.

Page 48

Thus I want to say: The '*pure*' concept of colour, which one is inclined to create from our normal colour concepts, is a chimera. To be sure there are different colour concepts and among them those that can be called purer and less pure.

Page 48

Instead of "chimera" I could have said "false idealization".

Perhaps the Platonic ideas are false idealizations.

If there is such a thing then, someone who idealizes falsely must talk nonsense--because he uses a mode of speaking that is valid in *one* language-game in another one where it doesn't belong.

Page 48

If types are deposited somewhere, who says *which* types? All that can be thought of?!

Page 48

What is the ideal representation of colour? Isn't it something like looking through a tube and seeing a small red circle (for instance)?--And am I now to name the colours according to this experience? Fine, but now I also have to apply these colour words in completely different cases. And how am I to compare them with the colours around me? And how useful will such a comparison be?--Or is the ideal way of showing a colour to fill the entire visual field

with it? As when one turns one's gaze towards the blue sky? But the old question still remains. For don't forget that your glance wanders and that *the* description of what you see doesn't exist.

Page Break 49

'It doesn't make any *sense*: he *knows* my thoughts.' Thus the inquiry after someone else's thoughts is not the game in which "knowing" should be applied.--Thus the sentence refers to the entire language-game.†1

Page 49

But does an astronomer calculating an eclipse of the moon say that the future can never be known? That is said when one feels uncertain about it.----Does the manufacturer say that of course one cannot know†2 whether his cars will work? [Cf. *PI* II, xi, p. 223d; cf. *LW* I, 189]

Page 49

Whoever utters that sentence makes a distinction, draws a line; and it may be an important line.--Does it become more important because of actual uncertainty?

Page 49

Then one can ask: What is the characteristic of what we can really know? And the answer will be: One can only *know* where no error is possible, or: where there are clear rules of evidence.

Page 49

"I know that he enjoyed seeing me."--What follows from that? What of importance follows? Forget that you have the correct idea of the state of his mind! Can I really say that the importance of this truth is that it has certain consequences?--It is pleasant to be with someone who is glad to see us, who behaves in such and such a way (if one knows a thing or two about this behaviour from previous occasions).

So if I *know* that he is happy, then I feel secure, not insecure, in my pleasure. And that, one could say, isn't knowing.--Still it is different if I know that he is seeing what he claims to be seeing.

"I know that he was sincerely pleased to see me."

Page Break 50

II: MS 170

Page 50

(around 1949)

Page Break 51

Page 51

People who don't have the concept 'tomorrow'. They still could have a quite well-developed language: various commands, questions, descriptions. Could we communicate with them?--But could we *describe* to them how people use the word "tomorrow", without teaching it to them? *What purpose* could the description serve?

'Tomorrow' plays such a great role because the change from day to night is so important to us. If it were not... [Cf. *RC* III, 116]

Page 51

If one wanted to give a rough description of the game with "tomorrow", analogously to a rough description of the differential calculus, then it would have to be a lot more primitive, and it would be difficult to imagine a purpose for it.

But think about what concepts people have for curved space.

Page 51

Even if someone's behaviour is very regular in itself, still it is hard for us to grasp this regularity if his behaviour deviates from ours in strange ways. Then one might say "I cannot get used to his...". Consider also that wish creates expectation.

Page 51

The language of someone who as an imbecile lives among normal people and is cared for by them. Perhaps he doesn't know the concept 'tomorrow'. [Cf. *RC* III, 118]

Page 51

Operating with concepts permeates our life. I see some sort of analogy with a very general use of keys. If for instance one always had to open a lock in order to move something.

Page 51

Can the psychologist teach us what seeing is? He doesn't teach us the use of the word 'to see'. Is "seeing" a technical term of psychology? Is "dog" a technical term of zoology?

Page Break 52

Perhaps the psychologist discovers differences among people that are not noticed in everyday life and show up only under experimental conditions. But blindness is not something that the psychologist discovers.

If seeing were something that the psychologist has discovered, then the word "seeing" could only mean a form of behaviour, an ability to act in such and such a way. So if the psychologist were to pronounce "There are people who *see*", then he would have to be able to describe for us the behaviour of these seeing people. But in doing this he would not have taught us the use of the form "I see something red and round", for instance, and more specifically would not have taught this to a sighted person. [a: cf. *RC III*, 337-338]

Page 52

Couldn't a seeing person manage completely without the word "see"? He might say "Over there there is... ". A normal child could manage *for a long time* without the word "see", but not for instance without the words "red", "yellow," "round".

Page 52

If I observe the course of my pains, which sense-impressions am I supposed to have had if I had not been observing? Would I have felt nothing? Or would I only have not remembered?

Page 52

"I wouldn't have seen it if I hadn't observed it."--What do the words "it" refer to? To the same thing?
"I wouldn't have felt the pain if I hadn't observed the pain."
But one can say after all "Observe your pain" and *not* "Feel pain!"

Page 52

Test: "Most chairs do not evaporate."

"If something like that had happened, I certainly would have heard about it."

Page Break 53

To be sure one can also say in this case "It's always been like that, so it will be like that this time too."--But how does one know that it always was that way?

Page 53

The one seems to be supported by the other, but neither obviously serves as the basis for the other.

Page 53

We say "Undoubtedly it is so", and don't know how very much this certainty determines our concepts.

To the question "Did the earth really exist before your birth" we would respond, half annoyed and half embarrassed, "Yes, of course!" All the while we would be conscious that on the one hand we are not at all capable of giving reasons for this because seemingly there are too many, and on the other hand that no doubt is possible, and that one cannot answer the questioner by way of *one* particular piece of instruction, but only by gradually imparting to him a picture of our world.

Page Break 54

III: MS 171

Page 54

(1949 or 1950)

Page Break 55

Page 55

An inner, in which it looks either like this or like that; we are not seeing it. In my inner it is either red or blue. I know which, no one else does.

Page 55

If pretending were not a complicated pattern, it would be imaginable that a new-born child pretends.

Page 55

Therefore I want to say that there is an original genuine expression of pain; that the expression of pain therefore is not equally connected to the pain and to the pretence.

Page 55

That is: the utterance of pain is not equally connected with the pain and the pretence.

Page 55

The important aspect for us is not†1 that the evidence makes the experience of someone else 'only probable', but rather that we regard precisely these phenomena as evidence for something important.†2

But let's assume that from the very first moment a child was born it could pretend, indeed in such a way that its first utterance of pain is pretence.--We could imagine a suspicious attitude toward a new-born child: but how would we teach it the word "pain" (or "a hurt")? Say in a questioning tone. Then we might view consistent behaviour as proof of genuineness.

Consider that you have to *teach* the child the *concept*. Thus you have to teach it evidence (the law of evidence, so to speak).

Remarkable the concept to which this game of evidence belongs.

Our concepts, judgements, reactions never appear in connection with just a single action, but rather with the whole swirl of human actions.†1

Only I know what I am thinking actually means nothing else than: only I *think* my own thoughts.

Can one imagine people who don't know pretence and to whom one cannot explain it?

Can one imagine people who cannot lie?--What else would these people lack? We should probably also imagine that they cannot make anything up and do not understand things that are made up.

Whoever couldn't pretend also couldn't play a role.

Isn't the difficulty this: the pretence resides in the *intention*? For we could after all *imitate* the behaviour of pain exactly, without pretending.

The capacity to pretend therefore resides in the ability to imitate, or in the ability to have this intention.

But we must assume that a subject can say the words "I am in pain". Therefore it is a matter of having the capacity to intend. Is it possible, for instance, to imagine people who cannot lie because for them a lie would be nothing but a dissonance. I want to imagine a case where people are truthful not as a matter of *morality*, but rather see something *absurd* in a lie. Whoever lies would be viewed as mentally ill.

Or better: Lying or pretending would have to appear to these people as perversity.

Is it correct to say that a fixed smile is actually no smile at all? How does one recognize that it isn't?

Smiling is one mien within a normal range of miens.--But is that an arbitrary determination? This is the way we learn to use the word.

The remark that... is not important to us, but rather the remark that this involved thing is a kind of evidence for us.

Someone groans under anaesthesia or in sleep. I am asked "Is he in pain?" I shrug my shoulders or say "I don't know whether he's in pain". Sometimes I acknowledge something as a criterion for it, but sometimes I don't.

Well, do I mean nothing by this? Oh yes: I am making a move in an existing game. But this game wouldn't exist if there weren't criteria in other cases.

The doubt in the different cases has a different colouring, so to speak.

One might say "a different truth-value".

"I happen to know that this is a sycamore; a sycamore is an external object, therefore there are external objects."

Something turns out to be pain or pretence. And that is essential to the concepts 'pain' and 'pretence', even if it is not evident in every single one of their applications.

Page 57

"Beyond a reasonable doubt." [Cf. *OC* 416, 607]

Page 57

I know... = I am certain that it is so and it is so.

I knew... = I was certain that it is so, and it was so.

Page Break 58

Page 58

I know how it is = I *can* say how it is, and it is as I say it is.

Page 58

A blind person touches an object and asks me "What is that?"--I answer "A table."--He: "Are you certain?"--I: "I *know* it is."

Page 58

"I know..." = I have the highest degree of certainty.

When Moore uses it, then it is as if he wanted to say: "The philosophers are always saying that one can have the feeling of knowing only in this and that case, but *I* have it also in this and this and this case." He looks at his hand, gives himself the feeling of knowing, and now says he has it.

Page 58

What purpose do the statements "He knows" and "I know" serve?

How is it shown that someone knows something? For only if that is clear is the concept of knowing clear.

Page 58

If someone says "Yes, now I know that it is a tree" and if he also says it on the right occasion, then this alone is not yet a sign that he is using the word "know" as we do.

Page 58

"I know that there is a tree here." One can say this for instance when for some reason one wants to repeat his own words (as when one recites a passage from a book by heart). Now how do we know which use you have made of the sentence? You can tell us. It could be the following: I'm thinking of people who say that it is uncertain that..., and now I say "No, it is not uncertain: I *know* that..." (As in "I *know* that he is not deceiving me".) Now, whoever says "I know that that is a tree" in this way means a tree and *not* this or that.

Page Break 59

Page 59

It is true that Moore knows that this is a tree; this shows in his entire behaviour. From this it does not follow that he does not misunderstand the words "I know etc." in philosophizing. He proved his misunderstanding by looking at his hands and saying "I know that these are hands" instead of simply noting "I know an immense number of facts concerning physical objects". And what is more, they are so certain for me that nothing can strengthen or destroy this certainty.

Page 59

What we find remarkable is not that..., rather we are looking at the fact that *this* is evidence for us.

Page 59

"In the inner there is either pain or pretence. On the outside there are signs (behaviour), which don't mean either one with complete certainty."

But that's not the way it is. In an extremely complicated way the outer signs sometimes mean unambiguously, sometimes without certainty: pain, pretence and several other things.†1

Page 59

"Nothing is as common as the colour reddish-green; for nothing is more common than the transition of leaves from green to red."

Page 59

"Believing, knowing, an experience which one recognizes as this very thing†2 while one is having it."†3

Page Break 60

Page 60

IV: MS 173

(1950)

"One knows when someone is really happy." But that doesn't mean that one can describe the genuine expression. But of course it is not *always* true that one recognizes the genuine expression, or knows whether the expression is genuine. Indeed there are cases where one is not happy either with "genuine" or "sham". Someone smiles and his further reactions fit neither a genuine nor a simulated joy. We might say "I don't know my way around with him. It is neither the picture (pattern) of genuine nor of pretended joy."

Mightn't his relation to a person with normal feelings be like that of a colour-blind person to the normal-sighted?

On the basis of my knowledge of his character I could state reliably that he will react in such and such a way in this situation; and it would also be possible that others can rely on my judgement without however being able to demand of me that I support my judgement with a verifiable description.

Let's assume that a painter represented the expression of blissful joy--and I see the picture and say "Maybe she's pretending."

It is at least conceivable that in some country a court relies on a man's statement about what is possible for him, if a witness has known him for a certain length of time. In this way even now one might ask a psychiatrist whether this or that person is capable of suicide. It is assumed in this connection that in general *experience* does not disprove such a statement.

I am trying to describe the laws or rules of evidence for empirical sentences: does one really characterize what is meant by the mental in this way?

The characteristic sign of the mental seems to be that one has to guess at it in someone else using external clues and is

only *acquainted* with it from one's own case.

But when closer reflection causes this view to go up in smoke, then what turns out is not that the inner is something outer, but that "outer" and "inner"†1 now no longer count as properties of evidence.†2 "Inner evidence" means nothing, and therefore neither does "outer evidence".

But indeed there is 'evidence for the inner' and 'evidence for the outer'.

"But all I ever perceive is the *outer*." If that makes sense, it must determine a concept. But why should I not say I perceive his doubts? (*He* cannot perceive them.)

Indeed, often I can describe his inner, as I perceive it, but not his outer.

The connection of inner and outer is part of these concepts. We don't draw this connection in order to magically remove the inner.

There are inner *concepts* and outer *concepts*.

What I want to say is surely that the inner differs from the outer in its *logic*. And that logic does indeed explain the expression "the inner", makes it understandable.†3

We don't need the concept "mental" (etc.) to justify that some of our conclusions are undetermined, etc. Rather this indeterminacy, etc., explains the use of the word "mental" to us.

"Of course actually all I see is the outer."

But am I not really speaking only of the outer? I say, for instance, under what circumstances people say this or that. And I do always mean *outer* circumstances. Therefore it is *as if* I wanted to explain (quasi-define) the inner through the outer. And yet it isn't so.

Page 63

Is the reason for this that the language-game is something outer?

Page 63

No evidence teaches us the psychological utterance.

Page 63

"Mental" for me is not a metaphysical, but a logical, epithet.

Page 63

"I see the outer and imagine an inner that fits it."

Page 63

When mien, gesture and circumstances are unambiguous, then the inner seems to be the outer; it is only when we cannot read the outer that an inner seems to be hidden behind it.

Page 63

There are inner and outer concepts, inner and outer ways of looking at man. Indeed there are also inner and outer facts -just as there are for example physical and mathematical facts. But they do not stand to each other like plants of different species. For what I have said sounds like someone saying: In nature there are all of these facts. Now what's wrong with that?

Page 63

The inner is tied up with the outer not only empirically, but also logically.

Page Break 64

The inner is tied up with the outer logically, and not just empirically.

Page 64

"In investigating the laws of evidence for the mental, I am investigating the *essence* of the mental." Is that true?

Page 64

Yes. The *essence* is not something that can be shown; only its features can be described.

Page 64

But doesn't a prejudice argue against this? To be sure we can little by little enumerate the *properties* of an inkwell, but its *essence*--mustn't it stand fast once and for all, isn't it presented to us with this very object, before our eyes? What we have here in front of us surely isn't the 'use of a word'! Certainly not; but the concept 'inkwell', which is necessary here after all, is not tangibly in front of us, nor does what is in front of us contain this concept. In order to represent it, it is not enough to put an inkwell in someone's hand. And this is not because that person is too lame-brained to read the concept off the object.

Page 64

I can show someone an object because its *colour* stands out and I want to demonstrate *it* to him, but that already presupposes that there is a certain game between us.

Page 64

Indeed he might be astonished when he sees the object, but in order to 'be astonished about the colour', in order for the colour to be the *reason* of his astonishment and not just the *cause* of his experience, he needs not just sight, but to have the concept of colour.

Page 64

Someone says on his word of honour that someone else believed this or that.--At that point one can ask him, "How do you know that", and he can answer "He assured me of this with utmost seriousness, and I know him extremely well".

Page Break 65

If I say "I can't figure him out", this bears little resemblance to: "I can't figure this mechanism out." I think it means *approximately*: I can't foresee his behaviour with the same certainty as with people 'with whom I do know my way about'.

Page 65

The question of evidence for what is experienced has to be connected with the certainty or uncertainty of foreseeing someone else's behaviour. But that's not quite the way it is; for only rarely does one predict someone else's reaction.

Page 65

I think unforeseeability must be *an* essential property of the mental. Just like the endless multiplicity of expression.

Page 65

What for instance speaks for, what against, a dog's having a mental life?

Page 65

Certainly it isn't its shape, colour, or anatomy. So it is its behaviour.

Page 65

Those who say that a dog has no soul support their case by what it can and cannot do. For if someone says that a dog cannot hope--from what does he deduce that? And whoever says that a dog *has* a soul can only support that with the behaviour he observes in the dog.

"Just look at the face and the movements of a dog, and you'll see that it has a soul." But what is it about the face? Is it only the similarity with the play of the features of the human face? Is it, at least among other things, the lack of stiffness?

Page 65

The *important* fine shades of behaviour are not predictable.

Page 65

But does that mean: If they could be foreseen, with a

Page Break 66

human we wouldn't speak of an inner as opposed to an outer?---Are we really imagining this kind of predictability clearly? Does it imply for instance that we wouldn't ask him for a decision?

Page 66

Imagine we were to encounter a human who had no soul. Why shouldn't something like that occur as an abnormality? So a human body would have been born with certain vital functions, but without a soul. Well, what would that look like?

Page 66

The *only* thing I can imagine in that case is that this human body acts like an automaton, and not like normal human bodies.

Page 66

When they say "Man consists of a body and a soul", then this would not be contradicted by such a phenomenon. For then this would be no (real) human, but something else, something very rare to be sure. But how can one know that it *never* happens? Only,--what would this phenomenon actually look like?

Page 66

Or is it supposed not to be a phenomenon at all? Should having a soul not be recognizable at all?

Page 66

Can there be heartlessness that has no expression? Would that be what we call "heartlessness"?

Page 66

One could also put it this way: How would a human body have to act so that one would not be inclined to speak of inner and outer human states?

Again and again, I think: "like a machine".

Page 66

Perhaps language, along with tone of voice and the play of features, is the most subtly gradated behaviour of men.

Page 66

Could the soulless one produce signs of pain? If he only

Page Break 67

screamed and writhed then one could still view this as an automatic reaction, but if he grimaced in pain and had a suffering look, then we would already have the feeling that we were looking *into him*.

But now, what if he always produced exactly the same suffering expression?

Page 67

It is as if he became *transparent* to us through a human facial expression.

Page 67

Anyone with a soul must be capable of pain, joy, grief, etc. etc. And if he is also to be capable of memory, of making decisions, of making a plan for something, with this he needs linguistic expression.

Page 67

It is not as if he had only indirect, while I have internal direct evidence for my mental state. Rather, he has evidence for it, (but) I do not.

Page 67

But if one now says that this evidence makes the mental only probable, that can have many meanings, and

they can be true or false. And it certainly doesn't mean that the evidence is only empirically connected with the mental (like a symptom with an illness).

Page 67

Why shouldn't one say: "The evidence for the mental in someone else is the outer"?

Well, there is no such thing as outer mediated and inner unmediated evidence for the inner.†1

Page 67

And to the extent that the evidence is uncertain, isn't this because it is only outer.

Page 67

That an actor can represent grief shows the uncertainty of evidence, but that he can represent *grief* also shows the reality of evidence.

Page Break 68

It is not the relationship of the inner to the outer that explains the uncertainty of the evidence, but rather the other way around--this relationship is only a picture-like representation of this uncertainty.

Page 68

It isn't only the mental that is represented to us on the stage; we are also given the illusion of a wound, or a mountain.

Page 68

Its being portrayable on the stage†1 is not the sole characteristic of the mental.

Page 68

Why do we say: "I didn't know what went on behind this brow", although it can be of no importance to us whatsoever what goes on behind someone's brow. Our uncertainty doesn't at all refer to what goes on in the inner; and even if it does refer to the mental, the mental finds its expression in the bodily.

So an uncertainty about the outer corresponds to an uncertainty concerning the inner.

Just as an uncertainty about the numeral that will come at the bottom line corresponds to an uncertainty about the number that is the result of a calculation.

Page 68

And that does *not* mean that in general the uncertainty about something mental†2 can be expressed as uncertainty about the outer.

Just as, to be sure, sorrow in its essence has an expression in one's mien, and yet I still may not be able to describe a mien other than by using the word "sorrowful".

Page 68

Could someone state in court: "I know that at that time he thought of..."? Well, this kind of statement could be admitted or not. Perhaps a judgement would be made that

Page Break 69

someone who has known the accused for so many years can deduce from his mien etc. what he thinks in a certain case. But perhaps such a statement wouldn't be admitted at all, and the opinion would be that not even an *utterance* of the accused could be entered as evidence if the only point of doing so is to describe his mental processes.

Page 69

"I can't figure these people out." And why should I want to?--Isn't it their reactions that I can't figure out? That for instance I cannot foresee; that keep on surprising me?

"He seems to react illogically." And that means: inconsequently.

Page 69

If one can't figure out some things this means that one can figure out other things. And sometimes that is expressed by saying one 'could imagine' what goes on in someone else. That sounds as if knowing what goes on in someone else is an *imagining* of this process. For instance if I know that someone hates me then I feel a kind of visual image of that hate. This opinion rests on a host of false ideas. To be sure one uses the words "to imagine someone else's hate (etc.)", and indeed image pictures can play a role here, or perhaps one makes a face like one that is filled with hate.

Page 69

From the outset the language-game is constructed so that a comparison with other language-games can lead to the 'outer-inner' picture. But to this is added the factual uncertainty that is part of guessing†1 someone else's mental processes. For, as has been said, it would be quite possible for this recognizing to be much more certain than it is. Indeed that pretending might take place mainly by *hiding* one's face

Page Break 70

(for instance). That is: pretending would be possible even if one couldn't put on a false face.

Page 70

But it is *not* true that uncertainty in recognizing his irritation (for instance) is simply uncertainty about his future behaviour. Rather in the concept there is an uncertainty of criteria. So sometimes he is transparent, as it were, and sometimes he isn't. And it is misleading to think of the real irritation as a facial expression of an *inner* face, so to speak, such that this facial expression is defined completely clearly, and that it is only the outer face that makes it uncertain whether the soul really has this expression.

Page 70

For even if he himself says without lying that he was a bit irritated, that doesn't mean that he then saw in himself that face that we called 'irritated'. Again we only have a verbal reaction from him, and it is by no means clear how much it *means*. The PICTURE is clear, but not its application.

Page 70

For even when I myself say "I was a little irritated about him" how do I know how to apply these words so precisely? Is it really so clear? Well, they are simply an utterance.

Page 70

But do I not know exactly what I mean by that utterance? "After all, I know exactly what inner state I am calling that." That means nothing. I know how the word is used, and sometimes I make this utterance unhesitatingly, and sometimes I hesitate and say, for instance, that I wasn't *exactly* irritated', or some such thing. But it is not *this* indeterminacy I was speaking of. Even where I say without hesitation that I was irritated, that does not establish how certain the further consequences of this signal are.

Page Break 71

When I said that there is an indeterminacy in the application I didn't mean that I didn't really know when I should utter the expression (as it would perhaps be if I didn't understand English well).

Page 71

One simply mustn't forget *which* connections are made when we learn how to use expressions such as "I am irritated".

Page 71

And don't think of a child's *guessing* the correct meaning, for whether it guessed it *correctly* must in turn be demonstrated in its use of the words.

Page 71

We say: "Let's imagine people who do not know *this* language-game." But in doing so we still have no clear conception of the life of these people in so far as it differs from our own. We do not yet know what we are supposed to imagine; for the life of these people is in all other ways to correspond with ours, and it still must be determined what we would call a life corresponding to ours under these new conditions.

Isn't it as if one said: There are people who play chess without the king? Questions immediately arise: Who wins now, who loses, and others. You have to make *further* decisions that you don't anticipate in that first determination. Just as you also don't have an overview of the original technique, and are only familiar with it from case to case.†1

Page 71

It is also a part of dissembling to regard others as capable of dissembling.

Page Break 72

If human beings act in such a way that we are inclined to suspect them of dissembling, but they show no mistrust of one another, then this doesn't present a picture of people who dissemble.

Page 72

'We cannot help but be constantly surprised by these people.'

Page 72

We could portray certain people on the stage and have them speak in monologues (asides) things that in real life they of course would not say out loud, but which would nevertheless correspond to their thoughts. But we couldn't portray alien humans this way. Even if we could predict their behaviour, we couldn't give them the appropriate asides.

And yet there's also something wrong with this way of looking at it. For someone might actually say

something to himself while he was going about doing things, and this could, for example, be quite conventional.

Page 72

That I can be someone's friend rests on the fact that he has the same *possibilities* as I myself have, or similar ones.

Page 72

Would it be correct to say our concepts reflect our life?

Page 72

They stand in the middle of it.

Page 72

The rule-governed nature of our language permeates our life.

Page 72

Of whom would we say, he doesn't have our concept of pain? I could assume that he knows no pain, but I want to assume that he does know it; we thus assume he gives expressions of pain and we could teach him the words "I have pain". Should he also be capable of remembering his pain?--Should he recognize expressions of pain in others as

Page Break 73

such; and how is this revealed? Should he show pity? Should he understand make-believe pain *as being just that*?

Page 73

"I don't know *how* irritated he was." "I don't know if he was *really* irritated."--Does he know himself? Well, we ask him, and he says, "Yes, I was."

Page 73

What then is this *uncertainty* about whether the other person was irritated? Is it a mental state of the uncertain person? Why should we be concerned with that? It lies in the use of the expression "He is irritated".

Page 73

But *one* is uncertain, another may be certain: he 'knows the look on this person's face' when he is irritated. How does he learn to know this sign of irritation as being such? That's not easy to say.

Page 73

But it is not only: "What does it mean to be uncertain about the state of another person?"--but also: "What does it mean 'to *know*, to be certain, that this person is irritated'?"

Page 73

Here it could now be asked what I really want, to what extent I want to deal with grammar.

Page 73

The certainty that he will visit me and the certainty that he is irritated have something in common. The game of tennis and the game of chess have something in common, too, but no one would say here: "It is very simple: they play in both cases, it's just that each time they play something different." *This* case shows us the dissimilarity to "One time he eats an apple, another time a pear", while in the other case it is not so easy to see.

Page 73

"I know that he arrived yesterday"--"I know that $2 \times 2 = 4$ "--"I know that he had pain"--"I know that there is a table standing there."

Page Break 74

In each case I know, it's only that it's always something different? *Oh yes*,--but the language-games are far more different than these sentences make us conscious of.

Page 74

"The world of physical objects and the world of consciousness." What do I know of *the latter*? What my senses teach me? That is how it is, if one sees, hears, feels, etc. etc. But do I really learn that? Or do I learn what it's like when I now see, hear, etc., and I *believe* that it was also like this before?

Page 74

What actually is the '*world*' of consciousness? There I'd like to say: "What goes on in my mind, what's going on in it now, what I see, hear,..." Couldn't we simplify that and say: "What I am now seeing."

Page 74

The question is clearly: How do we 'compare' physical objects how do we compare experiences?

Page 74

What actually is the '*world of consciousness*'?--That which is in my consciousness: what I am now seeing, hearing, feeling... And what, for example, am I now seeing? The answer to that cannot be: "Well, *all that*", accompanied by a sweeping gesture.

I observe this patch. "Now it is like so"--and simultaneously I point, for example, to a picture. I may constantly *observe* the same thing and what I *see* may then remain the same, or it may change. What I observe and what I see do not have the same (kind of) identity. Because the words "this patch", for example, do not allow us to recognize the (kind of) identity I mean.

"Psychology describes the phenomena of colour-blindness as well as those of normal sight." What are the 'phenomena of colour-blindness'? Certainly the reactions of the colour-blind person which differentiate him from the normal person. But certainly not *all* of the colour-blind person's reactions, for example not those that distinguish him from a

blind person. Can I teach the blind what seeing is, or can I teach this to the sighted? That doesn't mean anything. Then what does it mean: to describe *seeing*? But I can teach human beings the meaning of the words "blind" and "sighted", and indeed the sighted learn them, just as the blind do. Then do the blind know what it is like to see? But do the sighted know? Do they also know what it's like to have consciousness?

But can't psychologists observe the difference between the behaviour of the sighted and the blind? (Meteorologists the difference between rain and drought?) We certainly could, for example, observe the difference between the behaviour of rats whose whiskers had been removed and of those which were not mutilated in this way. And we could call that describing the role of this tactile apparatus.--The lives of the blind are different from those of the sighted.

The normal person can, for instance, learn to take dictation. What is that? Well, one person speaks and the other writes down what he says. Thus, if he says, for example, the sound *a*, the other writes the symbol "a", etc.--Now mustn't someone who *understands* this explanation either already have known the game, only perhaps not by this name,--or have learned it from the description? But Charlemagne certainly understood the principle of writing and still couldn't learn to write.†1 Someone can thus also understand the description of a technique yet not be able to learn it. But there are two cases of not-being-able-to-learn. In the one case we merely fail to gain a certain skill, in the other we lack comprehension. We can *explain* a game to someone: He may understand this explanation, but not be able to learn the game, or he may be incapable of understanding an explanation of the game. But the opposite is conceivable as well.

"You see the tree, the blind do not see it." This is what I would have to say to a sighted person. And so do I have

to say to the blind: "You do not see the tree, we see it"? What would it be like for the blind man to believe that he saw, or for me to believe I couldn't see?

Is it a phenomenon that I see the tree? It is one that I correctly recognize this as a tree, that I am not blind.

"I see a tree", as the expression of the visual impression--is this the description of a phenomenon? Of *what* phenomenon? How can I explain this to someone?

And yet isn't the fact that *I* have this visual impression a phenomenon for someone else? Because it is something that he observes, but not something that I observe.

The words "I am seeing a tree" are not the description of a phenomenon. (I couldn't say, for example, "I am seeing a tree! How strange!", but I could say: "I am seeing a tree, although there's no tree there. How strange!")

Or should I say: "The impression is not a phenomenon; but that L. W. has this impression is one"?

(We could imagine someone talking to himself describing the impression as one does a dream, without using the first person pronoun.)

To observe is not the same thing as to look at or to view.

"Look at this colour and say what it reminds you of." If the colour changes you are no longer looking at the one I meant.

One observes in order to see what one would not see if one did not observe.

Page 76

We say, for example "Look at this colour for a while." But we don't do that in order to *see* more than we would have seen at first glance.

Page Break 77

Could a "Psychology" contain the sentence: "There are human beings who *see*"?

Well, would that be false?--But to whom would this communicate anything? (And I don't just mean: what is being communicated is a long-familiar fact.)

Page 77

Is it a familiar fact to me that I see?

Page 77

We might want to say: If there were no such humans, then we wouldn't have the concept of *seeing*.--But couldn't Martians say something like this? Say by chance the first humans they met were all blind.

Page 77

And how can it be meaningless to say "There are humans who see", if it is not meaningless to say there are humans who are blind?

But the meaning of the sentence "There are humans who see", i.e. its possible use, is not immediately clear at any rate.

Page 77

Couldn't seeing be the *exception*? But neither the blind nor the sighted could *describe* it, except as an ability to do this or that. Including e.g. to play certain language-games; but there we must be careful how we describe these games.

Page 77

If we say "There are humans who see", the question follows: "And what *is* 'seeing'?" And how should we answer it? By teaching the questioner the use of the word "see"?

Page 77

How about this explanation: "There are people who behave like you and me, and not like that man over there, the blind one"?

Page 77

"With your eyes open, you can cross the street and not be run over, etc."

Page Break 78

The logic of *informing*.

Page 78

To say that a sentence which has the form of information has a use, is not yet to say anything about the *kind* of use it has.

Page 78

Can the psychologist inform me what seeing is? What do we *call* "informing someone what seeing is"? It is not the psychologist who teaches me the use of the word "seeing".

Page 78

If the psychologist informs us "There are people who see", we could ask him "And what do you call 'people who see'?" The answer to that would be of the sort "Human beings who react so-and-so, and behave so-and-so under such-and-such circumstances". "Seeing" would be a technical term of the psychologist, which he explains to us. Seeing is then something which he has observed in human beings.

Page 78

We learn to use the expressions "I see...", "he sees...", etc., before we learn to distinguish between seeing and blindness.

Page 78

"There are people who can talk", "I can say a sentence", "I can pronounce the word 'sentence'", "As you see, I am awake", "I am here".

Page 78

There is surely such a thing as instruction in the circumstances under which a certain sentence can be a piece of information. What should I call this instruction?

Page 78

Can I be said to have *observed* that I and other people can go around with our eyes open and not bump into things and that we can't do this with our eyes closed?

Page Break 79

When I tell someone I am not blind, is that an observation? I can, in any case, convince him of it by my behaviour.

Page 79

A blind man could easily find out whether I am blind too; by, for example, making a certain gesture with his hand, and asking me what he did.

Page 79

Couldn't we imagine a tribe of blind people? Couldn't it be capable of surviving under certain circumstances? And couldn't sighted people occur as exceptions?

Page 79

Suppose a blind man said to me: "You can go about without bumping into anything, I can't"--would the first part of that sentence transmit a piece of information?

Page 79

Well, he's not telling me anything new.

Page 79

There seem to be propositions that have the character of experiential propositions, but whose truth is unassailable for me. That is to say, if I assume that they are false, I must mistrust all my judgements.

Page 79

There are, in any case, errors which I take to be commonplace and others that have a different character and which must be set completely apart from the rest of my judgements as temporary *confusions*. But aren't there transitional cases between these two?

Page 79

If we introduce the concept of knowing into this investigation, it will be of no help; because knowing is not a psychological state whose special characteristics explain all kinds of things. On the contrary, the special logic of the concept "knowing" is not that of a psychological state.

Page Break 80

V: MS 174

Page 80

(1950)

Page Break 81

Page 81

The utterance of pain is not connected equally with pain and with pretence.

Page 81

Pretending is not as simple a concept as being in pain. [Cf. *LW I*, 876]

Page 81

Remember that you have to *teach* a child the *concept*. Therefore you have to teach it the game of evidence.

Page 81

That our evidence makes someone else's experience only probable doesn't take us far; but that this pattern of our experience that is hard to describe is an important piece of evidence for us does. †1

Page 81

That this fluctuation is an important part of our life.

But how can one say at all that it is something *fluctuating*? Against what do I measure its fluctuation? Well, there are countless configurations of smiling, for instance. And smiling that is smiling, and smiling that is not.

Page 81

What do we take note of in life?--"... He smiled at that point."--that can be infinitely important. But does a small distortion of the face *have* to be important? And does it have to be so for us because of the probable practical consequences?

Page 81

"He *cannot* know what's going on within me." But he can surmise it. So the only thing he can't do is *know* it. Therefore we are only making a distinction in the use of the word "know".

Page 81

But does an astronomer who calculates a lunar eclipse say that of course one cannot *know* the future? We express ourselves in this way when we feel uncertain about the future. The farmer says it about the weather; but the carp

Page Break 82

enter doesn't (say) that one cannot know whether his chairs will collapse.

Page 82

"I know that he was glad to see me." *What* do I know? What consequences does this fact have? I feel certain in my dealings with him. But is that knowing?

But what is the difference between surmising and knowing that he was glad?

If I know it I'll assert it without signs of doubt, and others will understand this statement. Well yes, it does have certain practical consequences; in a pinch something can be deduced from it, but that seems merely to be its shadow.

What is the interest of his inner state of gladness?

Page 82

If I believe that he was glad and find out later that this was not so, what consequences does *that* have?

Page 82

What difference does it make if at first I believe that he was glad and then realize that it wasn't true?

Page 82

We would like to project everything into his inner. We would like to say that *that's* what it's all about. For in this way we evade the difficulty of describing the *field* of the sentence.†1

Page 82

It's exactly as if one said that "Benzene has the structure <image>" means: the atoms are arranged *in this way*.

Page 82

But why do I say that I 'project' everything into the inner? Doesn't it reside in the inner? No. It doesn't *reside* in the inner, it *is* the inner. And that is only a *superficial* logical classification and not the description we need.

Page Break 83

We '*project*' nothing into his inner; we just give an explanation that doesn't get us any further.

Page 83

Imagine that the soul is a face, and when someone is glad this hidden face smiles. Let it be this way--but now we still want to know what importance this smile (or whatever the facial expression is) has.

Page 83

Indeed this could even be our regular expression: "His inner face smiled when he saw me", etc.

Page 83

First question: How does one know, how does one judge, whether his inner face is smiling? Second question: What importance does it have?---But both are connected. And one could ask *another*, although related, question: What importance does his--*outer*--smile have? For if the inner is of importance, then--in a (somewhat) different way--so must the outer be.

Page 83

(It is not easy to realize that my manipulations are justified.)

Page 83

But if "I know that he was glad" *certainly* does *not* mean: I know that he smiled, then it is something else that I know and that is important here.

Page 83

For under certain circumstances the inner smile could replace an outer one, and the question about the *meaning* would (still) remain unanswered.

Page 83

"I'm certain that he was glad to see me"; this could be stated in a court of law. Here the possible 'practical' consequences are clear. And this would be equally the case if the statement were "I am certain that he was not happy, but that he was pretending". One thing is to be expected of someone who is glad, another of him who feigns gladness.

Page Break 84

But is the fact that someone else is really glad to see me important to me because it has different consequences? I am comfortable when *this* person (with *this* past etc.) behaves *in this way*. And the '*in this way*' is a very complicated pattern, to be sure.

If one doesn't want to SOLVE philosophical problems why doesn't one give up dealing with them. For solving them means changing one's point of view, the old way of thinking. And if you don't want that, then you should consider the problems unsolvable.

It's always presupposed that the one who smiles *is* a human being and not just that what smiles is a human body. Certain circumstances and connections of smiling with other forms of behaviour are also presupposed. But when all that has been presupposed someone else's smile is pleasing to me.

If I ask someone on the street for directions then I prefer a friendly answer to an unfriendly one. I react immediately to someone else's behaviour. I presuppose the *inner* in so far as I presuppose a *human being*.

The 'inner' is a delusion. That is: the whole complex of ideas alluded to by this word is like a painted curtain drawn in front of the scene of the actual word use.

It seems to me: if one can't really *know* whether someone is (for instance) irritated, then one also cannot really believe or surmise it.

Isn't it true that whatever I can 'be certain of' I can also 'know'?

Wouldn't it be ridiculous if a lawyer in court were to say

that a witness couldn't *know* that someone had been angry, because anger is something inner?--Then one also cannot know whether hanging is punishment.

Whoever says "one cannot know *that*" makes a distinction between language-games. He says: In *such* language-games knowing exists, in *such* it doesn't, and in doing so he limits the concept 'knowing'.

This limitation could be useful if it emphasizes an important difference that is passed over by our ordinary use of language. But I believe that that is not the way it is.

But isn't mathematical certainty greater than any physical certainty, to say nothing of the certainty about what someone else feels?

And can't the greater certainty of mathematics simply be expressed this way: There is knowing in mathematics?

In mathematics a particular kind of evidence that can be clearly presented leaves no doubt open. That is not the way it is when we know that someone was glad.

There can't be a long dispute in a court of law about whether a calculation has this or that result; but there certainly can be about whether someone was irritated or not.

But does it follow that one can know the one and not know the other? More likely what follows is that in the one case one almost always knows the decision, in the other, one *frequently* doesn't.

If one says that one never knows whether someone else really felt this way or that, then that is not because perhaps after all he really felt differently, but because even God so to speak cannot *know* that the person felt that way.

I am for instance convinced that my friend was glad to see me. But now, in philosophizing, I say to myself that it could after all be otherwise; maybe he was just pretending. But then I immediately say to myself that, even if he himself were to admit this, I wouldn't be at all certain that he isn't mistaken in thinking that he knows himself. Thus there is an indeterminacy in the entire game.

One could say: In a game in which the rules are indeterminate one *cannot* know who has won and who has lost.

There is a 'why' to which the answer permits no predictions. That's the way it is with animistic explanations,

for instance. Many of Freud's explanations, or those of Goethe in his theory of colours, are of this kind. The explanation gives us an analogy. And now the phenomenon no longer stands alone; it is connected with others, and we feel reassured.

Page 86

If someone 'pretends friendship and then finally shows his true feelings, or confesses', we normally don't think of doubting this confession† I in turn, and of also saying that we cannot know what's really going on inside him. Rather, *certainty* now seems to be achieved.

Page 86

This is important: I might know from certain signs and from my knowledge of a person that he is glad, etc. But I cannot describe my observations to a third person and--even if he trusts them--thereby convince him of the genuineness of that gladness, etc.

Page 86

One says of an expression of feeling: "It looks genuine". And what meaning would that have were there not *convincing* criteria for genuineness? "That seems genuine" only makes sense if there is a "That is genuine".

Page Break 87

"This weeping gives the impression of being genuine"--so there is such a thing as *genuine* weeping. So there is a criterion for it. "But no *certain one!*"

Page 87

How does someone who accepts a criterion as certain differ from someone who doesn't?

Page 87

But does accepting no criterion as certain mean: never being certain that someone else feels this or that way? Can I be not quite certain and yet accept no criterion as certain? I am (behave) certain, but for instance I don't know *why*.

Page 87

What would it look like if everyone were always uncertain about everyone else's feelings? Seemingly when they are expressing sympathy, etc., for someone, they would always be a little doubtful, would always put on a doubtful expression or make a doubtful gesture.--But if we now leave off this *constant* gesture *because* it is constant, what behaviour then remains? Perhaps a behaviour that is cool, only superficially interested? But then we in turn don't have to interpret their behaviour as an expression of doubting. So it means nothing to say *everyone always...*

Page 87

There is uncertainty and there is certainty; but from this it does not follow that there are criteria that are certain.

Page 87

How would it be if someone were now to say: "I know that he is glad" means merely that I am certain of his gladness, and therefore also that *I* am reacting to him in such and such a way and, what is more, without uncertainty. Then it would be approximately like "I know that everything is for the best"--the expression of the position taken towards whatever comes along. And here there would be grounds for saying that this is not really knowledge. But the latter statement would convince no one, not even in a court of law, that everything is for the best.

Page Break 88

And here there is something important: The statement "I know that he is glad" would after all, even in a court of law, not count for more than: "I have the certain impression that he is glad." It would not be the same as if a physicist stated that he did this experiment and that *this* was the result; or as if a mathematician made a statement about a calculation.--If I have known the other person a long time, the court will probably also allow my statement to stand, will attach importance to it. But my absolute certainty will not mean *knowing* to the court. For if it were knowing, the court would have to be able to draw certain well-defined conclusions.

Page 88

And one cannot answer: "*I* draw certain conclusions from my knowledge, even if no one else can"--for *conclusions* must be valid for all.

Page 88

Here the connection of evidence with what it is evidence for is not ineluctable. And I *don't* mean: "the connection of the outer with the inner".

Page 88

One could even say: The uncertainty about the inner is an uncertainty about something outer.

Page 88

If "I know..." means: I can convince someone else if he believes my evidence, then one can say: I may well be as certain about his mood as about the truth of a mathematical proposition, but it is still false to say that I *know* his mood.

(But it is still false to say: Knowing is a different mental state from being certain. (I is a different person from L. W.))

Page 88

That is: 'knowing' is a psychological concept of a different kind from 'being certain', 'being convinced', 'believing', 'surmising', etc. The evidence for knowing is of a different kind.

Page Break 89

Russell's example: "I know that the present Prime Minister is bald"; the person who says this is certain just because he wrongly believes that X is Prime Minister; nevertheless the actual present Prime Minister is also bald and so the *assertion* is true and all the same the person doesn't *know* that it is.

Page 89

"I *know* that it is so" is to be sure an expression of my complete certainty, but, besides my being certain, other things follow from it.

Page 89

In the first place, "I cannot know his feelings" does *not* mean:... as opposed to *mine*. In the second place, it does not mean: I can never be completely sure of his feelings.

Page 89

Statement: "I know that the bottle was standing there."--"How do you know that?"--"I saw it there."---If the statement is: "I know that he was glad", and the question is asked: "How do you know that?" what is the answer? It is not simply the description of a physical state of affairs. Part of it is for instance that I know the person. If a film could be shown in the courtroom in which the whole scene were rendered--the play of his facial expressions, his gestures, his voice--sometimes this could have a fairly convincing effect. At least if he is not an actor. But it only has an effect for instance if those judging the scene belong to the same culture. I wouldn't know, for instance, what genuine gladness looks like with Chinese.

Page 89

Rather than directing our attention to the fact that one cannot *know* what someone else experiences, that an experience is in some sense the secret of the person who has it, we direct it instead to any and all rules of evidence that refer to experiences.

Page 89

It's important, for instance, that one must '*know*' someone in order to be able to judge what meaning is to be attributed

Page Break 90

to one of his expressions of feeling, and yet that one cannot describe what it is that one knows about him.

It is just as important that one cannot say what the essential observable consequences of an inner condition are. If for instance he really was glad, what can be expected from him, and what not? Of course there are such characteristic consequences, but they cannot be described in the same way as the reactions that characterize the state of a physical object.

Page 90

This must also be considered: Genuineness and falseness are not the only essential characteristics of an expression of feeling. One cannot tell, for instance, whether a cat that purrs and then right away scratches someone was pretending. It could be that someone uttered signs of gladness and then behaved in a completely unexpected way, and that we still could not say that the first expression was not genuine.

Page 90

It seems to me as little a fact that there can only be genuine or feigned expressions of feeling as that there can only be major or minor keys.

Page Break 91

VI: MS 176

Page 91

(1951)

"Can one know what goes on in someone else in the same way he himself knows it?"----Well, how does he know it? He can express his experience. No doubt within him whether he is really having this experience--analogous to the doubt whether he really has this or that disease--comes into play; and therefore it is wrong to say that he knows what he is experiencing. But someone else can very well doubt whether that person has this experience. Thus doubt does come into play, but, precisely for that reason, it is also possible that there is complete certainty.†1

Need I be less certain that someone is suffering pain than that $12 \times 12 = 144$?

And yet sometimes one says that one cannot know that. Well, above all, one can't prove it. That is, there is nothing here of the sort of proof that rests on (generally) known principles.

But that which is in him, how can I see it? Between his experience and me there is always the expression! Here is the picture: He sees it immediately, I only mediately. But that's not the way it is. He doesn't see something and describe it to us.

If 'something is going on inside him', then to be sure I don't see it, but who knows whether he himself sees it.---

Don't I really often see what is going on inside him?--"Yes, but not in the way in which he himself perceives it. I see that he is in pain, but don't feel any pain. And if I felt pain, it wouldn't be his." This means nothing.--On the other hand it would be conceivable that a connection could be established with someone else through which I would feel the same pain (i.e. the same kind of 'pain'), and in the same place, as the other person. But that this is the case

would have to be ascertained through both people's expression of pain.

And if this way of getting to know someone else's pain were to have proved its worth, it's conceivable that one would apply it against a person's expression of pain, and thus would mistrust his expression if it contradicted that test.

And now one can also imagine that there are people who follow that method *from the outset*, and call *that* "pain" which is ascertained by means of it. In that case their concept 'pain' will be related to ours, but different from it. (Of course it doesn't matter whether they call their concept by the same name as we use for our related one; it only matters that in their life it is analogous to our concept of pain.)

This analogue of our concept would then lack that uncertainty of evidence in ours. In *this* respect our concepts would not be similar.

(If we call that analogous concept 'pain', then these people can believe that they are in pain and also doubt it. But if someone were to say: "Well, in that case there simply is no essential similarity between the concepts"--then we can respond: Here there are immense differences, but also great similarities.)

One could imagine that a kind of thermometer is used to ascertain whether someone is in 'pain'. If someone screams or groans, then they insert the thermometer and only when the gauge reaches this or that point do they begin to feel sorry for the suffering person, and treat him as we do someone who 'obviously is in pain'.

Is the indeterminacy of the logic of the concept of pain connected with the actual absence of certain physical possibilities of reading thoughts and feelings?----If that's a causal question--how can I answer it?

Actually the question could be phrased in this way: How does what is *important* for us depend on what is physically possible?

Where measuring is not important we don't measure, even if we are *able to*.

"Is†1 the impossibility of knowing what goes on in someone else physical or logical? And if it is both--how do the two hang together?"

For a start: possibilities for exploring someone else could be imagined which don't exist in reality. Thus there is a physical impossibility.

The logical impossibility lies in the lack of exact rules of evidence. (Therefore we sometimes express ourselves in this way: "We may always be wrong; we can never be certain; what we observe can *still* be pretence." Although pretence is only one of many possible causes of a false judgement.)----We can imagine an arithmetic in which problems with small numbers can be solved with certainty, but in which the results become less certain the larger the numbers are. So that people who possess this art of calculating state that one can never be completely certain of the product of two large numbers, and that neither could a borderline be given between small and large numbers.

But of course it isn't true that we are never certain about the mental processes in someone else. In countless cases we are.

And now the question remains whether we would give up our language-game which rests on 'imponderable evidence' and frequently leads to uncertainty, if it were possible to exchange it for a more exact one which by and large would have similar consequences. For instance, we could work with a mechanical "lie detector" and redefine a lie as that which causes a deflection on the lie detector.

So the question is: Would we change our way of living if this or that were provided for us?--And how could I answer that?

FOOTNOTES

†1 "non & ne" appear to be an addition in the manuscript.

†2 This remark is preceded by an arrow: ←.

†1 The sentence is obviously incomplete. "Has" is an editor's surmise.

†1 These variants seem to be connected with the remark "I hear that someone is painting..."

†1 Var.: "the illness".

†1 Unclear in the MS.

†1 Var.: "my ego believes".

†1 Var.: "One would have to fill out the picture with behaviour indicating that two...".

†1 Variants: "I seem to have to occupy myself with the object."/"I have to occupy myself with the object."

†1 Var.: "--is that a special kind of seeing? Is it a seeing and thinking? A melding of both--as one is almost tempted to say? The question is: *Why* does one want to say that? Well, if one asks in *this* way it is not very difficult to answer."--An arrow at the end of the remark shows that it is connected to the following remark.

†1 The sentence is obviously incomplete. In the manuscript paragraph b originally read, and was then partially crossed out: "'The word (in the poem) is like the fitting picture of what it means'---".

†1 The sentence seems to be incomplete.

†1 Var.: "in the mind".

†2 Var.: "is a lying open to view."

Page 22

†1 Var.: "in the sentence".

Page 22

†2 Variants: "that exists before all truth or falsity."/"that exists whether it is true or false."

Page 23

†1 Var.: "inner process".

Page 23

†2 Var.: "correspondingly, or almost correspondingly,"

Page 23

†3 Var.: "Heap of sand".

Page 23

†4 Var.: "will".

Page 23

†5 Several variants.

Page 24

†1 The paragraphs appear as individual remarks in the manuscript, but an arrow indicates that they are intended as *one* remark.

Page 25

†1 Var.: "know".

Page 26

†1 The sentence is incomplete.

Page 27

†1 Var.: "This very special pattern in the convoluted drawing of human life."

Page 27

†2 Var.: "Dissimulation plays the same role with them as does walking on all fours with us."

Page 35

†1 At this point in the manuscript there is the following drawing:

How this drawing is connected with the text is not clear to us. In the margin of the page there is also a drawing of a human face.

Page 38

†1 Var.: "of a use and an expression".

Page 39

†1 In the manuscript there are drawings that are probably not connected with this remark.

Page 41

†1 The sentence is incomplete, and the entire remaining page of the manuscript is empty.

Page 42

†1 Life patterns.

Page 43

†1 Var.: "our will".

Page 49

†1 Remark crossed out.

Page 49

†2 Var.: "one of course is never certain".

Page 55

†1 Numerous variants.

Page 55

†2 Var.: "that we see precisely this that is difficult to describe as evidence, as evidence of something important."

Page 56

†1 Remark crossed out.

Page 59

†1 Var.: "In an involved way, the outer signs refer, sometimes with certainty, sometimes without, to pain, or dissimulation, or neither."

Page 59

†2 Var.: "as believing or knowing".

Page 59

†3 Var.: "which one recognizes as whatever it is while one has it."

Page 62

†1 Variants: "outward" and "inward".

Page 62

†2 Var.: "then to be sure the inner has not become the outer, but for us direct inner and indirect outer evidence of the mental no longer exist."

Page 62

†3 Var.: "explain the picture from inside and outside, makes it understandable."

Page 67

†1 Several variants.

Page 68

†1 Var.: "That it can be portrayed to us as an illusion."

Page 68

†2 Var.: "inner".

Page 69

†1 Var.: "recognizing".

Page 71

†1 This and the following remarks have been published in *Remarks on Colour* (III, remarks 296-350), ed. G.E.M. Anscombe (Blackwell, 1977). Here we have omitted one remark (no. 317, pp. 58-9, in *Remarks on Colour*) which has already been published in *Culture and Value*.

Page 75

†1 See *Culture and Value*, 2nd edn, p. 75.

Page 81

†1 This remark is dated 24.4.50.

Page 82

†1 Var.: "to give an account of the *field* of the statement."

Page 86

†1 Var.: "this evidence".

PREFACE

Page iv

What we publish here belongs to the last year and a half of Wittgenstein's life. In the middle of 1949 he visited the United States at the invitation of Norman Malcolm, staying at Malcolm's house in Ithaca. Malcolm acted as a goad to his interest in Moore's 'defence of common sense', that is to say his claim to *know* a number of propositions for sure, such as "Here is one hand, and here is another", and "The earth existed for a long time before my birth", and "I have never been far from the earth's surface". The first of these comes in Moore's 'Proof of the External World'. The two others are in his 'Defence of Common Sense'; Wittgenstein had long been interested in these and had said to Moore that this was his best article. Moore had agreed. This book contains the whole of what Wittgenstein wrote on this topic from that time until his death. It is all first-draft material, which he did not live to excerpt and polish.

Page iv

The material falls into four parts; we have shown the divisions at § 65, p. 10, § 192, p. 27 and § 299, p. 38. What we believe to be the first part was written on twenty loose sheets of lined foolscap, undated. These Wittgenstein left in his room in G. E. M. Anscombe's house in Oxford, where he lived (apart from a visit to Norway in the autumn) from April 1950 to February 1951. I (G. E. M. A.) am under the impression that he had written them in Vienna, where he stayed from the previous Christmas until March; but I cannot now recall the basis of this

impression. The rest is in small notebooks, containing dates; towards the end, indeed, the date of writing is always given. The last entry is two days before his death on April 29th 1951. We have left the dates exactly as they appear in the manuscripts. The numbering of the single sections, however, is by the Editors.

Page iv

It seemed appropriate to publish this work by itself. It is not a selection; Wittgenstein marked it off in his notebooks as a separate topic, which he apparently took up at four separate periods during this eighteen months. It constitutes a single sustained treatment of the topic.

G. E. M. Anscombe

ACKNOWLEDGMENT

Page 1

Dr. Lotte Labowsky and Dr. Anselm Müller are to be sincerely thanked for advice about the translation of this work.

Page Break 2

[On Certainty: Main Body]

Page 2

1. If you do know that *here is one hand*,†1 we'll grant you all the rest.

When one says that such and such a proposition can't be proved, of course that does not mean that it can't be derived from other propositions; any proposition can be derived from other ones. But they may be no more certain than it is itself. (On this a curious remark by H. Newman.)

Page 2

2. From its *seeming* to me--or to everyone--to be so, it doesn't follow that it *is* so.

What we can ask is whether it can make sense to doubt it.

Page 2

3. If e.g. someone says "I don't know if there's a hand here" he might be told "Look closer".--This possibility of satisfying oneself is part of the language-game. Is one of its essential features.

Page 2

4. "I know that I am a human being." In order to see how unclear the sense of this proposition is, consider its negation. At most it might be taken to mean "I know I have the organs of a human". (E.g. a brain which, after all, no one has ever yet seen.) But what about such a proposition as "I know I have a brain"? Can I doubt it? Grounds for *doubt* are lacking! Everything speaks in its favour, nothing against it. Nevertheless it is imaginable that my skull should turn out empty when it was operated on.

Page 2

5. Whether a proposition can turn out false after all depends on what I make count as determinants for that proposition.

Page 2

6. Now, can one enumerate what one knows (like Moore)? Straight off like that, I believe not.--For otherwise the expression "I know" gets misused. And through this misuse a queer and extremely important mental state seems to be revealed.

Page 2

7. My life shews that I know or am certain that there is a chair over there, or a door, and so on.--I tell a friend e.g. "Take that chair over there", "Shut the door", etc. etc.

Page Break 3

Page 3

8. The difference between the concept of 'knowing' and the concept of 'being certain' isn't of any great importance at all, except where "I know" is meant to mean: I *can't* be wrong. In a law-court, for example, "I am certain" could replace "I know" in every piece of testimony. We might even imagine its being forbidden to say "I know" there. (A passage in *Wilhelm Meister*, where "You know" or "You knew" is used in the sense "You were certain", the facts being different from what he knew.)

Page 3

9. Now do I, in the course of my life, make sure I know that here is a hand--my own hand, that is?

Page 3

10. I know that a sick man is lying here? Nonsense! I am sitting at his bedside, I am looking attentively into his

face.--So I don't know, then, that there is a sick man lying here? Neither the question nor the assertion makes sense. Any more than the assertion "I am here", which I might yet use at any moment, if suitable occasion presented itself. Then is " $2 \times 2 = 4$ " nonsense in the same way, and not a proposition of arithmetic, apart from particular occasions? " $2 \times 2 = 4$ " is a true proposition of arithmetic--not "on particular occasions" nor "always"--but the spoken or written sentence " $2 \times 2 = 4$ " in Chinese might have a different meaning or be out and out nonsense, and from this is seen that it is only in use that the proposition has its sense. And "I know that there's a sick man lying here", used in an *unsuitable* situation, seems not to be nonsense but rather seems matter-of-course, only because one can fairly easily imagine a situation to fit it, and one thinks that the words "I know that..." are always in place where there is no doubt, and hence even where the expression of doubt would be unintelligible.

Page 3

11. We just do not see how very specialized the use of "I know" is.

Page 3

12. --For "I know" seems to describe a state of affairs which guarantees what is known, guarantees it as a fact. One always forgets the expression "I thought I knew".

Page 3

13. For it is not as though the proposition "It is so" could be inferred from someone else's utterance: "I know it is so". Nor from the utterance together with its not being a lie.--But can't I infer "It is so" from my own utterance "I know etc."? Yes;

Page Break 4

and also "There is a hand there" follows from the proposition "He knows that there's a hand there". But from his utterance "I know..." it does not follow that he does know it.

Page 4

14. That he does know remains to be shewn.

Page 4

15. It needs to be *shewn* that no mistake was possible. Giving the assurance "I know" doesn't suffice. For it is after all only an assurance that I can't be making a mistake, and it needs to be *objectively* established that I am not making a mistake about *that*.

Page 4

16. "If I know something, then I also know that I know it, etc." amounts to: "I know that" means "I am incapable of being wrong about that". But whether I am so must admit of being established objectively.

Page 4

17. Suppose now I say "I'm incapable of being wrong about this: that is a book" while I point to an object. What would a mistake here be like? And have I any *clear* idea of it?

Page 4

18. "I know" often means: I have the proper grounds for my statement. So if the other person is acquainted with the language-game, he would admit that I know. The other, if he is acquainted with the language-game, must be able to imagine *how* one may know something of the kind.

Page 4

19. The statement "I know that here is a hand" may then be continued: "for it's *my* hand that I'm looking at". Then a reasonable man will not doubt that I know. Nor will the idealist; rather he will say that he was not dealing with the practical doubt which is being dismissed, but there is a further doubt *behind* that one.--That this is an *illusion* has to be shewn in a different way.

Page 4

20. "Doubting the existence of the external world" does not mean for example doubting the existence of a planet, which later observations proved to exist.--Or does Moore want to say that knowing that here is his hand is different in kind from knowing the existence of the planet Saturn? Otherwise it would be possible to point out the discovery of the planet Saturn to the doubters and say that its existence has been proved, and hence the existence of the external world as well.

Page Break 5

Page 5

21. Moore's view really comes down to this: the concept 'know' is analogous to the concepts 'believe', 'surmise', 'doubt', 'be convinced' in that the statement "I know..." can't be a mistake. And if that *is* so, then there can be an inference from such an utterance to the truth of an assertion. And here the form "I thought I knew" is being overlooked.--But if this latter is inadmissible, then a mistake in the *assertion* must be logically impossible too. And anyone who is acquainted with the language-game must realize this--an assurance from a reliable man that he *knows*

cannot contribute anything.

Page 5

22. It would surely be remarkable if we had to believe the reliable person who says "I can't be wrong"; or who says "I am not wrong".

Page 5

23. If I don't know whether someone has two hands (say, whether they have been amputated or not) I shall believe his assurance that he has two hands, if he is trustworthy. And if he says he *knows* it, that can only signify to me that he has been able to make sure, and hence that his arms are e.g. not still concealed by coverings and bandages, etc. etc. My believing the trustworthy man stems from my admitting that it is possible for him to make sure. But someone who says that perhaps there are no physical objects makes no such admission.

Page 5

24. The idealist's question would be something like: "What right have I not to doubt the existence of my hands?" (And to that the answer can't be: I *know* that they exist.) But someone who asks such a question is overlooking the fact that a doubt about existence only works in a language-game. Hence, that we should first have to ask: what would such a doubt be like?, and don't understand this straight off.

Page 5

25. One may be wrong even about "there being a hand here". Only in particular circumstances is it impossible.--"Even in a calculation one can be wrong--only in certain circumstances one can't."

Page 5

26. But can it be seen from a *rule* what circumstances logically exclude a mistake in the employment of rules of calculation?

What use is a rule to us here? Mightn't we (in turn) go wrong in applying it?

Page Break 6

Page 6

27. If, however, one wanted to give something like a rule here, then it would contain the expression "in normal circumstances". And we recognize normal circumstances but cannot precisely describe them. At most, we can describe a range of abnormal ones.

Page 6

28. What is 'learning a rule'?--*This*.

What is 'making a mistake in applying it'?--*This*. And what is pointed to here is something indeterminate.

Page 6

29. Practice in the use of the rule also shews what is a mistake in its employment.

Page 6

30. When someone has made sure of something, he says: "Yes, the calculation is right", but he did not infer that from his condition of certainty. One does not infer how things are from one's own certainty.

Certainty is *as it were* a tone of voice in which one declares how things are, but one does not infer from the tone of voice that one is justified.

Page 6

31. The propositions which one comes back to again and again as if bewitched--these I should like to expunge from philosophical language.

Page 6

32. It's not a matter of *Moore's* knowing that there's a hand there, but rather we should not understand him if he were to say "Of course I may be wrong about this". We should ask "What is it like to make such a mistake as that?"--e.g. what's it like to discover that it was a mistake?

Page 6

33. Thus we expunge the sentences that don't get us any further.

Page 6

34. If someone is taught to calculate, is he also taught that he can rely on a calculation of his teacher's? But these explanations must after all sometime come to an end. Will he also be taught that he can trust his senses--since he is indeed told in many cases that in such and such a special case you *cannot* trust them?

Rule and exception.

Page 6

35. But can't it be imagined that there should be no physical objects? I don't know. And yet "There are physical objects" is nonsense. Is it supposed to be an empirical proposition?

Page Break 7

And is *this* an empirical proposition: "There seem to be physical objects"?

36. "A is a physical object" is a piece of instruction which we give only to someone who doesn't yet understand either what "A" means, or what "physical object" means. Thus it is instruction about the use of words, and "physical object" is a logical concept. (Like colour, quantity,...) And that is why no such proposition as: "There are physical objects" can be formulated.

Yet we encounter such unsuccessful shots at every turn.

37. But is it an adequate answer to the scepticism of the idealist, or the assurances of the realist, to say that "There are physical objects" is nonsense? For them after all it is not nonsense. It would, however, be an answer to say: this assertion, or its opposite is a misfiring attempt to express what can't be expressed like that. And that it does misfire can be shewn; but that isn't the end of the matter. We need to realize that what presents itself to us as the first expression of a difficulty, or of its solution, may as yet not be correctly expressed at all. Just as one who has a just censure of a picture to make will often at first offer the censure where it does not belong, and an *investigation* is needed in order to find the right point of attack for the critic.

38. Knowledge in mathematics: Here one has to keep on reminding oneself of the unimportance of the 'inner process' or 'state' and ask "Why should it be important? What does it matter to me?" What is interesting is how we *use* mathematical propositions.

39. *This* is how calculation is done, in such circumstances a calculation is *treated* as absolutely reliable, as certainly correct.

40. Upon "I know that here is my hand" there may follow the question "How do you know?" and the answer to that presupposes that *this* can be known in *that* way. So, instead of "I know that here is my hand", one might say "Here is my hand", and then add *how* one knows.

41. "I know where I am feeling pain", "I know that I feel it *here*" is as wrong as "I know that I am in pain". But "I know where you touched my arm" is right.

42. One can say "He believes it, but it isn't so", but not "He knows it, but it isn't so". Does this stem from the difference between the mental states of belief and of knowledge? No.--One may for example call "mental state" what is expressed by tone of voice in speaking, by gestures etc. It would thus be *possible* to speak of a mental state of conviction, and that may be the same whether it is knowledge or false belief. To think that different states must correspond to the words "believe" and "know" would be as if one believed that different people had to correspond to the word "I" and the name "Ludwig", because the concepts are different.

43. What sort of proposition is this: "We *cannot* have miscalculated in $12 \times 12 = 144$ "? It must surely be a proposition of logic.--But now, is it not the same, or doesn't it come to the same, as the statement $12 \times 12 = 144$?

44. If you demand a rule from which it follows that there can't have been a miscalculation here, the answer is that we did not learn this through a rule, but by learning to calculate.

45. We got to know the *nature* of calculating by learning to calculate.

46. But then can't it be described how we satisfy ourselves of the reliability of a calculation? O yes! Yet no rule emerges when we do so.--But the most important thing is: The rule is not needed. Nothing is lacking. We do calculate according to a rule, and that is enough.

47. *This* is how one calculates. Calculating is *this*. What we learn at school, for example. Forget this transcendent certainty, which is connected with your concept of spirit.

48. However, out of a host of calculations certain ones might be designated as reliable once for all, others as not yet fixed. And now, is this a *logical* distinction?

49. But remember: even when the calculation is something fixed for me, this is only a decision for a practical purpose.

50. When does one say, I know that... $\times \dots = \dots$? When one has checked the calculation.

51. What sort of proposition is: "What could a mistake here be like!?" It would have to be a logical proposition. But is it a logic that is not used, because what it tells us is not taught by means of propositions.--It is a logical proposition; for it does describe the conceptual (linguistic) situation.

52. This situation is thus not the same for a proposition like "At this distance from the sun there is a planet" and "Here is a hand" (namely my own hand). The second can't be called a hypothesis. But there isn't a sharp boundary line between them.

53. So one might grant that Moore was right, if he is interpreted like this: a proposition saying that here is a physical object may have the same logical status as one saying that here is a red patch.

54. For it is not true that a mistake merely gets more and more improbable as we pass from the planet to my own hand. No: at some point it has ceased to be conceivable.

This is already suggested by the following: if it were not so, it would also be conceivable that we should be wrong in *every* statement about physical objects; that any we ever make are mistaken.

55. So is the *hypothesis* possible, that all the things around us don't exist? Would that not be like the hypothesis of our having miscalculated in all our calculations?

56. When one says: "Perhaps this planet doesn't exist and the light-phenomenon arises in some other way", then after all one needs an example of an object which does exist. This doesn't exist,--as *for example* does....

Or are we to say that *certainty* is merely a constructed point to which some things approximate more, some less closely? No. Doubt gradually loses its sense. This language-game just *is* like that.

And everything descriptive of a language-game is part of logic.

57. Now might not "I *know*, I am not just surmising, that here is my hand" be conceived as a proposition of grammar? Hence *not* temporally.

But in that case isn't it like *this* one: "I know, I am not just surmising, that I am seeing red"?

And isn't the consequence "So there are physical objects" like: "So there are colours"?

58. If "I know etc'." is conceived as a grammatical proposition, of course the "I" cannot be important. And it properly means "There is no such thing as a doubt in this case" or "The expression 'I do not know' makes no sense in this case". And of course it follows from this that "I *know*" makes no sense either.

59. "I know" is here a *logical* insight. Only realism can't be proved by means of it.

60. It is wrong to say that the 'hypothesis' that *this* is a bit of paper would be confirmed or disconfirmed by later experience, and that, in "I know that this is a bit of paper," the "I know" either relates to such an hypothesis or to a logical determination.

61. ... A meaning of a word is a kind of employment of it.

For it is what we learn when the word is incorporated into our language.

62. That is why there exists a correspondence between the concepts 'rule' and 'meaning'.

63. If we imagine the facts otherwise than as they are, certain language-games lose some of their importance, while

others become important. And in this way there is an alteration--a gradual one--in the use of the vocabulary of a language.

Page 10

64. Compare the meaning of a word with the 'function' of an official. And 'different meanings' with 'different functions'.

Page 10

65. When language-games change, then there is a change in concepts, and with the concepts the meanings of words change.

Page 10

66. I make assertions about reality, assertions which have different degrees of assurance. How does the degree of assurance come out? What consequences has it?

We may be dealing, for example, with the certainty of memory, or again of perception. I may be sure of something, but still know what test might convince me of error. I am e.g. quite sure of the date of a battle, but if I should find a different date in a

Page Break 11

recognized work of history, I should alter my opinion, and this would not mean I lost all faith in judging.

Page 11

67. Could we imagine a man who keeps on making mistakes where we regard a mistake as ruled out, and in fact never encounter one?

E.g. he says he lives in such and such a place, is so and so old, comes from such and such a city, and he speaks with the same certainty (giving all the tokens of it) as I do, but he is wrong.

But what is his relation to this error? What am I to suppose?

Page 11

68. The question is: what is the logician to say here?

Page 11

69. I should like to say: "If I am wrong about *this*, I have no guarantee that anything I say is true." But others won't say that about me, nor will I say it about other people.

Page 11

70. For months I have lived at address A, I have read the name of the street and the number of the house countless times, have received countless letters here and given countless people the address. If I am wrong about it, the mistake is hardly less than if I were (wrongly) to believe I was writing Chinese and not German.

Page 11

71. If my friend were to imagine one day that he had been living for a long time past in such and such a place, etc. etc., I should not call this a *mistake*, but rather a mental disturbance, perhaps a transient one.

Page 11

72. Not every false belief of this sort is a mistake.

Page 11

73. But what is the difference between mistake and mental disturbance? Or what is the difference between my treating it as a mistake and my treating it as mental disturbance?

Page 11

74. Can we say: a *mistake* doesn't only have a cause, it also has a ground? I.e., roughly: when someone makes a mistake, this can be fitted into what he knows aright.

Page 11

75. Would this be correct: If I merely believed wrongly that there is a table here in front of me, this might still be a mistake; but if I believe wrongly that I have seen this table, or one like it, every day for several months past, and have regularly used it, that isn't a mistake?

Page Break 12

Page 12

76. Naturally, my aim must be to give the statements that one would like to make here, but cannot make significantly.

Page 12

77. Perhaps I shall do a multiplication twice to make sure, or perhaps get someone else to work it over. But shall I work it over again twenty times, or get twenty people to go over it? And is that some sort of negligence? Would the certainty really be greater for being checked twenty times?

Page 12

78. And can I give a *reason* why it isn't?

Page 12

79. That I am a man and not a woman can be verified, but if I were to say I was a woman, and then tried to explain the error by saying I hadn't checked the statement, the explanation would not be accepted.

Page 12

80. The *truth* of my statements is the test of my *understanding* of these statements.

Page 12

81. That is to say: if I make certain false statements, it becomes uncertain whether I understand them.

Page 12

82. What counts as an adequate test of a statement belongs to logic. It belongs to the description of the language-game.

Page 12

83. The *truth* of certain empirical propositions belongs to our frame of reference.

Page 12

84. Moore says he *knows* that the earth existed long before his birth. And put like that it seems to be a personal statement about him, even if it is in addition a statement about the physical world. Now it is philosophically uninteresting whether Moore knows this or that, but it is interesting that, and how, it can be known. If Moore had informed us that he knew the distance separating certain stars, we might conclude from that that he had made some special investigations, and we shall want to know what these were. But Moore chooses precisely a case in which we all seem to know the same as he, and without being able to say how. I believe e.g. that I know as much about this matter (the existence of the earth) as Moore does, and if he knows that it is as he says, then *I* know it too. For it isn't, either, as if he had arrived at his proposition

Page Break 13

by pursuing some line of thought which, while it is open to me, I have not in fact pursued.

Page 13

85. And what goes into someone's knowing this? Knowledge of history, say? He must know what it means to say: the earth has already existed for such and such a length of time. For not *any* intelligent adult must know that. We see men building and demolishing houses, and are led to ask: "How long has this house been here?" But how does one come on the idea of asking this about a mountain, for example? And have all men the notion of the earth as a *body*, which may come into being and pass away? Why shouldn't I think of the earth as flat, but extending without end in every direction (including depth)? But in that case one might still say "I know that this mountain existed long before my birth."-But suppose I met a man who didn't believe that?

Page 13

86. Suppose I replaced Moore's "I know" by "I am of the unshakeable conviction"?

Page 13

87. Can't an assertoric sentence, which was capable of functioning as an hypothesis, also be used as a foundation for research and action? I.e. can't it simply be isolated from doubt, though not according to any explicit rule? It simply gets assumed as a truism, never called in question, perhaps not even ever formulated.

Page 13

88. It maybe for example that *all enquiry on our part* is set so as to exempt certain propositions from doubt, if they are ever formulated. They lie apart from the route travelled by enquiry.

Page 13

89. One would like to say: "Everything speaks for, and nothing against the earth's having existed long before...."

Yet might I not believe the contrary after all? But the question is: What would the practical effects of this belief be?--Perhaps someone says: "That's not the point. A belief is what it is whether it has any practical effects or not." One thinks: It is the same adjustment of the human mind anyway.

Page 13

90. "I know" has a primitive meaning similar to and related to "I see" ("wissen", "videre"). And "I knew he was in the room, but he wasn't in the room" is like "I saw him in the room, but he wasn't there". "I know" is supposed to express a relation, not

Page Break 14

between me and the sense of a proposition (like "I believe") but between me and a fact. So that the *fact* is taken into my consciousness. (Here is the reason why one wants to say that nothing that goes on in the outer world is really known, but only what happens in the domain of what are called sense-data.) This would give us a picture of

knowing as the perception of an outer event through visual rays which project it as it is into the eye and the consciousness. Only then the question at once arises whether one can be *certain* of this projection. And this picture does indeed show how our *imagination* presents knowledge, but not what lies at the bottom of this presentation.

Page 14

91. If Moore says he knows the earth existed etc., most of us will grant him that it has existed all that time, and also believe him when he says he is convinced of it. But has he also got the right *ground* for his conviction? For if not, then after all he doesn't *know* (Russell).

Page 14

92. However, we can ask: May someone have telling grounds for believing that the earth has only existed for a short time, say since his own birth?--Suppose he had always been told that,--would he have any good reason to doubt it? Men have believed that they could make rain; why should not a king be brought up in the belief that the world began with him? And if Moore and this king were to meet and discuss, could Moore really prove his belief to be the right one? I do not say that Moore could not convert the king to his view, but it would be a conversion of a special kind; the king would be brought to look at the world in a different way.

Remember that one is sometimes convinced of the *correctness* of a view by its *simplicity* or *symmetry*, i.e., these are what induce one to go over to this point of view. One then simply says something like: "*That's* how it must be."

Page 14

93. The propositions presenting what Moore '*knows*' are all of such a kind that it is difficult to imagine *why* anyone should believe the contrary. E.g. the proposition that Moore has spent his whole life in close proximity to the earth.--Once more I can speak of myself here instead of speaking of Moore. What could induce me to believe the opposite? Either a memory, or having been told.--

Page Break 15

Everything that I have seen or heard gives me the conviction that no man has ever been far from the earth. Nothing in my picture of the world speaks in favour of the opposite.

Page 15

94. But I did not get my picture of the world by satisfying myself of its correctness; nor do I have it because I am satisfied of its correctness. No: it is the inherited background against which I distinguish between true and false.

Page 15

95. The propositions describing this world-picture might be part of a kind of mythology. And their role is like that of rules of a game; and the game can be learned purely practically, without learning any explicit rules.

Page 15

96. It might be imagined that some propositions, of the form of empirical propositions, were hardened and functioned as channels for such empirical propositions as were not hardened but fluid; and that this relation altered with time, in that fluid propositions hardened, and hard ones became fluid.

Page 15

97. The mythology may change back into a state of flux, the river-bed of thoughts may shift. But I distinguish between the movement of the waters on the river-bed and the shift of the bed itself; though there is not a sharp division of the one from the other.

Page 15

98. But if someone were to say "So logic too is an empirical science" he would be wrong. Yet this is right: the same proposition may get treated at one time as something to test by experience, at another as a rule of testing.

Page 15

99. And the bank of that river consists partly of hard rock, subject to no alteration or only to an imperceptible one, partly of sand, which now in one place now in another gets washed away, or deposited.

Page 15

100. The truths which Moore says he knows, are such as, roughly speaking, all of us know, if he knows them.

Page 15

101. Such a proposition might be e.g. "My body has never disappeared and reappeared again after an interval."

Page 15

102. Might I not believe that once, without knowing it, perhaps in a state of unconsciousness, I was taken far away from the earth

Page Break 16

--that other people even know this, but do not mention it to me? But this would not fit into the rest of my convictions at all. Not that I could describe the system of these convictions. Yet my convictions do form a system, a

structure.

Page 16

103. And now if I were to say "It is my unshakeable conviction that etc.", this means in the present case too that I have not consciously arrived at the conviction by following a particular line of thought, but that it is anchored in all my *questions and answers*, so anchored that I cannot touch it.

Page 16

104. I am for example also convinced that the sun is not a hole in the vault of heaven.

Page 16

105. All testing, all confirmation and disconfirmation of a hypothesis takes place already within a system. And this system is not a more or less arbitrary and doubtful point of departure for all our arguments: no, it belongs to the essence of what we call an argument. The system is not so much the point of departure, as the element in which arguments have their life.

Page 16

106. Suppose some adult had told a child that he had been on the moon. The child tells me the story, and I say it was only a joke, the man hadn't been on the moon; no one has ever been on the moon; the moon is a long way off and it is impossible to climb up there or fly there.--If now the child insists, saying perhaps there is a way of getting there which I don't know, etc. what reply could I make to him? What reply could I make to the adults of a tribe who believe that people sometimes go to the moon (perhaps that is how they interpret their dreams), and who indeed grant that there are no ordinary means of climbing up to it or flying there?--But a child will not ordinarily stick to such a belief and will soon be convinced by what we tell him seriously.

Page 16

107. Isn't this altogether like the way one can instruct a child to believe in a God, or that none exists, and it will accordingly be able to produce apparently telling grounds for the one or the other?

Page Break 17

Page 17

108. "But is there then no objective truth? Isn't it true, or false, that someone has been on the moon?" If we are thinking within our system, then it is certain that no one has ever been on the moon. Not merely is nothing of the sort ever seriously reported to us by reasonable people, but our whole system of physics forbids us to believe it. For this demands answers to the questions "How did he overcome the force of gravity?" "How could he live without an atmosphere?" and a thousand others which could not be answered. But suppose that instead of all these answers we met the reply: "We don't know *how* one gets to the moon, but those who get there know at once that they are there; and even you can't explain everything." We should feel ourselves intellectually very distant from someone who said this.

Page 17

109. "An empirical proposition can be *tested*" (we say). But how? and through what?

Page 17

110. What *counts* as its test? "But is this an adequate test? And, if so, must it not be recognizable as such in logic?"--As if giving grounds did not come to an end sometime. But the end is not an ungrounded presupposition: it is an ungrounded way of acting.

Page 17

111. "I *know* that I have never been on the moon." That sounds quite different in the circumstances which actually hold, to the way it would sound if a good many men had been on the moon, and some perhaps without knowing it. In *this* case one could give grounds for this knowledge. Is there not a relationship here similar to that between the general rule of multiplying and particular multiplications that have been carried out?

I want to say: my not having been on the moon is as sure a thing for me as any grounds I could give for it.

Page 17

112. And isn't that what Moore wants to say, when he says he *knows* all these things?--But is his knowing it really what is in question, and not rather that some of these propositions must be solid for us?

Page 17

113. When someone is trying to teach us mathematics, he will not begin by assuring us that he *knows* that $a + b = b + a$.

Page 17

114. If you are not certain of any fact, you cannot be certain of the meaning of your words either.

Page Break 18

Page 18

115. If you tried to doubt everything you would not get as far as doubting anything. The game of doubting itself presupposes certainty.

Page 18

116. Instead of "I know...", couldn't Moore have said: "It stands fast for me that..."? And further: "It stands fast for me and many others...."

Page 18

117. Why is it not possible for me to doubt that I have never been on the moon? And how could I try to doubt it?

First and foremost, the supposition that perhaps I have been there would strike me as *idle*. Nothing would follow from it, nothing be explained by it. It would not tie in with anything in my life.

When I say "Nothing speaks for, everything against it," this presupposes a principle of speaking for and against. That is, I must be able to say what *would* speak for it.

Page 18

118. Now would it be correct to say: So far no one has opened my skull in order to see whether there is a brain inside; but everything speaks for, and nothing against, its being what they would find there?

Page 18

119. But can it also be said: Everything speaks for, and nothing against the table's still being there when no one sees it? For what does speak for it?

Page 18

120. But if anyone were to doubt it, how would his doubt come out in practice? And couldn't we peacefully leave him to doubt it, since it makes no difference at all?

Page 18

121. Can one say: "Where there is no doubt there is no knowledge either"?

Page 18

122. Doesn't one need grounds for doubt?

Page 18

123. Wherever I look, I find no ground for doubting that....

Page 18

124. I want to say: We use judgments as principles of judgment.

Page 18

125. If a blind man were to ask me "Have you got two hands?" I should not make sure by looking. If I were to have any doubt of it, then I don't know why I should trust my eyes. For why shouldn't I test my *eyes* by looking to find out whether I see my

Page Break 19

two hands? *What* is to be tested by *what*? (Who decides *what* stands fast?)

And what does it mean to say that such and such stands fast?

Page 19

126. I am not more certain of the meaning of my words than I am of certain judgments. Can I doubt that this colour is called "blue"?

(My) doubts form a system.

Page 19

127. For how do I know that someone is in doubt? How do I know that he uses the words "I doubt it" as I do?

Page 19

128. From a child up I learnt to judge like this. *This is* judging.

Page 19

129. This is how I learned to judge; *this* I got to know *as* judgment.

Page 19

130. But isn't it experience that teaches us to judge like *this*, that is to say, that it is correct to judge like *this*? But how does experience *teach* us, then? *We* may derive it from experience, but experience does not direct us to derive anything from experience. If it is the *ground* of our judging like *this*, and not just the cause, still we do not have a ground for seeing *this* in turn as a ground.

Page 19

131. No, experience is not the ground for our game of judging. Nor is its outstanding success.

Page 19

132. Men have judged that a king can make rain; *we* say this contradicts all experience. Today they judge that aeroplanes and the radio etc. are means for the closer contact of peoples and the spread of culture.

Page 19

133. Under ordinary circumstances I do not satisfy myself that I have two hands by seeing how it looks. *Why not?* Has experience shown it to be unnecessary? Or (again): Have we in some way learnt a universal law of induction, and do we trust it here too?--But why should we have learnt one *universal* law first, and not the special one straight away?

Page 19

134. After putting a book in a drawer, I assume it is there, unless.... "Experience always proves me right. There is no well attested case of a book's (simply) disappearing." It has *often* happened that a book has never turned up again, although we

Page Break 20

thought we knew for certain where it was.--But experience does really teach that a book, say, does not vanish away. (E.g. gradually evaporate.) But is it this experience with books etc. that leads us to assume that such a book has not vanished away? Well, suppose we were to find that under particular novel circumstances books did vanish away.--Shouldn't we alter our assumption? Can one give the lie to the effect of experience on our system of assumption?

Page 20

135. But do we not simply follow the principle that what has always happened will happen again (or something like it)? What does it mean to follow this principle? Do we really introduce it into our reasoning? Or is it merely the *natural law* which our inferring apparently follows? This latter it may be. It is not an item in our considerations.

Page 20

136. When Moore says he *knows* such and such, he is really enumerating a lot of empirical propositions which we affirm without special testing; propositions, that is, which have a peculiar logical role in the system of our empirical propositions.

Page 20

137. Even if the most trustworthy of men assures me that he *knows* things are thus and so, this by itself cannot satisfy me that he does know. Only that he believes he knows. That is why Moore's assurance that he knows... does not interest us. The propositions, however, which Moore retails as examples of such known truths are indeed interesting. Not because anyone knows their truth, or believes he knows them, but because they all have a *similar* role in the system of our empirical judgments.

Page 20

138. We don't, for example, arrive at any of them as a result of investigation.

There are e.g. historical investigations and investigations into the shape and also the age of the earth, but not into whether the earth has existed during the last hundred years. Of course many of us have information about this period from our parents and grandparents; but mayn't they be wrong?--"Nonsense!" one will say. "How should all these people be wrong?"--But is that an argument? Is it not simply the rejection of an idea? And

Page Break 21

perhaps the determination of a concept? For if I speak of a possible mistake here, this changes the role of "mistake" and "truth" in our lives.

Page 21

139. Not only rules, but also examples are needed for establishing a practice. Our rules leave loop-holes open, and the practice has to speak for itself.

Page 21

140. We do not learn the practice of making empirical judgments by learning rules: we are taught *judgments* and their connexion with other judgments. A *totality* of judgments is made plausible to us.

Page 21

141. When we first begin to *believe* anything, what we believe is not a single proposition, it is a whole system of propositions. (Light dawns gradually over the whole.)

Page 21

142. It is not single axioms that strike me as obvious, it is a system in which consequences and premises give one another *mutual* support.

Page 21

143. I am told, for example, that someone climbed this mountain many years ago. Do I always enquire into the reliability of the teller of this story, and whether the mountain did exist years ago? A child learns there are reliable and unreliable informants much later than it learns facts which are told it. It doesn't learn *at all* that that mountain has existed for a long time: that is, the question whether it is so doesn't arise at all. It swallows this consequence down, so to speak, together with *what* it learns.

Page 21

144. The child learns to believe a host of things. I.e. it learns to act according to these beliefs. Bit by bit there forms a system of what is believed, and in that system some things stand unshakeably fast and some are more or less liable to shift. What stands fast does so, not because it is intrinsically obvious or convincing; it is rather held fast by what lies around it.

Page 21

145. One wants to say "*All my experiences shew that it is so*". But how do they do that? For that proposition to which they point itself belongs to a particular interpretation of them.

"That I regard this proposition as certainly true also characterizes my interpretation of experience."

Page Break 22

Page 22

146. We form *the picture* of the earth as a ball floating free in space and not altering essentially in a hundred years. I said "*We form the picture etc.*" and this picture now helps us in the judgment of various situations.

I may indeed calculate the dimensions of a bridge, sometimes calculate that here things are more in favour of a bridge than a ferry, etc. etc.,--but somewhere I must begin with an assumption or a decision.

Page 22

147. The picture of the earth as a ball is a *good* picture, it proves itself everywhere, it is also a simple picture--in short, we work with it without doubting it.

Page 22

148. Why do I not satisfy myself that I have two feet when I want to get up from a chair? There is no why. I simply don't. This is how I act.

Page 22

149. My judgments themselves characterize the way I judge, characterize the nature of judgment.

Page 22

150. How does someone judge which is his right and which his left hand? How do I know that my judgment will agree with someone else's? How do I know that this colour is blue? If I don't trust *myself* here, why should I trust anyone else's judgment? Is there a why? Must I not begin to trust somewhere? That is to say: somewhere I must begin with not-doubting; and that is not, so to speak, hasty but excusable: it is part of judging.

Page 22

151. I should like to say: Moore does not *know* what he asserts he knows, but it stands fast for him, as also for me; regarding it as absolutely solid is part of our *method* of doubt and enquiry.

Page 22

152. I do not explicitly learn the propositions that stand fast for me. I can *discover* them subsequently like the axis around which a body rotates. This axis is not fixed in the sense that anything holds it fast, but the movement around it determines its immobility.

Page 22

153. No one ever taught me that my hands don't disappear when I am not paying attention to them. Nor can I be said to presuppose the truth of this proposition in my assertions etc., (as if they rested on it) while it only gets sense from the rest of our procedure of asserting.

Page Break 23

Page 23

154. There are cases such that, if someone gives signs of doubt where we do not doubt, we cannot confidently understand his signs as signs of doubt.

I.e.: if we are to understand his signs of doubt as such, he may give them only in particular cases and may not give them in others.

Page 23

155. In certain circumstances a man cannot make a *mistake*. ("Can" is here used logically, and the proposition does not mean that a man cannot say anything false in those circumstances.) If Moore were to pronounce the opposite of those propositions which he declares certain, we should not just not share his opinion: we should regard him as demented.

Page 23

156. In order to make a mistake, a man must already judge in conformity with mankind.

Page 23

157. Suppose a man could not remember whether he had always had five fingers or two hands? Should we understand him? Could we be sure of understanding him?

158. Can I be making a mistake, for example, in thinking that the words of which this sentence is composed are English words whose meaning I know?

159. As children we learn facts; e.g., that every human being has a brain, and we take them on trust. I believe that there is an island, Australia, of such-and-such a shape, and so on and so on; I believe that I had great-grandparents, that the people who gave themselves out as my parents really were my parents, etc. This belief may never have been expressed; even the thought that it was so, never thought.

160. The child learns by believing the adult. Doubt comes *after* belief.

161. I learned an enormous amount and accepted it on human authority, and then I found some things confirmed or disconfirmed by my own experience.

162. In general I take as true what is found in text-books, of geography for example. Why? I say: All these facts have been confirmed a hundred times over. But how do I know that? What is my evidence for it? I have a world-picture. Is it true or false? Above all it is the substratum of all my enquiring and asserting.

The propositions describing it are not all equally subject to testing.

163. Does anyone ever test whether this table remains in existence when no one is paying attention to it?

We check the story of Napoleon, but not whether all the reports about him are based on sense-deception, forgery and the like. For whenever we test anything, we are already presupposing something that is not tested. Now am I to say that the experiment which perhaps I make in order to test the truth of a proposition presupposes the truth of the proposition that the apparatus I believe I see is really there (and the like)?

164. Doesn't testing come to an end?

165. One child might say to another: "I know that the earth is already hundreds of years old" and that would mean: I have learnt it.

166. The difficulty is to realize the groundlessness of our believing.

167. It is clear that our empirical propositions do not all have the same status, since one can lay down such a proposition and turn it from an empirical proposition into a norm of description.

Think of chemical investigations. Lavoisier makes experiments with substances in his laboratory and now he concludes that this and that takes place when there is burning. He does not say that it might happen otherwise another time. He has got hold of a definite world-picture--not of course one that he invented: he learned it as a child. I say world-picture and not hypothesis, because it is the matter-of-course foundation for his research and as such also goes unmentioned.

168. But now, what part is played by the presupposition that a substance A always reacts to a substance B in the same way, given the same circumstances? Or is that part of the definition of a substance?

169. One might think that there were propositions declaring that chemistry is *possible*. And these would be propositions of a natural science. For what should they be supported by, if not by experience?

170. I believe what people transmit to me in a certain manner. In this way I believe geographical, chemical, historical facts etc.

That is how I *learn* the sciences. Of course learning is based on believing.

If you have learnt that Mont Blanc is 4000 metres high, if you have looked it up on the map, you say you *know* it.

And can it now be said: we accord credence in this way because it has proved to pay?

171. A principal ground for Moore to assume that he never was on the moon is that no one ever was on the moon or *could* come there; and this we believe on grounds of what we learn.

Page 25

172. Perhaps someone says "There must be some basic principle on which we accord credence", but what can such a principle accomplish? Is it more than a natural law of 'taking for true'?

Page 25

173. Is it maybe in my power what I believe? or what I unshakeably believe?

I believe that there is a chair over there. Can't I be wrong? But, can I believe that I am wrong? Or can I so much as bring it under consideration?--And mightn't I also hold fast to my belief whatever I learned later on?! But is my belief then *grounded*?

Page 25

174. I act with *complete* certainty. But this certainty is my own.

Page 25

175. "I know it" I say to someone else; and here there is a justification. But there is none for my belief.

Page 25

176. Instead of "I know it" one may say in some cases "That's how it is--rely upon it." In some cases, however "I learned it years and years ago"; and sometimes: "I am sure it is so."

Page 25

177. What I know, I believe.

Page 25

178. The wrong use made by Moore of the proposition "I know..." lies in his regarding it as an utterance as little subject to doubt as "I am in pain". And since from "I know it is so" there follows "It is so", then the latter can't be doubted either.

Page 25

179. It would be correct to say: "I believe..." has subjective truth; but "I know..." not.

Page Break 26

Page 26

180. Or again "I believe..." is an 'expression', but not "I know...".

Page 26

181. Suppose Moore had said "I swear..." instead of "I know...".

Page 26

182. The more primitive idea is that the earth *never* had a beginning. No child has reason to ask himself how long the earth has existed, because all change takes place *on* it. If what is called the earth really came into existence at some time--which is hard enough to picture--then one naturally assumes the beginning as having been an inconceivably long time ago.

Page 26

183. "It is certain that after the battle of Austerlitz Napoleon.... Well, in that case it's surely also certain that the earth existed then."

Page 26

184. "It is certain that we didn't arrive on this planet from another one a hundred years ago." Well, it's as certain as such things *are*.

Page 26

185. It would strike me as ridiculous to want to doubt the existence of Napoleon; but if someone doubted the existence of the earth 150 years ago, perhaps I should be more willing to listen, for now he is doubting our whole system of evidence. It does not strike me as if this system were more certain than a certainty within it.

Page 26

186. "I might suppose that Napoleon never existed and is a fable, but not that the *earth* did not exist 150 years ago."

Page 26

187. "Do you *know* that the earth existed then?"--"Of course I know that. I have it from someone who certainly knows all about it."

Page 26

188. It strikes me as if someone who doubts the existence of the earth at that time is impugning the nature of all historical evidence. And I cannot say of this latter that it is definitely *correct*.

Page 26

189. At some point one has to pass from explanation to mere description.

Page 26

190. What we call historical evidence points to the existence of the earth a long time before my birth;--the opposite hypothesis has *nothing* on its side.

Page Break 27

Page 27

191. Well, if everything speaks for an hypothesis and nothing against it--is it then certainly true? One may designate it as such.--But does it certainly agree with reality, with the facts?--With this question you are already going round in a circle.

Page 27

192. To be sure there is justification; but justification comes to an end.

Page 27

193. What does this mean: the truth of a proposition is *certain*?

Page 27

194. With the word "certain" we express complete conviction, the total absence of doubt, and thereby we seek to convince other people. That is *subjective* certainty.

But when is something objectively certain? When a mistake is not possible. But what kind of possibility is that? Mustn't mistake be *logically* excluded?

Page 27

195. If I believe that I am sitting in my room when I am not, then I shall not be said to have *made a mistake*. But what is the essential difference between this case and a mistake?

Page 27

196. Sure evidence is what we *accept* as sure, it is evidence that we go by in *acting* surely, acting without any doubt. What we call "a mistake" plays a quite special part in our language games, and so too does what we regard as certain evidence.

Page 27

197. It would be nonsense to say that we regard something as sure evidence because it is certainly true.

Page 27

198. Rather, we must first determine the role of deciding for or against a proposition.

Page 27

199. The reason why the use of the expression "true or false" has something misleading about it is that it is like saying "it tallies with the facts or it doesn't", and the very thing that is in question is what "tallying" is here.

Page 27

200. Really "The proposition is either true or false" only means that it must be possible to decide for or against it. But this does not say what the ground for such a decision is like.

Page 27

201. Suppose someone were to ask: "Is it really right for us to rely on the evidence of our memory (or our senses) as we do?"

Page Break 28

Page 28

202. Moore's certain propositions almost declare that we have a right to rely upon this evidence.

Page 28

203. [Everything[†]1 that we regard as evidence indicates that the earth already existed long before my birth. The contrary hypothesis has *nothing* to confirm it at all.

If everything speaks *for* an hypothesis and nothing against it, is it objectively *certain*? One can *call* it that. But does it *necessarily* agree with the world of facts? At the very best it shows us what "agreement" means. We find it difficult to imagine it to be false, but also difficult to make use of it.]

What does this agreement consist in, if not in the fact that what is evidence in these language games speaks for our proposition? (*Tractatus Logico-Philosophicus*)

Page 28

204. Giving grounds, however, justifying the evidence, comes to an end;--but the end is not certain propositions' striking us immediately as true, i.e. it is not a kind of *seeing* on our part; it is our *acting*, which lies at the bottom of the language-game.

Page 28

205. If the true is what is grounded, then the ground is not *true*, nor yet false.

Page 28

206. If someone asked us "but is that *true*?" we might say "yes" to him; and if he demanded grounds we might say "I can't give you any grounds, but if you learn more you too will think the same".

If this didn't come about, that would mean that he couldn't for example learn history.

Page 28

207. "Strange coincidence, that every man whose skull has been opened had a brain"

Page 28

208. I have a telephone conversation with New York. My friend tells me that his young trees have buds of such and such a kind. I am now convinced that his tree is.... Am I also convinced that the earth exists?

Page 28

209. The existence of the earth is rather part of the whole *picture* which forms the starting-point of belief for me.

Page 28

210. Does my telephone call to New York strengthen my conviction that the earth exists?

Page Break 29

Page 29

Much seems to be fixed, and it is removed from the traffic. It is so to speak shunted onto an unused siding.

Page 29

211. Now it gives our way of looking at things, and our researches, their form. Perhaps it was once disputed. But perhaps, for unthinkable ages, it has belonged to the *scaffolding* of our thoughts. (Every human being has parents.)

Page 29

212. In certain circumstances, for example, we regard a calculation as sufficiently checked. What gives us a right to do so? Experience? May that not have deceived us? Somewhere we must be finished with justification, and then there remains the proposition that *this* is how we calculate.

Page 29

213. Our 'empirical propositions' do not form a homogeneous mass.

Page 29

214. What prevents me from supposing that this table either vanishes or alters its shape and colour when no one is observing it, and then when someone looks at it again changes back to its old condition? "But who is going to suppose such a thing!"--one would feel like saying.

Page 29

215. Here we see that the idea of 'agreement with reality' does not have any clear application.

Page 29

216. The proposition "It is written".

Page 29

217. If someone supposed that *all* our calculations were uncertain and that we could rely on none of them (justifying himself by saying that mistakes are always possible) perhaps we would say he was crazy. But can we say he is in error? Does he not just react differently? We rely on calculations, he doesn't; we are sure, he isn't.

Page 29

218. Can I believe for one moment that I have ever been in the stratosphere? No. So do I *know* the contrary, like Moore?

Page 29

219. There cannot be any doubt about it for me as a reasonable person.--That's it.--

Page 29

220. The reasonable man *does not* have certain doubts.

Page 29

221. Can I be in doubt at *will*?

Page 29

222. I cannot possibly doubt that I was never in the stratosphere. Does that make me know it? Does it make it true?

Page Break 30

Page 30

223. For mightn't I be crazy and not doubting what I absolutely ought to doubt?

Page 30

224. "I *know* that it never happened, for if it had happened I could not possibly have forgotten it."

Page 30

But, supposing it *did* happen, then it just would have been the case that you had forgotten it. And how do

you know that you could not possibly have forgotten it? Isn't that just from earlier experience?

Page 30

225. What I hold fast to is not *one* proposition but a nest of propositions.

Page 30

226. Can I give the supposition that I have ever been on the moon any serious consideration at all?

Page 30

227. "Is that something that one can forget?!"

Page 30

228. "In such circumstances, people do not say 'Perhaps we've all forgotten', and the like, but rather they assume that..."

Page 30

229. Our talk gets its meaning from the rest of our proceedings.

Page 30

230. We are asking ourselves: what do we do with a statement "*I know...*"? For it is not a question of mental processes or mental states.

Page 30

And *that* is how one must decide whether something is knowledge or not.

Page 30

231. If someone doubted whether the earth had existed a hundred years ago, I should not understand, for *this* reason: I would not know what such a person would still allow to be counted as evidence and what not.

Page 30

232. "We could doubt every single one of these facts, but we could not doubt them *all*."

Wouldn't it be more correct to say: "we do not doubt them *all*".

Our not doubting them all is simply our manner of judging, and therefore of acting.

Page 30

233. If a child asked me whether the earth was already there before my birth, I should answer him that the earth did not begin only with my birth, but that it existed long, long before. And I should have the feeling of saying something funny.

Page Break 31

Rather as if the child had asked if such and such a mountain were higher than a tall house that it had seen. In answering the question I should have to be imparting a picture of the world to the person who asked it.

If I do answer the question with certainty, what gives me this certainty?

Page 31

234. I believe that I have forebears, and that every human being has them. I believe that there are various cities, and, quite generally, in the main facts of geography and history. I believe that the earth is a body on whose surface we move and that it no more suddenly disappears or the like than any other solid body: this table, this house, this tree, etc. If I wanted to doubt the existence of the earth long before my birth, I should have to doubt all sorts of things that stand fast for me.

Page 31

235. And that something stands fast for me is not grounded in my stupidity or credulity.

Page 31

236. If someone said "The earth has not long been..." what would he be impugning? Do I know?

Would it have to be what is called a scientific belief? Might it not be a mystical one? Is there any absolute necessity for him to be contradicting historical facts? or even geographical ones?

Page 31

237. If I say "an hour ago this table didn't exist", I probably mean that it was only made later on.

If I say "this mountain didn't exist then", I presumably mean that it was only formed later on--perhaps by a volcano.

If I say "this mountain didn't exist half an hour ago", that is such a strange statement that it is not clear what I mean. Whether for example I mean something untrue but scientific. Perhaps you think that the statement that the mountain didn't exist then is quite clear, however one conceives the context. But suppose someone said "This mountain didn't exist a minute ago, but an exactly similar one did instead". Only the accustomed context allows what is meant to come through clearly.

Page 31

238. I might therefore interrogate someone who said that the earth did not exist before his birth, in order to find out which of

Page Break 32

my convictions he was at odds with. And then it *might* be that he was contradicting my fundamental attitudes, and if that were how it was, I should have to put up with it.

Similarly if he said he had at some time been on the moon.

Page 32

239. I believe that every human being has two human parents; but Catholics believe that Jesus only had a human mother. And other people might believe that there are human beings with no parents, and give no credence to all the contrary evidence. Catholics believe as well that in certain circumstances a wafer completely changes its nature, and at the same time that all evidence proves the contrary. And so if Moore said "I know that this is wine and not blood", Catholics would contradict him.

Page 32

240. What is the belief that all human beings have parents based on? On experience. And how can I base this sure belief on my experience? Well, I base it not only on the fact that I have known the parents of certain people but on everything that I have learnt about the sexual life of human beings and their anatomy and physiology: also on what I have heard and seen of animals. But then is that really a proof?

Page 32

241. Isn't this an hypothesis, which, as I *believe*, is again and again completely confirmed?

Page 32

242. Mustn't we say at every turn: "I *believe* this with certainty"?

Page 32

243. One says "I know" when one is ready to give compelling grounds. "I know" relates to a possibility of demonstrating the truth. Whether someone knows something can come to light, assuming that he is convinced of it.

But if what he believes is of such a kind that the grounds that he can give are no surer than his assertion, then he cannot say that he knows what he believes.

Page 32

244. If someone says "I have a body", he can be asked "Who is speaking here with this mouth?"

Page 32

245. To whom does anyone say that he knows something? To himself, or to someone else. If he says it to himself, how is it distinguished from the assertion that he is *sure* that things are like that? There is no subjective sureness that I know something. The

Page Break 33

certainty is subjective, but not the knowledge. So if I say "I know that I have two hands", and that is not supposed to express just my subjective certainty, I must be able to satisfy myself that I am right. But I can't do that, for my having two hands is not less certain before I have looked at them than afterwards. But I could say: "That I have two hands is an irreversible belief." That would express the fact that I am not ready to let anything count as a disproof of this proposition.

Page 33

246. "Here I have arrived at a foundation of all my beliefs." "This position I will *hold!*" But isn't that, precisely, only because I am completely *convinced* of it?--What is 'being completely convinced' like?

Page 33

247. What would it be like to doubt now whether I have two hands? Why can't I imagine it at all? What would I believe if I didn't believe that? So far I have no system at all within which this doubt might exist.

Page 33

248. I have arrived at the rock bottom of my convictions.

And one might almost say that these foundation-walls are carried by the whole house.

Page 33

249. One gives oneself a false picture of *doubt*.

Page 33

250. My having two hands is, in normal circumstances, ascertain as anything that I could produce in evidence for it. That is why I am not in a position to take the sight of my hand as evidence for it.

Page 33

251. Doesn't this mean: I shall proceed according to this belief unconditionally, and not let anything confuse me?

Page 33

252. But it isn't just that I *believe* in this way that I have two hands, but that every reasonable person does.

Page 33

253. At the foundation of well-founded belief lies belief that is not founded.

Page 33

254. Any 'reasonable' person behaves like *this*.

Page 33

255. Doubting has certain characteristic manifestations, but they are only characteristic of it in particular circumstances. If

Page Break 34

someone said that he doubted the existence of his hands, kept looking at them from all sides, tried to make sure it wasn't 'all done by mirrors', etc., we should not be sure whether we ought to call that doubting. We might describe his way of behaving as like the behaviour of doubt, but his game would not be ours.

Page 34

256. On the other hand a language-game does change with time.

Page 34

257. If someone said to me that he doubted whether he had a body I should take him to be a half-wit. But I shouldn't know what it would mean to try to convince him that he had one. And if I had said something, and that had removed his doubt, I should not know how or why.

Page 34

258. I do not know how the sentence "I have a body" is to be used.

That doesn't unconditionally apply to the proposition that I have always been on or near the surface of the earth.

Page 34

259. Someone who doubted whether the earth had existed for 100 years might have a scientific, or on the other hand a philosophical, doubt.

Page 34

260. I would like to reserve the expression "I know" for the cases in which it is used in normal linguistic exchange.

Page 34

261. I cannot at present imagine a reasonable doubt as to the existence of the earth during the last 100 years.

Page 34

262. I can imagine a man who had grown up in quite special circumstances and been taught that the earth came into being 50 years ago, and therefore believed this. We might instruct him: the earth has long... etc.--We should be trying to give him our picture of the world.

This would happen through a kind of *persuasion*.

Page 34

263. The schoolboy *believes* his teachers and his schoolbooks.

Page 34

264. I could imagine Moore being captured by a wild tribe, and their expressing the suspicion that he has come from somewhere between the earth and the moon. Moore tells them that he

Page Break 35

knows etc. but he can't give them the grounds for his certainty, because they have fantastic ideas of human ability to fly and know nothing about physics. This would be an occasion for making that statement.

Page 35

265. But what does it say, beyond "I have never been to such and such a place, and have compelling grounds for believing that"?

Page 35

266. And here one would still have to say what are compelling grounds.

Page 35

267. "I don't merely have the visual impression of a tree: I *know* that it is a tree".

Page 35

268. "I know that this is a hand."--And what is a hand?--"Well, *this*, for example."

Page 35

269. Am I more certain that I have never been on the moon than that I have never been in Bulgaria? Why am I so sure? Well, I know that I have never been anywhere in the neighbourhood--for example I have never been in the Balkans.

Page 35

270. "I have compelling grounds for my certitude." These grounds make the certitude objective.

Page 35

271. What is a telling ground for something is not anything *I* decide.

Page 35

272. I know = I am familiar with it as a certainty.

Page 35

273. But when does one say of something that it is certain?

For there can be dispute whether something *is* certain; I mean, when something is *objectively* certain.

There are countless general empirical propositions that count as certain for us.

Page 35

274. One such is that if someone's arm is cut off it will not grow again. Another, if someone's head is cut off he is dead and will never live again.

Experience can be said to teach us these propositions. However, it does not teach us them in isolation: rather, it teaches us a host of interdependent propositions. If they were isolated I might perhaps doubt them, for I have no experience relating to them.

Page 35

275. If experience is the ground of our certainty, then naturally it is past experience.

Page Break 36

Page 36

And it isn't for example just my experience, but other people's, that I get knowledge from.

Now one might say that it is experience again that leads us to give credence to others. But what experience makes me believe that the anatomy and physiology books don't contain what is false? Though it is true that this trust is *backed up* by my own experience.

Page 36

276. We believe, so to speak, that this great building exists, and then we see, now here, now there, one or another small corner of it.

Page 36

277. "I can't help believing...."

Page 36

278. "I am comfortable that that is how things are."

Page 36

279. It is quite sure that motor cars don't grow out of the earth. We feel that if someone could believe the contrary he could believe *everything* that we say is untrue, and could question everything that we hold to be sure.

But how does this *one* belief hang together with all the rest? We should like to say that someone who could believe that does not accept our whole system of verification.

This system is something that a human being acquires by means of observation and instruction. I intentionally do not say "learns".

Page 36

280. After he has seen this and this and heard that and that, he is not in a position to doubt whether....

Page 36

281. *I, L. W.*, believe, am sure, that my friend hasn't sawdust in his body or in his head, even though I have no direct evidence of my senses to the contrary. I am sure, by reason of what has been said to me, of what I have read, and of my experience. To have doubts about it would seem to me madness--of course, this is also in agreement with other people; but *I* agree with them.

Page 36

282. I cannot say that I have good grounds for the opinion that cats do not grow on trees or that I had a father and a mother.

If someone has doubts about it--how is that supposed to have come about? By his never, from the beginning, having believed that he had parents? But then, is that conceivable, unless he has been taught it?

Page Break 37

Page 37

283. For how can a child immediately doubt what it is taught? That could mean only that he was incapable of learning certain language games.

Page 37

284. People have killed animals since the earliest times, used the fur, bones etc. etc. for various purposes; they have counted definitely on finding similar parts in any similar beast.

They have always learnt from experience; and we can see from their actions that they believe certain things definitely, whether they express this belief or not. By this I naturally do not want to say that men *should* behave like this, but only that they do behave like this.

Page 37

285. If someone is looking for something and perhaps roots around in a certain place, he shows that he believes that what he is looking for is there.

Page 37

286. What we believe depends on what we learn. We all believe that it isn't possible to get to the moon; but there might be people who believe that that is possible and that it sometimes happens. We say: these people do not know a lot that we know. And, let them be never so sure of their belief--they are wrong and we know it.

If we compare our system of knowledge with theirs then theirs is evidently the poorer one by far.

23.9.50

Page 37

287. The squirrel does not infer by induction that it is going to need stores next winter as well. And no more do we need a law of induction to justify our actions or our predictions.

Page 37

288. I know, not just that the earth existed long before my birth, but also that it is a large body, that this has been established, that I and the rest of mankind have forebears, that there are books about all this, that such books don't lie, etc. etc. etc. And I know all this? I believe it. This body of knowledge has been handed on to me and I have no grounds for doubting it, but, on the contrary, all sorts of confirmation.

And why shouldn't I say that I know all this? Isn't that what one does say?

Page Break 38

Page 38

But not only I know, or believe, all that, but the others do too. Or rather, I *believe* that they believe it.

Page 38

289. I am firmly convinced that others believe, believe they know, that all that is in fact so.

Page 38

290. I myself wrote in my book that children learn to understand a word in such and such a way. Do I know that, or do I believe it? Why in such a case do I write not "I believe etc." but simply the indicative sentence?

Page 38

291. We know that the earth is round. We have definitively ascertained that it is round.

We shall stick to this opinion, unless our whole way of seeing nature changes. "How do you know that?"--I believe it.

Page 38

292. Further experiments cannot *give the lie* to our earlier ones, at most they may change our whole way of looking at things.

Page 38

293. Similarly with the sentence "water boils at 100°C."

Page 38

294. This is how we acquire conviction, this is called "being rightly convinced".

Page 38

295. So hasn't one, in this sense, a *proof* of the proposition? But that the same thing has happened again is not a proof of it; though we do say that it gives us a right to assume it.

Page 38

296. This is what we *call* an "empirical foundation" for our assumptions.

Page 38

297. For we learn, not just that such and such experiments had those and those results, but also the conclusion which is drawn. And of course there is nothing wrong in our doing so. For this inferred proposition is an instrument for a definite use.

Page 38

298. 'We are quite sure of it' does not mean just that every single person is certain of it, but that we belong to a community which is bound together by science and education.

Page 38

299. We are satisfied that the earth is round.†1

300. Not all corrections of our views are on the same level.

301. Supposing it wasn't true that the earth had already existed long before I was born--how should we imagine the mistake being discovered?

302. It's no good saying "Perhaps we are wrong" when, if *no* evidence is trustworthy, trust is excluded in the case of the present evidence.

303. If, for example, we have always been miscalculating, and twelve times twelve isn't a hundred and forty-four, why should we trust any other calculation? And of course that is wrongly put.

304. But nor am I *making a mistake* about twelve times twelve being a hundred and forty-four. I may say later that I was confused just now, but not that I was making a mistake.

305. Here *once more* there is needed a step like the one taken in relativity theory.

306. "I don't know if this is a hand." But do you know what the word "hand" means? And don't say "I know what it means now for me". And isn't it an empirical fact--that *this* word is used like *this*?

307. And here the strange thing is that when I am quite certain of how the words are used, have no doubt about it, I can still give no *grounds* for my way of going on. If I tried I could give a thousand, but none as certain as the very thing they were supposed to be grounds for.

308. 'Knowledge' and 'certainty' belong to different *categories*. They are not two 'mental states' like, say 'surmising' and 'being sure'. (Here I assume that it is meaningful for me to say "I know what (e.g.) the word 'doubt' means" and that this sentence indicates that the word "doubt" has a logical role.) What interests us now is not being sure but knowledge. That is, we are interested in the fact that about certain empirical propositions no doubt can exist if making judgments is to be possible at all. Or again: I am inclined to believe that not everything that has the form of an empirical proposition *is* one.

309. Is it that rule and empirical proposition merge into one another?

310. A pupil and a teacher. The pupil will not let anything be explained to him, for he continually interrupts with doubts, for instance as to the existence of things, the meaning of words, etc. The teacher says "Stop interrupting me and do as I tell you. So far your doubts don't make sense at all".

311. Or imagine that the boy questioned the truth of history (and everything that connects up with it)--and even whether the earth had existed at all a hundred years before.

312. Here it strikes me as if this doubt were hollow. But in that case--isn't *belief* in history hollow too? No; there is so much that this connects up with.

313. So is *that* what makes us believe a proposition? Well--the grammar of "believe" just does hang together with the grammar of the proposition believed.

314. Imagine that the schoolboy really did ask "and is there a table there even when I turn round, and even when *no one* is there to see it?" Is the teacher to reassure him--and say "of course there is!"?

Perhaps the teacher will get a bit impatient, but think that the boy will grow out of asking such questions.

315. That is to say, the teacher will feel that this is not really a legitimate question at all.

And it would be just the same if the pupil cast doubt on the uniformity of nature, that is to say on the justification of inductive arguments.--The teacher would feel that this was only holding them up, that this way the pupil would only get stuck and make no progress.--And he would be right. It would be as if someone were looking for some object in a room; he opens a drawer and doesn't see it there; then he closes it again, waits, and opens it once more to see if perhaps it isn't there now, and keeps on like that. He has not learned to look for things. And in the same way this pupil has not learned how to ask questions. He has not learned *the* game that we are trying to teach him.

Page 40

316. And isn't it the same as if the pupil were to hold up his history lesson with doubts as to whether the earth really....?

Page Break 41

Page 41

317. This doubt isn't one of the doubts in our game. (But not as if we *chose* this game!)

Page 41

12.3.51

318. 'The question doesn't arise at all.' Its answer would characterize a *method*. But there is no sharp boundary between methodological propositions and propositions within a method.

Page 41

319. But wouldn't one have to say then, that there is no sharp boundary between propositions of logic and empirical propositions? The lack of sharpness *is* that of the boundary between *rule* and empirical proposition.

Page 41

320. Here one must, I believe, remember that the concept 'proposition' itself is not a sharp one.

Page 41

321. Isn't what I am saying: any empirical proposition can be transformed into a postulate--and then becomes a norm of description. But I am suspicious even of this. The sentence is too general. One almost wants to say "any empirical proposition can, theoretically, be transformed...", but what does "theoretically" mean here? It sounds all too reminiscent of the *Tractatus*.

Page 41

322. What if the pupil refused to believe that this mountain had been there beyond human memory?
We should say that he had no *grounds* for this suspicion.

Page 41

323. So rational suspicion must have grounds?

We might also say: "the reasonable man believes this".

Page 41

324. Thus we should not call anybody reasonable who believed something in despite of scientific evidence.

Page 41

325. When we say that we *know* that such and such..., we mean that any reasonable person in our position would also know it, that it would be a piece of unreason to doubt it. Thus Moore too wants to say not merely that *he* knows that he etc. etc., but also that anyone endowed with reason in his position would know it just the same.

Page 41

326. But who says what it is reasonable to believe in *this* situation?

Page Break 42

Page 42

327. So it might be said: "The reasonable man believes: that the earth has been there since long before his birth, that his life has been spent on the surface of the earth, or near it, that he has never, for example, been on the moon, that he has a nervous system and various innards like all other people, etc., etc."

Page 42

328. "I know it *as* I know that my name is L. W."

Page 42

329. 'If he calls *that* in doubt--whatever "doubt" means here--he will never learn this game!'

Page 42

330. So here the sentence "I know..." expresses the readiness to believe certain things.

Page 42

13.3.

331. If we ever do act with certainty on the strength of belief, should we wonder that there is much we cannot doubt?

Page 42

332. Imagine that someone were to say, without wanting to *philosophize*, "I don't know if I have ever been on the moon; I don't *remember* ever having been there". (Why would this person be so radically different from us?)

In the first place--how would he know that he was on the moon? How does he imagine it? Compare: "I do not know if I was ever in the village of X." But neither could I say that if X were in Turkey, for I know that I was never in Turkey.

Page 42

333. I ask someone "Have you ever been in China?" He replies "I don't know". Here one would surely say "You don't *know*? Have you any reason to believe you might have been there at some time? Were you for example ever near the Chinese border? Or were your parents there at the time when you were going to be born?"--Normally Europeans do know whether they have been in China or not.

Page 42

334. That is to say: only in such-and-such circumstances does a reasonable person doubt *that*.

Page 42

335. The procedure in a court of law rests on the fact that circumstances give statements a certain probability. The statement that, for example, someone came into the world without parents wouldn't ever be taken into consideration there.

Page Break 43

Page 43

336. But what men consider reasonable or unreasonable alters. At certain periods men find reasonable what at other periods they found unreasonable. And vice versa.

But is there no objective character here?

Very intelligent and well-educated people believe in the story of creation in the Bible, while others hold it as proven false, and the grounds of the latter are well known to the former.

Page 43

337. One cannot make experiments if there are not some things that one does not doubt. But that does not mean that one takes certain presuppositions on trust. When I write a letter and post it, I take it for granted that it will arrive--I expect this.

If I make an experiment I do not doubt the existence of the apparatus before my eyes. I have plenty of doubts, but not *that*. If I do a calculation I believe, without any doubts, that the figures on the paper aren't switching of their own accord, and I also trust my memory the whole time, and trust it without any reservation. The certainty here is the same as that of my never having been on the moon.

Page 43

338. But imagine people who were never quite certain of these things, but said that they were *very* probably so, and that it did not pay to doubt them. Such a person, then, would say in my situation: "It is extremely unlikely that I have ever been on the moon", etc., etc. *How* would the life of these people differ from ours? For there *are* people who say that it is merely extremely probable that water over a fire will boil and not freeze, and that therefore strictly speaking what we consider impossible is only improbable. What difference does this make in their lives? Isn't it just that they talk rather more about certain things than the rest of us?

Page 43

339. Imagine someone who is supposed to fetch a friend from the railway station and doesn't simply look the train up in the time-table and go to the station at the right time, but says: "I have *no* belief that the train will really arrive, but I will go to the station all the same." He does everything that the normal person does, but accompanies it with doubts or with self-annoyance, etc.

Page 43

340. We know, with the same certainty with which we believe *any* mathematical proposition, how the letters A and B are

Page Break 44

pronounced, what the colour of human blood is called, that other human beings have blood and call it "blood".

Page 44

341. That is to say, the *questions* that we raise and our *doubts* depend on the fact that some propositions are exempt from doubt, are as it were like hinges on which those turn.

Page 44

342. That is to say, it belongs to the logic of our scientific investigations that certain things are *in deed* not doubted.

Page 44

343. But it isn't that the situation is like this: We just *can't* investigate everything, and for that reason we are forced to rest content with assumption. If I want the door to turn, the hinges must stay put.

Page 44

344. My *life* consists in my being content to accept many things.

Page 44

345. If I ask someone "what colour do you see at the moment?", in order, that is, to learn what colour is there at the moment, I cannot at the same time question whether the person I ask understands English, whether he wants to take me in, whether my own memory is not leaving me in the lurch as to the names of colours, and so on.

Page 44

346. When I am trying to mate someone in chess, I cannot have doubts about the pieces perhaps changing places of themselves and my memory simultaneously playing tricks on me so that I don't notice.

Page 44

15.3.51

347. "I know that that's a tree." Why does it strike me as if I did not understand the sentence? though it is after all an extremely simple sentence of the most ordinary kind? It is as if I could not focus my mind on any meaning. Simply because I don't look for the focus where the meaning is. As soon as I think of an everyday use of the sentence instead of a philosophical one, its meaning becomes dear and ordinary.

Page 44

348. Just as the words "I am here" have a meaning only in certain contexts, and not when I say them to someone who is sitting in front of me and sees me clearly,--and not because they are superfluous, but because their meaning is not *determined* by the situation, yet stands in need of such determination.

Page Break 45

Page 45

349. "I know that that's a tree"--this may mean all sorts of things: I look at a plant that I take for a young beech and that someone else thinks is a black-currant. He says "that is a shrub"; I say it is a tree.--We see something in the mist which one of us takes for a man, and the other says "I know that that's a tree". Someone wants to test my eyes etc. etc.--etc. etc. Each time the 'that' which I declare to be a tree is of a different kind.

But what when we express ourselves more precisely? For example: "I know that that thing there is a tree, I can see it quite clearly."--Let us even suppose I had made this remark in the context of a conversation (so that it was relevant when I made it); and now, out of all context, I repeat it while looking at the tree, and I add "I mean these words as I did five minutes ago". If I added, for example, that I had been thinking of my bad eyes again and it was a kind of sigh, then there would be nothing puzzling about the remark.

For how a sentence is *meant* can be expressed by an expansion of it and may therefore be made part of it.

Page 45

350. "I know that that's a tree" is something a philosopher might say to demonstrate to himself or to someone else that he *knows* something that is not a mathematical or logical truth. Similarly, someone who was entertaining the idea that he was no use any more might keep repeating to himself "I can still do this and this and this". If such thoughts often possessed him one would not be surprised if he, apparently out of all context, spoke such a sentence out loud. (But here I have already sketched a background, a surrounding, for this remark, that is to say given it a context.) But if someone, in quite heterogeneous circumstances, called out with the most convincing mimicry: "Down with him!", one might say of these words (and their tone) that they were a pattern that does indeed have familiar applications, but that in this case it was not even clear what *language* the man in question was speaking. I might make with my hand the movement I should make if I were holding a hand-saw and sawing through a plank; but would one have any right to call this movement *sawing*, out of all context?--(It might be something quite different,)

Page Break 46

Page 46

351. Isn't the question "Have these words a meaning?" similar to "Is that a tool?" asked as one produces, say, a hammer? I say "Yes, it's a hammer". But what if the thing that any of us would take for a hammer were somewhere else a missile, for example, or a conductor's baton? Now make the application yourself.

Page 46

352. If someone says, "I know that that's a tree" I may answer: "Yes, that is a sentence. An English sentence. And what is it supposed to be doing?" Suppose he replies: "I just wanted to remind myself that I *know* things like that"!--

353. But suppose he said "I want to make a logical observation"?--If a forester goes into a wood with his men and says "*This* tree has got to be cut down, and *this* one and *this* one"--what if he then observes "I *know* that that's a tree"?--But might not *I* say of the forester "He *knows* that that's a tree--he doesn't examine it, or order his men to examine it"?

354. Doubting and non-doubting behaviour. There is the first only if there is the second.

355. A mad-doctor (perhaps) might ask me "Do you know what that is?" and I might reply "I know that it's a chair; I recognize it, it's always been in my room". He says this, possibly, to test not my eyes but my ability to recognize things, to know their names and their functions. What is in question here is a kind of knowing one's way about. Now it would be wrong for me to say "I believe that it's a chair" because that would express my readiness for my statement to be tested. While "I know that it..." implies *bewilderment* if what I said was not confirmed.

356. My "mental state", the "knowing", gives me no guarantee of what will happen. But it consists in this, that I should not understand where a doubt could get a foothold nor where a further test was possible.

357. One might say: "I know" expresses *comfortable* certainty, not the certainty that is still struggling."

358. Now I would like to regard this certainty, not as something akin to hastiness or superficiality, but as a form of life. (That is very badly expressed and probably badly thought as well.)

359. But that means I want to conceive it as something that lies beyond being justified or unjustified; as it were, as something animal.

360. I KNOW that this is my foot. I could not accept any experience as proof to the contrary.--That may be an exclamation; but what *follows* from it? At least that I shall act with a certainty that knows no doubt, in accordance with my belief.

361. But I might also say: It has been revealed to me by God that it is so. God has taught me that this is my foot. And therefore if anything happened that seemed to conflict with this knowledge I should have to regard *that* as deception.

362. But doesn't it come out here that knowledge is related to a decision?

363. And here it is difficult to find the transition from the exclamation one would like to make, to its consequences in what one does.

364. One might also put this question: "If you know that that is your foot,--do you also know, or do you only believe, that no future experience will seem to contradict your knowledge?" (That is, that nothing will seem to *you yourself* to do so.)

365. If someone replied: "I also know that it will never *seem* to me as if anything contradicted that knowledge",--what could we gather from that, except that he himself had no doubt that it would never happen?--

366. Suppose it were forbidden to say "I know" and only allowed to say "I believe I know"?

367. Isn't it the purpose of construing a word like "know" analogously to "believe" that then opprobrium attaches to the statement "I know" if the person who makes it is wrong?

As a result a mistake becomes something forbidden.

368. If someone says that he will recognize no experience as proof of the opposite, that is after all a *decision*. It is possible that he will act against it.

369. If I wanted to doubt whether this was my hand, how could I avoid doubting whether the word "hand" has any meaning? So that is something I seem to *know* after all.

370. But more correctly: The fact that I use the word "hand" and all the other words in my sentence without a second thought, indeed that I should stand before the abyss if I wanted so much as to try doubting their meanings--shews that absence of doubt belongs to the essence of the language-game, that the question "How do I know..." drags out the language-game, or else does away with it.

371. Doesn't "I know that that's a hand", in Moore's sense, mean the same, or more or less the same, as: I can make statements like "I have a pain in this hand" or "this hand is weaker than the other" or "I once broke this hand", and countless others, in language-games where a doubt as to the existence of this hand does not come in?

372. Only in certain cases is it possible to make an investigation "is that really a hand?" (or "my hand"). For "I doubt whether that is really my (or a) hand" makes no sense without some more precise determination. One cannot tell from these words alone whether any doubt at all is meant--nor what kind of doubt.

373. Why is it supposed to be possible to have grounds for *believing* something if it isn't possible to be certain?

374. We teach a child "that is your hand", not "that is perhaps (or "probably") your hand". That is how a child learns the innumerable language-games that are concerned with his hand. An investigation or question, 'whether this is really a hand' never occurs to him. Nor, on the other hand, does he learn that he *knows* that this is a hand.

375. Here one must realize that complete absence of doubt at some point, even where we would say that 'legitimate' doubt can exist, need not falsify a language-game. For there is also something like *another* arithmetic.

I believe that this admission must underlie any understanding of logic.

376. I may claim with passion that I know that this (for example) is my foot.

377. But this passion is after all something very rare, and there is no trace of it when I talk of this foot in the ordinary way.

378. Knowledge is in the end based on acknowledgement.

379. I say with passion "I *know* that this is a foot"--but what does it *mean*?

380. I might go on: "Nothing in the world will convince me of the opposite!" For me this fact is at the bottom of all knowledge. I shall give up other things but not this.

381. This "Nothing in the world" is obviously an attitude which one hasn't got towards everything one believes or is certain of.

382. That is not to say that nothing in the world will in fact be able to convince me of anything else.

383. The argument "I may be dreaming" is senseless for this reason: if I am dreaming, this remark is being dreamed as well--and indeed it is also being dreamed that these words have any meaning.

384. Now what kind of sentence is "Nothing in the world..."?

385. It has the form of a prediction, but of course it is not one that is based on experience.

386. Anyone who says, with Moore, that he knows that so and so...--gives the degree of certainty that something has for him. And it is important that this degree has a maximum value.

387. Someone might ask me: "How certain are you that that is a tree over there; that you have money in your pocket; that that is your foot?" And the answer in one case might be "not certain", in another "as good as certain", in the third "I can't doubt it". And these answers would make sense even without any grounds. I should not need, for example, to say: "I can't be certain whether that is a tree because my eyes aren't sharp enough". I want to

say: it made sense for Moore to say "I *know* that that is a tree", if he meant something quite particular by it.

[I believe it might interest a philosopher, one who can think himself, to read my notes. For even if I have hit the mark only rarely, he would recognize what targets I had been ceaselessly aiming at.]

388. Every one of us often uses such a sentence, and there is no question but that it makes sense. But does that mean it yields any philosophical conclusion? Is it more of a proof of the existence of external things, that I know that this is a hand, than that I don't know whether that is gold or brass?

18.3.

389. Moore wanted to give an example to shew that one really can *know* propositions about physical objects.--If there were a dispute whether one could have a pain in such and such a part of the body, then someone who just then had a pain in that spot might say: "I assure you, I have a pain there now." But it would sound odd if Moore had said: "I assure you, I know that's a tree." A personal experience simply has no interest for us here.

390. All that is important is that it makes sense to say that one knows such a thing; and consequently the assurance that one does know it can't accomplish anything here.

391. Imagine a language-game "When I call you, come in through the door". In any ordinary case, a doubt whether there really is a door there will be impossible.

392. What I need to shew is that a doubt is not necessary even when it is possible. That the possibility of the language-game doesn't depend on everything being doubted that can be doubted. (This is connected with the role of contradiction in mathematics.)

393. The sentence "I know that that's a tree" if it were said outside its language-game, might also be a quotation (from an English grammar-book perhaps).--"But suppose I *mean* it while I am saying it?" The old misunderstanding about the concept 'mean'.

394. "This is one of the things that I cannot doubt."

395. "I know all that." And that will come out in the way I act and in the way I speak about the things in question.

396. In the language-game (2),[†]1 can he say that he knows that those are building stones? "No, but he *does* know it."

397. Haven't I gone wrong and isn't Moore perfectly right? Haven't I made the elementary mistake of confusing one's thoughts with one's knowledge? Of course I do not think to myself "The earth already existed for some time before my birth", but do I *know* it any the less? Don't I show that I know it by always drawing its consequences)

398. And don't I know that there is no stairway in this house going six floors deep into the earth, even though I have never thought about it?

399. But doesn't my drawing the consequences only show that I accept this hypothesis?

19.3.

400. Here I am inclined to fight windmills, because I cannot yet say the thing I really want to say.

401. I want to say: propositions of the form of empirical propositions, and not only propositions of logic, form the

foundation of all operating with thoughts (with language).--This observation is not of the form "I know...". "I know..." states what *I* know, and that is not of logical interest.

Page 51

402. In this remark the expression "propositions of the form of empirical propositions" is itself thoroughly bad; the statements in question are statements about material objects. And they do not serve as foundations in the same way as hypotheses which, if they turn out to be false, are replaced by others.

(. . . und schreib getrost
"Im Anfang war die Tat.")

(...und schreib getrost)
("Im Anfang war die Tat."†2)

Page Break 52

Page 52

403. To say of man, in Moore's sense, that he *knows* something; that what he says is therefore unconditionally the truth, seems wrong to me.--It is the truth only inasmuch as it is an unmoving foundation of his language-games.

Page 52

404. I want to say: it's not that on some points men know the truth with perfect certainty. No: perfect certainty is only a matter of their attitude.

Page 52

405. But of course there is still a mistake even here.

Page 52

406. What I am aiming at is also found in the difference between the casual observation "I know that that's a...", as it might be used in ordinary life, and the same utterance when a philosopher makes it.

Page 52

407. For when Moore says "I know that that's..." I want to reply "you don't *know* anything!"--and yet I would not say that to anyone who was speaking without philosophical intention. That is, I feel (rightly?) that these two mean to say something different.

Page 52

408. For if someone says he knows such-and-such, and this is part of his philosophy--then his philosophy is false if he has slipped up in this statement.

Page 52

409. If I say "I know that that's a foot"--what am I really saying? Isn't the whole point that I am certain of the consequences--that if someone else had been in doubt I might say to him "you see--I told you so"? Would my knowledge still be worth anything if it let me down as a clue in action? And *can't* it let me down?

Page 52

20.3.

410. Our knowledge forms an enormous system. And only within this system has a particular bit the value we give it.

Page 52

411. If I say "*we assume* that the earth has existed for many years past" (or something similar), then of course it sounds strange that we should *assume* such a thing. But in the entire system of our language-games it belongs to the foundations. The assumption, one might say, forms the basis of action, and therefore, naturally, of thought.

Page Break 53

Page 53

412. Anyone who is unable to imagine a case in which one might say "I know that this is my hand" (and such cases are certainly rare) might say that these words were nonsense. True, he might also say "Of course I know--how could I not know?"--but then he would possibly be taking the sentence "this is my hand" as an *explanation* of the words "my hand".

Page 53

413. For suppose you were guiding a blind man's hand, and as you were guiding it along yours you said "this is my hand"; if he then said "are you sure?" or "do you know it is?", it would take very special circumstances for that to make sense.

Page 53

414. But on the other hand: how do I *know* that it is my hand? Do I even here know exactly what it means to say it is

my hand?--When I say "how do I know?" I do not mean that I have the least *doubt* of it. What we have here is a foundation for all my action. But it seems to me that it is wrongly expressed by the words "I know".

Page 53

415. And in fact, isn't the use of the word "know" as a preeminently philosophical word altogether wrong? If "know" has this interest, why not "being certain"? Apparently because it would be too subjective. But isn't "know" *just* as subjective? Isn't one misled simply by the grammatical peculiarity that "p" follows from "I know p"?

"I believe I know" would not need to express a lesser degree of certainty.--True, but one isn't trying to express even the greatest subjective certainty, but rather that certain propositions seem to underlie all questions and all thinking.

Page 53

416. And have we an example of this in, say, the proposition that I have been living in this room for weeks past, that my memory does not deceive me in this?

--"certain beyond all reasonable doubt"--

Page 53

21.3.

417. "I know that for the last month I have had a lath every day." What am I remembering? Each day and the bath each morning? No. I *know* that I bathed each day and I do not derive that from some other immediate datum. Similarly I say "I felt a

Page Break 54

pain in my arm" without this locality coming into my consciousness in any other way (such as by means of an image).

Page 54

418. Is my understanding only blindness to my own lack of understanding? It often seems so to me.

Page 54

419. If I say "I have never been in Asia Minor", where do I get this knowledge from? I have not worked it out, no one told me; my memory tells me.--So I can't be wrong about it? Is there a truth here which I *know*?--I cannot depart from this judgment without toppling all other judgments with it.

Page 54

420. Even a proposition like this one, that I am now living in England, has these two sides: it is not a *mistake*--but on the other hand, what do I know of England? Can't my judgment go all to pieces?

Would it not be possible that people came into my room and all declared the opposite?--even gave me 'proofs' of it, so that I suddenly stood there like a madman alone among people who were all normal, or a normal person alone among madmen? Might I not then suffer doubts about what at present seems at the furthest remove from doubt?

Page 54

421. I am in England.--Everything around me tells me so; wherever and however I let my thoughts turn, they confirm this for me at once.--But might I not be shaken if things such as I don't dream of at present were to happen?

Page 54

422. So I am trying to say something that sounds like pragmatism.

Here I am being thwarted by a kind of *Weltanschauung*.

Page 54

423. Then why don't I simply say with Moore "I *know* that I am in England"? Saying this is meaningful *in particular circumstances*, which I can imagine. But when I utter the sentence outside these circumstances, as an example to shew that I can know truths of this kind with certainty, then it at once strikes me as fishy.--Ought it to?

Page 54

424. I say "I know p" either to assure people that I, too, know the truth p, or simply as an emphasis of $\vdash p$. One says,

Page Break 55

too, "I don't *believe* it, I *know* it". And one might also put it like this (for example): "That is a tree. And that's not just surmise."

But what about this: "If I were to tell someone that that was a tree, that wouldn't be just surmise." Isn't this what Moore was trying to say?

Page 55

425. It would not be surmise and I might tell it to someone else with complete certainty, as something there is no doubt about. But does that mean that it is unconditionally the truth? May not the thing that I recognize with

complete certainty as the tree that I have seen here my whole life long--may this not be disclosed as something different? May it not confound me?

And nevertheless it was right, in the circumstances that give this sentence meaning, to say "I know (I do not merely surmise) that that's a tree". To say that in strict truth I only believe it, would be wrong. It would be completely *misleading* to say: "I believe my name is L. W." And this too is right: I cannot be making a *mistake* about it. But that does not mean that I am infallible about it.

Page 55

21.3.51

426. But how can we *show* someone that we *know* truths, not only about sense-data but also about things? For after all it can't be enough for someone to assure us that *he* knows this.

Well, what must our starting point be if we are to shew this?

Page 55

22.3.

427. We need to shew that even if he never uses the words "I know...", his conduct exhibits the thing we are concerned with.

Page 55

428. For suppose a person of normal behaviour assured us that he only *believed* his name was such-and-such, he *believed* he recognized the people he regularly lived with, he believed that he had hands and feet when he didn't actually see them, and so on. Can we shew him it is not so from the things he does (and says)?

Page 55

23.3.51

429. What reason have I, now, when I cannot see my toes, to assume that I have five toes on each foot?

Page Break 56

Page 56

Is it right to say that my reason is that previous experience has always taught me so? Am I more certain of previous experience than that I have ten toes?

That previous experience may very well be the *cause* of my present certitude; but is it its ground?

Page 56

430. I meet someone from Mars and he asks me "How many toes have human beings got?"--I say "Ten. I'll shew you", and take my shoes off. Suppose he was surprised that I knew with such certainty, although I hadn't looked at my toes--ought I to say: "We humans know how many toes we have whether we can see them or not"?

Page 56

26.3.

431. "I know that this room is on the second floor, that behind the door a short landing leads to the stairs, and so on." One could imagine cases where I should come out with this, but they would be extremely rare. But on the other hand I shew this knowledge day in, day out by my actions and also in what I say.

Now what does someone else gather from these actions and words of mine? Won't it be just that I am sure of my ground?--From the fact that I have been living here for many weeks and have gone up and down the stairs every day he will gather that I know where my room is situated.--I shall give him the assurance "I know" when he does *not* already know things which would have compelled the conclusion that I knew.

Page 56

432. The utterance "I know..." can only have its meaning in connection with the other evidence of my 'knowing'.

Page 56

433. So if I say to someone "I *know* that that's a tree", it is as if I told him "that is a tree; you can absolutely rely on it; there is no doubt about it". And a philosopher could only use the statement to show that this form of speech is actually used. But if his use of it is not to be merely an observation about English grammar, he must give the circumstances in which this expression functions.

Page 56

434. Now does *experience* teach us that in such-and-such circumstances people know this and that? Certainly, experience shews us that normally after so-and-so many days a man can find his way about a house he has been living in. Or even: experience

Page Break 57

teaches us that after such-and-such a period of training a man's judgment is to be trusted. He must, experience tells us, have learnt for so long in order to be able to make a correct prediction. But-- -- --

Page 57

27.3.

435. One is often bewitched by a word. For example, by the word "know".

Page 57

436. Is God bound by our knowledge? Are a lot of our statements *incapable* of falsehood? For that is what we want to say.

Page 57

437. I am inclined to say: "That *cannot* be false." That is interesting; but what consequences has it?

Page 57

438. It would not be enough to assure someone that I know what is going on at a certain place--without giving him grounds that satisfy him that I am in a position to know.

Page 57

439. Even the statement "I know that behind this door there is a landing and the stairway down to the ground floor" only sounds so convincing because everyone takes it for granted that I know it.

Page 57

440. There is something universal here; not just something personal.

Page 57

441. In a court of law the mere assurance "I know..." on the part of a witness would convince no one. It must be shown that he was in a position to know.

Even the assurance "I know that that's a hand", said while someone looked at his own hand, would not be credible unless we knew the circumstances in which it was said. And if we do know them, it seems to be an assurance that the person speaking is normal in this respect.

Page 57

442. For may it not happen that I *imagine* myself to *know* something?

Page 57

443. Suppose that in a certain language there were no word corresponding to our "know".--The people simply make assertions. ("That is a tree", etc.) Naturally it can occur for them to make mistakes. And so they attach a sign to the sentence which indicates how probable they take a mistake to be--or should I say, how probable a mistake is in this case? This latter can also

Page Break 58

be indicated by mentioning certain circumstances. For example "Then A said to B '...'. I was standing quite close to them and my hearing is good", or "A was at such-and-such a place yesterday. I saw him from a long way off. My eyes are not very good", or "There is a tree over there: I can see it clearly and I have seen it innumerable times before".

Page 58

444. "The train leaves at two o'clock. Check it once more to make certain" or "The train leaves at two o'clock. I have just looked it up in a new time-table". One may also add "I am reliable in such matters". The usefulness of such additions is obvious.

Page 58

445. But if I say "I have two hands", what can I add to indicate reliability? At the most that the circumstances are the ordinary ones.

Page 58

446. But why *am* I so certain that this is my hand? Doesn't the whole language-game rest on this kind of certainty?

Or: isn't this 'certainty' (already) presupposed in the language-game? Namely by virtue of the fact that one is not playing the game, or is playing it wrong, if one does not recognize objects with certainty.

Page 58

28.3.

447. Compare with this $12 \times 12 = 144$. Here too we don't say "perhaps". For, in so far as this proposition rests on our not miscounting or miscalculating and on our senses not deceiving us as we calculate, both propositions, the arithmetical one and the physical one, are on the same level.

I want to say: The physical game is just as certain as the arithmetical. But this can be misunderstood. My remark is a logical and not a psychological one.

Page 58

448. I want to say: If one doesn't marvel at the fact that the propositions of arithmetic (e.g. the multiplication tables) are 'absolutely certain', then why should one be astonished that the proposition "This is my hand" is so equally?

Page 58

449. Something must be taught us as a foundation.

450. I want to say: our learning has the form "that is a violet", "that is a table". Admittedly, the child might hear the word "violet" for the first time in the sentence "perhaps that is a

violet", but then he could ask "what is a violet?" Now this might of course be answered by showing him a picture. But how would it be if one said "that is a..." only when showing him a picture, but otherwise said nothing but "perhaps that is a..."--What practical consequences is that supposed to have?

A doubt that doubted everything would not be a doubt.

451. My objection against Moore, that the meaning of the isolated sentence "That is a tree" is undetermined, since it is not determined what the "that" is that is said to be a tree--doesn't work, for one can make the meaning more definite by saying, for example: "The object over there that looks like a tree is not an artificial imitation of a tree but a real one."

452. It would not be reasonable to doubt if that was a real tree or only.

My finding it beyond doubt is not what counts. If a doubt would be unreasonable, that cannot be seen from what *I* hold. There would therefore have to be a rule that declares doubt to be unreasonable here. But there isn't such a rule, either.

453. I do indeed say: "Here no reasonable person would doubt."--Could we imagine learned judges being asked whether a doubt was reasonable or unreasonable?

454. There are cases where doubt is unreasonable, but others where it seems logically impossible. And there seems to be no clear boundary between them.

29.3.

455. Every language-game is based on words 'and objects' being recognized again. We learn with the same inexorability that this is a chair as that $2 \times 2 = 4$.

456. If, therefore, I doubt or am uncertain about this being my hand (in whatever sense), why not in that case about the meaning of these words as well?

457. Do I want to say, then, that certainty resides in the nature of the language-game?

458. One doubts on specific grounds. The question is this: how is doubt introduced into the language-game?

459. If the shopkeeper wanted to investigate each of his apples without any reason, for the sake of being certain about everything, why doesn't he have to investigate the investigation? And can one talk of belief here (I mean belief as in 'religious belief', not surmise)? All psychological terms merely distract us from the thing that really matters.

460. I go to the doctor, shew him my hand and say "This is a hand, not...; I've injured it, etc., etc." Am I only giving him a piece of superfluous information? For example, mightn't one say: supposing the words "This is a hand" were a piece of information--how could you bank on his understanding this information? Indeed, if it is open to doubt 'whether that is a hand', why isn't it also open to doubt whether I am a human being who is informing the doctor of this?--But on the other hand one can imagine cases--even if they are very rare ones--where this declaration is not superfluous, or is only superfluous but not absurd.

461. Suppose that I were the doctor and a patient came to me, showed me his hand and said: "This thing that looks like a hand isn't just a superb imitation--it really is a hand" and went on to talk about his injury--should I really take this as a piece of information, even though a superfluous one? Shouldn't I be more likely to consider it nonsense, which admittedly did have the form of a piece of information? For, I should say, if this information really were meaningful, how can he be certain of what he says? The background is lacking for it to be information.

30.3.

462. Why doesn't Moore produce as one of the things that he knows, for example, that in such-and-such a part of England there is a village called so-and-so? In other words: why doesn't he mention a fact that is known to him and not to *every one* of us;'

Page 60

31.3.

463. This is certainly true, that the information "That is a tree", when no one could doubt it, might be a kind of joke and as such

Page Break 61

have meaning. A joke of this kind was in fact made once by Renan.

Page 61

3.4.51

464. My difficulty can also be shewn like this: I am sitting talking to a friend. Suddenly I say: "I knew all along that you were so-and-so." Is that really just a superfluous, though true, remark?

I feel as if these words were like "Good morning" said to someone in the middle of a conversation.

Page 61

465. How would it be if we had the words "They know nowadays that there are over... species of insects" instead of "I know that that's a tree"? If someone were suddenly to utter the first sentence out of all context one might think: he has been thinking of something else in the interim and is now saying out loud some sentence in his train of thought. Or again: he is in a trance and is speaking without understanding what he is saying.

Page 61

466. Thus it seems to me that I have known something the whole time, and yet there is no meaning in saying so, in uttering this truth.

Page 61

467. I am sitting with a philosopher in the garden; he says again and again "I know that that's a tree", pointing to a tree that is near us. Someone else arrives and hears this, and I tell him: "This fellow isn't insane. We are only doing philosophy."

Page 61

4.4.

468. Someone says irrelevantly "That's a tree". He might say this sentence because he remembers having heard it in a similar situation; or he was suddenly struck by the tree's beauty and the sentence was an exclamation; or he was pronouncing the sentence to himself as a grammatical example; etc., etc. And now I ask him "How did you mean that?" and he replies "It was a piece of information directed at you". Shouldn't I be at liberty to assume that he doesn't know what he is saying, if he is insane enough to want to give me this information?

Page 61

469. In the middle of a conversation, someone says to me out of the blue: "I wish you luck." I am astonished; but later I

Page Break 62

realize that these words connect up with his thoughts about me. And now they do not strike me as meaningless any more.

Page 62

470. Why is there no doubt that I am called L. W.? It does not seem at all like something that one could establish at once beyond doubt. One would not think that it is one of the indubitable truths.

Page 62

5.4.

[Here there is still a big gap in my thinking. And I doubt whether it will be filled now.]

Page 62

471. It is so difficult to find the *beginning*. Or, better: it is difficult to begin at the beginning. And not try to go further back.

Page 62

472. When a child learns language it learns at the same time what is to be investigated and what not. When it learns that there is a cupboard in the room, it isn't taught to doubt whether what it sees later on is still a cupboard or only a kind of stage set.

Page 62

473. Just as in writing we learn a particular basic form of letters and then vary it later, so we learn first the stability of things as the norm, which is then subject to alterations.

Page 62

474. This game proves its worth. That may be the cause of its being played, but it is not the ground.

Page 62

475. I want to regard man here as an animal; as a primitive being to which one grants instinct but not ratiocination. As a creature in a primitive state. Any logic good enough for a primitive means of communication needs no apology from us. Language did not emerge from some kind of ratiocination.

Page 62

6.4.

476. Children do not learn that books exist, that armchairs exist, etc. etc.,--they learn to fetch books, sit in armchairs, etc. etc.

Later, questions about the existence of things do of course arise. "Is there such a thing as a unicorn?" and so on. But such a question is possible only because as a rule no corresponding question presents itself. For how does one know how to set

Page Break 63

about satisfying oneself of the existence of unicorns? How did one learn the method for determining whether something exists or not?

Page 63

477. "So one must know that the objects whose names one teaches a child by an ostensive definition exist."-Why must one know they do? Isn't it enough that experience doesn't later show the opposite?

For why should the language-game rest on some kind of knowledge?

Page 63

7.4.

478. Does a child believe that milk exists? Or does it know that milk exists? Does a cat know that a mouse exists?

Page 63

479. Are we to say that the knowledge that there are physical objects comes very early or very late?

Page 63

8.4.

480. A child that is learning to use the word "tree". One stands with it in front of a tree and says "*Lovely tree!*" Clearly no doubt as to the tree's existence comes into the language-game. But can the child be said to *know*: 'that a tree exists'? Admittedly it's true that 'knowing something' doesn't involve *thinking* about it--but mustn't anyone who knows something be capable of doubt? And doubting means thinking.

Page 63

481. When one hears Moore say "*I know* that that's a tree", one suddenly understands those who think that that has by no means been settled.

The matter strikes one all at once as being unclear and blurred. It is as if Moore had put it in the wrong light.

It is as if I were to see a painting (say a painted stage-set) and recognize what it represents from a long way off at once and without the slightest doubt. But now I step nearer: and then I see a lot of patches of different colours, which are all highly ambiguous and do not provide any certainty whatever.

Page 63

482. It is as if "I know" did not tolerate a metaphysical emphasis.

Page 63

483. The correct use of the expression "I know". Someone with bad sight asks me: "do you believe that the thing we can see there is a tree?" I reply "*I know* it is; I can see it clearly and am familiar

Page Break 64

with it."--A: "Is N. N. at home?"--I: "I believe he is."--A: "Was he at home yesterday?"--I: "Yesterday he was--I know he was; I spoke to him."--A: "Do you know or only believe that this part of the house is built on later than the rest?"--I: "*I know* it is; I got it from so and so."

Page 64

484. In these cases, then, one says "I know" and mentions how one knows, or at least one can do so.

Page 64

485. We can also imagine a case where someone goes through a list of propositions and as he does so keeps asking "Do I know that or do I only believe it?" He wants to check the certainty of each individual proposition. It might be a question of making a statement as a witness before a court.

Page 64

9.4.

486. "Do you know or do you only believe that your name is L. W.?" Is that a meaningful question?

Do you know or do you only believe that what you are writing down now are German words? Do you only believe that "believe" has *this* meaning? *What* meaning?

Page 64

487. What is the proof that I *know* something? Most certainly not my saying I know it.

Page 64

488. And so, when writers enumerate all the things they *know*, that proves nothing whatever.

So the possibility of knowledge about physical objects cannot be proved by the protestations of those who believe that they have such knowledge.

Page 64

489. For what reply does one make to someone who says "I believe it merely strikes you as if you knew it"?

Page 64

490. When I ask "Do I know or do I only believe that I am called...?" it is no use to look within myself.

But I could say: not only do I never have the slightest doubt that I am called that, but there is no judgment I could be certain of if I started doubting about that.

Page 64

10.4.

491. "Do I know or do I only believe that I am called L. W.?"--Of course, if the question were "Am I certain or do I only surmise...?", then my answer could be relied on.

Page Break 65

Page 65

492. "Do I know or do I only believe...?" might also be expressed like this: What if it *seemed* to turn out that what until now has seemed immune to doubt was a false assumption? Would I react as I do when a belief has proved to be false? or would it seem to knock from under my feet the ground on which I stand in making any judgments at all?--But of course I do not intend this as a *prophecy*.

Would I simply say "I should never have thought it!"--or would I (have to) refuse to revise my judgment--because such a 'revision' would amount to annihilation of all yardsticks?

Page 65

493. So is this it: I must recognize certain authorities in order to make judgments at all?

Page 65

494. "I cannot doubt this proposition without giving up all judgment."

But what sort of proposition is that? (It is reminiscent of what Frege said about the law of identity.†1) It is certainly no empirical proposition. It does not belong to psychology. It has rather the character of a rule.

Page 65

495. One might simply say "O, rubbish" to someone who wanted to make objections to the propositions that are beyond doubt. That is, not reply to him but admonish him.

Page 65

496. This is a similar case to that of shewing that it has no meaning to say that a game has always been played wrong.

Page 65

497. If someone wanted to arouse doubts in me and spoke like this: here your memory is deceiving you, there you've been taken in, there again you have not been thorough enough in satisfying yourself, etc., and if I did not allow myself to be shaken but kept to my certainty--then my doing so cannot be wrong, even if only because this is just what defines a game.

Page 65

11.4.

498. The queer thing is that even though I find it quite correct for someone to say "Rubbish" and so brush aside the attempt to confuse him with doubts at bedrock,--nevertheless, I hold it to be incorrect if he seeks to defend himself (using, e.g., the words "I know").

Page Break 66

Page 66

499. I might also put it like this: the 'law of induction' can no more be *grounded* than certain particular propositions concerning the material of experience.

Page 66

500. But it would also strike me as nonsense to say "I know that the law of induction is true".

Imagine such a statement made in a court of law! It would be more correct to say "I believe in the law of..." where 'believe' has nothing to do with *surmising*.

Page 66

501. Am I not getting closer and closer to saying that in the end logic cannot be described? You must look at the practice of language, then you will see it.

Page 66

502. Could one say "I know the position of my hands with my eyes closed", if the position I gave always or mostly contradicted the evidence of other people?

Page 66

503. I look at an object and say "That is a tree", or "I know that that's a tree".--Now if I go nearer and it turns out that it isn't, I may say "It wasn't a tree after all" or alternatively I say "It *was* a tree but now it isn't any longer". But if all the others contradicted me, and said it never had been a tree, and if all the other evidences spoke against me--what *good* would it do me to stick to my "I know"?

Page 66

504. Whether *I know* something depends on whether the evidence backs me up or contradicts me. For to say one knows one has a pain means nothing.

Page 66

505. It is always by favour of Nature that one knows something.

Page 66

506. "If my memory deceives me *here* it can deceive me everywhere."

If I don't know *that*, how do I know if my words mean what I believe they mean?

Page 66

507. "If this deceives me, what does 'deceive' mean anymore?"

Page 66

508. What can I rely on?

Page 66

509. I really want to say that a language-game is only possible if one trusts something (I did not say "can trust something").

Page Break 67

Page 67

510. If I say "Of course I know that that's a towel" I am making an *utterance*.†1 I have no thought of a verification. For me it is an immediate utterance.

I don't think of past or future. (And of course it's the same for Moore, too.)

It is just like directly taking hold of something, as I take hold of my towel without having doubts.

Page 67

511. And yet this direct taking-hold corresponds to a *sureness*, not to a knowing.

But don't I take hold of a thing's name like that, too?

Page 67

12.4.

512. Isn't the question this: "What if you had to change your opinion even on these most fundamental things?" And to that the answer seems to me to be: "You don't *have* to change it. That is just what their being 'fundamental' is."

Page 67

513. What if something *really unheard-of* happened?--If I, say, saw houses gradually turning into steam without any obvious cause, if the cattle in the fields stood on their heads and laughed and spoke comprehensible words; if trees gradually changed into men and men into trees. Now, was I right when I said before all these things happened "I know that that's a house" etc., or simply "that's a house" etc.?

Page 67

514. This statement appeared to me fundamental; if it is false, what are 'true' or 'false' any more?!

Page 67

515. If my name is *not* L. W., how can I rely on what is meant by "true" and "false"?

Page 67

516. If something happened (such as someone telling me something) calculated to make me doubtful of my own name, there would certainly also be something that made the grounds of these doubts themselves seem doubtful, and I could therefore decide to retain my old belief.

Page 67

517. But might it not be possible for something to happen that threw me entirely off the rails? Evidence that made the most certain thing unacceptable to me? Or at any rate made me throw

Page Break 68

over my most fundamental judgments? (Whether rightly or wrongly is beside the point.)

Page 68

518. Could I imagine observing this in another person?

Page 68

519. Admittedly, if you are obeying the order "Bring me a book", you may have to check whether the thing you see over there really is a book, but then you do at least know what people mean by "book"; and if you don't you can look it up,--but then you must know what some other word means. And the fact that a word means such-and-such, is used in such-and-such a way, is in turn an empirical fact, like the fact that what you see over there is a book.

Therefore, in order for you to be able to carry out an order there must be some empirical fact about which you are not in doubt. Doubt itself rests only on what is beyond doubt.

Page 68

But since a language-game is something that consists in the recurrent procedures of the game in time, it seems impossible to say in any *individual* case that such-and-such must be beyond doubt if there is to be a language-game--though it is right enough to say that *as a rule* some empirical judgment or other must be beyond doubt.

Page 68

13.4.

520. Moore has every right to say he knows there's a tree there in front of him. Naturally he may be wrong. (For it is *not* the same as with the utterance "I believe there is a tree there".) But whether he is right or wrong in this case is of no philosophical importance. If Moore is attacking those who say that one cannot really know such a thing, he can't do it by assuring them that *he* knows this and that. For one need not believe him. If his opponents had asserted that one could not *believe* this and that, then he could have replied: "I believe it."

Page 68

14.4.

Page 68

521. Moore's mistake lies in this--countering the assertion that one cannot know that, by saying "I do know it".

Page 68

522. We say: if a child has mastered language--and hence its application--it must know the meaning of words. It must, for

Page Break 69

example, be able to attach the name of its colour to a white, black, red or blue object without the occurrence of any doubt.

Page 69

523. And indeed no one misses doubt here; no one is surprised that we do not merely *surmise* the meaning of our words.

Page 69

15.4.

524. Is it essential for our language-games ('ordering and obeying' for example) that no doubt appears at certain points, or is it enough if there is the feeling of being sure, admittedly with a slight breath of doubt?

That is, is it enough if I do not, as I do now, call something 'black', 'green', 'red', *straight off*, without any doubt at all interposing itself--but do instead say "I am sure that that is red", as one may say "I am sure that he will come today" (in other words with the 'feeling of being sure')?

The accompanying feeling is of course a matter of indifference to us, and equally we have no need to bother about the words "I am sure that" either.--What is important is whether they go with a difference in the *practice* of the language.

One might ask whether a person who spoke like this would always say "I am sure" on occasions where (for example) there is sureness in the reports we make (in an experiment, for example, we look through a tube and report the colour we see through it). If he does, our immediate inclination will be to check what he says. But if he proves to be perfectly reliable, one will say that his way of talking is merely a bit perverse, and does not affect the issue. One might for example suppose that he has read sceptical philosophers, become convinced that one can know nothing, and that is why he has adopted this way of speaking. Once we are used to it, it does not infect practice.

525. What, then, does the case look like where someone really has got a different relationship to the names of colours, for example, from us? Where, that is, there persists a slight doubt or a possibility of doubt in their use.

16.4.

526. If someone were to look at an English pillar-box and say "I am sure that it's red", we should have to suppose that he was

colour-blind, or believe he had no mastery of English and knew the correct name for the colour in some other language.

If neither was the case we should not quite understand him.

527. An Englishman who calls this colour "red" is not 'sure it is called "red" in English'.

A child who has mastered the use of the word is not 'sure that in his language this colour is called...'. Nor can one say of him that when he is learning to speak he learns that the colour is called that in English; nor yet: he *knows* this when he has learnt the use of the word.

528. And in spite of this: if someone asked me what the colour was called in German and I tell him, and now he asks me "are you sure?"--then I shall reply "I *know* it is; German is my mother tongue".

529. And one child, for example, will say, of another or of himself, that he already knows what such-and-such is called.

530. I may tell someone "this colour is called 'red' in English" (when for example I am teaching him English). In this case I should not say "I know that this colour..."--I would perhaps say that if I had just now learned it, or by contrast with another colour whose English name I am not acquainted with.

531. But now, isn't it correct to describe my present state as follows: I *know* what this colour is called in English? And if that is correct, why then should I not describe my state with the corresponding words "I know etc."?

532. So when Moore sat in front of a tree and said "I know that that's a tree", he was simply stating the truth about his state at the time.

[I do philosophy now like an old woman who is always mislaying something and having to look for it again: now her spectacles, now her keys.]

533. Well, if it was correct to describe his state out of context, then it was just as correct to utter the words "that's a tree" out of context.

534. But is it wrong to say: "A child that has mastered a language-game must *know* certain things"?

If instead of that one said "must be *able to do* certain things", that would be a pleonasm, yet this is just what I want to counter the first sentence with.--But: "a child acquires a knowledge of natural history". That presupposes that it can ask what such and such a plant is called.

535. The child knows what something is called if he can reply correctly to the question "what is that called?"

536. Naturally, the child who is just learning to speak has not yet got the concept *is called* at all.

537. Can one say of someone who hasn't this concept that he *knows* what such-and-such is called?

538. The child, I should like to say, learns to react in such-and-such a way; and in so reacting it doesn't so far know anything. Knowing only begins at a later level.

539. Does it go for knowing as it does for collecting?

540. A dog might learn to run to N at the call "N", and to M at the call "M",--but would that mean he knows what these people are called?

Page 71

541. "He only knows what this person is called--not yet what that person is called". That is something one cannot, strictly speaking, say of someone who simply has not yet got the concept of people's having names.

Page 71

542. "I can't describe this flower if I don't know that this colour is called 'red'."

Page 71

543. A child can use the names of people long before he can say in any form whatever: "I know this one's name; I don't know that one's yet."

Page 71

544. Of course I may truthfully say "I know what this colour is called in English", at the same time as I point (for example) to the colour of fresh blood. But -- -- --

Page 71

17.4.

Page 71

545. 'A child knows which colour is meant by the word "blue".' What he knows here is not all that simple.

Page Break 72

Page 72

546. I should say "I know what this colour is called" if e.g. what is in question is shades of colour whose name not everybody knows.

Page 72

547. One can't yet say to a child who is just beginning to speak and can use the words "red" and "blue": "Come on, you know what this colour is called called!"

Page 72

548. A child must learn the use of colour words before it can ask for the name of a colour.

Page 72

549. It would be wrong to say that I can only say "I know that there is a chair there" when there is a chair there. Of course it isn't *true* unless there is, but I have a right to say this if I am *sure* there is a chair there, even if I am wrong.
[Pretensions are a mortgage which burdens a philosopher's capacity to think.]

Page 72

18.4.

Page 72

550. If someone believes something, we needn't always be able to answer the question 'why he believes it'; but if he knows something, then the question "how does he know?" must be capable of being answered.

Page 72

551. And if one does answer this question, one must do so according to generally accepted axioms. *This* is how something of this sort may be known.

Page 72

552. Do I know that I am now sitting in a chair?--Don't I know it?! In the present circumstances no one is going to say that I know this; but no more will he say, for example, that I am conscious. Nor will one normally say this of the passers-by in the street.

But now, even if one doesn't say it, does that make it *untrue*??

Page 72

553. It is queer: if I say, without any special occasion, "I know"--for example, "I know that I am now sitting in a chair", this statement seems to me unjustified and presumptuous. But if I make the same statement where there is some need for it, then, although I am not a jot more certain of its truth, it seems to me to be perfectly justified and everyday.

Page Break 73

Page 73

554. In its language-game it is not presumptuous. There, it has no higher position than, simply, the human language-game. For there it has its restricted application.

But as soon as I say this sentence outside its context, it appears in a false light. For then it is as if I wanted to insist that there are things that I *know*. God himself can't say anything to me about them.

Page 73

19.4

555. We say we know that water boils when it is put over a fire. How do we know? Experience has taught us.--I say "I know that I had breakfast this morning"; experience hasn't taught me that. One also says "I know that he is in pain". The language-game is different every time, we are *sure* every time, and people will agree with us that we are *in a position* to know every time. And that is why the propositions of physics are found in textbooks for everyone.

If someone says he *knows* something, it must be something that, by general consent, he is in a position to know.

Page 73

556. One doesn't say: he is in a position to believe that.

Page 73

But one does say: "It is reasonable to assume that in this situation" (or "to believe that").

Page 73

557. A court-martial may well have to decide whether it was reasonable in such-and-such a situation to have assumed this or that with confidence (even though wrongly).

Page 73

558. We say we know that water boils and does not freeze under such-and-such circumstances. Is it conceivable that we are wrong? Wouldn't a mistake topple all judgment with it? More: what could stand if that were to fall? Might someone discover something that made us say "It was a mistake"?

Whatever may happen in the future, however water may behave in the future,--we *know* that up to now it has behaved *thus* in innumerable instances.

This fact is fused into the foundations of our language-game:

Page 73

559. You must bear in mind that the language-game is so to say something unpredictable. I mean: it is not based on grounds. It is not reasonable (or unreasonable).

It is there--like our life.

Page Break 74

Page 74

560. And the concept of knowing is coupled with that of the language-game.

Page 74

561. "I know" and "You can rely on it". But one cannot always substitute the latter for the former.

Page 74

562. At any rate it is important to imagine a language in which *our* concept 'knowledge' does not exist.

Page 74

563. One says "I know that he is in pain" although one can produce no convincing grounds for this.--Is this the same as "I am sure that he..."?--No. "I am sure" tells you my subjective certainty. "I know" means that I who know it, and the person who doesn't are separated by a difference in understanding. (Perhaps based on a difference in degree of experience.)

If I say "I know" in mathematics, then the justification for this is a proof.

Page 74

If in these two cases instead of "I know", one says "you can rely on it" then the substantiation is of a different kind in each case.

And substantiation comes to an end.

Page 74

564. A language-game: bringing building stones, reporting the number of available stones. The number is sometimes estimated, sometimes established by counting. Then the question arises "Do you believe there are as many stones as that?", and the answer "I know there are--I've just counted them". But here the "I know" could be dropped. If, however, there are several ways of finding something out for sure, like counting, weighing, measuring the stack, then the statement "I know" can take the place of mentioning *how* I know.

Page 74

565. But here there isn't yet any question of any 'knowledge' that *this* is called "a slab", *this* "a pillar", etc.

Page 74

566. Nor does a child who learns my language-game (No. 2)†1 learn to say "I know that this is called 'a slab'".

Now of course there is a language-game in which the child uses *that* sentence. This presupposes that the child is already capable of using the name as soon as he is given it. (As if someone were to tell me "this colour is called...".)--Thus, if the child

Page Break 75

has learnt a language-game with building stones, one can say something like "and *this* stone is called '...'", and in this way the original language-game has been *expanded*.

Page 75

567. And now, is my knowledge that I am called L. W. of the same kind as knowledge that water boils at 100°C.? Of course, this question is wrongly put.

Page 75

568. If one of my names were used only very rarely, then it might happen that I did not know it. It goes without saying that I know my name, only because, like anyone else, I use it over and over again.

Page 75

569. An inner experience cannot shew me that I *know* something.

Page 75

Hence, if in spite of that I say, "I know that my name is...", and yet it is obviously not an empirical proposition, -- -- --

Page 75

570. "I know this is my name; among us any grown-up knows what his name is."

Page 75

571. "My name is... you can rely on that. If it turns out to be wrong you need never believe me in the future."

Page 75

572. Don't I seem to know that I can't be wrong about such a thing as my own name?

This comes out in the words: "If that is wrong, then I am crazy." Very well, but those are words; but what influence has it on the application of language?

Page 75

573. Is it through the impossibility of anything's convincing me of the contrary?

Page 75

574. The question is, what *kind* of proposition is: "I know I can't be mistaken about that", or again "I can't be mistaken about that"?

This "I know" seems to prescind from all grounds: I simply *know* it. But if there can be any question at all of being mistaken here, then it must be possible to test whether I know it.

Page 75

575. Thus the purpose of the phrase "I know" might be to indicate where I can be relied on; but where that's what it's doing, the usefulness of this sign must emerge from *experience*.

Page Break 76

Page 76

576. One might say "How do I know that I'm not mistaken about my name?"--and if the reply was "Because I have used it so often", one might go on to ask "How do I know that I am not mistaken about *that*?" And here the "How do I know" cannot any longer have any significance.

Page 76

577. "My knowledge of my name is absolutely definite."

I would refuse to entertain any argument that tried to show the opposite!

And what does "I *would* refuse" mean? Is it the expression of an intention?

Page 76

578. But mightn't a higher authority assure me that I don't know the truth? So that I had to say "Teach me!"? But then my eyes would have to be opened.

Page 76

579. It is part of the language-game with people's names that everyone knows his name with the greatest certainty.

Page 76

20.4.

580. It might surely happen that whenever I said "I know" it turned out to be wrong. (Shewing up.)

Page 76

581. But perhaps I might nevertheless be unable to help myself, so that I kept on declaring "I know...". But ask yourself: how did the child learn the expression?

Page 76

582. "I know that" may mean: I am quite familiar with it--or again: it is certainly so.

Page 76

583. "I know that the name of this in... is '...'"--How do you know?--"I have learnt..."

Could I substitute "In... the name of this is '...'" for "I know etc." in this example?

Page 76

584. Would it be possible to make use of the verb "know" only in the question "How do you know?" following a simple assertion?--Instead of "I already know that" one says "I am familiar with that"; and this follows only upon being told the fact. But†1 what does one say instead of "I know what that is"?

Page 76

585. But doesn't "I know that that's a tree" say something different from "that is a tree"?

Page Break 77

Page 77

586. Instead of "I know what that is" one might say "I can say what that is". And if one adopted this form of expression what would then become of "I know that that is a..."?

Page 77

587. Back to the question whether "I know that that's a..." says anything different from "that is a...". In the first sentence a person is mentioned, in the second, not. But that does not shew that they have different meanings. At all events one often replaces the first form by the second, and then often gives the latter a special intonation. For one speaks differently when one makes an uncontradicted assertion from when one maintains an assertion in face of contradiction.

Page 77

588. But don't I use the words "I know that..." to say that I am in a certain state, whereas the mere assertion "that is a..." does not say this? And yet one often does reply to such an assertion by asking "how do you know?"--"But surely, only because the fact that I assert this gives to understand that I think I know it".--This point could be made in the following way: In a zoo there might be a notice "this is a zebra"; but never "I know that this is a zebra".

"I know" has meaning only when it is uttered by a person. But, given that, it is a matter of indifference whether what is uttered is "I know..." or "That is..."

Page 77

589. For how does a man learn to recognize his own state of knowing something?

Page 77

590. At most one might speak of recognizing a state, where what is said is "I know what that is". Here one can satisfy oneself that one really is in possession of this knowledge.

Page 77

591. "I know what kind of tree that is.--It is a chestnut."

"I know what kind of tree that is.--I know it's a chestnut."

The first statement sounds more natural than the second. One will only say "I know" a second time if one wants especially to emphasize certainty; perhaps to anticipate being contradicted. The first "I know" means roughly: I can say.

But in another case one might begin with the observation "that's a...", and then, when this is contradicted, counter by saying: "I know what sort of a tree it is", and by this means lay emphasis on being sure.

Page Break 78

Page 78

592. "I can tell you what kind of a... that is, and no doubt about it."

Page 78

593. Even when one can replace "I know" by "It is..." still one cannot replace the negation of the one by the negation of the other.

With "I don't know..." a new element enters our language-games.

Page 78

21.4.

594. My name is "L. W." And if someone were to dispute it, I should straightaway make connexions with innumerable things which make it certain.

Page 78

595. "But I can still imagine someone making all these connexions, and none of them corresponding with reality. Why shouldn't I be in a similar case?"

If I imagine such a person I also imagine a reality, a world that surrounds him; and I imagine him as thinking (and speaking) in contradiction to this world.

596. If someone tells me his name is N. N., it is meaningful for me to ask him "Can you be mistaken?" That is an allowable question in the language-game. And the answer to it, yes or no, makes sense.--Now of course this answer is not infallible either, i.e., there might be a time when it proved to be wrong, but that does not deprive the question "Can you be..." and the answer "No" of their meaning.

597. The reply to the question "Can you be mistaken?" gives the statement a definite weight. The answer may also be: "I don't *think* so."

598. But couldn't one reply to the question "Can you..." by saying: "I will describe the case to you and then you can judge for yourself whether I can be mistaken"?

For example, if it were a question of someone's own name, the fact might be that he had never used this name, but remembered he had read it on some document,--but on the other hand the answer might be: "I've had this name my whole life long, I've been called it by everybody." If *that* is not equivalent to the answer "I can't be mistaken", then the latter has no meaning

whatever. And yet quite obviously it points to a very important distinction.

599. For example one could describe the certainty of the proposition that water boils at *circa* 100°C. That isn't e.g. a proposition I have once heard (like this or that, which I could mention). I made the experiment myself at school. The proposition is a very elementary one in our text-books, which are to be trusted in matters like this because...--Now one can offer counter-examples to all this, which show that human beings have held this and that to be certain which later, according to our opinion, proved false. But the argument is worthless.†1 To say: in the end we can only adduce such grounds as *we* hold to be grounds, is to say nothing at all.

I believe that at the bottom of this is a misunderstanding of the nature of our language-games.

600. What kind of grounds have I for trusting text-books of experimental physics?

I have no grounds for not trusting them. And I trust them. I know how such books are produced--or rather, I believe I know. I have some evidence, but it does not go very far and is of a very scattered kind. I have heard, seen and read various things.

22.4.

601. There is always the danger of wanting to find an expression's meaning by contemplating the expression itself, and the frame of mind in which one uses it, instead of always thinking of the practice. That is why one repeats the expression to oneself so often, because it is as if one must see what one is looking for in the expression and in the feeling it gives one.

23.4.

602. Should I say "I believe in physics", or "I know that physics is true"?

603. I am taught that under *such* circumstances *this* happens. It has been discovered by making the experiment a few times. Not

that that would prove anything to us, if it weren't that this experience was surrounded by others which combine with it to form a system. Thus, people did not make experiments just about falling bodies but also about air resistance and all sorts of other things.

But in the end I rely on these experiences, or on the reports of them, I feel no scruples about ordering my own activities in accordance with them.--But hasn't this trust also proved itself? So far as I can judge--yes.

604. In a court of law the statement of a physicist that water boils at about 100°C. would be accepted unconditionally as truth.

If I mistrusted this statement what could I do to undermine it? Set up experiments myself? What would they prove?

Page 80

605. But what if the physicist's statement were superstition and it were just as absurd to go by it in reaching a verdict as to rely on ordeal by fire?

Page 80

606. That to my mind someone else has been wrong is no ground for assuming that I am wrong now.--But isn't it a ground for assuming that I *might* be wrong? It is *no* ground for any *unsureness* in my judgment, or my actions.

Page 80

607. A judge might even say "That is the truth--so far as a human being can know it". But what would this rider achieve? ("beyond all reasonable doubt").

Page 80

608. Is it wrong for me to be guided in my actions by the propositions of physics? Am I to say I have no good ground for doing so? Isn't precisely this what we call a 'good ground'?

Page 80

609. Supposing we met people who did not regard that as a telling reason. Now, how do we imagine this? Instead of the physicist, they consult an oracle. (And for that we consider them primitive.) Is it wrong for them to consult an oracle and be guided by it?--If we call this "wrong" aren't we using our language-game as a base from which to *combat* theirs?

Page Break 81

Page 81

610. And are we right or wrong to combat it? Of course there are all sorts of slogans which will be used to support our proceedings.

Page 81

611. Where two principles really do meet which cannot be reconciled with one another, then each man declares the other a fool and heretic.

Page 81

612. I said I would 'combat' the other man,--but wouldn't I give him *reasons*? Certainly; but how far do they go? At the end of reasons comes *persuasion*. (Think what happens when missionaries convert natives.)

Page 81

613. If I now say "I know that the water in the kettle on the gas-flame will not freeze but boil", I seem to be as justified in this "I know" as I am in *any*. 'If I know anything I know *this*'.--Or do I know with still *greater* certainty that the person opposite me is my old friend so-and-so? And how does that compare with the proposition that I am seeing with two *eyes* and shall see them if I look in the glass?--I don't know confidently what I am to answer here.--But still there is a difference between the cases. If the water over the gas freezes, of course I shall be as astonished as can be, but I shall assume some factor I don't know of, and perhaps leave the matter to physicists to judge. But what could make me doubt whether this person here is N. N., whom I have known for years? Here a doubt would seem to drag everything with it and plunge it into chaos.

Page 81

614. That is to say: If I were contradicted on all sides and told that this person's name was not what I had always known it was (and I use "know" here intentionally), then in that case the foundation of all judging would be taken away from me.

Page 81

615. Now does that mean: "I can only make judgments at all because things behave thus and thus (as it were, behave kindly)"?

Page 81

616. Why, would it be *unthinkable* that I should stay in the saddle however much the facts bucked?

Page Break 82

Page 82

617. Certain events would put me into a position in which I could not go on with the old language-game any further. In which I was torn away from the *sureness* of the game.

Indeed, doesn't it seem obvious that the possibility of a language-game is conditioned by certain facts?

Page 82

618. In that case it would seem as if the language-game must '*show*' the facts that make it possible. (But that's not how it is.)

Then can one say that only a certain regularity in occurrences makes induction possible? The 'possible' would of course have to be '*logically possible*'.

619. Am I to say: even if an irregularity in natural events did suddenly occur, that wouldn't *have* to throw me out of the saddle. I might make inferences then just as before, but whether one would call that "induction" is another question.

620. In particular circumstances one says "you can rely on this"; and this assurance may be justified or unjustified in everyday language, and it may also count as justified even when what was foretold does not occur. A *language-game exists* in which this assurance is employed.

24.4.

621. If anatomy were under discussion I should say: "I know that twelve pairs of nerves lead from the brain." I have never seen these nerves, and even a specialist will only have observed them in a few specimens.--This just is how the word "know" is correctly used here.

622. But now it is also correct to use "I know" in the contexts which Moore mentioned, at least *in particular circumstances*. (Indeed, I do not know what "I know that I am a human being" means. But even that might be given a sense.)

For each one of these sentences I can imagine circumstances that turn it into a move in one of our language-games, and by that it loses everything that is philosophically astonishing.

623. What is odd is that in such a case I always feel like saying (although it is wrong): "I know that--so far as one can know such a thing." That is incorrect, but something right is hidden behind it.

624. "Can you be mistaken about this colour's being called 'green' in English?" My answer to this can only be "No". If I were to say "Yes, for there is always the possibility of a delusion", that would mean nothing at all.

For is that rider something unknown to the other? And how is it known to me?

625. But does that mean that it is unthinkable that the word "green" should have been produced here by a slip of the tongue or a momentary confusion? Don't we know of such cases?--One can also say to someone "Mightn't you perhaps have made a slip?" That amounts to: "Think about it again".--

But these rules of caution only make sense if they come to an end somewhere.

A doubt without an end is not even a doubt.

626. Nor does it mean anything to say: "The English name of this colour is *certainly* 'green',--unless, of course, I am making a slip of the tongue or am confused in some way."

627. Wouldn't one have to insert this clause into *all* language-games? (Which shows its senselessness.)

628. When we say "Certain propositions must be excluded from doubt", it sounds as if I ought to put these propositions--for example, that I am called L. W.--into a logic-book. For if it belongs to the description of a language-game, it belongs to logic. But that I am called L. W. does not belong to any such description. The language-game that operates with people's names can certainly exist even if I am mistaken about my name,--but it does presuppose that it is nonsensical to say that the majority of people are mistaken about their names.

629. On the other hand, however, it is right to say of myself "I cannot be mistaken about my name", and wrong if I say "perhaps I am mistaken". But that doesn't mean that it is meaningless for others to doubt what I declare to be certain.

630. It is simply the normal case, to be incapable of mistake about the designation of certain things in one's mother tongue.

631. "I can't be making a mistake about it" simply characterizes one kind of assertion.

632. Certain and uncertain memory. If certain memory were not in general more reliable than uncertain memory, i.e., if it were not confirmed by further verification more often than uncertain memory was, then the expression of certainty and uncertainty would not have its present function in language.

Page 84

633. "I can't be making a mistake"--but what if I did make a mistake then, after all? For isn't that possible? But does that make the expression "I can't be etc." nonsense? Or would it be better to say instead "I can hardly be mistaken"? No; for that means something else.

Page 84

634. "I can't be making a mistake; and if the worst comes to the worst I shall make my proposition into a norm."

Page 84

635. "I can't be making a mistake; I was with him today."

Page 84

636. "I can't be making a mistake; but if after all something *should* appear to speak against my proposition I shall stick to it, despite this appearance."

Page 84

637. "I can't etc." shows my assertion its place in the game. But it relates essentially to *me*, not to the game in general.

If I am wrong in my assertion that doesn't detract from the usefulness of the language-game.

Page 84

25.4.

638. "I can't be making a mistake" is an ordinary sentence, which serves to give the certainty-value of a statement. And only in its everyday use is it justified.

Page 84

639. But what the devil use is it if--as everyone admits--I may be wrong about it, and therefore about the proposition it was supposed to support too?

Page 84

640. Or shall I say: the sentence excludes a certain *kind* of failure?

Page 84

641. "He told me about it today--I can't be making a mistake about that."--But what if it does turn out to be wrong?!--Mustn't one make a distinction between the ways in which something 'turns out wrong'?--How *can* it be *shewn* that my

Page Break 85

statement was wrong? Here evidence is facing evidence, and it must be *decided* which is to give way.

Page 85

642. But suppose someone produced the scruple: what if I suddenly as it were woke up and said "Just think, I've been imagining I was called L. W.!"----well, who says that I don't wake up once again and call *this* an extraordinary fancy, and so on?

Page 85

643. Admittedly one can imagine a case--and cases do exist--where after the 'awakening' one never has any more doubt which was imagination and which was reality. But such a case, or its possibility, doesn't discredit the proposition "I can't be wrong".

Page 85

644. For otherwise, wouldn't all assertion be discredited in this way?

Page 85

645. I can't be making a mistake,--but some day, rightly or wrongly, I may think I realize that I was not competent to judge.

Page 85

646. Admittedly, if that always or often happened it would completely alter the character of the language-game.

Page 85

647. There is a difference between a mistake for which, as it were, a place is prepared in the game, and a complete irregularity that happens as an exception.

Page 85

648. I may also convince someone else that I 'can't be making a mistake'.

I say to someone "So-and-so was with me this morning and told me such-and-such". If this is astonishing he may ask me: "You can't be mistaken about it?" That may mean: "Did that really happen *this morning*?" or on the other hand: "Are you sure you understood him properly?" It is easy to see what details I should add to show that I

was not wrong about the time, and similarly to show that I hadn't misunderstood the story. But all that can *not* show that I haven't dreamed the whole thing, or imagined it to myself in a dreamy way. Nor can it show that I haven't perhaps made some *slip of the tongue* throughout. (That sort of thing does happen.)

Page Break 86

Page 86

649. (I once said to someone--in English--that the shape of a certain branch was typical of the branch of an elm, which my companion denied. Then we came past some ashes, and I said "There, you see, here are the branches I was speaking about". To which he replied "But that's an ash"--and I said "I always meant ash when I said elm".)

Page 86

650. This surely means: the possibility of a *mistake* can be eliminated in certain (numerous) cases.--And one does eliminate mistakes in calculation in this way. For when a calculation has been checked over and over again one cannot then say "Its rightness is still only *very probable*--for an error may always still have slipped in". For suppose it did seem for once as if an error had been discovered--why shouldn't we suspect an error *here*?

Page 86

651. I cannot be making a mistake about 12×12 being 144. And now one cannot contrast *mathematical* certainty with the relative uncertainty of empirical propositions. For the mathematical proposition has been obtained by a series of actions that are in no way different from the actions of the rest of our lives, and are in the same degree liable to forgetfulness, oversight and illusion.

Page 86

652. Now can I prophesy that men will never throw over the present arithmetical propositions, never say that now at last they know how the matter stands? Yet would that justify a doubt on our part?

Page 86

653. If the proposition $12 \times 12 = 144$ is exempt from doubt, then so too must non-mathematical propositions be.

Page 86

26.4.51

654. But against this there are plenty of objections.--In the first place there is the fact that " 12×12 etc." is a *mathematical* proposition, and from this one may infer that only mathematical propositions are in this situation. And if this inference is not justified, then there ought to be a proposition that is just as certain, and deals with the process of this calculation, but isn't itself mathematical. I am thinking of such a proposition as: "The multiplication ' 12×12 ', when carried out by people who know how to calculate, will in the great majority of cases give the result '144'".

Page Break 87

Page 87

Nobody will contest this proposition, and naturally it is not a mathematical one. But has it got the certainty of the mathematical proposition?

Page 87

655. The mathematical proposition has, as it were officially, been given the stamp of incontestability. I.e.: "Dispute about other things; *this* is immovable--it is a hinge on which your dispute can turn."

Page 87

656. And one can *not* say that of the proposition that *I* am called L. W. Nor of the proposition that such-and-such people have calculated such-and-such a problem correctly.

Page 87

657. The propositions of mathematics might be said to be fossilized.--The proposition "I am called..." is not. But it too is regarded as *incontrovertible* by those who, like myself, have overwhelming evidence for it. And this not out of thoughtlessness. For, the evidence's being overwhelming consists precisely in the fact that we do not *need* to give way before any contrary evidence. And so we have here a buttress similar to the one that makes the propositions of mathematics incontrovertible.

Page 87

658. The question "But mightn't you be in the grip of a delusion now and perhaps later find this out?"--might also be raised as an objection to any proposition of the multiplication tables.

Page 87

659. "I cannot be making a mistake about the fact that I have just had lunch."

For if I say to someone "I have just eaten" he may believe that I am lying or have momentarily lost my wits but he won't believe that I am making a mistake. Indeed, the assumption that I might be making a mistake has no meaning here.

But that isn't true. I might, for example, have dropped off immediately after the meal without knowing it and have slept for an hour, and now believe I had just eaten.

But still, I distinguish here between different kinds of mistake.

660. I might ask: "*How* could I be making a mistake about my name being L. W.?" And I can say: I can't see how it would be possible.

661. How might I be mistaken in my assumption that I was never on the moon?

662. If I were to say "I have never been on the moon--but I may be mistaken", that would be idiotic.

For even the thought that I might have been transported there, by unknown means, in my sleep, *would not give me any right* to speak of a possible mistake here. I play the game *wrong* if I do.

663. I have a right to say "I can't be making a mistake about this" even if I am in error.

664. It makes a difference: whether one is learning in school what is right and wrong in mathematics, or whether I myself say that I cannot be making a mistake in a proposition.

665. In the latter case I am adding something special to what is generally laid down.

666. But how is it for example with anatomy (or a large part of it)? Isn't what it describes, too, exempt from all doubt?

667. Even if I came to a country where they believed that people were taken to the moon in dreams, I couldn't say to them: "I have never been to the moon. Of course I may be mistaken". And to their question "Mayn't you be mistaken?" I should have to answer: No.

668. What practical consequences has it if I give a piece of information and add that I can't be making a mistake about it?

(I might also add instead: "I can no more be wrong about this than about my name's being L. W.")

The other person might doubt my statement nonetheless. But if he trusts me he will not only accept my information, he will also draw definite conclusions from my conviction, as to how I shall behave.

669. The sentence "I can't be making a mistake" is certainly used in practice. But we may question whether it is then to be taken in a perfectly rigorous sense, or is rather a kind of exaggeration which perhaps is used only with a view to persuasion.

670. We might speak of fundamental principles of human enquiry.

671. I fly from here to a part of the world where the people have only indefinite information, or none at all, about the possibility of flying. I tell them I have just flown there from.... They ask me if I might be mistaken.--They have obviously a false impression of how the thing happens. (If I were packed up in a box it would be possible for me to be mistaken about the way I had travelled.) If I simply tell them that I can't be mistaken, that won't perhaps convince them; but it will if I describe the actual procedure to them. Then they will certainly not bring the possibility of a *mistake* into the question. But for all that--even if they trust me--they might believe I had been dreaming or that magic had made me imagine it.

672. 'If I don't trust *this* evidence why should I trust any evidence?'

673. Is it not difficult to distinguish between the cases in which I cannot and those in which I can *hardly* be mistaken? Is it always clear to which kind a case belongs? I believe not.

674. There are, however, certain types of case in which I rightly say I cannot be making a mistake, and Moore has given a few examples of such cases.

I can enumerate various typical cases, but not give any common characteristic. (N. N. cannot be mistaken about his having flown from America to England a few days ago. Only if he is mad can he take anything else to be possible.)

675. If someone believes that he has flown from America to England in the last few days, then, I believe, he cannot be making a *mistake*.

And just the same if someone says that he is at this moment sitting at a table and writing.

676. "But even if in such cases I can't be mistaken, isn't it possible that I am drugged?" If I am and if the drug has taken away my consciousness, then I am not now really talking and

thinking. I cannot seriously suppose that I am at this moment dreaming. Someone who, dreaming, says "I am dreaming", even if he speaks audibly in doing so, is no more right than if he said in his dream "it is raining", while it was in fact raining. Even if his dream were actually connected with the noise of the rain.

REMARKS ON COLOUR

Ludwig Wittgenstein: REMARKS ON COLOUR

Edited by
G.E.M. ANSCOMBE

Translated by
Linda L. McAlister and
Margarete Schättle

BASIL BLACKWELL

EDITOR'S PREFACE

Part III of this volume reproduces most of a MS book written in Oxford in the Spring of 1950. I have left out material on "inner-outer", remarks about Shakespeare and some general observations about life; all this both was marked as discontinuous with the text and also will appear elsewhere. Part I was written in Cambridge in March 1951: it is a selection and revision of the earlier material, with few additions. It is not clear whether Part II ante- or post-dates Part III. It was part of what was written on undated loose sheets of foolscap, the rest being devoted to certainty. Wittgenstein left these in his room in my house in Oxford when he went to Dr. Bevan's house in Cambridge in February 1951, in the expectation of dying there. His literary executors decided that the whole of this material might well be published, as it gives a clear sample of first-draft writing and subsequent selection. Much of what was not selected is of great interest, and this method of publication involves the least possible editorial intervention.

In the work of determining the text I was much helped by G. H. von Wright's careful typescript of it, and also by an independent typescript made by Linda McAlister and Margarete Schättle. We have to thank them also for their translation. This, with agreed revisions by the editor, is published here.

I should also like to thank Dr. L. Labowsky for reading through the German text.

G. E. M. Anscombe

I

1. A language-game: Report whether a certain body is lighter or darker than another.--But now there's a related one: State the relationship between the lightness of certain shades of colour. (Compare with this: Determining the relationship between the lengths of two sticks--and the relationship between two numbers.)--The form of the propositions in both language-games is the same: "X is lighter than Y". But in the first it is an external relation and the proposition is temporal, in the second it is an internal relation and the proposition is timeless.

2. In a picture in which a piece of white paper gets its lightness from the blue sky, the sky is lighter than the white paper. And yet in another sense blue is the darker and white the lighter colour. (Goethe). On the palette white is the lightest colour.

3. Lichtenberg says that very few people have ever seen pure white. So do most people use the word wrong, then? And how did *he* learn the correct use?--He constructed an ideal use from the ordinary one. And that is not to say a better one, but one that has been refined along certain lines and in the process something has been carried to extremes.

4. And of course such a construct may in turn teach us something about the way we in fact use the word.

Page 2

5. If I say a piece of paper is pure white, and if snow were placed next to it and it then appeared grey, in its normal surroundings I would still be right in calling it white and not light grey. It could be that I use a more refined concept of white in, say, a laboratory (where, for example, I also use a more refined concept of precise determination of time).

Page 2

6. What is there in favor of saying that green is a primary colour, not a blend of blue and yellow? Would it be right to say: "You can only know it directly by looking at the colours"? But how do I know that I mean the same by the words "primary colours" as some other

Page Break 3

person who is also inclined to call green a primary colour? No,--here language-games decide.

Page 3

7. Someone is given a certain yellow-green (or blue-green) and told to mix a less yellowish (or bluish) one--or to pick it out from a number of colour samples. A less yellowish green, however, is not a bluish one (and vice versa), and there is also such a task as choosing, or mixing a green that is neither yellowish nor bluish. I say "or mixing" because a green does not become both bluish" and yellowish because it is produced by a kind of mixture of yellow and blue.

Page 3

8. People might have the concept of intermediary colours or mixed colours even if they never produced colours by mixing (in whatever sense). Their language-games might only have to do with looking for or selecting already existing intermediary or blended colours.

Page 3

9. Even if green is not an intermediary colour between yellow and blue, couldn't there be people for whom there is bluish-yellow, reddish-green? I.e. people whose colour concepts deviate from ours--because, after all; the colour concepts of colour-blind people too deviate from those of normal people, and not every deviation from the norm must be a blindness, a defect.

Page 3

10. Someone who has learnt to find or to mix a shade of colour that is more yellowish, more whitish or more reddish, etc., than a given shade of colour, i.e. who knows the concept of intermediary colours, is (now) asked to show us a reddish-green. He may simply not understand this order and perhaps react as though he had first been asked to point out regular four-, five-, and six-angled plane figures, and then were asked to point out a regular one-angled plane figure. But what if he unhesitatingly pointed to a colour sample (say, to one that we would call a blackish brown)?

Page 3

11. Someone who is familiar with reddish-green should be in a position to produce a colour series which starts with red and ends with green and which perhaps even for us constitutes a continuous

Page Break 4

transition between the two. We would then discover that at the point where we always see the same shade, e.g. of brown, this person sometimes sees brown and sometimes reddish-green. It may be, for example, that he can differentiate between the colours of two chemical compounds that seem to us to be the same colour and he calls one brown and the other reddish-green.

Page 4

12. Imagine that all mankind, with rare exceptions, were red-green colour-blind. Or another case: everyone was either red-green or blue-yellow colour-blind.

Page 4

13. Imagine a *tribe* of colour-blind people, and there could easily be one. They would not have the same colour concepts as we do. For even assuming they speak, e.g. English, and thus have all the English colour words, they would still use them differently than we do and would *learn* their use differently.

Or if they have a foreign language, it would be difficult for us to translate their colour words into ours.

Page 4

14. But even if there were also people for whom it was natural to use the expressions "reddish-green" or "yellowish-blue" in a consistent manner and who perhaps also exhibit abilities which we lack, we would still not be forced to recognize that they see colours which we do not see. There is, after all, no *commonly* accepted criterion for what is a colour, unless it is one of our colours.

Page 4

15. In every serious philosophical question uncertainty extends to the very roots of the problem.

We must always be prepared to learn something totally new.

Page 4

16. The description of the phenomena of colour-blindness is part of psychology: and therefore the description of the phenomena of normal vision, too? Psychology only describes the *deviations* of colour-blindness from normal vision.

Page 4

17. Runge says (in the letter that Goethe reproduced in his *Theory of Colours*), there are transparent and opaque colours. White is an opaque colour.

This shows the indeterminateness in the concept of colour or again in that of sameness of colour.

Page Break 5

Page 5

18. Can a transparent green glass have the same colour as a piece of opaque paper or not? If such a glass were depicted in a painting, the colours would not be transparent on the palette. If we wanted to say the colour of the glass was also transparent in the painting, we would have to call the complex of colour patches which depict the glass its *colour*.

Page 5

19. Why is it that something can be transparent green but not transparent white?

Transparency and reflections exist only in the dimension of depth of a visual image.

The impression that the transparent medium makes is that something lies *behind* the medium. If the visual image is thoroughly monochromatic it cannot be transparent.

Page 5

20. Something white behind a coloured transparent medium appears in the colour of the medium, something black appears black. According to this rule, black on a white background would have to be seen through a 'white, transparent' medium as through a colourless one.

Page 5

21. Runge: "If we were to think of a bluish-orange, a reddish-green, or a yellowish-violet, we would have the same feeling as in the case of a southwesterly northwind.... Both white and Black are opaque or solid.... White water which is pure is as inconceivable as clear milk."

Page 5

22. We do not want to establish a theory of colour (neither a physiological one nor a psychological one), but rather the logic of colour concepts. And this accomplishes what people have often unjustly expected of a theory.

Page 5

23. "White water is inconceivable, etc." That means we cannot describe (e.g. paint), how something white and clear would look, and that means: we don't know what description, portrayal, these words demand of us.

Page 5

24. It is not immediately clear what transparent glass we should say has the *same colour* as an opaque colour sample. If I say, "I am looking for glass of *this colour*" (pointing to a piece of coloured

Page Break 6

paper), that would mean roughly that something white seen through the glass should look like my sample.

If the sample is pink, sky-blue or lilac, we will imagine the glass cloudy, but perhaps too as clear and only slightly reddish, bluish or violet.

Page 6

25. In the cinema we can sometimes see the events in the film as if they lay behind the screen and it were transparent, rather like a pane of glass. The glass would be taking the colour away from things and allowing only white, grey and black to come through. (Here we are not doing physics, we are regarding white and black as colours just like green and red).--We might thus think that we are here imagining a pane of glass that could be called white and transparent. And yet we are not tempted to call it that: so does the analogy with, e.g. a transparent green pane break down somewhere?

Page 6

26. We would say, perhaps, of a green pane: it colours the things behind it green, above all the white behind it.

Page 6

27. When dealing with logic, "One cannot imagine that" means: one doesn't know what one should imagine here.

Page 6

28. Would we say that my fictitious glass pane in the cinema gave the things behind it a white colouring?

Page 6

29. From the rule for the appearance of transparent coloured things that you have extracted from transparent green, red, etc., ascertain the appearance of transparent white! Why doesn't this work?

Page 6

30. Every coloured medium darkens that which is seen through it, it swallows light: now is my white glass also supposed to darken? And the more so the thicker it is? So it would really be a dark glass!

Page 6

31. Why can't we imagine transparent-white glass,--even if there isn't any in actuality? Where does the analogy with transparent coloured glass go wrong?

Page 6

32. Sentences are often used on the borderline between logic and the empirical, so that their meaning changes back and forth and

Page Break 7

they count now as expressions of norms, now as expressions of experience.

(For it is certainly not an accompanying mental phenomenon--this is how we imagine 'thoughts'--but the use, which distinguishes the logical proposition from the empirical one.)

Page 7

33. We speak of the 'colour of gold' and do not mean yellow. "Gold-coloured" is the property of a surface that shines or glitters.

Page 7

34. There is the glow of red-hot and of white-hot: but what would brown-hot and grey-hot look like? Why can't we conceive of these as a lower degree of white-hot?

Page 7

35. "Light is colourless". If so, then in the sense in which numbers are colourless.

Page 7

36. Whatever *looks* luminous does not look grey. Everything grey *looks* as though it is being illuminated.

Page 7

37. What we see as luminous we do not see as grey. But we can certainly see it as white.

Page 7

38. I could, then, see something *now* as weakly luminous, *now* as grey.

Page 7

39. I am not saying here (as the Gestalt psychologists do), that the *impression of white* comes about in such-and-such a way. Rather the question is precisely: what is the meaning of this expression, what is the logic of this concept?

Page 7

40. For the fact that we cannot conceive of something 'glowing grey' belongs neither to the physics nor to the psychology of colour.

Page 7

41. I am told that a substance burns with a grey flame. I don't know the colours of the flames of all substances; so why shouldn't that be possible?

Page 7

42. We speak of a 'dark red light' but not of a 'black-red light'.

Page Break 8

Page 8

43. A smooth white surface can reflect things: But what, then, if we made a mistake and that which appeared to be reflected in such a surface were *really* behind it and seen through it? Would the surface then be white and transparent?

Page 8

44. We speak of a 'black' mirror. But where it mirrors, it darkens, of course, but it doesn't look black, and that which is seen in it does not appear 'dirty' but 'deep'.

Page 8

45. Opaqueness is not a *property* of the white colour. Any more than transparency is a property of the green.

Page 8

46. And it does not suffice to say, the word "white" is used only for the appearance of surfaces. It could be that we

had two words for "green": one for green surfaces, the other for green transparent objects. The question would remain why there existed no colour word corresponding to the word "white" for something transparent.

Page 8

47. We wouldn't want to call a medium white if a black and white pattern (chess board) appeared unchanged when seen through it, even if this medium reduced the intensity of the other colours.

Page 8

48. We might want not to call a white high-light "white", and thus use that word only for that which we see as the colour of a surface.

Page 8

49. Of two places in my surroundings which I *see* in one sense as being the same colour, in another sense, the one can seem to me white and the other grey.

To me in one context this colour is white in a poor light, in another it is grey in good light.

These are propositions about the concepts 'white' and 'grey'.

Page 8

50. The bucket which I see in front of me is glazed shining white; it would be absurd to call it "grey" or to say "I really see a light grey". But it has a shiny highlight that is far lighter than the rest of its surface part of which is turned toward the light and part away from it, without appearing to be differently coloured. (*Appearing*, not just *being*.)

Page Break 9

Page 9

51. It is not the same thing to say: the impression of white or grey comes about under such-and-such conditions (causal), and: it is an impression in a certain context of colours and forms.

Page 9

52. White as a colour of substances (in the sense in which we say snow is white) is lighter than any other substance-colour; black darker. *Here* colour is a darkening, and if all such is removed from the substance, white remains, and for this reason we can call it "colourless".

Page 9

53. There is no such thing as phenomenology, but there are indeed phenomenological problems.

Page 9

54. It is easy to see that not all colour concepts are logically of the same sort, e.g. the difference between the concepts 'colour of gold' or 'colour of silver' and 'yellow' or 'grey'.

Page 9

55. A colour '*shines*' in its surroundings. (Just as eyes only smile in a face.) A 'blackish' colour--e.g. grey--doesn't '*shine*'.

Page 9

56. The difficulties we encounter when we reflect about the nature of colours (those which Goethe wanted to get sorted out in his *Theory of Colours*) are embedded in the indeterminateness of our concept of sameness of colour.

Page 9

57.

["I feel X"

"I observe X"

X does not stand for the same concept in the first and the second sentences, even if it may stand for the same verbal expression, e.g. for "a pain". For if we ask "what kind of a pain?" in the first case I could answer "This kind" and, for example, stick the questioner with a needle. In the second case I must answer the same question differently; e.g. "the pain in my foot".

In the second sentence X could also stand for "my pain", but not in the first.]

Page 9

58. Imagine someone pointing to a place in the iris of a Rembrandt eye and saying: "The walls in my room should be painted this colour".

Page Break 10

Page 10

59. I paint the view from my window; one particular spot, determined by its position in the architecture of a house, I paint ochre. I say this is the colour I see this spot. That does not mean that I see the colour of ochre here, for in *these* surroundings this pigment may look lighter, darker, more reddish, (etc.). "I see this spot the way I have painted it here with ochre, namely as a strongly reddish-yellow".

But what if someone asked me to give the *exact* shade of colour that I see there?--How should it be

described and how determined? Someone could ask me to produce a colour sample (a rectangular piece of paper of this colour). I don't say that such a comparison would be utterly uninteresting, but it shows us that it isn't from the outset clear how shades of colour are to be compared and what "sameness of colour" means.

Page 10

60. Imagine a painting cut up into small, almost monochromatic bits which are then used as pieces in a jig-saw puzzle. Even when such a piece is not monochromatic it should not indicate any three-dimensional shape, but should appear as a flat colour-patch. Only together with the other pieces does it become a bit of blue sky, a shadow, a highlight, transparent or opaque, etc. Do the individual pieces show us the *real colours* of the parts of the picture?

Page 10

61. We are inclined to believe the analysis of our colour concepts would lead ultimately to the *colours of places* in our visual field, which are independent of any spatial or physical interpretation; for here there is neither light nor shadow, nor high-light, etc., etc..

Page 10

62. The fact that I can say this place in my visual field is grey-green does not mean that I know what should be called an exact reproduction of this shade of colour.

Page 10

63. I see in a photograph (not a colour photograph) a man with dark hair and a boy with slicked-back blond hair standing in front of a kind of lathe, which is made in part of castings painted black, and in part of smooth axles, gears, etc., and next to it a grating made of light galvanized wire. I see the finished iron surfaces as iron-coloured, the boy's hair as blond, the grating as zinc-coloured, despite the fact that everything is depicted in lighter and darker tones of the photographic paper.

Page Break 11

Page 11

64. But do I really see the hair blond in the photograph? And what can be said in favor of this? What reaction of the viewer is supposed to show that he *sees* the hair blond, and doesn't just conclude from the shades of the photograph that it is blond?--If I were asked to describe the photograph I would do so in the most direct manner with these words. If this way of describing it won't do, then I would have to start looking for another.

Page 11

65. If the word "blond" itself can sound blond, then it's even easier for photographed hair to look blond!

Page 11

66. "Can't we imagine certain people having a different geometry of colour than we do?" That, of course, means: Can't we imagine people having colour concepts other than ours? And that in turn means: Can't we imagine people who do *not* have our colour concepts but who have concepts which are related to ours in such a way that we would also call them "colour concepts"?

Page 11

67. Look at your room late in the evening when you can hardly distinguish between colours any longer--and now turn on the light and paint what you saw earlier in the semi-darkness.--How do you compare the colours in such a picture with those of the semi-dark room?

Page 11

68. When we're asked "What do the words 'red', 'blue', 'black', 'white' mean?" we can, of course, immediately point to things which have these colours,--but our ability to explain the meanings of these words goes no further! For the rest, we have either no idea at all of their use, or a very rough and to some extent false one.

Page 11

69. I can imagine a logician who tells us that he has now succeeded in *really* being able to *think* $2 \times 2 = 4$.

Page 11

70. Goethe's theory of the constitution of the colours of the spectrum has not proved to be an unsatisfactory theory, rather it really isn't a theory at all. Nothing can be predicted with it. It is, rather, a vague schematic outline of the sort we find in James's psychology. Nor is there any *experimentum crucis* which could decide for or against the theory.

Page Break 12

Page 12

71. Someone who agrees with Goethe believes that Goethe correctly recognized the *nature* of colour. And nature here is not what results from experiments, but it lies in the concept of colour.

Page 12

72. One thing was irrefutably clear to Goethe: no lightness can come out of darkness--just as more and more shadows do not produce light.--This could be expressed as follows: we may call lilac a reddish-whitish-blue or

brown a blackish-reddish-yellow--but we *cannot* call a white a yellowish-reddish-greenish-blue, or the like. And *that* is something that experiments with the spectrum neither confirm nor refute. It would, however, also be wrong to say, "Just look at the colours in nature and you will see that it is so". For looking does not teach us anything about the concepts of colours.

Page 12

73. I cannot imagine that Goethe's remarks about the characters of the colours and colour combinations could be of any use to a painter; they could be of hardly any to a decorator. The colour of a blood-shot eye might have a splendid effect as the colour of a wall-hanging. Someone who speaks of the character of a colour is always thinking of just *one* particular way it is used.

Page 12

74. If there were a theory of colour harmony, perhaps it would begin by dividing the colours into groups and forbidding certain mixtures or combinations and allowing others. And, as in harmony, its rules would be given no justification.

Page 12

75. There may be mental defectives who cannot be taught the concept 'tomorrow', or the concept 'I', nor to tell time. Such people would not learn the use of the word 'tomorrow' etc..

Now to whom can I describe *what* these people cannot learn? Just to one who has learnt it? Can't I tell A that B cannot learn higher mathematics, even though A hasn't mastered it? Doesn't the person who has learned the game understand the word "chess" differently from someone who hasn't learnt it? There are differences between the use of the word which the former can make, and the use which the latter has learnt.

Page 12

76. Does describing a game always mean: giving a description through which someone can learn it?

Page Break 13

Page 13

77. Do the normally sighted and the colour-blind have the same concept of colour-blindness? The colour-blind not merely cannot learn to use our colour words, they can't learn to use the word "colour-blind" as a normal person does. They cannot, for example, establish colour-blindness in the same way as the normal do.

Page 13

78. There could be people who didn't understand our way of saying that orange is a rather reddish-yellow, and who would only be inclined to say something like that in cases where a transition from yellow through orange to red took place before their eyes. And for such people the expression "reddish-green" need present no difficulties.

Page 13

79. Psychology describes the phenomena of seeing.--For whom does it describe them? *What* ignorance can this description eliminate?

Page 13

80. Psychology describes what was observed.

Page 13

81. Can one describe to a blind person what it's like for someone to *see*?--Certainly. The blind learn a great deal about the difference between the blind and the sighted. But the question was badly put; as though seeing were an activity and there were a description of it.

Page 13

82. I can, of course, observe colour-blindness; then why not seeing?--I can observe what colour judgements a colour-blind person--or a normally sighted person, too--makes *under certain circumstances*.

Page 13

83. People sometimes say (though mistakenly), "Only I can know what I see". But not: "Only I can know whether I am colour-blind". (Nor again: "Only I can know whether I see or am blind".)

Page 13

84. The statement, "I see a red circle" and the statement "I see (am not blind)" are not logically of the same sort. How do we test the truth of the former, and how that of the latter?

Page 13

85. But can I believe that I see and be blind, or believe that I'm blind and see?

Page 13

86. Could a psychology textbook contain the sentence, "There are people who see"? Would this be wrong? But to whom will it communicate anything?

Page Break 14

87. How can it be nonsense to say, "There are people who see", if it is not nonsense to say "There are people who are blind"?

But suppose I had never heard of the existence of blind people and one day someone told me, "There are people who do not see", would I have to understand this sentence immediately? If I am not blind myself must I be conscious that I have the ability to see, and that, therefore, there may be people who do not have this ability?

88. If the psychologist teaches us, "There are people who see", we can then ask him: "And what do you call 'people who see'?" The answer to that would have to be: People who behave so-and-so under such-and-such circumstances.

II

1. We might speak of the colour-impression of a surface, by which we wouldn't mean the colour, but rather the composite of the shades of colour, which produces the impression (e.g.) of a brown surface.

2. Blending in white removes the *colouredness* from the colour; but blending in yellow does not.--Is that the basis of the proposition that there can be no clear transparent white?

3. But what kind of a proposition is that, that blending in white removes the colouredness from the colour?

As I mean it, it can't be a proposition of physics.

Here the temptation to believe in a phenomenology, something midway between science and logic, is very great.

4. What then is the essential nature of *cloudiness*? For red or yellow transparent things are not cloudy; white is cloudy.

5. Is cloudy that which conceals forms, and conceals forms because it obliterates light and shadow?

6. Isn't white that which does away with darkness?

7. We speak, of course, of 'black glass', yet you see a white surface as red through red glass but not as black through 'black' glass.

8. People often use tinted lenses in their eye-glasses in order to see clearly, but never cloudy lenses.

9. "The blending in of white obliterates the difference between light and dark, light and shadow"; does that define the concepts more closely? Yes, I believe it does.

10. If someone didn't find it to be this way, it wouldn't be that he had experienced the contrary, but rather that he wouldn't understand him.

11. In philosophy we must always ask: "How must we look at this problem in order for it to become solvable?"

12. For here (when I consider colours, for example) there is merely an inability to bring the concepts into some kind of order.

We stand there like the ox in front of the newly-painted stall door.

13. Think about how a painter would depict the view through a red-tinted glass. What results is a *complicated* surface picture. I.e. the picture will contain a great many gradations of red and of other colours adjacent to one another. And analogously if you looked through a blue glass.

But how about if you painted a picture such that the places become whitish where, before, something was made bluish or reddish?

14. Is the only difference here that the colours remain as saturated as before when a reddish light is cast on them,

while they don't with the whitish light? But we don't speak of a 'whitish light cast on things' at all!

Page 16

15. If everything looked whitish in a particular light, we wouldn't then conclude that the light source must look white.

Page 16

16. Phenomenological analysis (as e.g. Goethe would have it) is analysis of concepts and can neither agree with nor contradict physics.

Page 16

17. But what if somewhere the following situation prevailed: the light of a white-hot body makes things appear light but whitish, and so weakly-coloured; the light of a red-hot body makes things appear reddish, etc. (Only an invisible light source, not perceptible to the eye, makes them radiate in colours.)

Page 16

18. Yes, suppose even that things only radiated their colours when, in our sense, *no* light fell on them--when, for example, the sky were *black*? Couldn't we then say: only in black light do the full colours appear (to us)?

Page 16

19. But wouldn't there be a contradiction here?

Page 16

20. I don't *see* that the colours of bodies reflect light into my eye.

Page Break 17

III

24.3.50

Page 17

1. ? White must be the lightest colour in a picture.

Page 17

2. In the Tricolour, for example, the white cannot be darker than the blue and red.

Page 17

3. Here we have a sort of mathematics of colour.

26.3

Page 17

4. But pure yellow too is lighter than pure, saturated red, or blue. And is this proposition a matter of experience?--I don't know, for example, whether red (i.e. pure red) is lighter or darker than blue; to be able to say, I would have to see them. And yet, if I had seen them, I would know the answer once and for all, like the result of an arithmetical calculation.

Where do we draw the line here between logic and experience?

Page 17

5. The word whose meaning is not clear is "pure" or "saturated". How do we learn its meaning? How can we tell if people mean the same thing by it? I call a colour (e.g. red) "saturated" if it contains neither black nor white, if it is neither blackish nor whitish.

But this explanation only leads to a provisional understanding.

Page 17

6. What is the *importance* of the concept of saturated colour?

Page 17

7. One fact is obviously important here: namely that people reserve a special place for a given point on the colour wheel, and that they don't have to go to a lot of trouble to remember where the point is, but always find it easily.

Page 17

8. Is there such a thing as a 'natural history of colours' and to what extent is it analogous to a natural history of plants? Isn't the latter temporal, the former nontemporal

Page 17

9. If we say that the proposition "saturated yellow is lighter than saturated blue" doesn't belong to the realm of psychology (for only

Page Break 18

so could it be natural history)--this means that we are not *using* it as a proposition of natural history. And the question then is: what is the other, nontemporal *use* like?

Page 18

10. For this is the only way we can distinguish propositions of 'the mathematics of colour' from those of natural history.

Page 18

11. Or again, the question is this: can we (clearly) distinguish two uses here?

Page 18

12. If you impress two shades of colour on your memory, and A is lighter than B, and then later you call one shade "A" and another "B" but the one you called "B" is lighter than "A", you have called these shades by the wrong names. (This is logic).

Page 18

13. Let the concept of a 'saturated' colour be such that saturated X cannot be lighter than saturated Y at one time and darker at another; i.e. it makes no sense to say it is lighter at one time and darker at another. This determines the concept and is again a matter of logic.

The *usefulness* of a concept determined in this way is not decided here.

Page 18

14. This concept might only have a *very* limited use. And this simply because what we usually call a saturated X is an impression of colour in a particular surrounding. It is comparable to 'transparent' X.

Page 18

15. Give examples of simple language-games with the concept of 'saturated colours'.

Page 18

16. I assume that certain chemical compounds, e.g. the salts of a given acid, have saturated colours and could be recognized by them.

Page 18

17. Or you could tell where certain flowers come from by their saturated colours, e.g. you could say, "That must be an alpine flower because its colour is so intense".

Page 18

18. But in such a case there could be lighter and darker saturated red, etc.

Page 18

19. And don't I have to admit that sentences are often used on the borderline between logic and the empirical, so that their meaning

Page Break 19

shifts back and forth and they are now expressions of norms, now treated as expressions of experience?

For it is not the 'thought' (an accompanying mental phenomenon) but its use (something that surrounds it), that distinguishes the logical proposition from the empirical one.

Page 19

20. (The wrong picture confuses, the right picture helps.)

Page 19

21. The question will be, e.g.: can you teach the meaning of "saturated green" by teaching†1 the meaning of "saturated red", or "yellow", or "blue"?

Page 19

22. A *shine*, a 'high-light' cannot be black. If I were to substitute blackness for the lightness of high-lights in a picture, I wouldn't get black lights. And that is not simply because this is the one and only form in which a high-light occurs in nature, but *also* because we react to a *light* in this spot in a certain way. A flag may be yellow and black, another yellow and white.

Page 19

23. Transparency painted in a picture produces its effect in a different way than opaqueness.

Page 19

24. Why is transparent white impossible?--Paint a transparent red body, and then substitute white for red!

Black and white themselves have a hand in the business, where we have transparency of a colour. Substitute white for red and you no longer have the impression of transparency; just as you no longer have the impression of

solidity if you turn this drawing  into this one .

27.3

Page 19

25. Why isn't a saturated colour simply: *this*, or *this*, or *this*, or *this*?--Because we recognize it or determine it in a different way.

Page 19

26. Something that may make us suspicious is that some people have thought they recognized three primary colours, some four. Some have thought green to be an intermediary colour between blue and yellow, which strikes

me, for example, as wrong, even apart from any *experience*.

Page Break 20

Page 20

Blue and yellow, as well as red and green, seem to me to be opposites--but perhaps that is simply because I am used to seeing them at opposite points on the colour circle.

Indeed, what (so to speak psychological) *importance* does the question as to the number of Pure Colours have for me?

Page 20

27. I seem to see one thing that is of logical importance: if you call green an intermediary colour between blue and yellow, then you must also be able to say, for example, what a slightly bluish yellow is, or an only somewhat yellowish blue. And to me these expressions don't mean anything at all. But mightn't they mean something to someone else?

So if someone described the colour of a wall to me by saying: "It was a somewhat reddish yellow," I could understand him in such a way that I could choose approximately the right colour from among a number of samples. But if someone described the colour in *this* way: "It was a somewhat bluish yellow," I could not show him such a sample.--Here we usually say that in the one case we can imagine the colour, and in the other we can't--but this way of speaking is misleading, for there is no need whatsoever to think of an image that appears before the inner eye.

Page 20

28. There is such a thing as perfect pitch and there are people who don't have it; similarly we could suppose that there could be a great range of different talents with respect to seeing colours. Compare, for example, the concept 'saturated colour' with 'warm colour'. Must it be the case that everyone knows 'warm' and 'cool' colours? Apart from being taught to give this or that name to a certain disjunction of colours.

Couldn't there be a painter, for example, who had no concept whatsoever of 'four pure colours' and who even found it ridiculous to talk about such a thing?

Page 20

29. Or in other words: are people for whom this concept is not at all natural missing anything?

Page 20

30. Ask this question: Do you know what "reddish" means? And how do you show that you know it?

Language-games: "Point to a reddish yellow (white, blue, brown)--"Point to an even more reddish one"--"A less reddish one" etc.

Page Break 21

Now that you've mastered this game you will be told "Point to a somewhat reddish green" Assume there are two cases: Either you do point to a colour (and always the same one), perhaps to an olive green--or you say, "I don't know what that means," or "There's no such thing."

We might be inclined to say that the one person had a different colour concept from the other; or a different concept of '... ish.'

Page 21

31. We speak of "colour-blindness" and call it a *defect*. But there could easily be several differing abilities, none of which is clearly inferior to the others.--And remember, too, that a man may go through life without his colour-blindness being noticed, until some special occasion brings it to light.

Page 21

32. Is it possible then for different people in this way to have different colour concepts?--*Somewhat* different ones. Different with respect to one or another feature. And that will impair their mutual understanding to a greater or lesser extent, but often hardly at all.

Page 21

33. Here I would like to make a general observation concerning the nature of philosophical problems. Lack of clarity in philosophy is tormenting. It is felt as shameful. We feel: we do not know our way about where we *should* know our way about. And nevertheless it *isn't* so. We can get along very well without these distinctions *and* without knowing our way about here.

Page 21

34. What is the connection between the blending of colours and 'intermediary colours'? We can obviously speak of intermediary colours in a language-game in which we do not produce colours by mixing at all, but only *select* existing shades.

Yet *one* use of the concept of an intermediary colour is to recognize the blend of colours which produces a

given shade.

Page 21

35. Lichtenberg says that very few people have ever seen pure white. Do most people use the word wrong, then? And how did *he* learn the correct use?--On the contrary: he constructed an ideal use from the actual one. The way we construct a geometry. And 'ideal' does not mean something specially good, but only something carried to extremes.

Page 21

36. And of course such a construct can in turn teach us something about the actual use.

Page Break 22

Page 22

And we could also *introduce* a new concept of 'pure white', e.g. for scientific purposes.
(A new concept of this sort would then correspond to, say, the chemical concept of a 'salt'.)

Page 22

37. To what extent can we compare black and white to yellow, red and blue, and to what extent can't we?

If we had a checked wall-paper with red, blue, green, yellow, black and white squares, we would not be inclined to say that it is made up of two kinds of parts, of 'coloured' and, say, 'uncoloured' ones.

Page 22

38. Let us now suppose that people didn't contrast coloured pictures with black-and-white ones, but rather with blue-and-white ones. I.e.: couldn't blue too be felt (and that is to say, used) as not being an actual colour?

Page 22

39. My feeling is that blue obliterates yellow,--but why shouldn't I call a somewhat greenish yellow a "bluish yellow" and green an intermediary colour between blue and yellow, and a strongly bluish green a somewhat yellowish blue?

Page 22

40. In a greenish yellow I don't yet notice *anything* blue.--For me, green is one special way-station on the coloured path from blue to yellow, and red is another.

Page 22

41. What advantage would someone have over me who knew a direct route from blue to yellow? And what shows that I don't know such a path?--Does everything depend on my range of possible language-games with the form "...ish"?

Page 22

42. We will, therefore, have to ask ourselves: What would it be like if people knew colours which our people with normal vision do not know? In general this question will not admit of an unambiguous answer. For it is by no means clear that we *must* say of this sort of abnormal people that they know other *colours*. There is, after all, no commonly accepted criterion for what is a colour, unless it is one of our colours.

And yet we could imagine circumstances under which we would say, "These people see other colours in addition to ours."

Page Break 23

Page 23

28.3

43. In philosophy it is not enough to learn in every case *what* is to be said about a subject, but also *how* one must speak about it. We are always having to begin by learning the method of tackling it.

Page 23

44. Or again: In any serious question uncertainty extends to the very roots of the problem.

Page 23

45. One must always be prepared to learn something *totally* new.

Page 23

46. Among the colours: Kinship and Contrast. (And that is logic.)

Page 23

47. What does it mean to say, "Brown is akin to yellow?"

Page 23

48. Does it mean that the task of choosing a somewhat brownish yellow would be readily understood? (Or a somewhat more yellowish brown).

Page 23

49. The coloured intermediary between two colours.

Page 23

50. "Yellow is more akin to red than to blue."

Page 23

51. The differences between black-red-gold and black-red-yellow. Gold counts as a colour here.

Page 23

52. It is a fact that we can communicate with one another about the colours of things by means of six colour words. Also, that we do not use the words "reddish-green", "yellowish-blue" etc.

Page 23

53. Description of a jig-saw puzzle by means of the description of its pieces. I assume that these pieces never exhibit a three-dimensional form, but always appear as small flat bits, single- or many-coloured. Only when they are put together does something become a 'shadow', a 'high-light', a 'concave or convex monochromatic surface', etc.

Page 23

54. I can say: This man does not distinguish between red and green. But can I say that we normal people distinguish between red and green? We could, however, say: "*Here* we see two colours, he sees only *one*."

Page Break 24

Page 24

55. The description of the *phenomena* of colour-blindness is part of psychology. And the description of the phenomena of normal colour vision too? Of course--but what are the presuppositions of such a description and for whom is it a description? Or better: what are the means it employs? When I say, "What does it presuppose?" that means "How must one react to *this description* in order to *understand* it?" Someone who describes the phenomena of colour-blindness in a book describes them in the concepts of the sighted.

Page 24

56. This paper is lighter in some places than in others; but can I say that it is white only in certain places and gray in others?--Certainly, if I painted it, I would mix a gray for the darker places.

A surface-colour is a quality of a surface. One might (therefore) be tempted not to call it a pure colour concept. But then what would a pure one be?!

Page 24

57. It is not correct to say that in a *picture* white must always be the lightest colour. But it must be the lightest one in a flat pattern of coloured patches. A picture might show a book made of white paper in shadow, and lighter than this a luminous yellow or blue or reddish sky. But if I describe a plane surface, a wallpaper, for example, by saying that it consists of pure yellow, red, blue, white and black squares, the yellow ones cannot be lighter than the white ones, and the red cannot be lighter than the yellow.

This is why colours were shadows for Goethe.

Page 24

58. There seems to be a more fundamental' colour concept than that of the surface colour. It seems that one could present it either by means of small coloured elements in the field of vision, or by means of luminous points rather like stars. And larger coloured areas are composed of these coloured points or small coloured patches. Thus we could describe the colour impression of a surface area by specifying the position of the numerous small coloured patches within this area.

But how should we, for example, compare one of these small colour samples with a piece of the larger surface area? In what surroundings should the colour sample occur?

Page Break 25

Page 25

59. In everyday life we are virtually surrounded by impure colours. All the more remarkable that we have formed a concept of *pure* colours.

Page 25

29.3

60. Why don't we speak of a 'pure' brown? Is the reason merely the position of brown with respect to the other 'pure' colours, its relationship to them all?--Brown is, above all, a surface colour, i.e. there is no such thing as a *clear* brown, but only a muddy one. Also: brown contains black--(?)--How would a person have to behave for us to say of him that he knows a *pure, primary* brown?

Page 25

61. We must always bear in mind the question: How do people learn the meaning of colour names?

Page 25

62. What does, "Brown contains black," mean? There are more and less blackish browns. Is there one which isn't

blackish at all? There certainly isn't one that isn't *yellowish* at all. †1

Page 25

63. If we continue to think along these lines, 'internal properties' of a colour gradually occur to us, which we hadn't thought of at the outset. And that can show us the course of a philosophical investigation. We must always be prepared to come across a new one, one that has not occurred to us earlier.

Page 25

64. And we must not forget either that our colour words characterize the impression of a surface over which our glance wanders. That's what they're for.

Page 25

65. "Brown light". Suppose someone were to suggest that a traffic light be *brown*.

Page 25

66. It is only *to be expected* that we will find adjectives (as, for example, "iridescent") which are colour characteristics of an extended area or of a small expanse in a particular surrounding "shimmering", "glittering", "gleaming", "luminous").

Page 25

67. And indeed the pure colours do not even have special commonly used names, that's how unimportant they are to us.

Page Break 26

Page 26

68. Let us imagine that someone were to paint something from nature and in its natural colours. Every bit of the surface of such a painting has a definite colour. What colour? How do I determine its name? Should we, e.g. use the name under which the pigment applied to it is sold? But mightn't such a pigment look completely different in its special surrounding than on the palette?

Page 26

69. So perhaps we would then start to give special names to small coloured patches on a black background (for example).

What I really want to show here is that it is not at all clear a priori which are the simple colour concepts.

30.3

Page 26

70. It is not true that a darker colour is at the same time a more blackish one. That's certainly clear. A saturated yellow *is* darker, but is not more blackish than a whitish yellow. But amber isn't a 'blackish yellow' either. (?) And yet people speak of a 'black' glass or mirror.--Perhaps the trouble is that by "black" I mean essentially a surface colour?

I would not say of a ruby that it is blackish red, for that would suggest cloudiness. (On the other hand, don't forget that both cloudiness and transparency can be *painted*.)

Page 26

71. I treat colour concepts like the concepts of sensations.

Page 26

72. The colour concepts are to be treated like the concepts of sensations.

Page 26

73. There is no such thing as *the* pure colour concept.

Page 26

74. Where does the illusion come from then? Aren't we dealing here with a premature simplification of logic like any other?

Page 26

75. I.e., the various colour concepts are certainly closely related to one another, the various 'colour words' have a related use, but there are, on the other hand, all kinds of differences.

Page 26

76. Runge says that there are transparent and opaque colours. But this does not mean that you would use different greens to paint a piece of green glass and a green cloth in a picture.

Page Break 27

Page 27

77. It is a peculiar step taken in painting, that of depicting a highlight by means of a colour.

Page 27

78. The indefiniteness in the concept of colour lies, above all, in the indefiniteness of the concept of the sameness of colours, i.e. of the method of comparing colours.

Page 27

79. There is gold paint, but Rembrandt didn't use it to paint a golden helmet.

Page 27

80. What makes grey a neutral colour? Is it something physiological or something logical?

What makes bright colours bright? Is it a conceptual matter or a matter of cause and effect?

Why don't we include black and white in the colour circle? Only because we have a feeling that it's wrong?

Page 27

81. There is no such thing as luminous grey. Is that part of the concept of grey, or part of the psychology, i.e. the natural history, of grey? And isn't it odd that I don't know?

Page 27

82. Colours have characteristic causes and effects--that we do know.

Page 27

83. Grey is between two extremes (black and white), and can take on the hue of any other colour.

Page 27

84. Would it be conceivable for someone to see as black everything that we see as white, and *vice versa*?

Page 27

85. In a brightly coloured pattern black and white can be next to red and green, etc. without standing out as different.

This would not be the case, however, in the colour circle, if only because black and white mix with all the other colours. But also in particular, they both mix with their opposite pole.

Page 27

86. Can't we imagine people having a geometry of colours different from our normal one? And that, of course, means: can we describe it, can we immediately respond to the request to describe it, that is, do we know *unambiguously* what is being demanded of us?

The difficulty is obviously this: isn't it precisely the geometry of colours that shows us what we're talking about, i.e. that we are talking about colours?

Page Break 28

Page 28

87. The difficulty of imagining it (or of filling out the picture of it) is in knowing when one has pictured *that*. I.e. the indefiniteness of the request to imagine it.

Page 28

88. The difficulty is, therefore, one of knowing what we are supposed to consider as the analogue of something that is familiar to us.

Page 28

89. A colour which would be 'dirty' if it were the colour of a wall, needn't be so in a painting.

Page 28

90. I doubt that Goethe's remarks about the characters of the colours could be of any use to a painter. They could hardly be any to a decorator.

Page 28

91. If there were a theory of colour harmony, perhaps it would begin by dividing the colours into different groups and forbidding certain mixtures or combinations and allowing others; and, as in harmony, its rules would be given no justification.

Page 28

92. Mayn't that open our eyes to the *nature* of those differentiations among colours?

Page 28

93. [We don't say A knows something and B knows the opposite. But if we say "believes" instead of "knows", then it is a proposition.]

Page 28

94. Runge to Goethe: "If we were to think of a bluish orange, a reddish green or a yellowish violet, we would have the same feeling as in the case of a southwesterly northwind."

Also: what amounts to the same thing, "Both white and black are opaque or solid.... White water which is pure is as inconceivable as clear milk. If black merely made things dark, it could indeed be clear; but because it smirches things, it can't be."

Page 28

95. In my room I am surrounded by objects of different colours. It is easy to say what colour they are. But if I were

asked what colour I am now seeing from here at, say, *this* place on my table, I couldn't answer; the place is whitish (because the light wall makes the brown table lighter here) at any rate it is much lighter than the rest of the table, but, given a number of colour samples, I wouldn't be able to pick out one which had the same coloration as this area of the table.

Page Break 29

Page 29

96. Because it seems so to me--or to everybody--it does not follow that it *is* so.

Therefore: From the fact that this table seems brown to everyone, it does not follow that it is brown. But just what does it mean to say, "This table isn't really brown after all"?--So *does* it then follow from its appearing brown to us, that it is brown?

Page 29

97. Don't we just *call* brown the table which under certain circumstances appears brown to the normal-sighted? We could certainly conceive of someone to whom things seemed sometimes this colour and sometimes that, independently of the colour they are.

Page 29

98. That it seems so to men is their criterion for its *being* so.

Page 29

99. Being and seeming may, of course, be independent of one another in exceptional cases, but that doesn't make them logically independent; the language-game does not reside in the exception.

Page 29

100. *Golden* is a surface colour.

Page 29

101. We have *prejudices* with respect to the use of words.

Page 29

102. When we're asked "What do 'red', 'blue', 'black', 'white, mean?" we can, of course, immediately point to things which have these colours,--but that's all we can do: our ability to explain their meaning goes no further.

Page 29

103. For the rest, either we have no idea at all, or a very rough and to some extent false one.

Page 29

104. 'Dark' and 'blackish' are not the same concept.

Page 29

105. Runge says that black 'dirties'; what does that mean? Is that an emotional effect which black has on us? Is it an *effect* of the addition of black colour that is meant here?

Page 29

106. Why is it that a dark yellow doesn't have to be perceived as 'blackish', even if we call it dark?

The logic of the concept of colour is just much more complicated than it might seem.

Page Break 30

Page 30

107. The concepts 'matt' and 'shiny'. If, when we think of 'colour' we think of a property of a point in space, then the concepts matt and shiny have no reference to these colour concepts.

Page 30

108. The first 'solution' which occurs to us for the problem of colours is that the 'pure' colour concepts refer to points or tiny indivisible patches in space. Question: how are we to compare the colours of two such points? Simply by letting one's gaze move from one to the other? Or by moving a coloured object? If the latter, how do we know that this object has not changed colour in the process; if the former, how can we compare the coloured points without the comparison being influenced by what surrounds them?

Page 30

109. I could imagine a logician who tells us that he has now succeeded in *really* being able to *think* $2 \times 2 = 4$.

Page 30

110. If you are not clear about the role of logic in colour concepts, begin with the simple case of, e.g. a yellowish red. This exists, no one doubts that. How do I learn the use of the word "yellowish"? Through language-games in which, for example, things are put in a certain order.

Thus I can learn, in agreement with other people, to recognize yellowish and still more yellowish red, green, brown and white.

Page 30

In the course of this I learn to proceed independently just as I do in arithmetic. One person may react to the order to find a yellowish blue by producing a blue green, another may not understand the order. What does this depend upon?

Page 30

111. I say blue-green contains *no* yellow: if someone else claims that it certainly does contain yellow, who's right? How can we check? Is there only a verbal difference between us?--Won't the one recognize a pure green that tends neither toward blue nor toward yellow? And of what use is this? In what language-games can it be used? He will at least be able to respond to the command to pick out the green things that contain *no* yellow, and those that contain *no* blue. And this constitutes the demarcation point 'green', which the other does not know.

Page 30

112. The one can learn a language-game that the other one cannot. And indeed *this must* be what constitutes colour-blindness of all

Page Break 31

kinds. For if the 'colour-blind' person could learn all the language-games of normal people, why should he be excluded from certain professions?

Page 31

113. If someone had called this difference between green and orange to Runge's attention, perhaps he would have given up the idea that there are only *three* primary colours.

Page 31

114. Now to what extent is it a matter of logic rather than psychology that someone can or cannot learn a game?

Page 31

115. I say: The person who cannot play *this* game does not have *this* concept.

Page 31

116. Who has the concept 'tomorrow'? Of whom do we say this?

Page 31

117. I saw in a photograph a boy with slicked-back blond hair and a dirty light-coloured jacket, and a man with dark hair, standing in front of a machine which was made in part of castings painted black, and in part of finished, smooth axles, gears, etc., and next to it a grating made of light galvanized wire. The finished iron parts were iron coloured, the boy's hair was blond, the castings black, the grating zinc-coloured, despite the fact that everything was depicted simply in lighter and darker shades of the photographic paper.

Page 31

118. There may be mental defectives who cannot be taught the concept 'tomorrow' or the concept 'I', nor to tell time. Such would not learn the use of the word 'tomorrow' etc.

Page 31

119. Now to whom can I communicate *what* this mental defective cannot learn.? Just to whoever has learned it himself? Can't I tell someone that so-and-so cannot learn higher mathematics, even if this person himself hasn't mastered it? And yet: doesn't the person who has learned higher mathematics know more precisely what I mean? Doesn't the person who has learned the game understand the word 'chess' differently from someone who doesn't know it? What do we call "describing a technique"?

Page Break 32

Page 32

120. Or: Do normally sighted people and colour-blind people have the same concept of colour-blindness?

And yet the colour-blind person understands the statement "I am colour-blind", and its negation as well.

A colour-blind person not merely can't learn to use our colour words, he can't learn to use the word "colour-blind" exactly as a normal person does. He cannot for example always determine colour-blindness in cases where the normal-sighted can.

Page 32

121. And to whom can I describe all the things *we* normal people can learn?

Understanding the description itself already presupposes that he has learned something.

Page 32

122. How can I describe to someone how we use the word "tomorrow"? I can *teach* it to a child; but this does not mean I'm describing its use to him.

But can I describe the practice of people who have a concept, e.g. 'reddish-green', that we don't possess?--In any case I certainly can't *teach* this practice to anyone.

Page 32

123. Can I then only say: "These people call *this* (brown, for example) reddish green"? Wouldn't it then just be another word for something that I have a word for? If they really have a different concept than I do, this must be shown by the fact that I can't quite figure out their use of words.

Page 32

124. But I have kept on saying that it's conceivable for our concepts to be different than they are. Was that all nonsense?

11.4

Page 32

125. Goethe's theory of the origin of the spectrum *isn't* a theory of its origin that has proved unsatisfactory; it is really not a theory at all. *Nothing* can be predicted by means of it. It is, rather, a vague schematic outline, of the sort we find in James's psychology. There is no *experimentum crucis* for Goethe's theory of colour.

Someone who agrees with Goethe finds that Goethe correctly recognized the nature of colour. And here 'nature' does not mean a sum of experiences with respect to colours, but it is to be found in the concept of colour.

Page Break 33

Page 33

126. One thing was clear to Goethe: no lightness can come out of darkness-just as more and more shadows do not produce light. This could however be expressed as follows: we may, for example, call lilac a "reddish-whitish-blue", or brown a "reddish-blackish-yellow", but we *cannot* call white a "yellowish-reddish-greenish-blue" (or the like). And *that* is something that Newton didn't prove either. White is not a blend of colours in *this* sense.

12.4

Page 33

127. 'The colours' are not things that have definite properties, so that one could straight off look for or imagine colours that we don't yet know, *or* imagine someone who knows different ones than we do. It is quite possible that, under certain circumstances, we would say that people know colours that we don't know, but we are not forced to say this, for there is no indication as to what we should regard as adequate analogies to our colours, in order to be able to say it. This is like the case in which we speak of infra-red 'light'; there is a good reason for doing it, but we can also call it a misuse.

And something similar is true with my concept 'having pain in someone else's body'.

Page 33

128. There could very easily be a tribe of people who are all colour-blind and who nonetheless live very well; but would they have developed all our colour names, and how would their nomenclature correspond to ours? What would their natural language be like?? Do we know? Would they perhaps have three primary colours: blue, yellow and a third which takes the place of red and green?--What if we were to encounter such a tribe and wanted to learn their language? We would no doubt run into certain difficulties.

Page 33

129. Couldn't there be people who didn't understand our way of speaking when we say that orange is a reddish-yellow (etc.) and who were only inclined to say this in cases in which orange occurs in an actual transition from red to yellow? And for such people there might very well be a reddish green.

Page 33

Therefore, they couldn't 'analyse blends of colours' nor could they learn our use of X-ish Y. (Like people without perfect pitch).

Page 33

130. And what about people who only had colour-shape concepts? Should I say of them that they do not *see* that a green leaf and a

Page Break 34

green table--when I show them these things--have the same colour or have something in common? What if it had never 'occurred to them' to compare differently shaped objects of the same colour with one another? Due to their particular background, this comparison was of no importance to them, or had importance only in very exceptional cases, so that no linguistic tool was developed.

Page 34

131. A language-game: report on the greater lightness or darkness of bodies.--But now there is a *related* one: state the relationship between the lightness of certain *colours*. (Compare: the relationship between the lengths of two given sticks -the relationship between two given numbers.)

The form of the propositions is the same in both cases ("X lighter than Y"). But in the first language-game they are temporal and in the second non-temporal.

132. In a particular meaning of "white" white is the lightest colour of all.

In a picture in which a piece of white paper gets its lightness from the blue sky, the sky is lighter than the white paper. And yet in another sense blue is the darker and white the lighter colour (Goethe). With a white and a blue on the palette, the former would be lighter than the latter. On the palette, white is the lightest colour.

133. I may have impressed a certain grey-green upon my memory so that I can always correctly identify it without a sample. Pure red (blue, etc.) however, I can, so to speak, always reconstruct. It is simply a red that tends neither to one side nor to the other, and I recognize it without a sample, as e.g. I do a right angle, by contrast with an arbitrary acute or obtuse angle.

134. Now in this sense there are four (or, with white and black, six) pure colours.

135. A *natural history* of colours would have to report on their occurrence in nature, not on their *essence*. Its propositions would have to be temporal ones.

136. By analogy with the other colours, a black drawing on a white background seen through a transparent *white* glass would have to

appear unchanged as a black drawing on a white background. For the black must remain black and the white, because it is also the colour of the transparent body, remains unchanged.

137. We could imagine a glass through which black looked like black, white like white, and all the other colours appeared as shades of grey; so that seen through it everything appears as though in a photograph.

But why should I call that "white glass"?

138. The question is: is constructing a 'transparent white body' like constructing a 'regular triangle'?

139. I can look at a body and perhaps *see* a matt white surface, i.e. get the *impression* of such a surface, or the *impression* of transparency (whether it actually exists or not). This impression may be produced by the distribution of the colours, and white and the other colours are not involved in it in the *same* way.

(I took a green painted lead cupola to be translucent greenish glass without knowing at the time about the special distribution of colours that produced this appearance.)

140. And white may indeed occur in the visual impression of a transparent body, for example as a reflection, as a high-light. I.e. if the impression is perceived as transparent, the white which we see will simply not be *interpreted* as the body's being white.

141. I look through a transparent glass: does it follow that I don't see white? No, but I don't see the glass as white. But how does this come about? It can happen in various ways. I may see the white with *both* eyes as lying behind the glass. But simply in virtue of its position I may also see the white as a high-light (even when it isn't). And yet we're dealing here with seeing, not just taking something to be such-and-such. Nor is it at all necessary to use both eyes in order to see something as lying *behind* the glass.

142. The various 'colours' do not all have the same connexion with three-dimensional vision.

143. And it doesn't matter whether we explain this in terms of childhood experience or not.

144. It must be the connection between three-dimensionality, light and shadow.

145. Nor can we say that white is essentially the property of a--visual--surface. For it is conceivable that white should occur as a high-light or as the colour of a flame.

146. A body that is actually transparent can, of course, seem white to us; but it cannot seem white and transparent.

147. But we should not express this by saying: white is not a transparent colour.

148. 'Transparent' could be compared with 'reflecting'.

149. An element of visual space may be white or red, but can't be either transparent or opaque.

150. Transparency and reflection only exist in the dimension of depth of a visual image.

151. Why can't a monochromatic surface in the field of vision be amber-coloured? This colour-word refers to a transparent medium; thus if a painter paints a glass with amber-coloured wine in it, you could call the surface of the picture where this is depicted "amber-coloured", but you could not say this of any one monochromatic element of this surface.

152. Mightn't shiny black and matt black have different colour-names?

153. We don't say of something which looks transparent that it looks white.

154. "Can't we imagine people having a different geometry of colour than we do?"--That, of course, means: Can't we imagine people who have colour concepts which are other than ours; and that in turn means: Can't we imagine that people do not have our colour concepts and that they *have* concepts which are related to ours in such a way that we would also want to call them "colour concepts"?

155.†1 If people were used to seeing nothing but green squares and red circles, they might regard a green circle with the same kind of mistrust with which they would regard a freak, and, for example, they might even say it is *really* a red circle, but has something of a...†1

If people only had colour-shape concepts, they would have a special word for a red square and one for a red circle, and one for a green circle, etc. Now if they were to see a new *green* figure, should no similarity to the green circle, etc. occur to them? And shouldn't it occur to them that there is a similarity between green circles and red circles? But what do I want to say counts as showing that this similarity has occurred to them?

They might, *for example*, have a concept of 'going together'; and still not think of using colour words.

In fact there are tribes which only count up to 5 and they have probably not felt it necessary to describe anything that can't be described in this way.

156. Runge: "Black dirties". That means it takes the *brightness* out of a colour, but what does that mean? Black takes away the luminosity of a colour. But is that something logical or something psychological? There is such a thing as a luminous red, a luminous blue, etc., but no luminous black. Black is the, darkest of the colours. We say "deep black" but not "deep white".

But a 'luminous red' does not mean a *light* red. A dark red can be luminous too. But a colour is luminous as a result of its context, in its context.

Grey, however, is not luminous.

But black seems to make a colour cloudy, but darkness doesn't. A ruby could thus keep getting darker without ever becoming cloudy; but if it became blackish red, it would become cloudy. Now black is a surface colour. Darkness is not called a colour. In paintings darkness *can* also be depicted as black.

The difference between black and, say, a dark violet is similar to the difference between the sound of a bass drum and the sound of a kettle-drum. We say of the former that it is a noise not a tone. It is matt and absolutely black.

157. Look at your room late in the evening when you can hardly distinguish between colours any longer; and now turn on the light and paint what you saw in the twilight. There are pictures of landscapes or rooms in semi-darkness: But how do you compare the colours in such pictures with those you saw in semi-darkness? How different this comparison is from that of two colour samples which I have in front of me at the same time and compare by putting

them side by side!

Page 38

158. What is there in favour of saying that green is a primary colour and not a mixture of blue and yellow? Is it correct to answer: "You can only know it directly, by looking at the colours"? But how do I know that I mean the same by the words "primary colours" as someone else who is also inclined to call green a primary colour? No, here there are language-games that decide these questions.

There is a more or less bluish (or yellowish) green and someone may be told to mix a green less yellow (or blue) than a given yellow (or blue) one, or to pick one out from a number of colour samples. A less yellow green, however, is not a bluer one (and vice versa), and someone may also be given the task of choosing-or mixing-a green that is neither yellowish nor bluish. And I say "or mixing", because a green is not both yellowish and bluish on account of being produced by mixing yellow and blue.

Page 38

159. Consider that things can be reflected in a smooth white surface in such a way that their reflections seem to lie behind the surface and in a *certain* sense are seen through it.

Page 38

160. If I say a piece of paper is pure white and then place snow next to it and it then appears grey, in normal surroundings and for ordinary purposes I would call it white and not light grey. It could be that I'd use a different and, in a certain sense, more refined concept of white in, say, a laboratory, (where I sometimes also use a more refined concept of 'precise' determination of time).

Page 38

161. The pure saturated colours are essentially characterized by a certain relative lightness. Yellow, for example, is lighter than red. Is red lighter than blue? I don't know.

Page Break 39

Page 39

162. Someone who has learned the concept of intermediary colours, who has mastered the technique and who thus can find or mix shades of colour that are more whitish, more yellowish, more bluish than a given shade and so on, is now asked to pick out or to mix a reddish green.

Page 39

163. Someone who is familiar with reddish green should be in a position to produce a colour series which starts with red and ends with green and constitutes for us too a continuous transition between the two. We might then discover that at the point where we perhaps always see the same shade of brown, this person sometimes sees brown and sometimes reddish green. It may be, for example, that he can differentiate between the colours of two chemical compounds that seem to us to be the same colour, and he calls one "a brown" and the other "reddish green".

Page 39

164. In order to describe the phenomenon of red-green colour-blindness, I need only say what someone who is red-green colourblind *cannot* learn; but now in order to describe the 'phenomena of normal vision' I would have to enumerate the things we *can* do.

Page 39

165. Someone who describes the 'phenomena of colour-blindness' describes only the ways in which the colour-blind person *deviates* from the normal, not his vision in general.

But couldn't she also describe the ways in which normal vision deviates from total blindness? We might ask: who would learn from this? Can someone teach me that I see a tree?

And what is a 'tree', and what is 'seeing'?

Page 39

166. We can, for example, say: *This* is the way a person acts with a blindfold over his eyes, and *this* is the way a sighted person without a blindfold acts. With a blindfold he reacts thus and so, without the blindfold he walks briskly along the street, greets his acquaintances, nods to this one and that, avoids the cars and bicycles easily when he crosses the street, etc., etc. Even with new-born infants, we know that they can see from the fact that they follow movements with their eyes. Etc., etc.. The question is: who is supposed to understand the description? Only sighted people, or blind people too?

It makes sense, for example *[[sic]]*, to say "the sighted person distinguishes with his eyes between an unripe apple and a ripe one." But

Page Break 40

not: "The sighted person distinguishes a green apple from a red one." For what are 'red' and 'green'?

Marginal note: "The sighted person distinguishes an apple that appears red to him from one which appears

green."

But can't I say "I distinguish *this kind* of apple from *this kind*" (while pointing to a red apple and a green one)?

But what if someone points at two apples that seem to me to be exactly alike and says that?! On the other hand he could say to me "Both of them look exactly alike to you, so you might confuse them; but I see a difference and I can recognize each of them any time." That can be tested and confirmed.

Page 40

167. What is the experience that teaches me that I differentiate between red and green?

Page 40

168. Psychology describes the phenomena of seeing. For whom does it describe them? What ignorance can this description eliminate?

Page 40

169. If a sighted person had never heard of a blind person, couldn't we describe the behaviour of the blind person to him?

Page 40

170. I can say: "The colour-blind person cannot distinguish between a green apple and a red one" and that can be demonstrated. But can I say "I can distinguish between a green apple and a red one"? Well, perhaps by the taste. But still, for example, "I can distinguish an apple that you call 'green' from one that you call 'red', therefore I am not colour-blind".

Page 40

171. This piece of paper varies in lightness from place to place, but does it look grey to me in the darker places? The shadow that my hand casts is in part grey. I see the parts of the paper that are farther away from the light darker but still white, even though I would have to mix a grey to paint it. Isn't this similar to the fact that we often see a distant object merely as distant and not as smaller? Thus we cannot say "I notice that he looks smaller, and I conclude from that that he is farther away", but rather I notice that he is farther away, without being able to say how I notice it.

Page 40

172. The impression of a coloured transparent medium is that something is behind the medium. Thus if we have a thoroughly monochromatic visual image, it cannot be one of transparency.

Page Break 41

Page 41

173. Something white behind a coloured transparent medium appears in the colour of the medium, something black appears black. According to this rule a black drawing on white paper behind a white transparent medium must appear as though it were behind a colourless medium.

That†1 was not a proposition of physics, but rather a rule of the spatial interpretation of our visual experience. We could also say, it is a rule for painters: "If you want to portray something white behind something that is transparent and red, you have to paint it red." If you paint it white, it doesn't look as though it is behind the red thing.

Page 41

174. In the places where there is only a little less light on the white paper it doesn't seem at all grey, but always white.

Page 41

175. The question is: What must our visual picture be like if it is to show us a transparent medium? How must, e.g., the colour of the medium appear? Speaking in physical terms--although we are not directly concerned with the laws of physics here--everything seen through a green glass must look more or less dark green. The lightest shade would be that of the medium. That which we see through it is, thus, similar to a photograph. Now if we apply all this to white glass, everything should again look as though it were photographed, but in shades ranging from white to black. And if there were such glass--why shouldn't we want to call it *white*? Is there anything to be said against doing this; does the analogy with glass of other colours break down at any point?

Page 41

176. A cube of green glass looks green when it's lying in front of us. The overall impression is green; thus the overall impression of the white cube should be white.

Page 41

177. Where must the cube appear white for us to be able to call it white and transparent?

Page 41

178. Is it *because* the relationships and contrasts between white and the other colours are different from those between green and the other colours, that for white there is nothing analogous to a transparent green glass?

179. When light comes through it red glass casts a red light; now what would light coming through a white glass look like? Would yellow become whitish in such a light or merely lighter? And would black become grey or would it remain black?

180. We are not concerned with the facts of physics here except insofar as they determine the laws governing how things appear.

181. It is not immediately clear which transparent glass we should say had the 'same colour' as a piece of green paper.

182. If the paper is, e.g. pink, sky-blue or lilac we would imagine the glass to be somewhat *cloudy*, but we could also suppose it to be just a rather weak reddish, etc., clear glass. That's why something colourless is sometimes called "white".

183. We could say, the colour of a transparent glass is that which a white light source would appear when seen through that glass.

But seen through a *colourless* glass it appears as uncloudy *white*.

184. In the cinema it is often possible to see the events as 'though they were occurring behind the screen, as if the screen were transparent like a pane of glass. At the same time, however, the colour would be removed from these events and only white, grey and black would come through. But we are still not tempted to call it a transparent, *white* pane of glass.

How, then, would we see things through a pane of green glass? *One* difference would, of course, be that the green glass would diminish the difference between light and dark, while the other one shouldn't have any effect upon this difference. Then a 'grey transparent' pane would somewhat diminish it.

185. We might say of a pane of green glass that it gave things its colour. But does my 'white' pane do that?--If the green medium gives its colour to things, then, above all, to *white* things.

186. A thin layer of a coloured medium colours things only weakly: how should a thin 'white' glass colour them? Shall we suppose that it doesn't quite remove all their colour?

187. "We shouldn't be able to conceive of white water that is pure..." That is to say: we cannot describe how something white could look clear, and that means: we don't know what description is being asked for with these words.

188. We do not want to find a theory of colour (neither a physiological nor a psychological one), but rather the logic of colour concepts. And this accomplishes that which people have often unjustly expected from a theory.

189. Explaining colour words by pointing to coloured pieces of paper does not touch the concept of transparency. It is this concept that stands in unlike relations to the various colour concepts.

190. Thus, if someone wanted to say we don't even notice that the concepts of the different colours are so different, we would have to answer that he had simply paid attention to the analogy (the likeness) between these concepts, while the differences lie in the relations to other concepts. [A better remark on this.]

191. If a pane of green glass gives the things behind it a green colour, it turns white to green, red to black, yellow to greenish yellow, blue to greenish blue. The white pane should, therefore, make everything whitish, i.e. it should make everything *pale*; and, then why shouldn't it turn black to grey?--Even a yellow glass makes things darker, should a white glass make things darker too?

192. Every coloured medium makes the things seen through it darker in that it swallows up light: Now is my white

glass supposed to make things darker too, and more so the thicker it is? But it ought to leave white white: So the 'white glass' would really be a dark glass.

Page 43

193. If green becomes whitish through it, why doesn't grey become more whitish, and why doesn't black then become grey?

Page 43

194. Coloured glass mustn't make the things behind it lighter: so what should happen in the case of, e.g. something green? Should I see it as a grey-green?†1 then how should something green be seen through it? whitish-green?†1

Page Break 44

Page 44

195. If all the colours became whitish the picture would lose more and more depth.

Page 44

196. Grey is not poorly illuminated white, dark green is not poorly illuminated light green.

It is true that we say "At night all cats are grey", but that really means: we can't distinguish what colour they are and they *could* be grey.

Page 44

197. What constitutes the decisive difference between white and the other colours? Does it lie in the asymmetry of the relationships? And that is really to say, in the special position it has in the colour octohedron? Or is it rather the unlike position of the colours *vis-à-vis* dark and light?

Page 44

198. What should the painter paint if he wants to create the effect of a white, transparent glass?

Should red and green (etc.) become whitish?

Page 44

199. Isn't the difference simply that every coloured glass should impart colour to the white, while my glass must either leave it unchanged or simply make it darker?

Page 44

200. White seen through a coloured glass appears with the colour of the glass. That is a rule of the appearance of transparency. So white appears white through white glass, i.e. as through uncoloured glass.

Page 44

201. Lichtenberg speaks of 'pure white' and means by that the *lightest* of colours. No one could say that of pure yellow.

Page 44

202. It is odd to say white is solid, because of course yellow and red can be the colours of surfaces too, and as such, we do not categorially [[sic]] differentiate them from white.

Page 44

203. If we have a white cube with different strengths of illumination on its surfaces and look at it through a yellow glass, it now looks yellow and its surfaces still appear differently illuminated. How would it look through white glass? And how would a yellow cube look through white glass?

Page 44

204. Would it be as if we had mixed white or as if we had mixed grey with its colours?

Page Break 45

Page 45

205. Wouldn't it be possible for a glass to leave white, black and grey unchanged and make the rest of the colours whitish? And wouldn't this come close to being a white and transparent glass? The effect would then be like a photograph which still retained a trace of the natural colours. The degree of darkness of each colour would then have to be preserved, and certainly not *diminished*.

Page 45

206. This much I can understand: that a physical theory (such as Newton's) cannot solve the problems that motivated Goethe, even if he himself didn't solve them either.

Page 45

207. If I look at pure red through glass and it looks grey, has the glass actually given the colour a grey content? I.e.: or does it only *appear so*?

Page 45

208. Why do I feel that a white glass must colour black if it colours anything, while I can accept the fact that yellow

is swallowed up by black? Isn't it because clear coloured glass must colour white above all, and if it doesn't do that and is white, then it is cloudy.

Page 45

209. If you look at a landscape and screw up your eyes, the colours become less clear and everything begins to take on the character of black and white; but does it seem to me here as if I saw it through a pane of this or that coloured glass?

Page 45

210. We often speak of white as not coloured. Why? (We even do it when we are not thinking about transparency.)

Page 45

211. And it is strange that white sometimes appears on an equal footing with the other pure colours (as in flags), and then again sometimes it doesn't.

Why, for example, do we say that whitish green or red is "not *saturated*"? Why does white, but not yellow, make these colours weaker? Is that a matter of the psychology (the effect) of colours, or of their logic? Well, the fact that we use certain words such as "saturated", "muddy", etc. is a psychological matter; but that we make a sharp distinction at all, indicates that it is a conceptual matter.

Page 45

212. Is that connected with the fact that white gradually eliminates *all* contrasts, while red doesn't?

Page Break 46

Page 46

213. One and the same musical theme has a different character in the minor than in the major, but it is completely wrong to speak of the character of the minor mode in general. (In Schubert the major often sounds more sorrowful than the minor.)

And in this way I think that it is worthless and of no use whatsoever for the understanding of painting to speak of the characteristics of the individual colours. When we do it, we are really only thinking of special uses. That green as the colour of a tablecloth has this, red that effect, does not allow us to draw any conclusions as to their effect in a picture.

Page 46

214. White cancels out all colours,--does red do this too?

Page 46

215. Why is there no brown nor grey light? Is there no white light either? A luminous body can appear white but neither brown nor grey.

Page 46

216. Why can't we imagine a grey-hot?

Why can't we think of it as a lesser degree of white-hot?

Page 46

217. That something which seems luminous cannot also appear grey must be an indication that something luminous and colourless is always called "white"; this teaches us something about our concept of white.

Page 46

218. A weak white light is not a grey light.

Page 46

219. But the sky which illumines everything that we see can be grey! And how do I know merely by its appearance that it isn't itself luminous?

Page 46

220. That is to say roughly: something is 'grey' or 'white' only in a particular surrounding.

Page 46

221. I am not saying here what the Gestalt psychologists say: that the *impression of white* comes about in such and such a way. Rather the question is precisely: what is the impression of white, what is the meaning of this expression, what is the logic of this concept 'white'?

Page 46

222. For the fact that we cannot conceive of something 'grey-hot' does not pertain to the psychology of colours.

Page Break 47

Page 47

223. Imagine we were told that a substance burns with a grey flame. You don't know the colours of the flames of all substances: so why shouldn't that be possible? And yet it would mean nothing. If I heard such a thing, I would only think that the flame was *weakly luminous*.

Page 47

224. Whatever *looks* luminous does not look grey. Everything grey *looks* as though it is being illumined.

That something can 'appear luminous' is caused by the distribution of lightness in what is seen, but there is also such a thing as 'seeing something *as* luminous'; under certain circumstances one can take reflected light to be the light from a luminous body.

Page 47

225. I could, then, see something *now* as weakly luminous, *now* as grey.

Page 47

226. What we see as luminous we don't see as grey. But we can certainly see it as white.

Page 47

227. We speak of a 'dark red light', but not of a 'black-red light'.

Page 47

228. There is such a thing as the *impression* of luminosity.

Page 47

229. It is not the same thing to say: the impression of white or grey comes about under such and such conditions (causally), and to say that it is the impression of a certain context (definition). (The first is Gestalt psychology, the second logic.)

Page 47

230. The "primary phenomenon" (*Urphänomen*) is, e.g., what Freud thought he recognized in simple wish-fulfilment dreams. The primary phenomenon is a preconceived idea that takes possession of us.

Page 47

231. If a ghost appeared to me during the night, it could glow with a weak whitish light; but if it looked grey, then the light would have to appear as though it came from somewhere else.

Page 47

232. When psychology speaks of appearance, it connects it with reality. But we can speak of appearance alone, or we connect appearance with appearance.

Page Break 48

Page 48

233. We might say, the colour of the ghost is that which I must mix on the palette in order to paint it accurately.

Page 48

But how do we determine what the accurate picture is?

Page 48

234. Psychology connects what is experienced with something physical, but we connect what is experienced with what is experienced.

Page 48

235. We could paint semi-darkness in semi-darkness. And the 'right lighting' of a picture could be semi-darkness. (Stage scene-painting.)

Page 48

236. A smooth white surface can reflect things: But what, then, if we made a mistake and that which appeared to be reflected in such a surface were really behind it and seen through it? Would the surface then be white and transparent? Even then what we saw would not correspond to something, coloured and transparent.

Page 48

237. We speak of a 'black mirror'. But when it mirrors, it darkens, of course, but it doesn't look black, and its black doesn't 'smirch'.

Page 48

238. Why is green drowned in the black, while white isn't?

Page 48

239. There are colour concepts that only refer to the visual appearance of a surface, and there might be such as refer only to the appearance of transparent media, or rather to the visual impression of such media. We might want not to call a white high-light on silver, say, "white", and differentiate it from the white colour of a surface. I believe this is where the talk of "transparent" light comes from.

Page 48

240. If we taught a child the colour concepts by pointing to coloured flames, or coloured transparent bodies, the peculiarity of white, grey and black would show up more clearly.

Page 48

241. It is easy to see that not all colour concepts are logically of the same kind. It is easy to see the difference

between the concepts: 'the colour of gold' or 'the colour of silver' and 'yellow' or 'grey'.

But it is hard to see that there is a somewhat related difference between 'white' and 'red'.

Page Break 49

Page 49

242. Milk is not opaque because it is white,--as if white were something opaque.

If 'white' is a concept which only refers to a visual surface, why isn't there a colour concept related to 'white' that refers to transparent things?

Page 49

243. We wouldn't want to call a medium white-coloured, if a black and white pattern (chess board) appeared unchanged when seen through it, even if this medium changed other colours into whitish ones.

Page 49

244. Grey or a weakly illumined or luminous white can in one sense be the same colour, for if I *paint* the latter I may have to mix the former on the palette.

Page 49

245. Whether I see something as grey or as white can depend upon how I see the things around me illumined. To me in one context the colour is white in poor light, in another it is grey in good light.

Page 49

246. The bucket which I see in front of me is glazed gleaming white; I couldn't possibly call it grey or say "I really see grey". But it has a highlight that is far lighter than the rest of its surface, and because it is round there is a gradual transition from light to shadow, yet without there seeming to be a change of colour.

Page 49

247. What colour is the bucket at this spot? How should I decide this question?

Page 49

248. There is indeed no such thing as phenomenology, but there are phenomenological problems.

Page 49

249. We would like to say: when you mix in red you do not thin down the colours, when you mix in white you do. On the other hand, we don't always perceive pink or a whitish blue as thinned down.

Page 49

250. Can we say: "Luminous grey is white"?

Page 49

251. The difficulties which we encounter when we reflect about the nature of colours (those difficulties which Goethe wanted to deal with through his theory of colour) are contained in the fact that we have not *one* but several related concepts of the sameness of colours.

Page Break 50

Page 50

252. The question is: What must the visual image be like if we ought to call it that of a coloured, transparent medium? Or again: How must something look for it to appear to us as coloured and transparent? This is not a question of physics, but it is connected with physical questions.

Page 50

253. What is the nature of a visual image that we would call the image of a coloured transparent medium?

Page 50

254. There seem to be what we can call "colours of substances" and "colours of surfaces".

Page 50

255. Our colour concepts sometimes relate to substances (Snow is white), sometimes to surfaces (this table is brown), sometimes to the illumination (in the reddish evening light), sometimes to transparent bodies. And isn't there also an application to a place in the visual field, logically independent of a spatial context?

Can't I say "there I see white" (and paint it, for example) even if I can't in any way give a three-dimensional interpretation of the visual image? (Spots of colour.) (I am thinking of pointillist painting.)

Page 50

256. To be able generally to name a colour, is not the same as being able to copy it exactly. I can perhaps say "There I see a reddish place" and yet I can't mix a colour that I recognize as being exactly the same.

Page 50

257. Try, for example, to paint what you see when you close your eyes! And yet you can *roughly* describe it.

Page 50

258. Think of the colours of polished silver, nickel, chrome, etc. or of the colour of a scratch in these metals.

259. I give a colour the name "F" and I say it is the colour that I see *there*. Or perhaps I paint my visual image and then simply say "I see *this*". Now, what colour is at *this* spot in my image? How do I determine it? I introduce, say, the word "cobalt blue": How do I fix what 'C' is? I could take as the paradigm of this colour a paper or the dye in a pot.

How do I now determine that a surface (for example) has this colour? Everything depends on the method of comparison.

260. What we can call the "coloured" overall impression of a surface is by no means a kind of arithmetical mean of all the colours of the surface.

261.

["I see (hear, feel, etc.) X"
"I am observing X"

X does not stand for the same concept the first time and the second, even if the same expression, e.g. "a pain", is used both times. For the question "what kind of a pain?" could follow the first proposition and one could answer this by sticking the questioner with a needle. But if the question "what kind of a pain?" follows the second proposition, the answer must be of a different sort, e.g. "The pain in my hand.")

262. I would like to say "*this* colour is at *this* spot in my visual field (completely apart from any interpretation)". But what would I use this sentence for? "This" colour must (of course) be one that I can reproduce. And it must be determined under what circumstances I say something is this colour.

263. Imagine someone pointing to a spot in the iris in a face by Rembrandt and saying "the wall in my room should be painted this colour."

264. The fact that we can say "This spot in my visual field is grey-green" does not mean that we know what to call an exact reproduction of this shade of colour.

265. I paint the view from my window; one particular spot, determined by its position in the architecture of a house, I paint ochre. I say "I see this spot in this colour."

That does not mean that I see the colour ochre at this spot, for the pigment may appear much lighter or darker or more reddish (etc.) than ochre, in these surroundings.

I can perhaps say "I see this spot the way I have painted it here (with ochre); but it has a strongly reddish look to me."

But what if someone asked me to give the *exact* shade of colour that appears to me here? How should I describe it and how should I determine it? Someone could ask me, for example, to produce a colour sample, a rectangular piece of paper of this colour. I don't say

that such a comparison is utterly uninteresting, but it shows that it isn't from the outset clear how shades of colour are to be compared, and therefore, what "sameness of colour" means here.

266. Imagine a painting being cut up into small almost monochromatic bits which are then used as pieces in a puzzle. Even when such a piece is not monochromatic, it should not indicate any three-dimensional shape, but should appear as a flat colour-patch. Only together with the other pieces does it become a bit of sky, a shadow, a high-light, a concave or convex surface, etc..

267. Thus we might say that this puzzle shows us the actual colours of the various spots in the picture.

268. One might be inclined to believe that an analysis of our colour concepts would lead ultimately to the colours of places in our visual field, which would be independent of any spatial or physical interpretation, for here there would be neither illumination nor shadow nor high-light, nor transparency nor opaqueness, etc..

269. Something which appears to us as a light monochromatic line without breadth on a dark background can look

white but not grey(?). A planet couldn't look light grey.

Page 52

270. But wouldn't we *interpret* the point or the line as grey under certain circumstances? (Think of a photograph.)

Page 52

271. Do I actually see the boy's hair blond in the photograph?!--Do I see it grey?

Do I only *infer* that whatever looks *this way* in the picture, must in reality be blond?

In one sense I see it blond, in another I see it lighter or darker grey.

Page 52

272. 'Dark red' and 'blackish red' are not the same sort of concepts. A ruby can appear dark red when one looks through it, but if it's clear it cannot appear blackish red. The painter may depict it by means of a blackish red patch, but in the picture this patch will not have a blackish red effect. It is seen as having depth, just as the plane appears to be three-dimensional.

Page Break 53

Page 53

273. In a film, as in a photograph, face and hair do not look *grey*, they make a very natural impression; on the other hand, food on a plate often looks grey and therefore unappetizing in a film.

Page 53

274. What does it mean, though, that hair looks blond in a photograph? How does it come out that it *looks* this way as opposed to our simply *concluding* that this is its colour? Which of our reactions makes us say that?--Doesn't a stone or plaster head look white?

Page 53

275. If the word "blond" itself can sound blond, then it's even easier for photographed hair to look blond!

Page 53

276. It would be very natural for me to describe the photograph in these words "A man with dark hair and a boy with combed-back blond hair are standing by a machine." This is how I would describe the *photograph*, and if someone said that doesn't describe it but the objects that were probably photographed, I could say the picture looks *as though* the hair had been that colour.

Page 53

277. If I were called upon to describe the photograph, I'd do it in these words.

Page 53

278. The colour-blind understand the statement that they are colour-blind. The blind, the statement that they are blind. But they can't use these sentences in as many different ways as a normal person can. For just as the normal person can master language-games with, e.g. colour words, which they cannot learn, he can also master language-games with the words "colour-blind" and "blind".

Page 53

279. Can one explain to a blind person what it's like to *see*?--Certainly; the blind do learn a great deal about the difference between themselves and the sighted. And yet, we want to answer no to this question.--But isn't it posed in a misleading way? We can describe both to someone who does not play soccer and to someone who does 'what it's like to play soccer', perhaps to the latter so that he can check the correctness of the description. Can we then describe to the sighted person what it is like to see? But we *can* certainly explain to him what blindness is! I.e. we can describe to him the characteristic behaviour of a blind person and we can blindfold him. On the other hand, we cannot make a blind person see for a while; we can, however, describe to him how the sighted behave.

Page Break 54

Page 54

280. Can we say 'colour-blindness' (or 'blindness') is a phenomenon and 'seeing' is not?

That would mean something like: "I see" is expression, "I am blind" is not. But after all that's not true. People on the street often take me for blind. I could say to someone who does this "I see", i.e. I am not blind.

Page 54

281. We could say: It is a phenomenon that there are people who can't learn this or that. This phenomenon is colour-blindness.--It would therefore be an inability; seeing, however, would be the ability.

Page 54

282. I say to B, who cannot play chess: "A can't learn chess". B can understand that.--But now I say to someone who is absolutely unable to learn any game, so-and-so can't learn a game. What does he know of the nature of a game? Mightn't he have, e.g. a completely wrong concept of a game? Well, he may understand that we can't invite either him or the other one to a party, because they can't play any games.

Page 54

283. Does everything that I want to say here come down to the fact that the utterance "I see a red circle" and "I see, I'm not blind" are logically different? How do we test a person to find out if the first statement is true? And to find out if the second is true? Psychology teaches us how to determine colour-blindness, and thereby normal vision too. But *who* can learn this?

Page 54

284. I can't teach anyone a game that I can't learn myself. A colour-blind person cannot teach a normal person the normal use of colour words. Is that true? He can't give him a *demonstration* of the game, of the use.

Page 54

285. Couldn't a member of a tribe of colour-blind people get the idea of imagining a strange sort of human being (whom we would call "normally sighted")? Couldn't he, for example, portray such a normally sighted person on the stage? In the same way as he is able to portray someone who has the gift of prophesy without having it himself. It's at least conceivable.

Page Break 55

Page 55

286. But would it ever occur to colour-blind people to call themselves "colour-blind"?--Why not?

But how could 'normally sighted people' learn the 'normal' use of colour words, if they were the exceptions in a colour-blind population?--Isn't it possible that they just use colour words 'normally', and perhaps, in the eyes of the others they make certain mistakes, until the others finally learn to appreciate these unusual abilities.

Page 55

287. I can imagine (depict), how it would seem to me if I met such a person.

Page 55

288. I can imagine how a human being would behave who regards that which is important to me as unimportant. But can I imagine his *state*?--What does that mean? Can I imagine the state of someone who considers important what I consider important?

Page 55

289. I could even exactly imitate someone who was doing a multiplication problem without being able to learn multiplication myself.

And I couldn't then teach others to multiply, although it would be conceivable that I gave someone the impetus to learn it.

Page 55

290. A colour-blind person can obviously describe the test by which his colour-blindness was discovered. And what he can subsequently describe, he could also have invented.

Page 55

291. Can one describe higher mathematics to someone without thereby teaching it to him? Or again: *Is* this instruction a *description* of the kind of calculation? To describe the game of tennis to someone is *not* to teach it to him (and vice versa). On the other hand, someone who didn't know what tennis is, and now learns to play, then knows what it is. ("Knowledge by description and knowledge by acquaintance".)

Page 55

292. Someone who has perfect pitch can learn a language-game that I cannot learn.

Page 55

293. We could say people's concepts show what matters to them and what doesn't. But it's not as if this *explained* the particular concepts they have. It is only to rule out the view that we have the right concepts and other people the wrong ones. (There is a continuum between an error in calculation and a different mode of calculating.)

Page Break 56

Page 56

294. When blind people speak, as they like to do, of blue sky and other specifically visual phenomena, the sighted person often says "Who knows what he imagines that to mean"--But why doesn't he say this about other sighted people? It is, of course, a wrong expression to begin with.

Page 56

295. That which I am writing about so tediously, may be obvious to someone whose mind is less decrepit.

Page 56

296. We say: "Let's imagine human beings who don't know *this* language-game". But this does not give us any clear idea of the life of these people, of where it deviates from ours. We don't yet know what we have to imagine; for the life of these people *is* supposed to correspond to ours for the rest, and it first has to be determined what we would

call a life that corresponds to ours under the new circumstances.

Isn't it as if we said: There are people who play chess without the king? Questions immediately arise: Who wins now, who loses, etc. You have to make *further* decisions which you didn't foresee in that first statement. Just as you don't have an overview of the original technique, you are merely familiar with it from case to case.

Page 56

297. It is also a part of dissembling, to regard others as capable of dissembling.

Page 56

298. If human beings acted in such a way that we were inclined to suspect them of dissembling, but they showed no mistrust of one another, then this doesn't present a picture of people who dissemble.

Page 56

299. 'We cannot help but be constantly surprised by these people'.

Page 56

300. We could portray certain people on the stage and have them speak in monologues (asides) things that in real life they of course would not say out loud, but which would nevertheless correspond to their thoughts. But we couldn't portray an alien kind of humans this way. Even if we could predict their behaviour, we couldn't give them the appropriate asides.

And yet there's something wrong with this way of looking at it. For someone might actually say something to himself while he was going about doing things, and this could simply be quite conventional.

Page Break 57

Page 57

301. That I can be someone's friend rests on the fact that he has the same *possibilities* as I myself have, or similar ones.

Page 57

302. Would it be correct to say our concepts reflect our life? They stand in the middle of it.

Page 57

303. The rule-governed nature of our languages permeates our life.

Page 57

304. When would we say of someone, he doesn't have our concept of pain? I could assume that he knows no pain, but I want to assume that he does know it; we thus assume he gives expressions of pain and we could teach him the words "I have pain". Should he also be capable of remembering his pain?--Should he recognize expressions of pain in others as such; and how is this revealed? Should he show pity?--should he understand make-believe pain *as being just that*?

Page 57

305. "I don't know *how* irritated he was". "I don't know if he was *really* irritated".--Does he know himself? Well, we ask him, and he says, "Yes, I was."

Page 57

306. What then is this *uncertainty* about whether the other person was irritated? Is it a mental state of the uncertain person? Why should we be concerned with that? It lies in the use of the expression "He is irritated".

Page 57

307. But *one* is uncertain, another may be certain: he 'knows the look on this person's face' when he is irritated. How does he learn to know this sign of irritation as being such? That's not easy to say.

Page 57

308. But it is not only: "What does it mean to be uncertain about the state of another person?"--but also "What does it mean 'to *know*, to be certain, that that person is irritated'?"

Page 57

309. Here it could now be asked what I really want, to what extent I want to deal with grammar.

Page 57

310. The certainty that he will visit me and the certainty that he is irritated have something in common. The game of tennis and the game of chess have something in common, too, but no one would

Page Break 58

say here: "It is very simple: they play in both cases, it's just that each time they play something different." *This* case shows us the dissimilarity to "One time he eats an apple, another time a pear", while in the other case it is not so easy to see.

Page 58

311. "I know, that he arrived yesterday"--"I know, that $2 \times 2 = 4$ "--"I know that he had pain"--"I know that there is a

table standing there".

Page 58

312. In each case I know, it's only that it's always something different? *Oh yes*,--but the language-games are far more different than these sentences make us conscious of.

Page 58

313. "The world of physical objects and the world of consciousness". What do I know of *the latter*? What my senses teach me? I.e. how it is, if one sees, hears, feels, etc., etc.--But do I really learn that? Or do I learn what it's like when *I now* see, hear, etc., and *I believe* that it was also like this before?

Page 58

314. What actually is the '*world*' of consciousness? There I'd like to say: "What goes on in my mind, what's going on in it now, what I see, hear,..." Couldn't we simplify that and say: "What I am now seeing."

Page 58

315. The question is clearly: How do we compare physical objects--how do we compare experiences?

Page 58

316. What actually is the '*world of consciousness*'?--That which is in my consciousness: what I am now seeing, hearing, feeling....--And what, for example, am I now seeing? The answer to that cannot be: "Well, *all that*" accompanied by a sweeping gesture.

Page 58

317. When someone who believes in God looks around him and asks "Where did everything that I see come from?" "Where did everything come from?" he is *not* asking for a (causal) explanation; and the point of his question is that it is the expression of such a request. Thus, he is expressing an attitude toward all explanations. But how is this shown in his life? It is the attitude that takes a particular matter seriously, but then at a particular point doesn't take it seriously after all, and declares that something else is even more serious.

In this way a person can say it is very serious that so-and-so died

Page Break 59

before he could finish a certain work; and in another sense it doesn't matter at all. Here we use the words "in a profounder sense".

What I actually want to say is that here too it is not a matter of the *words* one uses or of what one is thinking when using them, but rather of the difference they make at various points in life. How do I know that two people mean the same when both say they believe in God? And one can say just the same thing about the Trinity. Theology which insists on the use of *certain* words and phrases and bans others, makes nothing clearer (Karl Barth). It, so to speak, fumbles around with words, because it wants to say something and doesn't know how to express it. *Practices* give words their meaning.

Page 59

318. I observe this patch. "Now it's like *so*"--and simultaneously I point to e.g. a picture. I may constantly *observe* the same thing and what I *see* may then remain the same, or it may change. What I observe and what I see do not have the same (kind of) identity. Because the words "this patch", for example, do not allow us to recognize the (kind of) identity I mean.

Page 59

319. "Psychology describes the phenomena of colour-blindness as well as those of normal sight." What are the '*phenomena of colour-blindness*'? Certainly the reactions of the colour-blind person which differentiate him from the normal person. But certainly not *all* of the colour-blind person's reactions, for example, not those that distinguish him from a blind person.--Can I teach the blind what seeing is, or can I teach this to the sighted? That doesn't mean anything. Then what does it mean: to describe *seeing*? But I can teach human beings the meaning of the words "blind" and "sighted", and indeed the sighted learn them, just as the blind do. Then do the blind know what it is like to see? But do the sighted know? Do they also know what it's like to have consciousness?

But can't psychologists observe the difference between the behaviour of the sighted and the blind? (Meteorologists the difference between rain and drought?). We certainly could, e.g. observe the difference between the behaviour of rats whose whiskers had been removed and of those which were not mutilated in this way. And perhaps we could call that describing the role of this tactile apparatus.--The lives of the blind are different from those of the sighted.

Page 59

320. The normal person can, e.g. learn to take dictation. What is that? Well, one person speaks and the other writes down what he

Page Break 60

says. Thus, if he says e.g. the sound *a*, the other writes the symbol "a", etc. Now mustn't someone who *understands* this explanation either already have known the game, only perhaps not by this name,--or have learnt it from the description? But Charlemagne certainly understood the principle of writing and still couldn't learn to write. Someone can thus also understand the description of a technique yet not be able to learn it. But there are two cases of not-being-able-to-learn. In the one case we merely fail to acquire a certain competence, in the other we lack comprehension. We can *explain* a game to someone: He may understand this explanation, but not be able to learn the game, or he may be incapable of understanding my explanation of the game. But the opposite is conceivable as well.

Page 60

321. "You see the tree, the blind do not see it". This is what I would have to say to a sighted person. And so do I have to say to the blind: "You do not see the tree, we see it"? What would it be like for the blind man to believe that he saw, or for me to believe I couldn't see?

Page 60

322. Is it a phenomenon that I see the tree? It is one that I correctly recognize this as a tree, that I am not blind.

Page 60

323. "I see a tree", as the expression of the visual impression,--is this the description of a phenomenon? *What* phenomenon? How can I explain this to someone?

And yet isn't the fact that I have this visual impression a phenomenon for someone else? Because it is something that he observes, but not something that I observe.

The words "I am seeing a tree" are not the description of a phenomenon. (I couldn't say, for example, "I am seeing a tree! How strange!", but I could say: "I am seeing a tree, but there's no tree there. How strange!")

Page 60

324. Or should I say: "The impression is not a phenomenon; but that L.W. has this impression is one"?

Page 60

325. (We could imagine someone talking to himself and describing the impression as one does a dream, without using the first person pronoun.)

Page Break 61

Page 61

326. To observe is not the same thing as to look at or to view.

"Look at this colour and say what it reminds you of". If the colour changes you are no longer looking at the one I meant.

One observes in order to see what one would not see if one did not observe.

Page 61

327. We say, for example "Look at this colour for a certain length of time". But we don't do that in order to *see* more than we had seen at first glance.

Page 61

328. Could a "Psychology" contain the sentence: "There are human beings who see"?

Well, would that be false?--But to whom would this communicate anything? (And I don't just mean: what is being communicated is a long familiar fact.)

Page 61

329. Is it a familiar fact to me that I see?

Page 61

330. We might want to say: If there were no such humans, then we wouldn't have the concept of *seeing*.--But couldn't Martians say something like this? Somehow, by chance, the first humans they met were all blind.

Page 61

331. And how can it be meaningless to say "there are humans who see," if it is not meaningless to say there are humans who are blind?

But the meaning of the sentence "there are humans who see", i.e. its possible use at any rate, is not immediately clear.

Page 61

332. Couldn't seeing be the *exception*? But neither the blind nor the sighted could describe it, except as an ability to do this or that. Including e.g. playing certain language-games; but there we must be careful how we describe these games.

Page 61

333. If we say "there are humans who see", the question follows "And what *is* 'seeing'?" And how should we answer it? By teaching the questioner the use of the word "see"?

Page 61

334. How about this explanation: "There are people who behave like you and me, and not like that man over there, the blind one"?

Page Break 62

Page 62

335. "With your eyes open, you can cross the street and not be run over, etc."
The logic of *information*.

Page 62

336. To say that a sentence which has the form of information has a use, is not yet to say anything about the *kind* of use it has.

Page 62

337. Can the psychologist inform me what seeing is? What do we *call* "informing someone what seeing is?"

Page 62

It is not the psychologist who teaches me the use of the word "seeing".

Page 62

338. If the psychologist informs us "There are people who see", we could ask him "And what do you call 'People who see'?" The answer to that would be of the sort "Human beings who react so-and-so, and behave so-and-so under such-and-such circumstances". "Seeing" would be a technical term of the psychologist, which he explains to us. Seeing is then something which he has observed in human beings.

Page 62

339. We learn to use the expressions "I see...", "he sees...", etc. before we learn to distinguish between seeing and blindness.

Page 62

340. "There are people who can talk", "I can say a sentence", "I can pronounce the word 'sentence'", "As you see, I am awake", "I am here".

Page 62

341. There is surely such a thing as instruction in the circumstances under which a certain sentence can be a piece of information. What should I call this instruction?

Page 62

342. Can I be said to have observed that I and other people can go around with our eyes open and not bump into things and that we can't do this with our eyes closed?

Page 62

343. When I tell someone I am not blind, is that an observation? I can, in any case, convince him of it by my behaviour.

Page Break 63

Page 63

344. A blind man could easily find out if I am blind too; by, for example, making a certain gesture with his hand, and asking me what he did.

Page 63

345. Couldn't we imagine a tribe of blind people? Couldn't it be capable of sustaining life under certain circumstances? And mightn't sighted people occur as exceptions?

Page 63

346. Suppose a blind man said to me: "You can go about without bumping into anything, I can't"--Would he be communicating anything to me in the first part of the sentence?

Page 63

347. Well, he's not telling me anything new.

Page 63

348. There seem to be propositions that have the character of experiential propositions, but whose truth is for me unassailable. That is to say, if I assume that they are false, I must mistrust all my judgements.

Page 63

349. There are, in any case, errors which I take to be commonplace and others that have a different character and which must be set apart from the rest of my judgements as temporary *confusions*. But aren't there transitional cases between these two

Page 63

350. If we introduce the concept of knowing into this investigation, it will be of no help; because knowing is not a

psychological state whose special characteristics explain all kinds of things. On the contrary, the special logic of the concept "knowing" is not that of a psychological state.
